GRAPHS OF PARENT FUNCTIONS

### Linear Function

\[ f(x) = mx + b \]

**Domain:** \((-\infty, \infty)\)
**Range:** \((-\infty, \infty)\)
**x-intercept:** \(-\frac{b}{m}, 0\)
**y-intercept:** \((0, b)\)
**Increasing when** \(m > 0\)
**Decreasing when** \(m < 0\)

### Absolute Value Function

\[ f(x) = |x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases} \]

**Domain:** \((-\infty, \infty)\)
**Range:** \([0, \infty)\)
**Intercept:** \((0, 0)\)
**Decreasing on** \((-\infty, 0)\)
**Increasing on** \((0, \infty)\)
**Even function**
**y-axis symmetry**

### Square Root Function

\[ f(x) = \sqrt{x} \]

**Domain:** \([0, \infty)\)
**Range:** \([0, \infty)\)
**Intercept:** \((0, 0)\)
**Increasing on** \((0, \infty)\)

### Greatest Integer Function

\[ f(x) = \lfloor x \rfloor \]

**Domain:** \((-\infty, \infty)\)
**Range:** the set of integers
**x-intercepts:** in the interval \([0, 1)\)
**y-intercept:** \((0, 0)\)
**Constant between each pair of consecutive integers**
**Jumps vertically one unit at each integer value**

### Quadratic (Squaring) Function

\[ f(x) = ax^2 \]

**Domain:** \((-\infty, \infty)\)
**Range:** \([0, \infty)\)
**x-intercepts:** \(0, 0\)
**y-intercept:** \((0, 0)\)
**Decreasing on** \((-\infty, 0)\) for \(a > 0\)
**Increasing on** \((0, \infty)\) for \(a > 0\)
**Decreasing on** \((-\infty, 0)\) for \(a < 0\)
**Increasing on** \((0, \infty)\) for \(a < 0\)
**Even function**
**y-axis symmetry**
**Relative minimum** \((a > 0)\),
**relative maximum** \((a < 0)\),
or vertex: \((0, 0)\)

### Cubic Function

\[ f(x) = x^3 \]

**Domain:** \((-\infty, \infty)\)
**Range:** \((-\infty, \infty)\)
**Intercept:** \((0, 0)\)
**Increasing on** \((-\infty, \infty)\)
**Odd function**
**Origin symmetry**

A Word from the Author

Welcome to the Second Edition of *Precalculus with Limits!* We are proud to offer you a new and revised version of our textbook. With the Second Edition, we have listened to you, our users, and have incorporated many of your suggestions for improvement.

In this edition, we continue to offer instructors and students a text that is pedagogically sound, mathematically precise, and still comprehensible. There are many changes in the mathematics, art, and design; the more significant changes are noted here.

- **New Chapter Openers** Each Chapter Opener has three parts, *In Mathematics*, *In Real Life*, and *In Careers*. *In Mathematics* describes an important mathematical topic taught in the chapter. *In Real Life* tells students where they will encounter this topic in real-life situations. *In Careers* relates application exercises to a variety of careers.

- **New Study Tips and Warning/Cautions** Insightful information is given to students in two new features. The *Study Tip* provides students with useful information or suggestions for learning the topic. The *Warning/Caution* points out common mathematical errors made by students.

- **New Algebra Helps** *Algebra Help* directs students to sections of the textbook where they can review algebra skills needed to master the current topic.

- **New Side-by-Side Examples** Throughout the text, we present solutions to many examples from multiple perspectives—algebraically, graphically, and numerically. The side-by-side format of this pedagogical feature helps students to see that a problem can be solved in more than one way and to see that different methods yield the same result. The side-by-side format also addresses many different learning styles.
• **New Capstone Exercises**  Capstones are conceptual problems that synthesize key topics and provide students with a better understanding of each section’s concepts. Capstone exercises are excellent for classroom discussion or test prep, and teachers may find value in integrating these problems into their reviews of the section.

• **New Chapter Summaries**  The Chapter Summary now includes an explanation and/or example of each objective taught in the chapter.

• **Revised Exercise Sets**  The exercise sets have been carefully and extensively examined to ensure they are rigorous and cover all topics suggested by our users. Many new skill-building and challenging exercises have been added.

For the past several years, we’ve maintained an independent website—CalcChat.com—that provides free solutions to all odd-numbered exercises in the text. Thousands of students using our textbooks have visited the site for practice and help with their homework. For the Second Edition, we were able to use information from CalcChat.com, including which solutions students accessed most often, to help guide the revision of the exercises.

I hope you enjoy the Second Edition of Precalculus with Limits. As always, I welcome comments and suggestions for continued improvements.

Ron Larson
I would like to thank the many people who have helped me prepare the text and the supplements package. Their encouragement, criticisms, and suggestions have been invaluable.

Thank you to all of the instructors who took the time to review the changes in this edition and to provide suggestions for improving it. Without your help, this book would not be possible.

**Reviewers**

Chad Pierson, University of Minnesota-Duluth; Sally Shao, Cleveland State University; Ed Stumpf, Central Carolina Community College; Fuzhen Zhang, Nova Southeastern University; Dennis Shepherd, University of Colorado, Denver; Rhonda Kilgo, Jacksonville State University; C. Altay Özgener, Manatee Community College Bradenton; William Forrest, Baton Rouge Community College; Tracy Cook, University of Tennessee Knoxville; Charles Hale, California State Poly University Pomona; Samuel Evers, University of Alabama; Seongchun Kwon, University of Toledo; Dr. Arun K. Agarwal, Grambling State University; Hyounkyun Oh, Savannah State University; Michael J. McConnell, Clarion University; Martha Chalhoub, Collin County Community College; Angela Lee Everett, Chattanooga State Tech Community College; Heather Van Dyke, Walla Walla Community College; Gregory Buthusiem, Burlington County Community College; Ward Shaffer, College of Coastal Georgia; Carmen Thomas, Chatham University; Emily J. Keaton

My thanks to David Falvo, The Behrend College, The Pennsylvania State University, for his contributions to this project. My thanks also to Robert Hostetler, The Behrend College, The Pennsylvania State University, and Bruce Edwards, University of Florida, for their significant contributions to previous editions of this text.

I would also like to thank the staff at Larson Texts, Inc. who assisted with proofreading the manuscript, preparing and proofreading the art package, and checking and typesetting the supplements.

On a personal level, I am grateful to my spouse, Deanna Gilbert Larson, for her love, patience, and support. Also, a special thanks goes to R. Scott O’Neil. If you have suggestions for improving this text, please feel free to write to me. Over the past two decades I have received many useful comments from both instructors and students, and I value these comments very highly.

Ron Larson
Supplements for the Instructor

*Annotated Instructor’s Edition*  This AIE is the complete student text plus point-of-use annotations for the instructor, including extra projects, classroom activities, teaching strategies, and additional examples. Answers to even-numbered text exercises, Vocabulary Checks, and Explorations are also provided.

*Complete Solutions Manual*  This manual contains solutions to all exercises from the text, including Chapter Review Exercises and Chapter Tests.

*Instructor’s Companion Website*  This free companion website contains an abundance of instructor resources.

*PowerLecture™ with ExamView®*  The CD-ROM provides the instructor with dynamic media tools for teaching college algebra. PowerPoint® lecture slides and art slides of the figures from the text, together with electronic files for the test bank and a link to the Solution Builder, are available. The algorithmic ExamView allows you to create, deliver, and customize tests (both print and online) in minutes with this easy-to-use assessment system. Enhance how your students interact with you, your lecture, and each other.

*Solutions Builder*  This is an electronic version of the complete solutions manual available via the PowerLecture and Instructor’s Companion Website. It provides instructors with an efficient method for creating solution sets to homework or exams that can then be printed or posted.

*Online AIE to the Note Taking Guide*  This AIE includes the answers to all problems in the innovative Note Taking Guide.
Supplements for the Student

**Student Companion Website**  This free companion website contains an abundance of student resources.

**Instructional DVDs**  Keyed to the text by section, these DVDs provide comprehensive coverage of the course—along with additional explanations of concepts, sample problems, and applications—to help students review essential topics.

**Student Study and Solutions Manual**  This guide offers step-by-step solutions for all odd-numbered text exercises, Chapter and Cumulative Tests, and Practice Tests with solutions.

**Premium eBook**  The Premium eBook offers an interactive version of the textbook with search features, highlighting and note-making tools, and direct links to videos or tutorials that elaborate on the text discussions.

**Enhanced WebAssign**  Enhanced WebAssign is designed for you to do your homework online. This proven and reliable system uses pedagogy and content found in Larson’s text, and then enhances it to help you learn Precalculus more effectively. Automatically graded homework allows you to focus on your learning and get interactive study assistance outside of class.

**Note Taking Guide**  This is an innovative study aid, in the form of a notebook organizer, that helps students develop a section-by-section summary of key concepts.
This page intentionally left blank
In Mathematics
Functions show how one variable is related to another variable.

In Real Life
Functions are used to estimate values, simulate processes, and discover relationships. For instance, you can model the enrollment rate of children in preschool and estimate the year in which the rate will reach a certain number. Such an estimate can be used to plan measures for meeting future needs, such as hiring additional teachers and buying more books. (See Exercise 113, page 64.)

IN CAREERS
There are many careers that use functions. Several are listed below.

• Financial analyst
  Exercise 95, page 51

• Biologist
  Exercise 73, page 91

• Tax preparer
  Example 3, page 104

• Oceanographer
  Exercise 83, page 112
The Cartesian Plane

Just as you can represent real numbers by points on a real number line, you can represent ordered pairs of real numbers by points in a plane called the **rectangular coordinate system**, or the **Cartesian plane**, named after the French mathematician René Descartes (1596–1650).

The Cartesian plane is formed by using two real number lines intersecting at right angles, as shown in Figure 1.1. The horizontal real number line is usually called the **x-axis**, and the vertical real number line is usually called the **y-axis**. The point of intersection of these two axes is the **origin**, and the two axes divide the plane into four parts called **quadrants**.

Each point in the plane corresponds to an **ordered pair** \((x, y)\) of real numbers \(x\) and \(y\), called **coordinates** of the point. The **x-coordinate** represents the directed distance from the **y-axis** to the point, and the **y-coordinate** represents the directed distance from the **x-axis** to the point, as shown in Figure 1.2.

The notation \((x, y)\) denotes both a point in the plane and an open interval on the real number line. The context will tell you which meaning is intended.

**Example 1**  
**Plotting Points in the Cartesian Plane**

Plot the points \((-1, 2), (3, 4), (0, 0), (3, 0), \) and \((-2, -3)\).

**Solution**

To plot the point \((-1, 2)\), imagine a vertical line through \(-1\) on the **x-axis** and a horizontal line through 2 on the **y-axis**. The intersection of these two lines is the point \((-1, 2)\). The other four points can be plotted in a similar way, as shown in Figure 1.3.
The beauty of a rectangular coordinate system is that it allows you to see relationships between two variables. It would be difficult to overestimate the importance of Descartes’s introduction of coordinates in the plane. Today, his ideas are in common use in virtually every scientific and business-related field.

**Example 2 Sketching a Scatter Plot**

From 1994 through 2007, the numbers $N$ (in millions) of subscribers to a cellular telecommunication service in the United States are shown in the table, where $t$ represents the year. Sketch a scatter plot of the data. (Source: CTIA-The Wireless Association)

**Solution**

To sketch a scatter plot of the data shown in the table, you simply represent each pair of values by an ordered pair $(t, N)$ and plot the resulting points, as shown in Figure 1.4. For instance, the first pair of values is represented by the ordered pair $(1994, 24.1)$. Note that the break in the $t$-axis indicates that the numbers between 0 and 1994 have been omitted.

<table>
<thead>
<tr>
<th>Year, $t$</th>
<th>Subscribers, $N$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1994</td>
<td>24.1</td>
</tr>
<tr>
<td>1995</td>
<td>33.8</td>
</tr>
<tr>
<td>1996</td>
<td>44.0</td>
</tr>
<tr>
<td>1997</td>
<td>55.3</td>
</tr>
<tr>
<td>1998</td>
<td>69.2</td>
</tr>
<tr>
<td>1999</td>
<td>86.0</td>
</tr>
<tr>
<td>2000</td>
<td>109.5</td>
</tr>
<tr>
<td>2001</td>
<td>128.4</td>
</tr>
<tr>
<td>2002</td>
<td>140.8</td>
</tr>
<tr>
<td>2003</td>
<td>158.7</td>
</tr>
<tr>
<td>2004</td>
<td>182.1</td>
</tr>
<tr>
<td>2005</td>
<td>207.9</td>
</tr>
<tr>
<td>2006</td>
<td>233.0</td>
</tr>
<tr>
<td>2007</td>
<td>255.4</td>
</tr>
</tbody>
</table>

**FIGURE 1.4**

Now try Exercise 25.

In Example 2, you could have let $t = 1$ represent the year 1994. In that case, the horizontal axis would not have been broken, and the tick marks would have been labeled 1 through 14 (instead of 1994 through 2007).

**TECHNOLOGY**

The scatter plot in Example 2 is only one way to represent the data graphically. You could also represent the data using a bar graph or a line graph. If you have access to a graphing utility, try using it to represent graphically the data given in Example 2.
### The Pythagorean Theorem and the Distance Formula

The following famous theorem is used extensively throughout this course.

#### Pythagorean Theorem

For a right triangle with hypotenuse of length \( c \) and sides of lengths \( a \) and \( b \), you have \( a^2 + b^2 = c^2 \), as shown in Figure 1.5. (The converse is also true. That is, if \( a^2 + b^2 = c^2 \), then the triangle is a right triangle.)

Suppose you want to determine the distance between two points \((x_1, y_1)\) and \((x_2, y_2)\) in the plane. With these two points, a right triangle can be formed, as shown in Figure 1.6. The length of the vertical side of the triangle is \( |y_2 - y_1| \), and the length of the horizontal side is \( |x_2 - x_1| \). By the Pythagorean Theorem, you can write

\[
d^2 = (x_2 - x_1)^2 + (y_2 - y_1)^2
\]

This result is the **Distance Formula**.

### The Distance Formula

The distance \( d \) between the points \((x_1, y_1)\) and \((x_2, y_2)\) in the plane is

\[
d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.
\]

#### Example 3  Finding a Distance

Find the distance between the points \((-2, 1)\) and \((3, 4)\).

**Algebraic Solution**

Let \((x_1, y_1) = (-2, 1)\) and \((x_2, y_2) = (3, 4)\). Then apply the Distance Formula.

\[
d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}
\]

\[
d = \sqrt{[3 - (-2)]^2 + (4 - 1)^2}
\]

\[
d = \sqrt{[5]^2 + [3]^2}
\]

\[
d = \sqrt{34}
\]

\[
\approx 5.83
\]

So, the distance between the points is about 5.83 units. You can use the Pythagorean Theorem to check that the distance is correct.

\[
d^2 = 3^2 + 5^2
\]

\[
(\sqrt{34})^2 \approx 3^2 + 5^2
\]

\[
34 = 34
\]

**Graphical Solution**

Use centimeter graph paper to plot the points \( A(-2, 1) \) and \( B(3, 4) \). Carefully sketch the line segment from \( A \) to \( B \). Then use a centimeter ruler to measure the length of the segment.

The line segment measures about 5.8 centimeters, as shown in Figure 1.7. So, the distance between the points is about 5.8 units.

**Now try Exercise 31.**
Section 1.1 Rectangular Coordinates

Verifying a Right Triangle
Show that the points and are vertices of a right triangle.

Solution
The three points are plotted in Figure 1.8. Using the Distance Formula, you can find the lengths of the three sides as follows.

\[ d_1 = \sqrt{(5 - 2)^2 + (7 - 1)^2} = \sqrt{9 + 36} = \sqrt{45} \]
\[ d_2 = \sqrt{(4 - 2)^2 + (0 - 1)^2} = \sqrt{4 + 1} = \sqrt{5} \]
\[ d_3 = \sqrt{(5 - 4)^2 + (7 - 0)^2} = \sqrt{1 + 49} = \sqrt{50} \]

Because \( (d_1)^2 + (d_2)^2 = 45 + 5 = 50 = (d_3)^2 \)

you can conclude by the Pythagorean Theorem that the triangle must be a right triangle.

Now try Exercise 43.

The Midpoint Formula
To find the midpoint of the line segment that joins two points in a coordinate plane, you can simply find the average values of the respective coordinates of the two endpoints using the Midpoint Formula.

**The Midpoint Formula**
The midpoint of the line segment joining the points \((x_1, y_1)\) and \((x_2, y_2)\) is given by the Midpoint Formula

\[
\text{Midpoint} = \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).
\]

For a proof of the Midpoint Formula, see Proofs in Mathematics on page 122.

Example 5 Finding a Line Segment's Midpoint
Find the midpoint of the line segment joining the points \((-5, -3)\) and \((9, 3)\).

Solution
Let \((x_1, y_1) = (-5, -3)\) and \((x_2, y_2) = (9, 3)\).

\[
\text{Midpoint} = \left( \frac{-5 + 9}{2}, \frac{-3 + 3}{2} \right) = \left( \frac{4}{2}, \frac{0}{2} \right) = (2, 0)
\]

The midpoint of the line segment is \((2, 0)\), as shown in Figure 1.9.

Now try Exercise 47(c).
## Applications

### Example 6  Finding the Length of a Pass

A football quarterback throws a pass from the 28-yard line, 40 yards from the sideline. The pass is caught by a wide receiver on the 5-yard line, 20 yards from the same sideline, as shown in Figure 1.10. How long is the pass?

### Solution

You can find the length of the pass by finding the distance between the points $(40, 28)$ and $(20, 5)$.

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Substitute for $x_1, y_1, x_2,$ and $y_2$.

$$= \sqrt{(40 - 20)^2 + (28 - 5)^2}$$

Simplify.

$$= \sqrt{400 + 529}$$

Simplify.

$$= \sqrt{929}$$

Use a calculator.

$$\approx 30$$

So, the pass is about 30 yards long.

**CHECKPoint** Now try Exercise 57.

In Example 6, the scale along the goal line does not normally appear on a football field. However, when you use coordinate geometry to solve real-life problems, you are free to place the coordinate system in any way that is convenient for the solution of the problem.

### Example 7  Estimating Annual Revenue

Barnes & Noble had annual sales of approximately $5.1 billion in 2005, and $5.4 billion in 2007. Without knowing any additional information, what would you estimate the 2006 sales to have been?  (Source: Barnes & Noble, Inc.)

### Solution

One solution to the problem is to assume that sales followed a linear pattern. With this assumption, you can estimate the 2006 sales by finding the midpoint of the line segment connecting the points $(2005, 5.1)$ and $(2007, 5.4)$.

$$\text{Midpoint } = \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$$

Substitute for $x_1, x_2, y_1$ and $y_2$.

$$= \left( \frac{2005 + 2007}{2}, \frac{5.1 + 5.4}{2} \right)$$

Simplify.

$$= (2006, 5.25)$$

So, you would estimate the 2006 sales to have been about $5.25 billion, as shown in Figure 1.11. (The actual 2006 sales were about $5.26 billion.)

**CHECKPoint** Now try Exercise 59.
Translating Points in the Plane

The triangle in Figure 1.12 has vertices at the points \((-1, 2)\), \((1, -4)\), and \((2, 3)\). Shift the triangle three units to the right and two units upward and find the vertices of the shifted triangle, as shown in Figure 1.13.

**Solution**

To shift the vertices three units to the right, add 3 to each of the \(x\)-coordinates. To shift the vertices two units upward, add 2 to each of the \(y\)-coordinates.

<table>
<thead>
<tr>
<th>Original Point</th>
<th>Translated Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-1, 2))</td>
<td>((-1 + 3, 2 + 2) = (2, 4))</td>
</tr>
<tr>
<td>((1, -4))</td>
<td>((1 + 3, -4 + 2) = (4, -2))</td>
</tr>
<tr>
<td>((2, 3))</td>
<td>((2 + 3, 3 + 2) = (5, 5))</td>
</tr>
</tbody>
</table>

The figures provided with Example 8 were not really essential to the solution. Nevertheless, it is strongly recommended that you develop the habit of including sketches with your solutions—even if they are not required.

Extending the Example

Example 8 shows how to translate points in a coordinate plane. Write a short paragraph describing how each of the following transformed points is related to the original point.

<table>
<thead>
<tr>
<th>Original Point</th>
<th>Transformed Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>((x, y))</td>
<td>((-x, y))</td>
</tr>
<tr>
<td>((x, y))</td>
<td>((x, -y))</td>
</tr>
<tr>
<td>((x, y))</td>
<td>((-x, -y))</td>
</tr>
</tbody>
</table>
1.1 EXERCISES

VOCABULARY

1. Match each term with its definition.

(a) x-axis (i) point of intersection of vertical axis and horizontal axis
(b) y-axis (ii) directed distance from the x-axis
(c) origin (iii) directed distance from the y-axis
(d) quadrants (iv) four regions of the coordinate plane
(e) x-coordinate (v) horizontal real number line
(f) y-coordinate (vi) vertical real number line

In Exercises 2–4, fill in the blanks.

2. An ordered pair of real numbers can be represented in a plane called the rectangular coordinate system or the _______ plane.
3. The _______ _______ is a result derived from the Pythagorean Theorem.
4. Finding the average values of the representative coordinates of the two endpoints of a line segment in a coordinate plane is also known as using the _______ _______.

SKILLS AND APPLICATIONS

In Exercises 5 and 6, approximate the coordinates of the points.

5. \[ y = \begin{array}{c} 6 \\ 2 \\ -2 \\ -4 \end{array} \]
   \[ x = \begin{array}{c} 1 \\ -1 \\ 2 \\ 0 \end{array} \]

6. \[ y = \begin{array}{c} 4 \\ 2 \\ -2 \\ -4 \end{array} \]
   \[ x = \begin{array}{c} 2 \\ 0 \\ -2 \\ 4 \end{array} \]

In Exercises 7–10, plot the points in the Cartesian plane.

7. \((-4, 2), (-3, -6), (0, 5), (1, -4)\)
8. \((0, 0), (3, 1), (-2, 4), (1, -1)\)
9. \((3, 8), (0.5, -1), (5, -6), (-2, 2.5)\)
10. \((1, -\frac{1}{2}), (\frac{2}{3}, 3), (-3, 4), (-\frac{4}{3}, -\frac{5}{2})\)

In Exercises 11–14, find the coordinates of the point.

11. The point is located three units to the left of the y-axis and four units above the x-axis.
12. The point is located eight units below the x-axis and four units to the right of the y-axis.
13. The point is located five units below the x-axis and the coordinates of the point are equal.
14. The point is on the x-axis and 12 units to the left of the y-axis.

In Exercises 15–24, determine the quadrant(s) in which \((x, y)\) is located so that the condition(s) is (are) satisfied.

15. \(x > 0\) and \(y < 0\)
16. \(x < 0\) and \(y < 0\)
17. \(x = -4\) and \(y > 0\)
18. \(x > 2\) and \(y = 3\)
19. \(y < -5\)
20. \(x > 4\)
21. \(x < 0\) and \(-y > 0\)
22. \(-x > 0\) and \(y < 0\)
23. \(xy > 0\)
24. \(xy < 0\)

In Exercises 25 and 26, sketch a scatter plot of the data shown in the table.

25. NUMBER OF STORES The table shows the number \(y\) of Wal-Mart stores for each year \(x\) from 2000 through 2007. (Source: Wal-Mart Stores, Inc.)

<table>

In Exercises 27–38, find the distance between the points.

27. \((6, −3), (6, 5)\)  
28. \((1, 4), (8, 4)\)  
29. \((−3, −1), (2, −1)\)  
30. \((−3, −4), (−3, 6)\)  
31. \((−2, 6), (3, −6)\)  
32. \((8, 5), (0, 20)\)  
33. \((1, 4), (−5, −1)\)  
34. \((1, 3), (3, −2)\)  
35. \((1, 3), (2, −1)\)  
36. \((−2, 3), (−1, 2)\)  
37. \((−4.2, 3.1), (−12.5, 4.8)\)  
38. \((9.5, −2.6), (−3.9, 8.2)\)

In Exercises 39–42, \( a \) find the length of each side of the right triangle, and \( b \) show that these lengths satisfy the Pythagorean Theorem.

39. \[(4, 5), (0, 2), (4, 2)\]
40. \[(1, 0), (13, 5), (13, 0)\]
41. \[(9, 4), (9, 1), (−1, 1)\]
42. \[(1, 5), (5, −2), (1, −2)\]

In Exercises 43–46, show that the points form the vertices of the indicated polygon.

43. Right triangle: \((4, 0), (2, 1), (−1, −5)\)
44. Right triangle: \((−1, 3), (3, 5), (5, 1)\)
45. Isosceles triangle: \((1, −3), (3, 2), (−2, 4)\)
46. Isosceles triangle: \((2, 3), (4, 9), (−2, 7)\)

In Exercises 47–56, \( a \) plot the points, \( b \) find the distance between the points, and \( c \) find the midpoint of the line segment joining the points.

47. \((1, 1), (9, 7)\)  
48. \((1, 12), (6, 0)\)  
49. \((−4, 10), (4, −5)\)  
50. \((−7, −4), (2, 8)\)  
51. \((−1, 2), (5, 4)\)  
52. \((2, 10), (10, 2)\)  
53. \((\frac{1}{2}, 1), (−\frac{3}{2}, \frac{1}{2})\)  
54. \((−\frac{1}{3}, −\frac{1}{3}), (\frac{1}{3}, −\frac{1}{3})\)  
55. \((6.2, 5.4), (−3.7, 1.8)\)  
56. \((−16.8, 12.3), (5.6, 4.9)\)

57. **FLYING DISTANCE** An airplane flies from Naples, Italy in a straight line to Rome, Italy, which is 120 kilometers north and 150 kilometers west of Naples. How far does the plane fly?

58. **SPORTS** A soccer player passes the ball from a point that is 18 yards from the endline and 12 yards from the sideline. The pass is received by a teammate who is 42 yards from the same endline and 50 yards from the same sideline, as shown in the figure. How long is the pass?

SALES In Exercises 59 and 60, use the Midpoint Formula to estimate the sales of Big Lots, Inc. and Dollar Tree Stores, Inc. in 2005, given the sales in 2003 and 2007. Assume that the sales followed a linear pattern. (Source: Big Lots, Inc.; Dollar Tree Stores, Inc.)

In Exercises 61–64, the polygon is shifted to a new position in the plane. Find the coordinates of the vertices of the polygon in its new position.

61. Original coordinates of vertices: (−1, −1), (1, 3), (2, −1), (3, 0)
   Shift: six units upward, two units to the right

62. Original coordinates of vertices: (−3, 6), (1, 3), (5, 3), (−1, 3)
   Shift: three units upward, six units to the right

63. Original coordinates of vertices: (−7, −2), (−2, 2), (−2, −4), (−7, −4)
   Shift: eight units upward, four units to the right

64. Original coordinates of vertices: (5, 8), (3, 6), (7, 6), (5, 2)
   Shift: six units downward, 10 units to the left

65. Approximate the highest price of a gallon of whole milk shown in the graph. When did this occur?

66. Approximate the percent change in the price of milk from the price in 1996 to the highest price shown in the graph.

67. ADVERTISING The graph shows the average costs of a 30-second television spot (in thousands of dollars) during the Super Bowl from 2000 to 2008. (Source: Nielson Media and TNS Media Intelligence)

   (a) Estimate the percent increase in the average cost of a 30-second spot from Super Bowl XXXIV in 2000 to Super Bowl XXXVIII in 2004.

   (b) Estimate the percent increase in the average cost of a 30-second spot from Super Bowl XXXIV in 2000 to Super Bowl XLII in 2008.

68. ADVERTISING The graph shows the average costs of a 30-second television spot (in thousands of dollars) during the Academy Awards from 1995 to 2007. (Source: Nielson Monitor-Plus)

   (a) Estimate the percent increase in the average cost of a 30-second spot in 1996 to the cost in 2002.

   (b) Estimate the percent increase in the average cost of a 30-second spot in 1996 to the cost in 2007.

69. MUSIC The graph shows the numbers of performers who were elected to the Rock and Roll Hall of Fame from 1991 through 2008. Describe any trends in the data. From these trends, predict the number of performers elected in 2010. (Source: rockhall.com)
70. **LABOR FORCE** Use the graph below, which shows the minimum wage in the United States (in dollars) from 1950 to 2009. (Source: U.S. Department of Labor)

(a) Which decade shows the greatest increase in minimum wage?

(b) Approximate the percent increases in the minimum wage from 1990 to 1995 and from 1995 to 2009.

(c) Use the percent increase from 1995 to 2009 to predict the minimum wage in 2013.

(d) Do you believe that your prediction in part (c) is reasonable? Explain.

72. **DATA ANALYSIS: EXAM SCORES** The table shows the mathematics entrance test scores $x$ and the final examination scores $y$ in an algebra course for a sample of 10 students.

<table>
<thead>

(b) Find the year in which the numbers of men’s and women’s teams were nearly equal.

(c) Find the year in which the difference between the numbers of men’s and women’s teams was the greatest. What was this difference?

EXPLORATION

75. A line segment has \((x_1, y_1)\) as one endpoint and \((x_m, y_m)\) as its midpoint. Find the other endpoint \((x_2, y_2)\) of the line segment in terms of \(x_1, y_1, x_m,\) and \(y_m.\)

76. Use the result of Exercise 75 to find the coordinates of the endpoint of a line segment if the coordinates of the other endpoint and midpoint are, respectively, (a) \((1, -2), (4, -1)\) and (b) \((-5, 11), (2, 4).\)

77. Use the Midpoint Formula three times to find the three points that divide the line segment joining \((x_1, y_1)\) and \((x_2, y_2)\) into four parts.

78. Use the result of Exercise 77 to find the points that divide the line segment joining the given points into four equal parts.

(a) \((1, -2), (4, -1)\) \hspace{1em} (b) \((-2, -3), (0, 0)\)

79. MAKE A CONJECTURE Plot the points \((2, 1), \hspace{1em} (-3, 5),\) and \((7, -3)\) on a rectangular coordinate system. Then change the sign of the \(x-\)coordinate of each point and plot the three new points on the same rectangular coordinate system. Make a conjecture about the location of a point when each of the following occurs.

(a) The sign of the \(x-\)coordinate is changed.

(b) The sign of the \(y-\)coordinate is changed.

(c) The signs of both the \(x-\) and \(y-\)coordinates are changed.

80. COLLINEAR POINTS Three or more points are\(\textit{collinear}\) if they all lie on the same line. Use the steps below to determine if the set of points \(\{(2, 3), (2, 6), (6, 3)\}\) and the set of points \(\{(8, 3), (5, 2), (2, 1)\}\) are collinear.

(a) For each set of points, use the Distance Formula to find the distances from \(A\) to \(B,\) from \(B\) to \(C,\) and from \(A\) to \(C.\) What relationship exists among these distances for each set of points?

(b) Plot each set of points in the Cartesian plane. Do all the points of either set appear to lie on the same line?

(c) Compare your conclusions from part (a) with the conclusions you made from the graphs in part (b). Make a general statement about how to use the Distance Formula to determine collinearity.

TRUE OR FALSE? In Exercises 81 and 82, determine whether the statement is true or false. Justify your answer.

81. In order to divide a line segment into 16 equal parts, you would have to use the Midpoint Formula 16 times.

82. The points \((-8, 4), (2, 11),\) and \((-5, 1)\) represent the vertices of an isosceles triangle.

83. THINK ABOUT IT When plotting points on the rectangular coordinate system, is it true that the scales on the \(x-\) and \(y-\)axes must be the same? Explain.

84. CAPSTONE Use the plot of the point \((x_0, y_0)\) in the figure. Match the transformation of the point with the correct plot. Explain your reasoning. [The plots are labeled (i), (ii), (iii) and (iv).]

85. PROOF Prove that the diagonals of the parallelogram in the figure intersect at their midpoints.
The Graph of an Equation

In Section 1.1, you used a coordinate system to represent graphically the relationship between two quantities. There, the graphical picture consisted of a collection of points in a coordinate plane.

Frequently, a relationship between two quantities is expressed as an equation in two variables. For instance, \( y = 7 - 3x \) is an equation in \( x \) and \( y \). An ordered pair \( (a, b) \) is a solution or solution point of an equation in two variables if the equation is true when \( a \) is substituted for \( x \) and \( b \) is substituted for \( y \). For instance, \((1, 4)\) is a solution of \( y = 7 - 3x \) because \( 4 = 7 - 3(1) \) is a true statement.

In this section, you will review some basic procedures for sketching the graph of an equation in two variables. The graph of an equation is the set of all points that are solutions of the equation.

Example 1  Determining Solution Points

Determine whether (a) \((2, 13)\) and (b) \((-1, -3)\) lie on the graph of \( y = 10x - 7 \).

Solution

a. \( y = 10x - 7 \)  
   \[
   13 \overset{?}{=} 10(2) - 7 \\
   13 = 13
   \]
   Thus, \((2, 13)\) is a solution.

b. \( y = 10x - 7 \)  
   \[
   -3 \overset{?}{=} 10(-1) - 7 \\
   -3 \neq -17
   \]
   Thus, \((-1, -3)\) is not a solution.

The basic technique used for sketching the graph of an equation is the point-plotting method.

**Algebra Help**

When evaluating an expression or an equation, remember to follow the Basic Rules of Algebra. To review these rules, see Appendix A.1.
Example 2  Sketching the Graph of an Equation

Sketch the graph of

\[ y = 7 - 3x. \]

Solution

Because the equation is already solved for \( y \), construct a table of values that consists of several solution points of the equation. For instance, when \( x = -1 \),

\[ y = 7 - 3(-1) = 10 \]

which implies that \((-1, 10)\) is a solution point of the graph.

<td>4</td>
<td>-5</td>
<td>(4, -5)</td>
</tr>
</tbody>
</table>

From the table, it follows that

\((-1, 10), (0, 7), (1, 4), (2, 1), (3, -2), \) and \((4, -5)\)

are solution points of the equation. After plotting these points, you can see that they appear to lie on a line, as shown in Figure 1.14. The graph of the equation is the line that passes through the six plotted points.

![Figure 1.14](image)

CHECKPOINT  Now try Exercise 15.
Example 3  Sketching the Graph of an Equation

Sketch the graph of

\[ y = x^2 - 2. \]

Solution

Because the equation is already solved for \( y \), begin by constructing a table of values.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( -2 )</th>
<th>( -1 )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y = x^2 - 2 )</td>
<td>2</td>
<td>-1</td>
<td>-2</td>
<td>-1</td>
<td>2</td>
<td>7</td>
</tr>
<tr>
<td>( (x, y) )</td>
<td>(-2, 2)</td>
<td>(-1, -1)</td>
<td>(0, -2)</td>
<td>(1, -1)</td>
<td>(2, 2)</td>
<td>(3, 7)</td>
</tr>
</tbody>
</table>

Next, plot the points given in the table, as shown in Figure 1.15. Finally, connect the points with a smooth curve, as shown in Figure 1.16.

Study Tip

One of your goals in this course is to learn to classify the basic shape of a graph from its equation. For instance, you will learn that the linear equation in Example 2 has the form

\[ y = mx + b \]

and its graph is a line. Similarly, the quadratic equation in Example 3 has the form

\[ y = ax^2 + bx + c \]

and its graph is a parabola.

Click Point  Now try Exercise 17.

The point-plotting method demonstrated in Examples 2 and 3 is easy to use, but it has some shortcomings. With too few solution points, you can misrepresent the graph of an equation. For instance, if only the four points

\((-2, 2), (-1, -1), (1, -1), \text{ and } (2, 2)\)

in Figure 1.15 were plotted, any one of the three graphs in Figure 1.17 would be reasonable.
Intercepts of a Graph

It is often easy to determine the solution points that have zero as either the $x$-coordinate or the $y$-coordinate. These points are called intercepts because they are the points at which the graph intersects or touches the $x$- or $y$-axis. It is possible for a graph to have no intercepts, one intercept, or several intercepts, as shown in Figure 1.18.

Note that an $x$-intercept can be written as the ordered pair $(x, 0)$ and a $y$-intercept can be written as the ordered pair $(0, y)$. Some texts denote the $x$-intercept as the $x$-coordinate of the point $(a, 0)$ and the $y$-intercept as the $y$-coordinate of the point $(0, b)$ rather than the point itself. Unless it is necessary to make a distinction, we will use the term intercept to mean either the point or the coordinate.

Finding $x$- and $y$-Intercepts

1. To find $x$-intercepts, let $y$ be zero and solve the equation for $x$.
2. To find $y$-intercepts, let $x$ be zero and solve the equation for $y$.

Example 4 Finding $x$- and $y$-Intercepts

Find the $x$- and $y$-intercepts of the graph of $y = x^3 - 4x$.

Solution

Let $y = 0$. Then

$$0 = x^3 - 4x = x(x^2 - 4)$$

has solutions $x = 0$ and $x = \pm 2$.

$x$-intercepts: $(0, 0), (2, 0), (-2, 0)$

Let $x = 0$. Then

$$y = (0)^3 - 4(0)$$

has one solution, $y = 0$.

$y$-intercept: $(0, 0)$

See Figure 1.19.

CHECKPOINT Now try Exercise 23.
Symmetry

Graphs of equations can have symmetry with respect to one of the coordinate axes or with respect to the origin. Symmetry with respect to the x-axis means that if the Cartesian plane were folded along the x-axis, the portion of the graph above the x-axis would coincide with the portion below the x-axis. Symmetry with respect to the y-axis or the origin can be described in a similar manner, as shown in Figure 1.20.

Knowing the symmetry of a graph before attempting to sketch it is helpful, because then you need only half as many solution points to sketch the graph. There are three basic types of symmetry, described as follows.

**Graphical Tests for Symmetry**

1. A graph is symmetric with respect to the x-axis if, whenever \((x, y)\) is on the graph, \((x, -y)\) is also on the graph.

2. A graph is symmetric with respect to the y-axis if, whenever \((x, y)\) is on the graph, \((-x, y)\) is also on the graph.

3. A graph is symmetric with respect to the origin if, whenever \((x, y)\) is on the graph, \((-x, -y)\) is also on the graph.

You can conclude that the graph of \(y = x^2 - 2\) is symmetric with respect to the y-axis because the point \((-x, y)\) is also on the graph of \(y = x^2 - 2\). (See the table below and Figure 1.21.)

<table>
<thead>
<tr>
<th>(x)</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(y)</td>
<td>7</td>
<td>2</td>
<td>-1</td>
<td>-1</td>
<td>2</td>
<td>7</td>
</tr>
<tr>
<td>((x, y))</td>
<td>(-3, 7)</td>
<td>(-2, 2)</td>
<td>(-1, -1)</td>
<td>(1, -1)</td>
<td>(2, 2)</td>
<td>(3, 7)</td>
</tr>
</tbody>
</table>

**Algebraic Tests for Symmetry**

1. The graph of an equation is symmetric with respect to the x-axis if replacing \(y\) with \(-y\) yields an equivalent equation.

2. The graph of an equation is symmetric with respect to the y-axis if replacing \(x\) with \(-x\) yields an equivalent equation.

3. The graph of an equation is symmetric with respect to the origin if replacing \(x\) with \(-x\) and \(y\) with \(-y\) yields an equivalent equation.
Testing for Symmetry

Test for symmetry with respect to both axes and the origin.

Solution

- **x-axis:** Write original equation.
  \( y = 2x^3 \)
  Replace with \( -y = 2x^3 \) Result is not an equivalent equation.

- **y-axis:** Write original equation.
  \( y = 2x^3 \)
  Replace \( x \) with \(-x\).
  \( y = -2x^3 \)
  Simplify. Result is not an equivalent equation.

- **Origin:** Write original equation.
  \( y = 2x^3 \)
  Replace \( y \) with \(-y\) and \( x \) with \(-x\).
  \( -y = 2(-x)^3 \)
  Replace \( x \) with \(-x\).
  \( -y = -2x^3 \)
  Simplify.
  \( y = 2x^3 \)
  Equivalent equation

Of the three tests for symmetry, the only one that is satisfied is the test for origin symmetry (see Figure 1.22).

*CHECK Point* Now try Exercise 33.

Using Symmetry as a Sketching Aid

Use symmetry to sketch the graph of \( x - y^2 = 1 \).

Solution

Of the three tests for symmetry, the only one that is satisfied is the test for \( x \)-axis symmetry because \( x - (\text{-}y)^2 = 1 \) is equivalent to \( x - y^2 = 1 \). So, the graph is symmetric with respect to the \( x \)-axis. Using symmetry, you only need to find the solution points above the \( x \)-axis and then reflect them to obtain the graph, as shown in Figure 1.23.

*CHECK Point* Now try Exercise 49.

Sketching the Graph of an Equation

Sketch the graph of \( y = |x - 1| \).

Solution

This equation fails all three tests for symmetry and consequently its graph is not symmetric with respect to either axis or to the origin. The absolute value sign indicates that \( y \) is always nonnegative. Create a table of values and plot the points, as shown in Figure 1.24. From the table, you can see that \( x = 0 \) when \( y = 1 \). So, the \( y \)-intercept is \((0, 1)\). Similarly, \( y = 0 \) when \( x = 1 \). So, the \( x \)-intercept is \((1, 0)\).

<table>
<thead>
<tr>
<th>( x )</th>
<th>(-2)</th>
<th>(-1)</th>
<th>(0)</th>
<th>(1)</th>
<th>(2)</th>
<th>(3)</th>
<th>(4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y =</td>
<td>x - 1</td>
<td>)</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>((x, y))</td>
<td>((-2, 3))</td>
<td>((-1, 2))</td>
<td>((0, 1))</td>
<td>((1, 0))</td>
<td>((2, 1))</td>
<td>((3, 2))</td>
<td>((4, 3))</td>
</tr>
</tbody>
</table>

*CHECK Point* Now try Exercise 53.
Throughout this course, you will learn to recognize several types of graphs from their equations. For instance, you will learn to recognize that the graph of a second-degree equation of the form
\[ y = ax^2 + bx + c \]
is a parabola (see Example 3). The graph of a circle is also easy to recognize.

**Circles**

Consider the circle shown in Figure 1.25. A point \((x, y)\) is on the circle if and only if its distance from the center \((h, k)\) is \(r\). By the Distance Formula,
\[ \sqrt{(x - h)^2 + (y - k)^2} = r. \]
By squaring each side of this equation, you obtain the **standard form of the equation of a circle**.

**Standard Form of the Equation of a Circle**

The point \((x, y)\) lies on the circle of radius \(r\) and center \((h, k)\) if and only if
\[ (x - h)^2 + (y - k)^2 = r^2. \]

From this result, you can see that the standard form of the equation of a circle with its center at the origin, \((h, k) = (0, 0)\), is simply
\[ x^2 + y^2 = r^2. \]

Circle with center at origin

**Example 8** Finding the Equation of a Circle

The point \((3, 4)\) lies on a circle whose center is at \((-1, 2)\), as shown in Figure 1.26. Write the standard form of the equation of this circle.

**Solution**

The radius of the circle is the distance between \((-1, 2)\) and \((3, 4)\).

\[
\begin{align*}
r &= \sqrt{(x - h)^2 + (y - k)^2} \\
&= \sqrt{[3 - (-1)]^2 + (4 - 2)^2} \\
&= \sqrt{4^2 + 2^2} \\
&= \sqrt{16 + 4} \\
&= \sqrt{20}
\end{align*}
\]

Radius

Using \((h, k) = (-1, 2)\) and \(r = \sqrt{20}\), the equation of the circle is
\[
(x - h)^2 + (y - k)^2 = r^2
\]

Equation of circle

\[
\begin{align*}
(x - (-1))^2 + (y - 2)^2 &= (\sqrt{20})^2 \\
(x + 1)^2 + (y - 2)^2 &= 20.
\end{align*}
\]

Standard form

Now try Exercise 73.
You should develop the habit of using at least two approaches to solve every problem. This helps build your intuition and helps you check that your answers are reasonable.

**Application**

In this course, you will learn that there are many ways to approach a problem. Three common approaches are illustrated in Example 9.

A *Numerical Approach*: Construct and use a table.

A *Graphical Approach*: Draw and use a graph.

An *Algebraic Approach*: Use the rules of algebra.

### Example 9  Recommended Weight

The median recommended weight $y$ (in pounds) for men of medium frame who are 25 to 59 years old can be approximated by the mathematical model

$$y = 0.073x^2 - 6.99x + 289.0, \quad 62 \leq x \leq 76$$

where $x$ is the man’s height (in inches). *(Source: Metropolitan Life Insurance Company)*

#### a.

Construct a table of values that shows the median recommended weights for men with heights of 62, 64, 66, 68, 70, 72, 74, and 76 inches.

#### b.

Use the table of values to sketch a graph of the model. Then use the graph to estimate graphically the median recommended weight for a man whose height is 71 inches.

#### c.

Use the model to confirm algebraically the estimate you found in part (b).

**Solution**

#### a.

You can use a calculator to complete the table, as shown at the left.

#### b.

The table of values can be used to sketch the graph of the equation, as shown in Figure 1.27. From the graph, you can estimate that a height of 71 inches corresponds to a weight of about 161 pounds.

#### c.

To confirm algebraically the estimate found in part (b), you can substitute 71 for $x$ in the model.

$$y = 0.073(71)^2 - 6.99(71) + 289.0 = 160.70$$

So, the graphical estimate of 161 pounds is fairly good.

**CHECK POINT**  Now try Exercise 87.
1.2  EXERCISES

**VOCABULARY:** Fill in the blanks.

1. An ordered pair \((a, b)\) is a _______ of an equation in \(x\) and \(y\) if the equation is true when \(a\) is substituted for \(x\), and \(b\) is substituted for \(y\).

2. The set of all solution points of an equation is the _______ of the equation.

3. The points at which a graph intersects or touches an axis are called the _______ of the graph.

4. A graph is symmetric with respect to the _______ if, whenever \((x, y)\) is on the graph, \((-x, y)\) is also on the graph.

5. The equation \((x - h)^2 + (y - k)^2 = r^2\) is the standard form of the equation of a _______ with center _______ and radius _______.

6. When you construct and use a table to solve a problem, you are using a _______ approach.

**SKILLS AND APPLICATIONS**

In Exercises 7–14, determine whether each point lies on the graph of the equation.

<table>
<thead>
<tr>

In Exercises 19–22, graphically estimate the \(x\)- and \(y\)-intercepts of the graph. Verify your results algebraically.

19. \(y = (x - 3)^2\)

20. \(y = 16 - 4x^2\)

21. \(y = |x + 2|\)

22. \(y^2 = 4 - x\)

In Exercises 23–32, find the \(x\)- and \(y\)-intercepts of the graph of the equation.

23. \(y = 5x - 6\)

24. \(y = 8 - 3x\)

25. \(y = \sqrt{x} + 4\)

26. \(y = \sqrt{2x - 1}\)

27. \(y = |3x - 7|\)

28. \(y = -|x + 10|\)

29. \(y = 2x^2 - 4x^2\)

30. \(y = x^3 - 25\)

31. \(y^2 = 6 - x\)

32. \(y^2 = x + 1\)
In Exercises 33–40, use the algebraic tests to check for symmetry with respect to both axes and the origin.

33. \(x^2 - y = 0\)  
34. \(x - y^2 = 0\)  
35. \(y = x^3\)  
36. \(y = x^4 - x^2 + 3\)  
37. \(y = \frac{x}{x^2 + 1}\)  
38. \(y = \frac{1}{x^2 + 1}\)  
39. \(xy^2 + 10 = 0\)  
40. \(xy = 4\)

In Exercises 41–44, assume that the graph has the indicated type of symmetry. Sketch the complete graph of the equation.

41. y-axis symmetry  
42. x-axis symmetry

43. Origin symmetry  
44. y-axis symmetry

In Exercises 45–56, identify any intercepts and test for symmetry. Then sketch the graph of the equation.

45. \(y = -3x + 1\)  
46. \(y = 2x - 3\)  
47. \(y = x^2 - 2x\)  
48. \(-x^2 - 2x\)  
49. \(y = x^3 + 3\)  
50. \(y = x^3 - 1\)  
51. \(y = \sqrt{x - 3}\)  
52. \(y = \sqrt{1 - x}\)  
53. \(y = |x - 6|\)  
54. \(y = 1 - |x|\)  
55. \(x = y^2 - 1\)  
56. \(x = y^2 - 5\)

In Exercises 57–68, use a graphing utility to graph the equation. Use a standard setting. Approximate any intercepts.

57. \(y = 3 - \frac{x}{2}\)  
58. \(y = \frac{y}{2} - 1\)  
59. \(y = x^2 - 4x + 3\)  
60. \(y = x^2 + x - 2\)  
61. \(y = \frac{2x}{x - 1}\)  
62. \(y = \frac{4}{x^2 + 1}\)  
63. \(y = \sqrt{x} + 2\)  
64. \(y = \sqrt[3]{x + 1}\)  
65. \(y = x\sqrt{x} + 6\)  
66. \(y = (6 - x)\sqrt{x}\)  
67. \(y = |x + 3|\)  
68. \(y = 2 - |x|\)

In Exercises 69–76, write the standard form of the equation of the circle with the given characteristics.

69. Center: (0, 0); Radius: 4  
70. Center: (0, 0); Radius: 5  
71. Center: (2, -1); Radius: 4  
72. Center: (-7, -4); Radius: 7  
73. Center: (-1, 2); Solution point: (0, 0)  
74. Center: (3, -2); Solution point: (-1, 1)  
75. Endpoints of a diameter: (0, 0), (6, 8)  
76. Endpoints of a diameter: (-4, -1), (4, 1)

In Exercises 77–82, find the center and radius of the circle, and sketch its graph.

77. \(x^2 + y^2 = 25\)  
78. \(x^2 + y^2 = 16\)  
79. \((x - 1)^2 + (y + 3)^2 = 9\)  
80. \(x^2 + (y - 1)^2 = 1\)  
81. \((x - \frac{1}{2})^2 + (y - \frac{1}{2})^2 = \frac{9}{4}\)  
82. \((x - 2)^2 + (y + 3)^2 = \frac{25}{9}\)

83. DEPRECIATION A hospital purchases a new magnetic resonance imaging (MRI) machine for $500,000. The depreciated value \(y\) (reduced value) after \(t\) years is given by \(y = 500,000 - 40,000t,\) \(0 \leq t \leq 8\). Sketch the graph of the equation.

84. CONSUMERISM You purchase an all-terrain vehicle (ATV) for $8000. The depreciated value \(y\) after \(t\) years is given by \(y = 8000 - 900t,\) \(0 \leq t \leq 6\). Sketch the graph of the equation.

85. GEOMETRY A regulation NFL playing field (including the end zones) of length \(x\) and width \(y\) has a perimeter of \(342\) or \(\frac{1000}{3}\) yards.

(a) Draw a rectangle that gives a visual representation of the problem. Use the specified variables to label the sides of the rectangle.

(b) Show that the width of the rectangle is \(y = \frac{520}{3} - x\) and its area is \(A = \frac{520}{3} - x\).

(c) Use a graphing utility to graph the area equation. Be sure to adjust your window settings.

(d) From the graph in part (c), estimate the dimensions of the rectangle that yield a maximum area.

(e) Use your school’s library, the Internet, or some other reference source to find the actual dimensions and area of a regulation NFL playing field and compare your findings with the results of part (d).

The symbol \(\text{graph}\) indicates an exercise or a part of an exercise in which you are instructed to use a graphing utility.
86. **GEOMETRY** A soccer playing field of length \(x\) and width \(y\) has a perimeter of 360 meters.

(a) Draw a rectangle that gives a visual representation of the problem. Use the specified variables to label the sides of the rectangle.

(b) Show that the width of the rectangle is \(y = 180 - x\) and its area is \(A = x(180 - x)\).

(c) Use a graphing utility to graph the area equation. Be sure to adjust your window settings.

(d) From the graph in part (c), estimate the dimensions of the rectangle that yield a maximum area.

(e) Use your school’s library, the Internet, or some other reference source to find the actual dimensions and area of a regulation Major League Soccer field and compare your findings with the results of part (d).

87. **POPULATION STATISTICS** The table shows the life expectancies of a child (at birth) in the United States for selected years from 1920 to 2000. (Source: U.S. National Center for Health Statistics)

<table>
<thead>
<tr>
<th>Year</th>
<th>Life Expectancy, (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1920</td>
<td>54.1</td>
</tr>
<tr>
<td>1930</td>
<td>59.7</td>
</tr>
<tr>
<td>1940</td>
<td>62.9</td>
</tr>
<tr>
<td>1950</td>
<td>68.2</td>
</tr>
<tr>
<td>1960</td>
<td>69.7</td>
</tr>
<tr>
<td>1970</td>
<td>70.8</td>
</tr>
<tr>
<td>1980</td>
<td>73.7</td>
</tr>
<tr>
<td>1990</td>
<td>75.4</td>
</tr>
<tr>
<td>2000</td>
<td>77.0</td>
</tr>
</tbody>
</table>

A model for the life expectancy during this period is

\[ y = -0.0025t^2 + 0.574t + 44.25, \quad 20 \leq t \leq 100 \]

where \(y\) represents the life expectancy and \(t\) is the time in years, with \(t = 20\) corresponding to 1920.

(a) Use a graphing utility to graph the data from the table and the model in the same viewing window. How well does the model fit the data? Explain.

(b) Determine the life expectancy in 1990 both graphically and algebraically.

(c) Use the graph to determine the year when life expectancy was approximately 76.0. Verify your answer algebraically.

(d) One projection for the life expectancy of a child born in 2015 is 78.9. How does this compare with the projection given by the model?

88. **ELECTRONICS** The resistance (in ohms) of 1000 feet of solid copper wire at 68 degrees Fahrenheit can be approximated by the model

\[ R = \frac{10,770}{x^2} - 0.37, \quad 5 \leq x \leq 100 \]

where \(x\) is the diameter of the wire in mils (0.001 inch). (Source: American Wire Gage)

(a) Complete the table.

<table>
<thead>
<tr>
<th>(x)</th>
<th>(y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>40</td>
<td></td>
</tr>
<tr>
<td>50</td>
<td></td>
</tr>
</tbody>
</table>

(b) Use the table of values in part (a) to sketch a graph of the model. Then use your graph to estimate the resistance when \(x = 85.5\).

(c) Use the model to confirm algebraically the estimate you found in part (b).

(d) What can you conclude in general about the relationship between the diameter of the copper wire and the resistance?

**EXPLORATION**

89. **THINK ABOUT IT** Find \(a\) and \(b\) if the graph of \(y = ax^2 + bx^3\) is symmetric with respect to (a) the y-axis and (b) the origin. (There are many correct answers.)

90. **CAPSTONE** Match the equation or equations with the given characteristic.

(i) \(y = 3x^3 - 3x\) (ii) \(y = (x + 3)^2\)

(iii) \(y = 3x - 3\) (iv) \(y = \sqrt{x}\)

(v) \(y = 3x^2 + 3\) (vi) \(y = \sqrt{x + 3}\)

(a) Symmetric with respect to the y-axis
(b) Three x-intercepts
(c) Symmetric with respect to the origin
(d) \((-2, 1)\) is a point on the graph
(e) Symmetric with respect to the origin
(f) Graph passes through the origin
Using Slope

The simplest mathematical model for relating two variables is the \textit{linear equation in two variables} \( y = mx + b \). The equation is called \textit{linear} because its graph is a line. (In mathematics, the term \textit{line} means \textit{straight line}.) By letting \( x = 0 \), you obtain

\[
y = m(0) + b \quad \text{Substitute 0 for } x.
\]

\[
= b.
\]

So, the line crosses the \( y \)-axis at \( y = b \), as shown in Figure 1.28. In other words, the \( y \)-intercept is \((0, b)\). The steepness or slope of the line is \( m \).

\[
y = mx + b
\]

The slope of a nonvertical line is the number of units the line rises (or falls) vertically for each unit of horizontal change from left to right, as shown in Figure 1.28 and Figure 1.29.

\[
\text{Slope} \quad \text{y-Intercept}
\]

A linear equation that is written in the form \( y = mx + b \) is said to be written in \textit{slope-intercept form}.

\[\text{The Slope-Intercept Form of the Equation of a Line}\]

The graph of the equation

\[y = mx + b\]

is a line whose slope is \( m \) and whose \( y \)-intercept is \((0, b)\).
Once you have determined the slope and the \(y\)-intercept of a line, it is a relatively simple matter to sketch its graph. In the next example, note that none of the lines is vertical. A vertical line has an equation of the form
\[ x = a. \]

The equation of a vertical line cannot be written in the form \(y = mx + b\) because the slope of a vertical line is undefined, as indicated in Figure 1.30.

### Example 1 Graphing a Linear Equation

Sketch the graph of each linear equation.

**a.** \(y = 2x + 1\)

**b.** \(y = 2\)

**c.** \(x + y = 2\)

**Solution**

**a.** Because \(b = 1\), the \(y\)-intercept is \((0, 1)\). Moreover, because the slope is \(m = 2\), the line rises two units for each unit the line moves to the right, as shown in Figure 1.31.

**b.** By writing this equation in the form \(y = (0)x + 2\), you can see that the \(y\)-intercept is \((0, 2)\) and the slope is zero. A zero slope implies that the line is horizontal—that is, it doesn’t rise or fall, as shown in Figure 1.32.

**c.** By writing this equation in slope-intercept form

\[
\begin{align*}
x + y &= 2 & \text{Write original equation.} \\
y &= -x + 2 & \text{Subtract } x \text{ from each side.} \\
y &= (-1)x + 2 & \text{Write in slope-intercept form.}
\end{align*}
\]

you can see that the \(y\)-intercept is \((0, 2)\). Moreover, because the slope is \(m = -1\), the line falls one unit for each unit the line moves to the right, as shown in Figure 1.33.

Now try Exercise 17.
Finding the Slope of a Line

Given an equation of a line, you can find its slope by writing the equation in slope-intercept form. If you are not given an equation, you can still find the slope of a line. For instance, suppose you want to find the slope of the line passing through the points \((x_1, y_1)\) and \((x_2, y_2)\), as shown in Figure 1.34. As you move from left to right along this line, a change of \((y_2 - y_1)\) units in the vertical direction corresponds to a change of \((x_2 - x_1)\) units in the horizontal direction.

The ratio of \((y_2 - y_1)\) to \((x_2 - x_1)\) represents the slope of the line that passes through the points \((x_1, y_1)\) and \((x_2, y_2)\).

\[
\text{Slope} = \frac{\text{change in } y}{\text{change in } x} = \frac{\text{rise}}{\text{run}} = \frac{y_2 - y_1}{x_2 - x_1}
\]

The Slope of a Line Passing Through Two Points

The slope \(m\) of the nonvertical line through \((x_1, y_1)\) and \((x_2, y_2)\) is

\[
m = \frac{y_2 - y_1}{x_2 - x_1}
\]

where \(x_1 \neq x_2\).

When this formula is used for slope, the order of subtraction is important. Given two points on a line, you are free to label either one of them as \((x_1, y_1)\) and the other as \((x_2, y_2)\). However, once you have done this, you must form the numerator and denominator using the same order of subtraction.

\[
\begin{align*}
\text{Correct} & : m = \frac{y_2 - y_1}{x_2 - x_1} \\
\text{Correct} & : m = \frac{y_1 - y_2}{x_1 - x_2} \\
\text{Incorrect} & : m = \frac{y_2 - y_1}{x_1 - x_2}
\end{align*}
\]

For instance, the slope of the line passing through the points \((3, 4)\) and \((5, 7)\) can be calculated as

\[
m = \frac{7 - 4}{5 - 3} = \frac{3}{2}
\]

or, reversing the subtraction order in both the numerator and denominator, as

\[
m = \frac{4 - 7}{3 - 5} = \frac{-3}{-2} = \frac{3}{2}
\]
Example 2  Finding the Slope of a Line Through Two Points

Find the slope of the line passing through each pair of points.

a. \((-2, 0)\) and \((3, 1)\)  
b. \((-1, 2)\) and \((2, 2)\)  
c. \((0, 4)\) and \((1, -1)\)  
d. \((3, 4)\) and \((3, 1)\)

Solution

a. Letting \((x_1, y_1) = (-2, 0)\) and \((x_2, y_2) = (3, 1)\), you obtain a slope of

\[ m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{1 - 0}{3 - (-2)} = \frac{1}{5}. \]

See Figure 1.35.

b. The slope of the line passing through \((-1, 2)\) and \((2, 2)\) is

\[ m = \frac{2 - 2}{2 - (-1)} = \frac{0}{3} = 0. \]

See Figure 1.36.

c. The slope of the line passing through \((0, 4)\) and \((1, -1)\) is

\[ m = \frac{-1 - 4}{1 - 0} = \frac{-5}{1} = -5. \]

See Figure 1.37.

d. The slope of the line passing through \((3, 4)\) and \((3, 1)\) is

\[ m = \frac{1 - 4}{3 - 3} = \frac{-3}{0}. \]

Because division by 0 is undefined, the slope is undefined and the line is vertical.

Algebra Help

To find the slopes in Example 2, you must be able to evaluate rational expressions. You can review the techniques for evaluating rational expressions in Appendix A.4.

Study Tip

In Figures 1.35 to 1.38, note the relationships between slope and the orientation of the line.

a. Positive slope: line rises from left to right
b. Zero slope: line is horizontal
c. Negative slope: line falls from left to right
d. Undefined slope: line is vertical

Now try Exercise 31.
Writing Linear Equations in Two Variables
If \((x_1, y_1)\) is a point on a line of slope \(m\) and \((x, y)\) is any other point on the line, then
\[
\frac{y - y_1}{x - x_1} = m.
\]
This equation, involving the variables \(x\) and \(y\), can be rewritten in the form
\[
y - y_1 = m(x - x_1)
\]
which is the **point-slope form** of the equation of a line.

**Point-Slope Form of the Equation of a Line**
The equation of the line with slope \(m\) passing through the point \((x_1, y_1)\) is
\[
y - y_1 = m(x - x_1).
\]

The point-slope form is most useful for finding the equation of a line. You should remember this form.

**Example 3** Using the Point-Slope Form
Find the slope-intercept form of the equation of the line that has a slope of 3 and passes through the point \((1, -2)\).

**Solution**
Use the point-slope form with \(m = 3\) and \((x_1, y_1) = (1, -2)\).
\[
y - y_1 = m(x - x_1)
\]
\[
y - (-2) = 3(x - 1)
\]
\[
y + 2 = 3x - 3
\]
\[
y = 3x - 5
\]
The slope-intercept form of the equation of the line is \(y = 3x - 5\). The graph of this line is shown in Figure 1.39.

**CHECK POINT** Now try Exercise 51.

The point-slope form can be used to find an equation of the line passing through two points \((x_1, y_1)\) and \((x_2, y_2)\). To do this, first find the slope of the line
\[
m = \frac{y_2 - y_1}{x_2 - x_1}, \quad x_1 \neq x_2
\]
and then use the point-slope form to obtain the equation
\[
y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1).
\]
This is sometimes called the **two-point form** of the equation of a line.
Parallel and Perpendicular Lines

Slope can be used to decide whether two nonvertical lines in a plane are parallel, perpendicular, or neither.

**Parallel and Perpendicular Lines**

1. Two distinct nonvertical lines are **parallel** if and only if their slopes are equal. That is, $m_1 = m_2$.

2. Two nonvertical lines are **perpendicular** if and only if their slopes are negative reciprocals of each other. That is, $m_1 = -1/m_2$.

**Example 4** Finding Parallel and Perpendicular Lines

Find the slope-intercept forms of the equations of the lines that pass through the point $(2, -1)$ and are (a) parallel to and (b) perpendicular to the line $2x - 3y = 5$.

**Solution**

By writing the equation of the given line in slope-intercept form

$$2x - 3y = 5$$

Write original equation.

$$-3y = -2x + 5$$

Subtract $2x$ from each side.

$$y = \frac{2}{3}x - \frac{5}{3}$$

Write in slope-intercept form.

you can see that it has a slope of $m = \frac{2}{3}$, as shown in Figure 1.40.

a. Any line parallel to the given line must also have a slope of $\frac{2}{3}$. So, the line through $(2, -1)$ that is parallel to the given line has the following equation.

$$y - (-1) = \frac{2}{3}(x - 2)$$

Write in point-slope form.

$$3(y + 1) = 2(x - 2)$$

Multiply each side by 3.

$$3y + 3 = 2x - 4$$

Distributive Property

$$y = \frac{2}{3}x - \frac{7}{3}$$

Write in slope-intercept form.

b. Any line perpendicular to the given line must have a slope of $-\frac{3}{2}$ (because $-\frac{3}{2}$ is the negative reciprocal of $\frac{2}{3}$). So, the line through $(2, -1)$ that is perpendicular to the given line has the following equation.

$$y - (-1) = -\frac{3}{2}(x - 2)$$

Write in point-slope form.

$$2(y + 1) = -3(x - 2)$$

Multiply each side by 2.

$$2y + 2 = -3x + 6$$

Distributive Property

$$y = -\frac{3}{2}x + 2$$

Write in slope-intercept form.

**Check Point** Now try Exercise 87.

Notice in Example 4 how the slope-intercept form is used to obtain information about the graph of a line, whereas the point-slope form is used to write the equation of a line.
Applications

In real-life problems, the slope of a line can be interpreted as either a ratio or a rate. If the x-axis and y-axis have the same unit of measure, then the slope has no units and is a ratio. If the x-axis and y-axis have different units of measure, then the slope is a rate or rate of change.

Example 5 Using Slope as a Ratio

The maximum recommended slope of a wheelchair ramp is \( \frac{1}{12} \). A business is installing a wheelchair ramp that rises 22 inches over a horizontal length of 24 feet. Is the ramp steeper than recommended?  

(Source: Americans with Disabilities Act Handbook)

Solution

The horizontal length of the ramp is 24 feet or 288 inches, as shown in Figure 1.41. So, the slope of the ramp is

\[
\text{Slope} = \frac{\text{vertical change}}{\text{horizontal change}} = \frac{22 \text{ in.}}{288 \text{ in.}} = 0.076.
\]

Because \( \frac{1}{12} \approx 0.083 \), the slope of the ramp is not steeper than recommended.

Example 6 Using Slope as a Rate of Change

A kitchen appliance manufacturing company determines that the total cost in dollars of producing \( x \) units of a blender is

\[
C = 25x + 3500.
\]

Describe the practical significance of the y-intercept and slope of this line.

Solution

The y-intercept (0, 3500) tells you that the cost of producing zero units is $3500. This is the fixed cost of production—it includes costs that must be paid regardless of the number of units produced. The slope of \( m = 25 \) tells you that the cost of producing each unit is $25, as shown in Figure 1.42. Economists call the cost per unit the marginal cost. If the production increases by one unit, then the “margin,” or extra amount of cost, is $25. So, the cost increases at a rate of $25 per unit.
Most business expenses can be deducted in the same year they occur. One exception is the cost of property that has a useful life of more than 1 year. Such costs must be depreciated (decreased in value) over the useful life of the property. If the same amount is depreciated each year, the procedure is called linear or straight-line depreciation. The book value is the difference between the original value and the total amount of depreciation accumulated to date.

### Example 7 Straight-Line Depreciation

A college purchased exercise equipment worth $12,000 for the new campus fitness center. The equipment has a useful life of 8 years. The salvage value at the end of 8 years is $2000. Write a linear equation that describes the book value of the equipment each year.

**Solution**

Let \( V \) represent the value of the equipment at the end of year \( t \). You can represent the initial value of the equipment by the data point \((0, 12,000)\) and the salvage value of the equipment by the data point \((8, 2000)\). The slope of the line is

\[
m = \frac{2000 - 12,000}{8 - 0} = -1250
\]

which represents the annual depreciation in dollars per year. Using the point-slope form, you can write the equation of the line as follows.

\[
V = 12,000 = -1250(t - 0) \quad \text{Write in point-slope form.}
\]

\[
V = -1250t + 12,000 \quad \text{Write in slope-intercept form.}
\]

The table shows the book value at the end of each year, and the graph of the equation is shown in Figure 1.43.

<table>
<thead>
<tr>
<th>Year, ( t )</th>
<th>Value, ( V )</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**CHECK POINT**  Now try Exercise 121.

In many real-life applications, the two data points that determine the line are often given in a disguised form. Note how the data points are described in Example 7.
Predicting Sales

The sales for Best Buy were approximately $35.9 billion in 2006 and $40.0 billion in 2007. Using only this information, write a linear equation that gives the sales (in billions of dollars) in terms of the year. Then predict the sales for 2010. *(Source: Best Buy Company, Inc.)*

**Solution**

Let represent 2006. Then the two given values are represented by the data points

\[(6, 35.9) \quad \text{and} \quad (7, 40.0).\]

The slope of the line through these points is

\[
m = \frac{40.0 - 35.9}{7 - 6} = 4.1.
\]

Using the point-slope form, you can find the equation that relates the sales \(y\) and the year \(t\) to be

\[
y = 35.9 + 4.1(t - 6)\] Write in point-slope form.

\[
y = 4.1t + 11.3.\] Write in slope-intercept form.

According to this equation, the sales for 2010 will be

\[
y = 4.1(10) + 11.3 = 41 + 11.3 = $52.3\text{ billion. (See Figure 1.44.)}
\]

The prediction method illustrated in Example 8 is called **linear extrapolation**. Note in Figure 1.45 that an extrapolated point does not lie between the given points. When the estimated point lies between two given points, as shown in Figure 1.46, the procedure is called **linear interpolation**.

Because the slope of a vertical line is not defined, its equation cannot be written in slope-intercept form. However, every line has an equation that can be written in the general form

\[
Ax + By + C = 0
\]

where \(A\) and \(B\) are not both zero. For instance, the vertical line given by \(x = a\) can be represented by the general form \(x - a = 0\).

**Summary of Equations of Lines**

1. General form: \(Ax + By + C = 0\)
2. Vertical line: \(x = a\)
3. Horizontal line: \(y = b\)
4. Slope-intercept form: \(y = mx + b\)
5. Point-slope form: \(y - y_1 = m(x - x_1)\)
6. Two-point form: \(y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)\)
1.3 EXERCISES

VOCABULARY

In Exercises 1–7, fill in the blanks.

1. The simplest mathematical model for relating two variables is the _______ equation in two variables $y = mx + b$.
2. For a line, the ratio of the change in $y$ to the change in $x$ is called the _______ of the line.
3. Two lines are _______ if and only if their slopes are equal.
4. Two lines are _______ if and only if their slopes are negative reciprocals of each other.
5. When the $x$-axis and $y$-axis have different units of measure, the slope can be interpreted as a _______.
6. The prediction method ___________ is the method used to estimate a point on a line when the point does not lie between the given points.
7. Every line has an equation that can be written in _______ form.
8. Match each equation of a line with its form.
   (a) $Ax + By + C = 0$     (i) Vertical line
   (b) $x = a$                (ii) Slope-intercept form
   (c) $y = b$                (iii) General form
   (d) $y = mx + b$           (iv) Point-slope form
   (e) $y - y_1 = m(x - x_1)$ (v) Horizontal line

SKILLS AND APPLICATIONS

In Exercises 9 and 10, identify the line that has each slope.

9. (a) $m = \frac{2}{3}$     10. (a) $m = 0$
   (b) $m$ is undefined.    (b) $m = -\frac{3}{4}$
   (c) $m = -2$             (c) $m = 1$

In Exercises 11 and 12, sketch the lines through the point with the indicated slopes on the same set of coordinate axes.

<table>
<thead>
<tr>
<th>Point</th>
<th>Slopes</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(2, 3)$</td>

</tr>
</tbody>
</table>

In Exercises 13–16, estimate the slope of the line.

13. $y$     14. $y$

In Exercises 17–28, find the slope and $y$-intercept (if possible) of the equation of the line. Sketch the line.

17. $y = 5x + 3$
18. $y = x - 10$
19. $y = -\frac{1}{2}x + 4$
20. $y = -\frac{3}{2}x + 6$
21. $5x - 2 = 0$
22. $3y + 5 = 0$
23. $7x + 6y = 30$
24. $2x + 3y = 9$
25. $y - 3 = 0$
26. $y + 4 = 0$
27. $x + 5 = 0$
28. $x - 2 = 0$

In Exercises 29–40, plot the points and find the slope of the line passing through the pair of points.

<table>

</table>

In Exercises 41–50, use the point on the line and the slope $m$ of the line to find three additional points through which the line passes. (There are many correct answers.)

41. $(2, 1), \ m = 0$  
42. $(3, -2), \ m = 0$

43. $(5, -6), \ m = 1$  
44. $(10, -6), \ m = -1$

45. $(–8, 1), \ m$ is undefined. 
46. $(1, 5), \ m$ is undefined.

47. $(–5, 4), \ m = 2$  
48. $(0, –9), \ m = -2$

49. $(7, –2), \ m = \frac{1}{2}$  
50. $(–1, –6), \ m = –\frac{1}{2}$

In Exercises 51–64, find the slope-intercept form of the equation of the line that passes through the given point and has the indicated slope $m$. Sketch the line.

51. $(0, –2), \ m = 3$  
52. $(0, 10), \ m = -1$

53. $(–3, 6), \ m = -2$  
54. $(0, 0), \ m = 4$

55. $(4, 0), \ m = –\frac{1}{2}$  
56. $(8, 2), \ m = \frac{1}{4}$

57. $(2, –3), \ m = –\frac{3}{2}$  
58. $(–2, –5), \ m = \frac{3}{4}$

59. $(6, –1), \ m$ is undefined. 
60. $(–10, 4), \ m$ is undefined.

61. $(4, \frac{3}{2}), \ m = 0$  
62. $(-\frac{1}{2}, \frac{3}{2}), \ m = 0$

63. $(–5.1, 1.8), \ m = 5$  
64. $(2.3, –8.5), \ m = –2.5$

In Exercises 65–78, find the slope-intercept form of the equation of the line passing through the points. Sketch the line.

65. $(5, –1), (–5, 5)$  
66. $(4, 3), (–4, –4)$

67. $(–8, 1), (–8, 7)$  
68. $(1, –4), (6, 4)$

69. $(\frac{2}{3}, \frac{1}{2}), (\frac{4}{3}, \frac{5}{2})$  
70. $(1, 1), (6, –\frac{3}{2})$

71. $(–\frac{1}{18}, –\frac{2}{9}), (\frac{1}{18}, –\frac{2}{9})$  
72. $(\frac{5}{3}, \frac{2}{3}), (–\frac{5}{3}, \frac{2}{3})$

73. $(1, 0.6), (–2, –0.6)$  
74. $(–8, 0.6), (2, –2.4)$

75. $(2, –1), (\frac{1}{2}, –1)$  
76. $(\frac{1}{2}, –2), (6, –6, –2)$

77. $(\frac{1}{2}, –8), (\frac{5}{2}, 1)$  
78. $(1.5, –2), (1.5, 0.2)$

In Exercises 79–82, determine whether the lines are parallel, perpendicular, or neither.

79. $L_1: y = \frac{1}{3}x – 2$  
80. $L_1: y = 4x – 1$

$L_2: y = \frac{1}{3}x + 3$  
$L_2: y = 4x + 7$

81. $L_1: y = \frac{1}{2}x – 3$  
82. $L_1: y = –\frac{1}{7}x – 5$

$L_2: y = –\frac{1}{2}x + 1$  
$L_2: y = \frac{5}{4}x + 1$

In Exercises 83–86, determine whether the lines $L_1$ and $L_2$ passing through the pairs of points are parallel, perpendicular, or neither.

83. $L_1: (0, –1), (5, 9)$  
84. $L_1: (–2, –1), (1, 5)$

$L_2: (0, 3), (4, 1)$  
$L_2: (1, 3), (5, –5)$

85. $L_1: (3, 6), (–6, 0)$  
86. $L_1: (4, 8), (–4, 2)$

$L_2: (0, –1), (5, \frac{7}{4})$  
$L_2: (3, –5), (–1, \frac{1}{2})$

In Exercises 87–96, write the slope-intercept forms of the equations of the lines through the given point (a) parallel to the given line and (b) perpendicular to the given line.

87. $4x – 2y = 3, \ (2, 1)$  
88. $x + y = 7, \ (–3, 2)$

89. $3x + 4y = 7, \ (–\frac{3}{4}, \frac{5}{4})$  
90. $5x + 3y = 0, \ (\frac{2}{5}, \frac{3}{5})$

91. $y + 3 = 0, \ (–1, 0)$  
92. $y = 2 = 0, \ (–4, 1)$

93. $x – 4 = 0, \ (3, –2)$  
94. $x + 2 = 0, \ (–5, 1)$

95. $x – y = 4, \ (2.5, 6.8)$  
96. $6x + 2y = 9, \ (–3.9, –1.4)$

In Exercises 97–102, use the intercept form to find the equation of the line with the given intercepts. The intercept form of the equation of a line with intercepts $(a, 0)$ and $(0, b)$ is

$$\frac{x}{a} + \frac{y}{b} = 1, \ a \neq 0, \ b \neq 0.$$

97. $x$-intercept: $(2, 0)$  
98. $x$-intercept: $(–3, 0)$

$y$-intercept: $(0, 3)$  
$y$-intercept: $(0, 4)$

99. $x$-intercept: $(–\frac{1}{3}, 0)$  
100. $x$-intercept: $(\frac{2}{3}, 0)$

$y$-intercept: $(0, –\frac{2}{3})$  
$y$-intercept: $(0, –\frac{2}{3})$

101. Point on line: $(1, 2)$  
102. Point on line: $(–3, 4)$

$x$-intercept: $(c, 0)$  
$x$-intercept: $(d, 0)$

$y$-intercept: $(0, c), \ c \neq 0$  
$y$-intercept: $(0, d), \ d \neq 0$

In Exercises 103–106, identify any relationships that exist among the lines, and then use a graphing utility to graph the three equations in the same viewing window. Adjust the viewing window so that the slope appears visually correct—that is, so that parallel lines appear parallel and perpendicular lines appear to intersect at right angles.

103. (a) $y = 2x$  
(b) $y = –2x$  
(c) $y = \frac{1}{2}x$

104. (a) $y = \frac{2}{3}x$  
(b) $y = –\frac{1}{3}x$  
(c) $y = \frac{3}{2}x + 2$

105. (a) $y = –\frac{1}{2}x$  
(b) $y = –\frac{1}{2}x + 3$  
(c) $y = 2x – 4$

106. (a) $y = x – 8$  
(b) $y = x + 1$  
(c) $y = –x + 3$

In Exercises 107–110, find a relationship between $x$ and $y$ such that $(x, y)$ is equidistant (the same distance) from the two points.

107. $(4, –1), (–2, 3)$  
108. $(6, 5), (1, –8)$

109. $(\frac{3}{2}, \frac{5}{2}), (–7, 1)$  
110. $(–\frac{1}{2}, –4), (\frac{2}{3}, \frac{5}{3})$
111. **SALES** The following are the slopes of lines representing annual sales $y$ in terms of time $x$ in years. Use the slopes to interpret any change in annual sales for a one-year increase in time.

(a) The line has a slope of $m = 135$.
(b) The line has a slope of $m = 0$.
(c) The line has a slope of $m = -40$.

112. **REVENUE** The following are the slopes of lines representing daily revenues $y$ in terms of time $x$ in days. Use the slopes to interpret any change in daily revenues for a one-day increase in time.

(a) The line has a slope of $m = 400$.
(b) The line has a slope of $m = 100$.
(c) The line has a slope of $m = 0$.

113. **AVERAGE SALARY** The graph shows the average salaries for senior high school principals from 1996 through 2008. (Source: Educational Research Service)

(a) Use the slopes of the line segments to determine the time periods in which the average salary increased the greatest and the least.
(b) Find the slope of the line segment connecting the points for the years 1996 and 2008.
(c) Interpret the meaning of the slope in part (b) in the context of the problem.

114. **SALES** The graph shows the sales (in billions of dollars) for Apple Inc. for the years 2001 through 2007. (Source: Apple Inc.)

(a) Use the slopes of the line segments to determine the years in which the sales showed the greatest increase and the least increase.
(b) Find the slope of the line segment connecting the points for the years 2001 and 2007.
(c) Interpret the meaning of the slope in part (b) in the context of the problem.

115. **ROAD GRADE** You are driving on a road that has a 6% uphill grade (see figure). This means that the slope of the road is approximately $\frac{6}{100}$. Approximate the amount of vertical change in your position if you drive 200 feet.

116. **ROAD GRADE** From the top of a mountain road, a surveyor takes several horizontal measurements $x$ and several vertical measurements $y$, as shown in the table $(x$ and $y$ are measured in feet).

<table>
<thead>
<tr>
<th>$x$</th>
<th>300</th>
<th>600</th>
<th>900</th>
<th>1200</th>
<th>1500</th>
<th>1800</th>
<th>2100</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y$</td>
<td>-25</td>
<td>-50</td>
<td>-75</td>
<td>-100</td>
<td>-125</td>
<td>-150</td>
<td>-175</td>
</tr>
</tbody>
</table>

(a) Sketch a scatter plot of the data.
(b) Use a straightedge to sketch the line that you think best fits the data.
(c) Find an equation for the line you sketched in part (b).
(d) Interpret the meaning of the slope of the line in part (c) in the context of the problem.
(e) The surveyor needs to put up a road sign that indicates the steepness of the road. For instance, a surveyor would put up a sign that states “8% grade” on a road with a downhill grade that has a slope of $-\frac{8}{100}$. What should the sign state for the road in this problem?

**RATE OF CHANGE** In Exercises 117 and 118, you are given the dollar value of a product in 2010 and the rate at which the value of the product is expected to change during the next 5 years. Use this information to write a linear equation that gives the dollar value $V$ of the product in terms of the year $t$. (Let $t = 10$ represent 2010.)

<table>
<thead>
<tr>
<th>2010 Value</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>117. $2540$</td>
<td>$125$ decrease per year</td>
</tr>
<tr>
<td>118. $156$</td>
<td>$4.50$ increase per year</td>
</tr>
</tbody>
</table>
119. **DEPRECIATION** The value \( V \) of a molding machine \( t \) years after it is purchased is

\[
V = -4000t + 58,500, \quad 0 \leq t \leq 5.
\]

Explain what the \( V \)-intercept and the slope measure.

120. **COST** The cost \( C \) of producing \( n \) computer laptop bags is given by

\[
C = 1.25n + 15,750, \quad 0 < n.
\]

Explain what the \( C \)-intercept and the slope measure.

121. **DEPRECIATION** A sub shop purchases a used pizza oven for $875. After 5 years, the oven will have to be replaced. Write a linear equation giving the value \( V \) of the equipment during the 5 years it will be in use.

122. **DEPRECIATION** A school district purchases a high-volume printer, copier, and scanner for $25,000. After 10 years, the equipment will have to be replaced. Its value at that time is expected to be $2000. Write a linear equation giving the value \( V \) of the equipment during the 10 years it will be in use.

123. **SALES** A discount outlet is offering a 20% discount on all items. Write a linear equation giving the sale price \( S \) for an item with a list price \( L \).

124. **HOURLY WAGE** A microchip manufacturer pays its assembly line workers $12.25 per hour. In addition, workers receive a piecework rate of $0.75 per unit produced. Write a linear equation for the hourly wage \( W \) in terms of the number of units \( x \) produced per hour.

125. **MONTHLY SALARY** A pharmaceutical salesperson receives a monthly salary of $2500 plus a commission of 7% of sales. Write a linear equation for the salesperson’s monthly wage \( W \) in terms of monthly sales \( S \).

126. **BUSINESS COSTS** A sales representative of a company using a personal car receives $120 per day for lodging and meals plus $0.55 per mile driven. Write a linear equation giving the daily cost \( C \) to the company in terms of \( x \), the number of miles driven.

127. **CASH FLOW PER SHARE** The cash flow per share for the Timberland Co. was $1.21 in 1999 and $1.46 in 2007. Write a linear equation that gives the cash flow per share in terms of the year. Let \( t = 9 \) represent 1999. Then predict the cash flows for the years 2012 and 2014. (Source: The Timberland Co.)

128. **NUMBER OF STORES** In 2003 there were 1078 J.C. Penney stores and in 2007 there were 1067 stores. Write a linear equation that gives the number of stores in terms of the year. Let \( t = 3 \) represent 2003. Then predict the numbers of stores for the years 2012 and 2014. Are your answers reasonable? Explain. (Source: J.C. Penney Co.)

129. **COLLEGE ENROLLMENT** The Pennsylvania State University had enrollments of 40,571 students in 2000 and 44,112 students in 2008 at its main campus in University Park, Pennsylvania. (Source: Penn State Fact Book)

(a) Assuming the enrollment growth is linear, find a linear model that gives the enrollment in terms of the year \( t \), where \( t = 0 \) corresponds to 2000.

(b) Use your model from part (a) to predict the enrollments in 2010 and 2015.

(c) What is the slope of your model? Explain its meaning in the context of the situation.

130. **COLLEGE ENROLLMENT** The University of Florida had enrollments of 46,107 students in 2000 and 51,413 students in 2008. (Source: University of Florida)

(a) What was the average annual change in enrollment from 2000 to 2008?

(b) Use the average annual change in enrollment to estimate the enrollments in 2002, 2004, and 2006.

(c) Write the equation of a line that represents the given data in terms of the year \( t \), where \( t = 0 \) corresponds to 2000. What is its slope? Interpret the slope in the context of the problem.

(d) Using the results of parts (a)–(c), write a short paragraph discussing the concepts of slope and average rate of change.

131. **COST, REVENUE, AND PROFIT** A roofing contractor purchases a shingle delivery truck with a shingle elevator for $42,000. The vehicle requires an average expenditure of $6.50 per hour for fuel and maintenance, and the operator is paid $11.50 per hour.

(a) Write a linear equation giving the total cost \( C \) of operating this equipment for \( t \) hours. (Include the purchase cost of the equipment.)

(b) Assuming that customers are charged $30 per hour of machine use, write an equation for the revenue \( R \) derived from \( t \) hours of use.

(c) Use the formula for profit

\[
P = R - C
\]

to write an equation for the profit derived from \( t \) hours of use.

(d) Use the result of part (c) to find the break-even point—that is, the number of hours this equipment must be used to yield a profit of 0 dollars.
132. RENTAL DEMAND  A real estate office handles an apartment complex with 50 units. When the rent per unit is $580 per month, all 50 units are occupied. However, when the rent is $625 per month, the average number of occupied units drops to 47. Assume that the relationship between the monthly rent and the demand is linear.

(a) Write the equation of the line giving the demand in terms of the rent $p$.

(b) Use this equation to predict the number of units occupied when the rent is $655.

(c) Predict the number of units occupied when the rent is $595.

133. GEOMETRY  The length and width of a rectangular garden are 15 meters and 10 meters, respectively. A walkway of width $x$ surrounds the garden.

(a) Draw a diagram that gives a visual representation of the problem.

(b) Write the equation for the perimeter $y$ of the walkway in terms of $x$.

(c) Use a graphing utility to graph the equation for the perimeter.

(d) Determine the slope of the graph in part (c). For each additional one-meter increase in the width of the walkway, determine the increase in its perimeter.

134. AVERAGE ANNUAL SALARY  The average salaries (in millions of dollars) of Major League Baseball players from 2000 through 2007 are shown in the scatter plot. Find the equation of the line that you think best fits these data. (Let $y$ represent the average salary and let $t$ represent the year, with $t = 0$ corresponding to 2000.) (Source: Major League Baseball Players Association)

![Average Annual Salary Scatter Plot]

135. DATA ANALYSIS: NUMBER OF DOCTORS  The numbers of doctors of osteopathic medicine $y$ (in thousands) in the United States from 2000 through 2008, where $x$ is the year, are shown as data points $(x, y)$. (Source: American Osteopathic Association)

(a) Sketch a scatter plot of the data. Let $x = 0$ correspond to 2000.

(b) Use a straightedge to sketch the line that you think best fits the data.

(c) Find the equation of the line from part (b). Explain the procedure you used.

(d) Write a short paragraph explaining the meanings of the slope and $y$-intercept of the line in terms of the data.

(e) Compare the values obtained using your model with the actual values.

(f) Use your model to estimate the number of doctors of osteopathic medicine in 2012.

136. DATA ANALYSIS: AVERAGE SCORES  An instructor gives regular 20-point quizzes and 100-point exams in an algebra course. Average scores for six students, given as data points $(x, y)$, where $x$ is the average quiz score and $y$ is the average test score, are $(18, 87)$, $(10, 55)$, $(19, 96)$, $(16, 79)$, $(13, 76)$, and $(15, 82)$. [Note: There are many correct answers for parts (b)–(d).]

(a) Sketch a scatter plot of the data.

(b) Use a straightedge to sketch the line that you think best fits the data.

(c) Find an equation for the line you sketched in part (b).

(d) Use the equation in part (c) to estimate the average test score for a person with an average quiz score of 17.

(e) The instructor adds 4 points to the average test score of each student in the class. Describe the changes in the positions of the plotted points and the change in the equation of the line.
EXPLORATION

TRUE OR FALSE? In Exercises 137 and 138, determine whether the statement is true or false. Justify your answer.

137. A line with a slope of $\frac{-5}{7}$ is steeper than a line with a slope of $\frac{-6}{7}$.
138. The line through $(-8, 2)$ and $(-1, 4)$ and the line through $(0, -4)$ and $(-7, 7)$ are parallel.
139. Explain how you could show that the points $A(2, 3)$, $B(2, 9)$, and $C(4, 3)$ are the vertices of a right triangle.
140. Explain why the slope of a vertical line is said to be undefined.
141. With the information shown in the graphs, is it possible to determine the slope of each line? Is it possible that the lines could have the same slope? Explain.

(a) 
(b)

142. The slopes of two lines are $-4$ and $\frac{5}{2}$. Which is steeper? Explain.
143. Use a graphing utility to compare the slopes of the lines $y = mx$, where $m = 0.5, 1, 2$, and 4. Which line rises most quickly? Now, let $m = -0.5, -1, -2$, and $-4$. Which line falls most quickly? Use a square setting to obtain a true geometric perspective. What can you conclude about the slope and the “rate” at which the line rises or falls?
144. Find $d_1$ and $d_2$ in terms of $m_1$ and $m_2$, respectively (see figure). Then use the Pythagorean Theorem to find a relationship between $m_1$ and $m_2$.

145. THINK ABOUT IT Is it possible for two lines with positive slopes to be perpendicular? Explain.

146. CAPSTONE Match the description of the situation with its graph. Also determine the slope and y-intercept of each graph and interpret the slope and y-intercept in the context of the situation. [The graphs are labeled (i), (ii), (iii), and (iv).]

(a) A person is paying $20 per week to a friend to repay a $200 loan.
(b) An employee is paid $8.50 per hour plus $2 for each unit produced per hour.
(c) A sales representative receives $30 per day for food plus $0.32 for each mile traveled.
(d) A computer that was purchased for $750 depreciates $100 per year.

PROJECT: BACHELOR’S DEGREES To work an extended application analyzing the numbers of bachelor’s degrees earned by women in the United States from 1996 through 2007, visit this text’s website at academic.cengage.com. (Data Source: U.S. National Center for Education Statistics)
Introduction to Functions

Many everyday phenomena involve two quantities that are related to each other by some rule of correspondence. The mathematical term for such a rule of correspondence is a relation. In mathematics, relations are often represented by mathematical equations and formulas. For instance, the simple interest earned on $1000 for 1 year is related to the annual interest rate \( r \) by the formula \( I = 1000r \).

The formula \( I = 1000r \) represents a special kind of relation that matches each item from one set with exactly one item from a different set. Such a relation is called a function.

To help understand this definition, look at the function that relates the time of day to the temperature in Figure 1.47.

![Figure 1.47](image_url)

This function can be represented by the following ordered pairs, in which the first coordinate (\( x \)-value) is the input and the second coordinate (\( y \)-value) is the output.

\[ \{(1, 9^\circ), (2, 13^\circ), (3, 15^\circ), (4, 15^\circ), (5, 12^\circ), (6, 10^\circ)\} \]

Characteristics of a Function from Set \( A \) to Set \( B \)

1. Each element in \( A \) must be matched with an element in \( B \).
2. Some elements in \( B \) may not be matched with any element in \( A \).
3. Two or more elements in \( A \) may be matched with the same element in \( B \).
4. An element in \( A \) (the domain) cannot be matched with two different elements in \( B \).
Functions are commonly represented in four ways.

**Four Ways to Represent a Function**

1. **Verbally** by a sentence that describes how the input variable is related to the output variable
2. **Numerically** by a table or a list of ordered pairs that matches input values with output values
3. **Graphically** by points on a graph in a coordinate plane in which the input values are represented by the horizontal axis and the output values are represented by the vertical axis
4. **Algebraically** by an equation in two variables

To determine whether or not a relation is a function, you must decide whether each input value is matched with exactly one output value. If any input value is matched with two or more output values, the relation is not a function.

**Example 1**  Testing for Functions

Determine whether the relation represents \( y \) as a function of \( x \).

a. The input value \( x \) is the number of representatives from a state, and the output value \( y \) is the number of senators.

b. This table describes \( y \) as a function of \( x \). The input value 2 is matched with two different \( y \)-values.

c. The graph in Figure 1.48 describes \( y \) as a function of \( x \). Each input value is matched with exactly one output value.

Representing functions by sets of ordered pairs is common in discrete mathematics. In algebra, however, it is more common to represent functions by equations or formulas involving two variables. For instance, the equation

\[
y = x^2
\]

represents the variable \( y \) as a function of the variable \( x \). In this equation, \( x \) is
the independent variable and $y$ is the dependent variable. The domain of the function is the set of all values taken on by the independent variable $x$, and the range of the function is the set of all values taken on by the dependent variable $y$.

### Example 2  Testing for Functions Represented Algebraically

Which of the equations represent(s) $y$ as a function of $x$?

**a.** $x^2 + y = 1$

**b.** $-x + y^2 = 1$

**Solution**

To determine whether $y$ is a function of $x$, try to solve for $y$ in terms of $x$.

**a.** Solving for $y$ yields

\[
\begin{align*}
x^2 + y &= 1 \\
y &= 1 - x^2.
\end{align*}
\]

Write original equation.

To each value of $x$ there corresponds exactly one value of $y$. So, $y$ is a function of $x$.

**b.** Solving for $y$ yields

\[
\begin{align*}
-x + y^2 &= 1 \\
y^2 &= 1 + x \\
y &= \pm \sqrt{1 + x}.
\end{align*}
\]

Write original equation.

The $\pm$ indicates that to a given value of $x$ there correspond two values of $y$. So, $y$ is not a function of $x$.

**CHECK point** Now try Exercise 21.

### Function Notation

When an equation is used to represent a function, it is convenient to name the function so that it can be referenced easily. For example, you know that the equation $y = 1 - x^2$ describes $y$ as a function of $x$. Suppose you give this function the name “$f$.” Then you can use the following function notation.

<table>
<thead>
<tr>
<th>Input $x$</th>
<th>Output $f(x)$</th>
<th>Equation $f(x) = 1 - x^2$</th>
</tr>
</thead>
</table>

The symbol $f(x)$ is read as the value of $f$ at $x$ or simply $f$ of $x$. The symbol $f(x)$ corresponds to the $y$-value for a given $x$. So, you can write $y = f(x)$. Keep in mind that $f$ is the name of the function, whereas $f(x)$ is the value of the function at $x$. For instance, the function given by

\[
f(x) = 3 - 2x
\]

has function values denoted by $f(-1)$, $f(0)$, $f(2)$, and so on. To find these values, substitute the specified input values into the given equation.

- For $x = -1$, $f(-1) = 3 - 2(-1) = 3 + 2 = 5$.
- For $x = 0$, $f(0) = 3 - 2(0) = 3 - 0 = 3$.
- For $x = 2$, $f(2) = 3 - 2(2) = 3 - 4 = -1$.

Leonhard Euler (1707–1783), a Swiss mathematician, is considered to have been the most prolific and productive mathematician in history. One of his greatest influences on mathematics was his use of symbols, or notation. The function notation $y = f(x)$ was introduced by Euler.
Although $f$ is often used as a convenient function name and $x$ is often used as the independent variable, you can use other letters. For instance, 

$$f(x) = x^2 - 4x + 7, \quad f(t) = t^2 - 4t + 7, \quad \text{and} \quad g(s) = s^2 - 4s + 7$$

all define the same function. In fact, the role of the independent variable is that of a “placeholder.” Consequently, the function could be described by

$$f(x) = (x) - 4(x) + 7.$$ 

### Example 3 Evaluating a Function

Let $g(x) = -x^2 + 4x + 1$. Find each function value.

a. $g(2)$  
b. $g(t)$  
c. $g(x + 2)$

#### Solution

a. Replacing $x$ with 2 in $g(x) = -x^2 + 4x + 1$ yields the following.

$$g(2) = -(2)^2 + 4(2) + 1 = -4 + 8 + 1 = 5$$

b. Replacing $x$ with $t$ yields the following.

$$g(t) = -(t)^2 + 4(t) + 1 = -t^2 + 4t + 1$$

c. Replacing $x$ with $x + 2$ yields the following.

$$g(x + 2) = -(x + 2)^2 + 4(x + 2) + 1$$

$$= -(x^2 + 4x + 4) + 4x + 8 + 1$$

$$= -x^2 - 4x + 4x + 8 + 1$$

$$= -x^2 + 5$$

### Example 4 A Piecewise-Defined Function

Evaluate the function when $x = -1, 0,$ and 1.

$$f(x) = \begin{cases} 
x^2 + 1, & x < 0 \\
x - 1, & x \geq 0
\end{cases}$$

#### Solution

Because $x = -1$ is less than 0, use $f(x) = x^2 + 1$ to obtain

$$f(-1) = (-1)^2 + 1 = 2.$$ 

For $x = 0$, use $f(x) = x - 1$ to obtain

$$f(0) = (0) - 1 = -1.$$ 

For $x = 1$, use $f(x) = x - 1$ to obtain

$$f(1) = (1) - 1 = 0.$$ 

### Checkpoint

Now try Exercise 41.

A function defined by two or more equations over a specified domain is called a piecewise-defined function.
Finding Values for Which \( f(x) = 0 \)

Find all real values of \( x \) such that \( f(x) = 0 \).

**a.** \( f(x) = -2x + 10 \)

**Solution**

For each function, set and solve for \( x \).

\[
-2x + 10 = 0 \quad \text{Set } f(x) \text{ equal to } 0.
\]

\[
-2x = -10 \quad \text{Subtract 10 from each side.}
\]

\[
x = 5 \quad \text{Divide each side by } -2.
\]

So, \( f(x) = 0 \) when \( x = 5 \).

**b.** \( f(x) = x^2 - 5x + 6 \)

**Example 5** Finding Values for Which \( f(x) = 0 \)

Find all real values of \( x \) such that \( f(x) = 0 \).

**a.** \( f(x) = -2x + 10 \)

**Solution**

For each function, set \( f(x) = 0 \) and solve for \( x \).

\[
-2x + 10 = 0 \quad \text{Set } f(x) \text{ equal to } 0.
\]

\[
-2x = -10 \quad \text{Subtract 10 from each side.}
\]

\[
x = 5 \quad \text{Divide each side by } -2.
\]

So, \( f(x) = 0 \) when \( x = 5 \).

**b.** \( f(x) = x^2 - 5x + 6 \)

\[
(x - 2)(x - 3) = 0 \quad \text{Factor.}
\]

\[
x - 2 = 0 \quad \Rightarrow \quad x = 2 \quad \text{Set 1st factor equal to } 0.
\]

\[
x - 3 = 0 \quad \Rightarrow \quad x = 3 \quad \text{Set 2nd factor equal to } 0.
\]

So, \( f(x) = 0 \) when \( x = 2 \) or \( x = 3 \).

**Example 6** Finding Values for Which \( f(x) = g(x) \)

Find the values of \( x \) for which \( f(x) = g(x) \).

**a.** \( f(x) = x^2 + 1 \) and \( g(x) = 3x - x^2 \)

**b.** \( f(x) = x^2 - 1 \) and \( g(x) = -x^2 + x + 2 \)

**Solution**

**a.** \( x^2 + 1 = 3x - x^2 \)

\[
2x^2 - 3x + 1 = 0 \quad \text{Set } f(x) \text{ equal to } g(x).
\]

\[
(2x - 1)(x - 1) = 0 \quad \text{Write in general form.}
\]

\[
2x - 1 = 0 \quad \Rightarrow \quad x = \frac{1}{2} \quad \text{Set 1st factor equal to } 0.
\]

\[
x - 1 = 0 \quad \Rightarrow \quad x = 1 \quad \text{Set 2nd factor equal to } 0.
\]

So, \( f(x) = g(x) \) when \( x = \frac{1}{2} \) or \( x = 1 \).

**b.** \( x^2 - 1 = -x^2 + x + 2 \)

\[
2x^2 - x - 3 = 0 \quad \text{Set } f(x) \text{ equal to } g(x).
\]

\[
(2x - 3)(x + 1) = 0 \quad \text{Write in general form.}
\]

\[
2x - 3 = 0 \quad \Rightarrow \quad x = \frac{3}{2} \quad \text{Set 1st factor equal to } 0.
\]

\[
x + 1 = 0 \quad \Rightarrow \quad x = -1 \quad \text{Set 2nd factor equal to } 0.
\]

So, \( f(x) = g(x) \) when \( x = \frac{3}{2} \) or \( x = -1 \).

**CHECKpoint** Now try Exercise 67.
The Domain of a Function

The domain of a function can be described explicitly or it can be implied by the expression used to define the function. The implied domain is the set of all real numbers for which the expression is defined. For instance, the function given by

\[ f(x) = \frac{1}{x^2 - 4} \]

has an implied domain that consists of all real numbers other than These two values are excluded from the domain because division by zero is undefined. Another common type of implied domain is that used to avoid even roots of negative numbers. For example, the function given by

\[ f(x) = \sqrt{x} \]

is defined only for \( x \geq 0 \). So, its implied domain is the interval \([0, \infty)\). In general, the domain of a function excludes values that would cause division by zero or that would result in the even root of a negative number.

Example 7  Finding the Domain of a Function

Find the domain of each function.

a. \( f: \{(-3, 0), (-1, 4), (0, 2), (2, 2), (4, -1)\} \)

b. \( g(x) = \frac{1}{x + 5} \)

c. Volume of a sphere: \( V = \frac{4}{3} \pi r^3 \)

d. \( h(x) = \sqrt{4 - 3x} \)

Solution

a. The domain of \( f \) consists of all first coordinates in the set of ordered pairs.

\[ \text{Domain} = \{-3, -1, 0, 2, 4\} \]

b. Excluding \( x \)-values that yield zero in the denominator, the domain of \( g \) is the set of all real numbers \( x \) except \( x = -5 \).

c. Because this function represents the volume of a sphere, the values of the radius \( r \) must be positive. So, the domain is the set of all real numbers \( r \) such that \( r > 0 \).

d. This function is defined only for \( x \)-values for which

\[ 4 - 3x \geq 0. \]

By solving this inequality, you can conclude that \( x \leq \frac{4}{3} \). So, the domain is the interval \(( -\infty, \frac{4}{3} ]\).

Check Point  Now try Exercise 73.

In Example 7(c), note that the domain of a function may be implied by the physical context. For instance, from the equation

\[ V = \frac{4}{3} \pi r^3 \]

you would have no reason to restrict \( r \) to positive values, but the physical context implies that a sphere cannot have a negative or zero radius.
Applications

Example 8  The Dimensions of a Container

You work in the marketing department of a soft-drink company and are experimenting with a new can for iced tea that is slightly narrower and taller than a standard can. For your experimental can, the ratio of the height to the radius is 4, as shown in Figure 1.49.

a. Write the volume of the can as a function of the radius \( r \).
b. Write the volume of the can as a function of the height \( h \).

Solution

a. Write as a function of \( r \).
\[
V(r) = \pi r^2 h = \pi r^2 (4r) = 4\pi r^3
\]
Write \( V \) as a function of \( r \).

b. Write as a function of \( h \).
\[
V(h) = \pi \left( \frac{h}{4} \right)^2 h = \frac{\pi h^3}{16}
\]
Write \( V \) as a function of \( h \).

Example 9  The Path of a Baseball

A baseball is hit at a point 3 feet above ground at a velocity of 100 feet per second and an angle of 45°. The path of the baseball is given by the function
\[
f(x) = -0.0032x^2 + x + 3
\]
where \( x \) and \( f(x) \) are measured in feet. Will the baseball clear a 10-foot fence located 300 feet from home plate?

Algebraic Solution

When \( x = 300 \), you can find the height of the baseball as follows.
\[
f(x) = -0.0032x^2 + x + 3 \quad \text{Write original function.}
\]
\[
f(300) = -0.0032(300)^2 + 300 + 3 \quad \text{Substitute 300 for } x.
\]
\[
= 15 \quad \text{Simplify.}
\]
When \( x = 300 \), the height of the baseball is 15 feet, so the baseball will clear a 10-foot fence.

Graphical Solution

Use a graphing utility to graph the function \( y = -0.0032x^2 + x + 3 \). Use the value feature or the zoom and trace features of the graphing utility to estimate that \( y = 15 \) when \( x = 300 \), as shown in Figure 1.50. So, the ball will clear a 10-foot fence.

In the equation in Example 9, the height of the baseball is a function of the distance from home plate.
Alternative-Fueled Vehicles

The number (in thousands) of alternative-fueled vehicles in the United States increased in a linear pattern from 1995 to 1999, as shown in Figure 1.51. Then, in 2000, the number of vehicles took a jump and, until 2006, increased in a different linear pattern. These two patterns can be approximated by the function

\[ V(t) = \begin{cases} 
18.08t + 155.3, & 5 \leq t \leq 9 \\
34.75t + 74.9, & 10 \leq t \leq 16 
\end{cases} \]

where \( t \) represents the year, with \( t = 5 \) corresponding to 1995. Use this function to approximate the number of alternative-fueled vehicles for each year from 1995 to 2006.

(Source: Science Applications International Corporation; Energy Information Administration)

**Solution**

From 1995 to 1999, use \[ V(t) = 18.08t + 155.3. \]

<table>
<thead>
<tr>
<th>Year (5 ↔ 1995)</th>
<th>Number of alternative-fueled vehicles (in thousands)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1995</td>
<td>245.7</td>
</tr>
<tr>
<td>1996</td>
<td>263.8</td>

</tbody>
</table>

**CHECK Point** Now try Exercise 95.

### Difference Quotients

One of the basic definitions in calculus employs the ratio

\[ f(x + h) - f(x) \]

\[ h \]

This ratio is called a **difference quotient**, as illustrated in Example 11.

**Example 11 Evaluating a Difference Quotient**

For \( f(x) = x^2 - 4x + 7 \), find \[ \frac{f(x + h) - f(x)}{h}. \]

**Solution**

\[ f(x + h) - f(x) = \left[ (x + h)^2 - 4(x + h) + 7 \right] - (x^2 - 4x + 7) \]

\[ = \frac{x^2 + 2xh + h^2 - 4x - 4h + 7 - x^2 + 4x - 7}{h} \]

\[ = \frac{2xh + h^2 - 4h}{h} = \frac{h(2x + h - 4)}{h} = 2x + h - 4, \quad h \neq 0 \]

**CHECK Point** Now try Exercise 103.

The symbol \( \square \) indicates an example or exercise that highlights algebraic techniques specifically used in calculus.
You may find it easier to calculate the difference quotient in Example 11 by first finding and then substituting the resulting expression into the difference quotient, as follows.

\[ f(x + h) = (x + h)^2 - 4(x + h) + 7 = x^2 + 2xh + h^2 - 4x - 4h + 7 \]

\[ \frac{f(x + h) - f(x)}{h} = \frac{(x^2 + 2xh + h^2 - 4x - 4h + 7) - (x^2 - 4x + 7)}{h} \]

\[ = \frac{2xh + h^2 - 4h}{h} = \frac{h(2x + h - 4)}{h} = 2x + h - 4, \quad h \neq 0 \]

Summary of Function Terminology

Function: A function is a relationship between two variables such that to each value of the independent variable there corresponds exactly one value of the dependent variable.

Function Notation: \( y = f(x) \)
- \( f \) is the name of the function.
- \( y \) is the dependent variable.
- \( x \) is the independent variable.
- \( f(x) \) is the value of the function at \( x \).

Domain: The domain of a function is the set of all values (inputs) of the independent variable for which the function is defined. If \( x \) is in the domain of \( f \), \( f \) is said to be defined at \( x \). If \( x \) is not in the domain of \( f \), \( f \) is said to be undefined at \( x \).

Range: The range of a function is the set of all values (outputs) assumed by the dependent variable (that is, the set of all function values).

Implied Domain: If \( f \) is defined by an algebraic expression and the domain is not specified, the implied domain consists of all real numbers for which the expression is defined.

Classroom Discussion

Everyday Functions  In groups of two or three, identify common real-life functions. Consider everyday activities, events, and expenses, such as long distance telephone calls and car insurance. Here are two examples.

a. The statement, “Your happiness is a function of the grade you receive in this course” is not a correct mathematical use of the word “function.” The word “happiness” is ambiguous.

b. The statement, “Your federal income tax is a function of your adjusted gross income” is a correct mathematical use of the word “function.” Once you have determined your adjusted gross income, your income tax can be determined.

Describe your functions in words. Avoid using ambiguous words. Can you find an example of a piecewise-defined function?
1.4 EXERCISES

VOCABULARY: Fill in the blanks.

1. A relation that assigns to each element x from a set of inputs, or ________, exactly one element y in a set of outputs, or ________, is called a ________.

2. Functions are commonly represented in four different ways, ________, ________, ________, and ________.

3. For an equation that represents y as a function of x, the set of all values taken on by the ________ variable x is the domain, and the set of all values taken on by the ________ variable y is the range.

4. The function given by
   \[ f(x) = \begin{cases} 
   2x - 1, & x < 0 \\
   x^2 + 4, & x \geq 0 
   \end{cases} \]
   is an example of a ________ function.

5. If the domain of the function f is not given, then the set of values of the independent variable for which the expression is defined is called the ________ ________.

6. In calculus, one of the basic definitions is that of a ________ ________, given by \( \frac{f(x + h) - f(x)}{h} \), \( h \neq 0 \).

SKILLS AND APPLICATIONS

In Exercises 7–10, is the relationship a function?

In Exercises 15 and 16, which sets of ordered pairs represent functions from A to B? Explain.

15. A = \{0, 1, 2, 3\} and B = \{−2, −1, 0, 1, 2\}
    (a) \{(0, 1), (1, −2), (2, 0), (3, 2)\}
    (b) \{(0, −1), (2, 2), (1, −2), (3, 0), (1, 1)\}
    (c) \{(0, 0), (1, 0), (2, 0), (3, 0)\}
    (d) \{(0, 2), (3, 0), (1, 1)\}

16. A = \{a, b, c\} and B = \{0, 1, 2, 3\}
    (a) \{(a, 1), (c, 2), (c, 3), (b, 3)\}
    (b) \{(a, 1), (b, 2), (c, 3)\}
    (c) \{(1, a), (0, a), (2, c), (3, b)\}
    (d) \{(c, 0), (b, 0), (a, 3)\}
CIRCULATION OF NEWSPAPERS  In Exercises 17 and 18, use the graph, which shows the circulation (in millions) of daily newspapers in the United States. (Source: Editor & Publisher Company)

18. Let \( f(x) \) represent the circulation of evening newspapers in year \( x \). Find \( f(2002) \).

In Exercises 19–36, determine whether the equation represents \( y \) as a function of \( x \).

19. \( x^2 + y^2 = 4 \)
20. \( x^2 - y^2 = 16 \)
21. \( x^2 + y = 4 \)
22. \( y - 4x^2 = 36 \)
23. \( 2x + 3y = 4 \)
24. \( 2x + 5y = 10 \)
25. \( (x + 2)^2 + (y - 1)^2 = 25 \)
26. \( (x - 2)^2 + y^2 = 4 \)
27. \( y^2 = x^2 - 1 \)
28. \( x + y^2 = 4 \)
29. \( y = \sqrt{16 - x^2} \)
30. \( y = \sqrt{x + 5} \)
31. \( y = |x| - 4 - x \)
32. \( |y| = 4 - x \)
33. \( x = 14 \)
34. \( y = -75 \)
35. \( y + 5 = 0 \)
36. \( x - 1 = 0 \)

In Exercises 37–52, evaluate the function at each specified value of the independent variable and simplify.

37. \( f(x) = 2x - 3 \)
   (a) \( f(1) \)  (b) \( f(-3) \)  (c) \( f(x - 1) \)
38. \( g(y) = 7 - 3y \)
   (a) \( g(0) \)  (b) \( g\left(\frac{2}{3}\right) \)  (c) \( g(s + 2) \)
39. \( V(r) = \frac{4}{3} \pi r^3 \)
   (a) \( V(3) \)  (b) \( V\left(\frac{1}{2}\right) \)  (c) \( V(2r) \)
40. \( S(r) = 4 \pi r^2 \)
   (a) \( S(2) \)  (b) \( S\left(\frac{1}{2}\right) \)  (c) \( S(3r) \)
41. \( g(t) = 4t^2 - 3t + 5 \)
   (a) \( g(2) \)  (b) \( g(t - 2) \)  (c) \( g(t) - g(2) \)
42. \( h(t) = t^2 - 2t \)
   (a) \( h(2) \)  (b) \( h(1.5) \)  (c) \( h(x + 2) \)
43. \( f(y) = 3 - \sqrt{y} \)
   (a) \( f(4) \)  (b) \( f(0.25) \)  (c) \( f(4x^2) \)
44. \( f(x) = \sqrt{x + 8} + 2 \)
   (a) \( f(-8) \)  (b) \( f(1) \)  (c) \( f(x - 8) \)
45. \( q(x) = \frac{1}{x^2 - 9} \)
   (a) \( q(0) \)  (b) \( q(3) \)  (c) \( q(y + 3) \)
46. \( q(t) = \frac{2t^2 + 3}{t^2} \)
   (a) \( q(2) \)  (b) \( q(0) \)  (c) \( q(-x) \)
47. \( f(x) = \frac{|x|}{x} \)
   (a) \( f(2) \)  (b) \( f(-2) \)  (c) \( f(x - 1) \)
48. \( f(x) = |x| + 4 \)
   (a) \( f(2) \)  (b) \( f(-2) \)  (c) \( f(x^2) \)
49. \( f(x) = \begin{cases} 
2x + 1, & x < 0 \\
2x + 2, & x \geq 0 
\end{cases} \)
   (a) \( f(-1) \)  (b) \( f(0) \)  (c) \( f(2) \)
50. \( f(x) = \begin{cases} 
2x^2 + 2, & x \leq 1 \\
2x^2 + 2, & x > 1 
\end{cases} \)
   (a) \( f(-2) \)  (b) \( f(1) \)  (c) \( f(2) \)
51. \( f(x) = \begin{cases} 
4, & -1 \leq x \leq 1 \\
x^2, & x > 1 
\end{cases} \)
   (a) \( f(-2) \)  (b) \( f\left(-\frac{1}{2}\right) \)  (c) \( f(3) \)
52. \( f(x) = \begin{cases} 
4 - 5x, & x \leq -2 \\
x^2 + 1, & -2 < x < 2 \\
0, & x \geq 2 
\end{cases} \)
   (a) \( f(-3) \)  (b) \( f(4) \)  (c) \( f(-1) \)

In Exercises 53–58, complete the table.

53. \( f(x) = x^2 - 3 \)

\[
\begin{array}{|c|c|c|c|c|}
\hline
x & -2 & -1 & 0 & 1 & 2 \\
\hline
f(x) & & & & & \\
\hline
\end{array}
\]

54. \( g(x) = \sqrt{x - 3} \)

\[
\begin{array}{|c|c|c|c|c|}
\hline
x & 3 & 4 & 5 & 6 & 7 \\
\hline
g(x) & & & & & \\
\hline
\end{array}
\]

55. \( h(t) = \frac{1}{2} |t + 3| \)

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
 t & -5 & -4 & -3 & -2 & -1 \\
\hline
h(t) & & & & & \\
\hline
\end{array}
\]
In Exercises 67–70, find the value(s) of for which

56. \( f(x) = \frac{|x - 2|}{x - 2} \)

\[
\begin{array}{c|ccccc}
  x  & 0 & 1 & \frac{3}{2} & \frac{5}{2} & 4 \\
  f(x) & & & & & \\
\end{array}
\]

57. \( f(x) = \begin{cases} -\frac{1}{2}x + 4, & x \leq 0 \\ (x - 2)^2, & x > 0 \end{cases} \)

\[
\begin{array}{c|ccc}
  x  & -2 & -1 & 0 \\
  f(x) & & & \\
\end{array}
\]

58. \( f(x) = \begin{cases} 9 - x^2, & x < 3 \\ x - 3, & x \geq 3 \end{cases} \)

\[
\begin{array}{c|ccccc}
  x  & 1 & 2 & 3 & 4 & 5 \\
  f(x) & & & & & \\
\end{array}
\]

In Exercises 59–66, find all real values of \( x \) such that \( f(x) = 0 \).

59. \( f(x) = 15 - 3x \)  
60. \( f(x) = 5x + 1 \)

61. \( f(x) = \frac{3x - 4}{5} \)  
62. \( f(x) = \frac{12 - x^2}{5} \)

63. \( f(x) = x^2 - 9 \)  
64. \( f(x) = x^2 - 8x + 15 \)

65. \( f(x) = x^3 - x \)  
66. \( f(x) = x^3 - x^2 - 4x + 4 \)

In Exercises 67–70, find the value(s) of \( x \) for which \( f(x) = g(x) \).

67. \( f(x) = x^2, \quad g(x) = x + 2 \)  
68. \( f(x) = x^2 + 2x + 1, \quad g(x) = 7x - 5 \)

69. \( f(x) = x^4 - 2x^2, \quad g(x) = 2x^2 \)  
70. \( f(x) = \sqrt{x} - 4, \quad g(x) = 2 - x \)

In Exercises 71–82, find the domain of the function.

71. \( f(x) = 5x^2 + 2x - 1 \)  
72. \( g(x) = 1 - 2x^2 \)

73. \( h(t) = \frac{4}{t} \)  
74. \( s(y) = \frac{3y}{y + 5} \)

75. \( g(y) = \sqrt{y - 10} \)  
76. \( f(t) = \frac{\sqrt{t} + 4}{t} \)

77. \( g(x) = \frac{\sqrt{x}}{x} \)  
78. \( h(x) = \frac{\sqrt{x} + 6}{6 + x} \)

79. \( f(s) = \frac{\sqrt{s} - 1}{s} \)  
80. \( f(x) = \frac{\sqrt{x} + 6}{6 + x} \)

81. \( f(x) = \frac{x - 4}{\sqrt{x}} \)  
82. \( f(x) = \frac{x + 2}{\sqrt{x} - 10} \)

In Exercises 83–86, assume that the domain of \( f \) is the set \( A = \{-2, -1, 0, 1, 2\} \). Determine the set of ordered pairs that represents the function \( f \).

83. \( f(x) = x^2 \)  
84. \( f(x) = (x - 3)^2 \)

85. \( f(x) = |x| + 2 \)  
86. \( f(x) = |x + 1| \)

87. GEOMETRY Write the area \( A \) of a square as a function of its perimeter \( P \).

88. GEOMETRY Write the area \( A \) of a circle as a function of its circumference \( C \).

89. MAXIMUM VOLUME An open box of maximum volume is to be made from a square piece of material 24 centimeters on a side by cutting equal squares from the corners and turning up the sides (see figure).

(a) The table shows the volumes \( V \) (in cubic centimeters) of the box for various heights \( x \) (in centimeters). Use the table to estimate the maximum volume.

<table>
<thead>
<tr>
<th>Height, ( x )</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume, ( V )</td>
<td>484</td>
<td>800</td>
<td>972</td>
<td>1024</td>
<td>980</td>
<td>864</td>
</tr>
</tbody>
</table>

(b) Plot the points \((x, V)\) from the table in part (a). Does the relation defined by the ordered pairs represent \( V \) as a function of \( x \)?

(c) If \( V \) is a function of \( x \), write the function and determine its domain.

90. MAXIMUM PROFIT The cost per unit in the production of an MP3 player is $60. The manufacturer charges $90 per unit for orders of 100 or less. To encourage large orders, the manufacturer reduces the charge by $0.15 per MP3 player for each unit ordered in excess of 100 (for example, there would be a charge of $87 per MP3 player for an order size of 120).

(a) The table shows the profits \( P \) (in dollars) for various numbers of units ordered, \( x \). Use the table to estimate the maximum profit.

<table>
<thead>
<tr>
<th>Units, ( x )</th>
<th>110</th>
<th>120</th>
<th>130</th>
<th>140</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profit, ( P )</td>
<td>3135</td>
<td>3240</td>
<td>3315</td>
<td>3360</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Units, ( x )</th>
<th>150</th>
<th>160</th>
<th>170</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profit, ( P )</td>
<td>3375</td>
<td>3360</td>
<td>3315</td>
</tr>
</tbody>
</table>
(b) Plot the points \((x, P)\) from the table in part (a). Does the relation defined by the ordered pairs represent \(P\) as a function of \(x\)?

(c) If \(P\) is a function of \(x\), write the function and determine its domain.

91. GEOMETRY A right triangle is formed in the first quadrant by the \(x\)- and \(y\)-axes and a line through the point \((2, 1)\) (see figure). Write the area \(A\) of the triangle as a function of \(x\), and determine the domain of the function.

92. GEOMETRY A rectangle is bounded by the \(x\)-axis and the semicircle \(y = \sqrt{36 - x^2}\) (see figure). Write the area \(A\) of the rectangle as a function of \(x\), and graphically determine the domain of the function.

93. PATH OF A BALL The height \(y\) (in feet) of a baseball thrown by a child is

\[
y = -\frac{1}{10}x^2 + 3x + 6
\]

where \(x\) is the horizontal distance (in feet) from where the ball was thrown. Will the ball fly over the head of another child 30 feet away trying to catch the ball? (Assume that the child who is trying to catch the ball holds a baseball glove at a height of 5 feet.)

94. PRESCRIPTION DRUGS The numbers \(d\) (in millions) of drug prescriptions filled by independent outlets in the United States from 2000 through 2007 (see figure) can be approximated by the model

\[
d(t) = \begin{cases} 
10.6t + 699, & 0 \leq t \leq 4 \\
15.5t + 637, & 5 \leq t \leq 7 
\end{cases}
\]

where \(t\) represents the year, with \(t = 0\) corresponding to 2000. Use this model to find the number of drug prescriptions filled by independent outlets in each year from 2000 through 2007. (Source: National Association of Chain Drug Stores)

95. MEDIAN SALES PRICE The median sale prices \(p\) (in thousands of dollars) of an existing one-family home in the United States from 1998 through 2007 (see figure) can be approximated by the model

\[
p(t) = \begin{cases} 
1.011t^2 - 12.38t + 170.5, & 8 \leq t \leq 13 \\
-6.950t^2 + 222.55t - 1557.6, & 14 \leq t \leq 17 
\end{cases}
\]

where \(t\) represents the year, with \(t = 8\) corresponding to 1998. Use this model to find the median sale price of an existing one-family home in each year from 1998 through 2007. (Source: National Association of Realtors)

96. POSTAL REGULATIONS A rectangular package to be sent by the U.S. Postal Service can have a maximum combined length and girth (perimeter of a cross section) of 108 inches (see figure).
97. COST, REVENUE, AND PROFIT A company produces a product for which the variable cost is $12.30 per unit and the fixed costs are $98,000. The product sells for $17.98. Let \( x \) be the number of units produced and sold.

(a) The total cost for a business is the sum of the variable cost and the fixed costs. Write the total cost \( C \) as a function of the number of units produced.

(b) Write the revenue \( R \) as a function of the number of units sold.

(c) Write the profit \( P \) as a function of the number of units sold. \( \text{(Note: } P = R - C \text{)} \)

98. AVERAGE COST The inventor of a new game believes that the variable cost for producing the game is $0.95 per unit and the fixed costs are $6000. The inventor sells each game for $1.69. Let \( x \) be the number of games sold.

(a) The total cost for a business is the sum of the variable cost and the fixed costs. Write the total cost \( C \) as a function of the number of games sold.

(b) Write the average cost per unit \( \bar{C} = C/x \) as a function of \( x \).

99. TRANSPORTATION For groups of 80 or more people, a charter bus company determines the rate per person according to the formula

\[
\text{Rate} = 8 - 0.05(n - 80), \quad n \geq 80
\]

where the rate is given in dollars and \( n \) is the number of people.

(a) Write the revenue \( R \) for the bus company as a function of \( n \).

(b) Use the function in part (a) to complete the table. What can you conclude?

<table>
<thead>
<tr>
<th>( n )</th>
<th>90</th>
<th>100</th>
<th>110</th>
<th>120</th>
<th>130</th>
<th>140</th>
<th>150</th>
</tr>
</thead>
<tbody>
<tr>
<td>( R(n) )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

100. PHYSICS The force \( F \) (in tons) of water against the face of a dam is estimated by the function \( F(y) = 149.76\sqrt{10}y^{3/2} \), where \( y \) is the depth of the water (in feet).

(a) Complete the table. What can you conclude from the table?

<table>
<thead>
<tr>
<th>( t )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>( N )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Use the table to approximate the depth at which the force against the dam is 1,000,000 tons.

(c) Find the depth at which the force against the dam is 1,000,000 tons algebraically.
In Exercises 103–110, find the difference quotient and simplify your answer.

103. \( f(x) = x^2 - x + 1, \quad \frac{f(2 + h) - f(2)}{h}, \quad h \neq 0 \)

104. \( f(x) = 5x - x^2, \quad \frac{f(5 + h) - f(5)}{h}, \quad h \neq 0 \)

105. \( f(x) = x^3 + 3x, \quad \frac{f(x + h) - f(x)}{h}, \quad h \neq 0 \)

106. \( f(x) = 4x^2 - 2x, \quad \frac{f(x + h) - f(x)}{h}, \quad h \neq 0 \)

107. \( g(x) = \frac{1}{x^2}, \quad \frac{g(x) - g(3)}{x - 3}, \quad x \neq 3 \)

108. \( f(t) = \frac{1}{t^2}, \quad \frac{f(t) - f(1)}{t - 1}, \quad t \neq 1 \)

109. \( f(x) = \sqrt[3]{5x}, \quad \frac{f(x) - f(5)}{x - 5}, \quad x \neq 5 \)

110. \( f(x) = x^{2/3} + 1, \quad \frac{f(x) - f(8)}{x - 8}, \quad x \neq 8 \)

In Exercises 111–114, match the data with one of the following functions:

\( f(x) = cx, \quad g(x) = cx^2, \quad h(x) = c\sqrt{|x|}, \quad \text{and} \quad r(x) = \frac{c}{x} \)

and determine the value of the constant \( c \) that will make the function fit the data in the table.

111. \[
\begin{array}{cccc}
  x & -4 & -1 & 0 \\
  y & 32 & -2 & -32 \\
\end{array}
\]

112. \[
\begin{array}{cccc}
  x & -4 & -1 & 0 \\
  y & -1 & -\frac{1}{4} & 0 \\
\end{array}
\]

113. \[
\begin{array}{cccc}
  x & -4 & -1 & 0 \\
  y & -8 & -32 & \text{Undefined} \\
\end{array}
\]

EXPLORATION

TRUE OR FALSE? In Exercises 115–118, determine whether the statement is true or false. Justify your answer.

115. Every relation is a function.

116. Every function is a relation.

117. The domain of the function given by \( f(x) = x^4 - 1 \) is \((-\infty, \infty)\) and the range of \( f(x) \) is \((0, \infty)\).

118. The set of ordered pairs \((-8, -2), (-6, 0), (-4, 0), (-2, 2), (0, 4), (2, -2)\) represents a function.

119. THINK ABOUT IT Consider \( f(x) = \sqrt{x - 1} \) and \( g(x) = \frac{1}{\sqrt{x - 1}} \).

Why are the domains of \( f \) and \( g \) different?

120. THINK ABOUT IT Consider \( f(x) = \sqrt{x - 2} \) and \( g(x) = \sqrt{x + 2} \). Why are the domains of \( f \) and \( g \) different?

121. THINK ABOUT IT Given \( f(x) = x^2 \), is \( f \) the independent variable? Why or why not?

122. CAPSTONE

(a) Describe any differences between a relation and a function.

(b) In your own words, explain the meanings of domain and range.

In Exercises 123 and 124, determine whether the statements use the word function in ways that are mathematically correct. Explain your reasoning.

123. (a) The sales tax on a purchased item is a function of the selling price.

(b) Your score on the next algebra exam is a function of the number of hours you study the night before the exam.

124. (a) The amount in your savings account is a function of your salary.

(b) The speed at which a free-falling baseball strikes the ground is a function of the height from which it was dropped.
The Graph of a Function

In Section 1.4, you studied functions from an algebraic point of view. In this section, you will study functions from a graphical perspective.

The graph of a function is the collection of ordered pairs such that is in the domain of . As you study this section, remember that

- is the directed distance from the -axis
- is the directed distance from the -axis

as shown in Figure 1.52.

Finding the Domain and Range of a Function

Use the graph of the function shown in Figure 1.53, to find (a) the domain of (b) the function values and , and (c) the range of .

Solution

a. The closed dot at indicates that is in the domain of whereas the open dot at indicates that is not in the domain. So, the domain of is all in the interval .

b. Because is a point on the graph of , it follows that . Similarly, because is a point on the graph of , it follows that .

c. Because the graph does not extend below or above , the range of is the interval .

Example 1 Finding the Domain and Range of a Function

Use the graph of the function , shown in Figure 1.53, to find (a) the domain of , (b) the function values , and (c) the range of .

Solution

a. The closed dot at indicates that whereas the open dot at indicates that is not in the domain. So, the domain of is all in the interval .

b. Because is a point on the graph of , it follows that . Similarly, because is a point on the graph of , it follows that .

c. Because the graph does not extend below or above , the range of is the interval .

The use of dots (open or closed) at the extreme left and right points of a graph indicates that the graph does not extend beyond these points. If no such dots are shown, assume that the graph extends beyond these points.
By the definition of a function, at most one \( y \)-value corresponds to a given \( x \)-value. This means that the graph of a function cannot have two or more different points with the same \( x \)-coordinate, and no two points on the graph of a function can be vertically above or below each other. It follows, then, that a vertical line can intersect the graph of a function at most once. This observation provides a convenient visual test called the **Vertical Line Test** for functions.

**Vertical Line Test for Functions**

A set of points in a coordinate plane is the graph of \( y \) as a function of \( x \) if and only if no vertical line intersects the graph at more than one point.

**Example 2**  
Vertical Line Test for Functions

Use the Vertical Line Test to decide whether the graphs in Figure 1.54 represent \( y \) as a function of \( x \).

**Solution**

a. This is not a graph of \( y \) as a function of \( x \), because you can find a vertical line that intersects the graph twice. That is, for a particular input \( x \), there is more than one output \( y \).

b. This is a graph of \( y \) as a function of \( x \), because every vertical line intersects the graph at most once. That is, for a particular input \( x \), there is at most one output \( y \).

c. This is a graph of \( y \) as a function of \( x \). (Note that if a vertical line does not intersect the graph, it simply means that the function is undefined for that particular value of \( x \).) That is, for a particular input \( x \), there is at most one output \( y \).

**CHECK POINT**  
Now try Exercise 17.

**TECHNOLOGY**

Most graphing utilities are designed to graph functions of \( x \) more easily than other types of equations. For instance, the graph shown in Figure 1.54(a) represents the equation \( x = (y - 1)^2 = 0 \). To use a graphing utility to duplicate this graph, you must first solve the equation for \( y \) to obtain \( y = 1 \pm \sqrt{x} \), and then graph the two equations \( y_1 = 1 + \sqrt{x} \) and \( y_2 = 1 - \sqrt{x} \) in the same viewing window.
Zeros of a Function

If the graph of a function of \( x \) has an \( x \)-intercept at \( (a, 0) \), then \( a \) is a zero of the function.

Example 3  Finding the Zeros of a Function

Find the zeros of each function.

a. \( f(x) = 3x^2 + x - 10 \)

b. \( g(x) = \sqrt{10 - x^2} \)

c. \( h(t) = \frac{2t - 3}{t + 5} \)

Solution

To find the zeros of a function, set the function equal to zero and solve for the independent variable.

a. \( 3x^2 + x - 10 = 0 \)  
   Set \( f(x) \) equal to 0.  
   \( (3x - 5)(x + 2) = 0 \)  
   Factor.  
   \( 3x - 5 = 0 \)  
   \( x = \frac{5}{3} \)  
   Set 1st factor equal to 0.  
   \( x + 2 = 0 \)  
   \( x = -2 \)  
   Set 2nd factor equal to 0.  
   The zeros of \( f \) are \( x = \frac{5}{3} \) and \( x = -2 \). In Figure 1.55, note that the graph of \( f \) has \( \left(\frac{5}{3}, 0\right) \) and \( (-2, 0) \) as its \( x \)-intercepts.

b. \( \sqrt{10 - x^2} = 0 \)  
   Set \( g(x) \) equal to 0.  
   \( 10 - x^2 = 0 \)  
   Square each side.  
   \( 10 = x^2 \)  
   Add \( x^2 \) to each side.  
   \( \pm \sqrt{10} = x \)  
   Extract square roots.  
   The zeros of \( g \) are \( x = -\sqrt{10} \) and \( x = \sqrt{10} \). In Figure 1.56, note that the graph of \( g \) has \( (-\sqrt{10}, 0) \) and \( (\sqrt{10}, 0) \) as its \( x \)-intercepts.

c. \( h(t) = \frac{2t - 3}{t + 5} \)  
   Set \( h(t) \) equal to 0.  
   \( 2t - 3 = 0 \)  
   Multiply each side by \( t + 5 \).  
   \( 2t = 3 \)  
   Add 3 to each side.  
   \( t = \frac{3}{2} \)  
   Divide each side by 2.  
   The zero of \( h \) is \( t = \frac{3}{2} \). In Figure 1.57, note that the graph of \( h \) has \( \left(\frac{3}{2}, 0\right) \) as its \( t \)-intercept.

CHECKPOINT  Now try Exercise 23.
Increasing and Decreasing Functions

The more you know about the graph of a function, the more you know about the function itself. Consider the graph shown in Figure 1.58. As you move from left to right, this graph falls from $x = -2$ to $x = 0$, is constant from $x = 0$ to $x = 2$, and rises from $x = 2$ to $x = 4$.

Increasing, Decreasing, and Constant Functions

A function $f$ is increasing on an interval if, for any $x_1$ and $x_2$ in the interval, $x_1 < x_2$ implies $f(x_1) < f(x_2)$.

A function $f$ is decreasing on an interval if, for any $x_1$ and $x_2$ in the interval, $x_1 < x_2$ implies $f(x_1) > f(x_2)$.

A function $f$ is constant on an interval if, for any $x_1$ and $x_2$ in the interval, $f(x_1) = f(x_2)$.

Example 4  Increasing and Decreasing Functions

Use the graphs in Figure 1.59 to describe the increasing or decreasing behavior of each function.

Solution

a. This function is increasing over the entire real line.

b. This function is increasing on the interval $(-\infty, -1)$, decreasing on the interval $(-1, 1)$, and increasing on the interval $(1, \infty)$.

c. This function is increasing on the interval $(-\infty, 0)$, constant on the interval $(0, 2)$, and decreasing on the interval $(2, \infty)$.

To help you decide whether a function is increasing, decreasing, or constant on an interval, you can evaluate the function for several values of $x$. However, calculus is needed to determine, for certain, all intervals on which a function is increasing, decreasing, or constant.
The points at which a function changes its increasing, decreasing, or constant behavior are helpful in determining the **relative minimum** or **relative maximum** values of the function.

**Definitions of Relative Minimum and Relative Maximum**

A function value \( f(a) \) is called a **relative minimum** of \( f \) if there exists an interval \((x_1, x_2)\) that contains \( a \) such that

\[
x_1 < x < x_2 \quad \text{implies} \quad f(a) \leq f(x).
\]

A function value \( f(a) \) is called a **relative maximum** of \( f \) if there exists an interval \((x_1, x_2)\) that contains \( a \) such that

\[
x_1 < x < x_2 \quad \text{implies} \quad f(a) \geq f(x).
\]

Figure 1.60 shows several different examples of relative minima and relative maxima. In Section 2.1, you will study a technique for finding the exact point at which a second-degree polynomial function has a relative minimum or relative maximum. For the time being, however, you can use a graphing utility to find reasonable approximations of these points.

**Example 5**  
**Approximating a Relative Minimum**

Use a graphing utility to approximate the relative minimum of the function given by \( f(x) = 3x^2 - 4x - 2 \).

**Solution**

The graph of \( f \) is shown in Figure 1.61. By using the **zoom** and **trace** features or the **minimum** feature of a graphing utility, you can estimate that the function has a relative minimum at the point

\[
(0.67, -3.33). \quad \text{Relative minimum}
\]

Later, in Section 2.1, you will be able to determine that the exact point at which the relative minimum occurs is \( \left( \frac{\pi}{4}, -\frac{\pi^2}{4} \right) \).

**CHECK POINT**  
Now try Exercise 57.

You can also use the **table** feature of a graphing utility to approximate numerically the relative minimum of the function in Example 5. Using a table that begins at 0.6 and increments the value of \( x \) by 0.01, you can approximate that the minimum of \( f(x) = 3x^2 - 4x - 2 \) occurs at the point \( (0.67, -3.33) \).

**TECHNOLOGY**

If you use a graphing utility to estimate the \( x \)- and \( y \)-values of a relative minimum or relative maximum, the **zoom** feature will often produce graphs that are nearly flat. To overcome this problem, you can manually change the vertical setting of the viewing window. The graph will stretch vertically if the values of \( Y_{\text{min}} \) and \( Y_{\text{max}} \) are closer together.
Average Rate of Change

In Section 1.3, you learned that the slope of a line can be interpreted as a rate of change. For a nonlinear graph whose slope changes at each point, the average rate of change between any two points \((x_1, f(x_1))\) and \((x_2, f(x_2))\) is the slope of the line through the two points (see Figure 1.62). The line through the two points is called the secant line, and the slope of this line is denoted as \(m_{sec}\).

\[
\text{Average rate of change of } f \text{ from } x_1 \text{ to } x_2 = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{\text{change in } y}{\text{change in } x} = m_{sec}
\]

**Example 6 Average Rate of Change of a Function**

Find the average rates of change of \(f(x) = x^3 - 3x\) (a) from \(x_1 = -2\) to \(x_2 = 0\) and (b) from \(x_1 = 0\) to \(x_2 = 1\) (see Figure 1.63).

**Solution**

a. The average rate of change of \(f\) from \(x_1 = -2\) to \(x_2 = 0\) is

\[
\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(0) - f(-2)}{0 - (-2)} = \frac{0 - (-2)}{2} = 1.
\]

Secant line has positive slope.

b. The average rate of change of \(f\) from \(x_1 = 0\) to \(x_2 = 1\) is

\[
\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(1) - f(0)}{1 - 0} = \frac{-2 - 0}{1} = -2.
\]

Secant line has negative slope.

**CHECK Point** Now try Exercise 75.

**Example 7 Finding Average Speed**

The distance \(s\) (in feet) a moving car is from a stoplight is given by the function \(s(t) = 20t^{3/2}\), where \(t\) is the time (in seconds). Find the average speed of the car (a) from \(t_1 = 0\) to \(t_2 = 4\) seconds and (b) from \(t_1 = 4\) to \(t_2 = 9\) seconds.

**Solution**

a. The average speed of the car from \(t_1 = 0\) to \(t_2 = 4\) seconds is

\[
\frac{s(t_2) - s(t_1)}{t_2 - t_1} = \frac{s(4) - s(0)}{4 - 0} = \frac{160 - 0}{4} = 40 \text{ feet per second.}
\]

b. The average speed of the car from \(t_1 = 4\) to \(t_2 = 9\) seconds is

\[
\frac{s(t_2) - s(t_1)}{t_2 - t_1} = \frac{s(9) - s(4)}{9 - 4} = \frac{540 - 160}{5} = 76 \text{ feet per second.}
\]

**CHECK Point** Now try Exercise 113.
Even and Odd Functions

In Section 1.2, you studied different types of symmetry of a graph. In the terminology of functions, a function is said to be even if its graph is symmetric with respect to the $y$-axis and to be odd if its graph is symmetric with respect to the origin. The symmetry tests in Section 1.2 yield the following tests for even and odd functions.

**Tests for Even and Odd Functions**

A function $y = f(x)$ is even if, for each $x$ in the domain of $f$,
\[ f(-x) = f(x). \]

A function $y = f(x)$ is odd if, for each $x$ in the domain of $f$,
\[ f(-x) = -f(x). \]

**Example 8 Even and Odd Functions**

a. The function $g(x) = x^3 - x$ is odd because $g(-x) = -g(x)$, as follows.
\[
\begin{align*}
  g(-x) &= (-x)^3 - (-x) \\
  &= -x^3 + x \\
  &= -(x^3 - x) \\
  &= -g(x)
\end{align*}
\]
Substitute $-x$ for $x$.
Simplify.
Distributive Property
Test for odd function

b. The function $h(x) = x^2 + 1$ is even because $h(-x) = h(x)$, as follows.
\[
\begin{align*}
  h(-x) &= (-x)^2 + 1 \\
  &= x^2 + 1 \\
  &= h(x)
\end{align*}
\]
Substitute $-x$ for $x$.
Simplify.
Test for even function

The graphs and symmetry of these two functions are shown in Figure 1.64.

Now try Exercise 83.
VOCABULARY: Fill in the blanks.

1. The graph of a function $f$ is the collection of \((x, f(x))\) such that $x$ is in the domain of $f$.
2. The ______________ ________ is used to determine whether the graph of an equation is a function of $y$ in terms of $x$.
3. The ______________ of a function $f$ are the values of $x$ for which $f(x) = 0$.
4. A function $f$ is ______________ on an interval if, for any $x_1$ and $x_2$ in the interval, $x_1 < x_2$ implies $f(x_1) > f(x_2)$.
5. A function value $f(a)$ is a relative ______________ of $f$ if there exists an interval $(x_1, x_2)$ containing $a$ such that $x_1 < x < x_2$ implies $f(a) \approx f(x)$.
6. The ______________ __________ between any two points $(x_1, f(x_1))$ and $(x_2, f(x_2))$ is the slope of the line through the two points, and this line is called the ______________ line.
7. A function $f$ is ______________ if, for each $x$ in the domain of $f$, $f(-x) = -f(x)$.
8. A function $f$ is ______________ if its graph is symmetric with respect to the y-axis.

SKILLS AND APPLICATIONS

In Exercises 9–12, use the graph of the function to find the domain and range of $f$.

9. ![Graph 9](image9.png)
10. ![Graph 10](image10.png)
11. ![Graph 11](image11.png)
12. ![Graph 12](image12.png)

In Exercises 13–16, use the graph of the function to find the domain and range of $f$ and the indicated function values.

13. (a) $f(-2)$ (b) $f(-1)$ (c) $f\left(\frac{1}{2}\right)$ (d) $f(1)$
14. (a) $f(-1)$ (b) $f(2)$ (c) $f(0)$ (d) $f(1)$

In Exercises 17–22, use the Vertical Line Test to determine whether $y$ is a function of $x$. To print an enlarged copy of the graph, go to the website [www.mathgraphs.com](http://www.mathgraphs.com).

17. $y = \frac{1}{2}x^2$
18. $y = \frac{1}{3}x^3$
19. $x - y^2 = 1$
20. $x^2 + y^2 = 25$
In Exercises 23–32, find the zeros of the function algebraically.

23. \( f(x) = 2x^2 - 7x - 30 \)
24. \( f(x) = 3x^2 + 22x - 16 \)
25. \( f(x) = \frac{x}{9x^2 - 4} \)
26. \( f(x) = \frac{x^2 - 9x + 14}{4x} \)
27. \( f(x) = \frac{1}{2}x^3 - x \)
28. \( f(x) = x^3 - 4x^2 - 9x + 36 \)
29. \( f(x) = 4x^3 - 24x^2 - x + 6 \)
30. \( f(x) = 9x^4 - 25x^2 \)
31. \( f(x) = \sqrt{2x} - 1 \)
32. \( f(x) = \sqrt{3x + 2} \)

In Exercises 33–38, (a) use a graphing utility to graph the function and find the zeros of the function and (b) verify your results from Part (a) algebraically.

33. \( f(x) = 3 + \frac{5}{x} \)
34. \( f(x) = x(x - 7) \)
35. \( f(x) = \sqrt{2x + 11} \)
36. \( f(x) = \sqrt{3x - 14} - 8 \)
37. \( f(x) = \frac{3x - 1}{x - 6} \)
38. \( f(x) = \frac{2x^2 - 9}{3 - x} \)

In Exercises 39–46, determine the intervals over which the function is increasing, decreasing, or constant.

39. \( f(x) = \frac{1}{2}x \)
40. \( f(x) = x^2 - 4x \)
41. \( f(x) = x^3 - 3x^2 + 2 \)
42. \( f(x) = \sqrt{x^2 - 1} \)

In Exercises 47–56, (a) use a graphing utility to graph the function and visually determine the intervals over which the function is increasing, decreasing, or constant, and (b) make a table of values to verify whether the function is increasing, decreasing, or constant over the intervals you identified in Part (a).

43. \( f(x) = |x + 1| + |x - 1| \)
44. \( f(x) = \frac{x^2 + x + 1}{x + 1} \)
45. \( f(x) = \begin{cases} x + 3, & x \leq 0 \\ 3, & 0 < x \leq 2 \\ 2x + 1, & x > 2 \end{cases} \)
46. \( f(x) = \begin{cases} 2x + 1, & x \leq -1 \\ x^2 - 2, & x > -1 \end{cases} \)
47. \( f(x) = 3 \)
48. \( g(x) = x \)
49. \( g(x) = \frac{s^2}{4} \)
50. \( h(x) = x^2 - 4 \)
51. \( f(t) = -t^4 \)
52. \( f(x) = 3x^4 - 6x^2 \)
53. \( f(x) = \sqrt{1 - x} \)
54. \( f(x) = x\sqrt{x + 3} \)
55. \( f(x) = x^{3/2} \)
56. \( f(x) = x^{2/3} \)
In Exercises 57–66, use a graphing utility to graph the function and approximate (to two decimal places) any relative minimum or relative maximum values.

57. \( f(x) = (x - 4)(x + 2) \)  
58. \( f(x) = 3x^2 - 2x - 5 \)  
59. \( f(x) = -x^2 + 3x - 2 \)  
60. \( f(x) = -2x^2 + 9x \)  
61. \( f(x) = x(x - 2)(x + 3) \)  
62. \( f(x) = x^3 - 3x^2 - x + 1 \)  
63. \( g(x) = 2x^3 + 3x^2 - 12x \)  
64. \( h(x) = x^3 - 6x^2 + 15 \)  
65. \( h(x) = (x - 1)^3 \)  
66. \( g(x) = x\sqrt{4 - x} \)

In Exercises 67–74, graph the function and determine the intervals for which \( f(x) \geq 0 \).

67. \( f(x) = 4 - x \)  
68. \( f(x) = 4x + 2 \)  
69. \( f(x) = 9 - x^2 \)  
70. \( f(x) = x^2 - 4x \)  
71. \( f(x) = \sqrt{x} - 1 \)  
72. \( f(x) = \sqrt{x} + 2 \)  
73. \( f(x) = -(1 + |x|) \)  
74. \( f(x) = \frac{1}{2} |2 - |x|| \)

In Exercises 75–82, find the average rate of change of the function from \( x_1 \) to \( x_2 \).

Function  
75. \( f(x) = -2x + 15 \)  
76. \( f(x) = 3x + 8 \)  
77. \( f(x) = x^2 + 12x - 4 \)  
78. \( f(x) = x^2 - 2x + 8 \)  
79. \( f(x) = x^3 - 3x^2 - x \)  
80. \( f(x) = -x^3 + 6x^2 + x \)  
81. \( f(x) = -\sqrt{x - 2} + 5 \)  
82. \( f(x) = -\sqrt{x + 1} + 3 \)

In Exercises 83–90, determine whether the function is even, odd, or neither. Then describe the symmetry.

83. \( f(x) = x^6 - 2x^2 + 3 \)  
84. \( h(x) = x^3 - 5 \)  
85. \( g(x) = x^3 - 5x \)  
86. \( f(t) = t^2 + 2t - 3 \)  
87. \( h(x) = x\sqrt{x + 5} \)  
88. \( f(x) = x\sqrt{1 - x^2} \)  
89. \( f(s) = 4s^{3/2} \)  
90. \( g(s) = 4s^{2/3} \)

In Exercises 91–100, sketch a graph of the function and determine whether it is even, odd, or neither. Verify your answers algebraically.

91. \( f(x) = 5 \)  
92. \( f(x) = -9 \)  
93. \( f(x) = 3x - 2 \)  
94. \( f(x) = 5 - 3x \)  
95. \( h(x) = x^2 - 4 \)  
96. \( f(x) = -x^2 - 8 \)  
97. \( f(x) = \sqrt{1 - x} \)  
98. \( g(t) = \sqrt{t - 1} \)  
99. \( f(x) = |x + 2| \)  
100. \( f(x) = -|x - 5| \)

In Exercises 101–104, write the height \( h \) of the rectangle as a function of \( x \).

101. \( y = -x^2 + 4x - 1 \)
102. \( y = 4x - x^2 \)
103. \( y = 4x - x^2 \)
104. \( y = \frac{2x}{x^2} + \frac{1}{4x} \)

In Exercises 105–108, write the length \( L \) of the rectangle as a function of \( y \).

105. \( y = x^2 + 4 \)
106. \( y = \sqrt{2y} \)
107. \( y = x^2 \)
108. \( y = \frac{2y}{x^2} + \frac{1}{4x} \)

109. **Electronics**  
The number of lumens (time rate of flow of light) \( L \) from a fluorescent lamp can be approximated by the model

\[
L = -0.294x^2 + 97.744x - 664.875, \quad 20 \leq x \leq 90
\]

where \( x \) is the wattage of the lamp.

(a) Use a graphing utility to graph the function.

(b) Use the graph from part (a) to estimate the wattage necessary to obtain 2000 lumens.
110. DATA ANALYSIS: TEMPERATURE  The table shows the temperatures \( y \) (in degrees Fahrenheit) in a certain city over a 24-hour period. Let \( x \) represent the time of day, where \( x = 0 \) corresponds to 6 A.M.

<table>
<thead>
<tr>
<th>Time, ( x )</th>

A model that represents these data is given by
\[ y = 0.026x^3 - 1.03x^2 + 10.2x + 34, \quad 0 \leq x \leq 24. \]

(a) Use a graphing utility to create a scatter plot of the data. Then graph the model in the same viewing window.
(b) How well does the model fit the data?
(c) Use the graph to approximate the times when the temperature was increasing and decreasing.
(d) Use the graph to approximate the maximum and minimum temperatures during this 24-hour period.
(e) Could this model be used to predict the temperatures in the city during the next 24-hour period? Why or why not?

111. COORDINATE AXIS SCALE  Each function described below models the specified data for the years 1998 through 2008, with \( t = 8 \) corresponding to 1998. Estimate a reasonable scale for the vertical axis (e.g., hundreds, thousands, millions, etc.) of the graph and justify your answer. (There are many correct answers.)

(a) \( f(t) \) represents the average salary of college professors.
(b) \( f(t) \) represents the U.S. population.
(c) \( f(t) \) represents the percent of the civilian work force that is unemployed.

112. GEOMETRY  Corners of equal size are cut from a square with sides of length 8 meters (see figure).

(a) Write the area \( A \) of the resulting figure as a function of \( x \). Determine the domain of the function.
(b) Use a graphing utility to graph the area function over its domain. Use the graph to find the range of the function.
(c) Identify the figure that would result if \( x \) were chosen to be the maximum value in the domain of the function. What would be the length of each side of the figure?

113. ENROLLMENT RATE  The enrollment rates \( r \) of children in preschool in the United States from 1970 through 2005 can be approximated by the model
\[ r = -0.021t^2 + 1.44t + 39.3, \quad 0 \leq t \leq 35 \]
where \( t \) represents the year, with \( t = 0 \) corresponding to 1970. (Source: U.S. Census Bureau)

(a) Use a graphing utility to graph the model.
(b) Find the average rate of change of the model from 1970 through 2005. Interpret your answer in the context of the problem.

114. VEHICLE TECHNOLOGY SALES  The estimated revenues \( r \) (in millions of dollars) from sales of in-vehicle technologies in the United States from 2003 through 2008 can be approximated by the model
\[ r = 157.30t^2 - 397.4t + 6114, \quad 3 \leq t \leq 8 \]
where \( t \) represents the year, with \( t = 3 \) corresponding to 2003. (Source: Consumer Electronics Association)

(a) Use a graphing utility to graph the model.
(b) Find the average rate of change of the model from 2003 through 2008. Interpret your answer in the context of the problem.

PHYSICS  In Exercises 115–120, (a) use the position equation \( s = -16t^2 + v_0t + s_0 \) to write a function that represents the situation, (b) use a graphing utility to graph the function, (c) find the average rate of change of the function from \( t_1 \) to \( t_2 \), (d) describe the slope of the secant line through \( t_1 \) and \( t_2 \), (e) find the equation of the secant line through \( t_1 \) and \( t_2 \), and (f) graph the secant line in the same viewing window as your position function.
115. An object is thrown upward from a height of 6 feet at a velocity of 64 feet per second.
   \[ t_1 = 0, \ t_2 = 3 \]
116. An object is thrown upward from a height of 6.5 feet at a velocity of 72 feet per second.
   \[ t_1 = 0, \ t_2 = 4 \]
117. An object is thrown upward from ground level at a velocity of 120 feet per second.
   \[ t_1 = 3, \ t_2 = 5 \]
118. An object is thrown upward from ground level at a velocity of 96 feet per second.
   \[ t_1 = 2, \ t_2 = 5 \]
119. An object is dropped from a height of 120 feet.
   \[ t_1 = 0, \ t_2 = 2 \]
120. An object is dropped from a height of 80 feet.
   \[ t_1 = 1, \ t_2 = 2 \]

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 121 and 122, determine whether the statement is true or false. Justify your answer.

121. A function with a square root cannot have a domain that is the set of real numbers.
122. It is possible for an odd function to have the interval \([0, \infty)\) as its domain.

123. If \(f\) is an even function, determine whether \(g\) is even, odd, or neither. Explain.
   (a) \(g(x) = -f(x)\)  \hspace{1cm} (b) \(g(x) = f(-x)\)
   (c) \(g(x) = f(x) - 2\)  \hspace{1cm} (d) \(g(x) = f(x - 2)\)

124. **THINK ABOUT IT** Does the graph in Exercise 19 represent \(x\) as a function of \(y\)? Explain.

**THINK ABOUT IT** In Exercises 125–130, find the coordinates of a second point on the graph of a function \(f\) if the given point is on the graph and the function is (a) even and (b) odd.

125. \((-\frac{3}{2}, 4)\)  \hspace{1cm} 126. \((-\frac{3}{2}, -7)\)
127. \((4, 9)\)  \hspace{1cm} 128. \((5, -1)\)
129. \((x, -y)\)  \hspace{1cm} 130. \((2a, 2c)\)

131. **WRITING** Use a graphing utility to graph each function. Write a paragraph describing any similarities and differences you observe among the graphs.
   (a) \(y = x\)  \hspace{1cm} (b) \(y = x^2\)  \hspace{1cm} (c) \(y = x^3\)
   (d) \(y = x^4\)  \hspace{1cm} (e) \(y = x^5\)  \hspace{1cm} (f) \(y = x^6\)

132. **CONJECTURE** Use the results of Exercise 131 to make a conjecture about the graphs of \(y = x^7\) and \(y = x^8\). Use a graphing utility to graph the functions and compare the results with your conjecture.

133. Use the information in Example 7 to find the average speed of the car from \(t_1 = 0\) to \(t_2 = 9\) seconds. Explain why the result is less than the value obtained in part (b) of Example 7.

134. Graph each of the functions with a graphing utility. Determine whether the function is even, odd, or neither.
   \(f(x) = x^2 - x^4\)
   \(g(x) = 2x^3 + 1\)
   \(h(x) = x^5 - 2x^3 + x\)
   \(j(x) = 2 - x^6 - x^8\)
   \(k(x) = x^5 - 2x^4 + x - 2\)
   \(p(x) = x^9 + 3x^5 - x^3 + x\)

What do you notice about the equations of functions that are odd? What do you notice about the equations of functions that are even? Can you describe a way to identify a function as odd or even by inspecting the equation? Can you describe a way to identify a function as neither odd nor even by inspecting the equation?

135. **WRITING** Write a short paragraph describing three different functions that represent the behaviors of quantities between 1998 and 2009. Describe one quantity that decreased during this time, one that increased, and one that was constant. Present your results graphically.

136. **CAPSTONE** Use the graph of the function to answer (a)–(e).
   \(y = f(x)\)
   
   (a) Find the domain and range of \(f\).
   (b) Find the zero(s) of \(f\).
   (c) Determine the intervals over which \(f\) is increasing, decreasing, or constant.
   (d) Approximate any relative minimum or relative maximum values of \(f\).
   (e) Is \(f\) even, odd, or neither?
Linear and Squaring Functions

One of the goals of this text is to enable you to recognize the basic shapes of the graphs of different types of functions. For instance, you know that the graph of the linear function \( f(x) = ax + b \) is a line with slope \( m = a \) and \( y \)-intercept at \((0, b)\). The graph of the linear function has the following characteristics.

- The domain of the function is the set of all real numbers.
- The range of the function is the set of all real numbers.
- The graph has an \( x \)-intercept of \(-\frac{b}{m}\) and a \( y \)-intercept of \((0, b)\).
- The graph is increasing if \( m > 0 \), decreasing if \( m < 0 \), and constant if \( m = 0 \).

**Example 1** Writing a Linear Function

Write the linear function \( f \) for which \( f(1) = 3 \) and \( f(4) = 0 \).

**Solution**

To find the equation of the line that passes through \((x_1, y_1) = (1, 3)\) and \((x_2, y_2) = (4, 0)\), first find the slope of the line.

\[
m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{0 - 3}{4 - 1} = -\frac{3}{3} = -1
\]

Next, use the point-slope form of the equation of a line.

\[
y - y_1 = m(x - x_1) \quad \text{Point-slope form}
\]

\[
y - 3 = -1(x - 1) \quad \text{Substitute for } x_1, y_1, \text{ and } m.
\]

\[
y = -x + 4 \quad \text{Simplify.}
\]

\[
f(x) = -x + 4 \quad \text{Function notation}
\]

The graph of this function is shown in Figure 1.65.

![Figure 1.65](image-url)
There are two special types of linear functions, the constant function and the identity function. A constant function has the form

\[ f(x) = c \]

and has the domain of all real numbers with a range consisting of a single real number \( c \). The graph of a constant function is a horizontal line, as shown in Figure 1.66. The identity function has the form

\[ f(x) = x. \]

Its domain and range are the set of all real numbers. The identity function has a slope of \( m = 1 \) and a \( y \)-intercept at \((0, 0)\). The graph of the identity function is a line for which each \( x \)-coordinate equals the corresponding \( y \)-coordinate. The graph is always increasing, as shown in Figure 1.67.

The graph of the squaring function

\[ f(x) = x^2 \]

is a U-shaped curve with the following characteristics.

- The domain of the function is the set of all real numbers.
- The range of the function is the set of all nonnegative real numbers.
- The function is even.
- The graph has an intercept at \((0, 0)\).
- The graph is decreasing on the interval \((-\infty, 0)\) and increasing on the interval \((0, \infty)\).
- The graph is symmetric with respect to the \( y \)-axis.
- The graph has a relative minimum at \((0, 0)\).

The graph of the squaring function is shown in Figure 1.68.
Cubic, Square Root, and Reciprocal Functions

The basic characteristics of the graphs of the cubic, square root, and reciprocal functions are summarized below.

1. The graph of the cubic function \( f(x) = x^3 \) has the following characteristics.
   - The domain of the function is the set of all real numbers.
   - The range of the function is the set of all real numbers.
   - The function is odd.
   - The graph has an intercept at \((0, 0)\).
   - The graph is increasing on the interval \((-\infty, \infty)\).
   - The graph is symmetric with respect to the origin.

   The graph of the cubic function is shown in Figure 1.69.

2. The graph of the square root function \( f(x) = \sqrt{x} \) has the following characteristics.
   - The domain of the function is the set of all nonnegative real numbers.
   - The range of the function is the set of all nonnegative real numbers.
   - The graph has an intercept at \((0, 0)\).
   - The graph is increasing on the interval \((0, \infty)\).

   The graph of the square root function is shown in Figure 1.70.

3. The graph of the reciprocal function \( f(x) = \frac{1}{x} \) has the following characteristics.
   - The domain of the function is \((-\infty, 0) \cup (0, \infty)\).
   - The range of the function is \((-\infty, 0) \cup (0, \infty)\).
   - The function is odd.
   - The graph does not have any intercepts.
   - The graph is decreasing on the intervals \((-\infty, 0)\) and \((0, \infty)\).
   - The graph is symmetric with respect to the origin.

   The graph of the reciprocal function is shown in Figure 1.71.
Step and Piecewise-Defined Functions

Functions whose graphs resemble sets of stairsteps are known as step functions. The most famous of the step functions is the greatest integer function, which is denoted by \([x]\) and defined as

\[ f(x) = [x] = \text{the greatest integer less than or equal to } x. \]

Some values of the greatest integer function are as follows.

\[
\begin{align*}
[-1] &= \text{(greatest integer } \leq -1) = -1 \\
[-1.5] &= \text{(greatest integer } \leq -1.5) = -2 \\
\lfloor \frac{1}{10} \rfloor &= \text{(greatest integer } \leq \frac{1}{10}) = 0 \\
\lfloor 1.5 \rfloor &= \text{(greatest integer } \leq 1.5) = 1
\end{align*}
\]

The graph of the greatest integer function

\[ f(x) = [x] \]

has the following characteristics, as shown in Figure 1.72.

- The domain of the function is the set of all real numbers.
- The range of the function is the set of all integers.
- The graph has a y-intercept at (0, 0) and x-intercepts in the interval \([0, 1)\).
- The graph is constant between each pair of consecutive integers.
- The graph jumps vertically one unit at each integer value.

### Example 2 Evaluating a Step Function

Evaluate the function when \(x = -1, 2, \) and \(\frac{3}{2}\).

\[ f(x) = [x] + 1 \]

**Solution**

For \(x = -1\), the greatest integer \(\leq -1\) is \(-1\), so

\[ f(-1) = [-1] + 1 = -1 + 1 = 0. \]

For \(x = 2\), the greatest integer \(\leq 2\) is 2, so

\[ f(2) = [2] + 1 = 2 + 1 = 3. \]

For \(x = \frac{3}{2}\), the greatest integer \(\leq \frac{3}{2}\) is 1, so

\[ f\left(\frac{3}{2}\right) = [1] + 1 = 1 + 1 = 2. \]

You can verify your answers by examining the graph of \(f(x) = [x] + 1\) shown in Figure 1.73.

Recall from Section 1.4 that a piecewise-defined function is defined by two or more equations over a specified domain. To graph a piecewise-defined function, graph each equation separately over the specified domain, as shown in Example 3.
**Example 3**  Graphing a Piecewise-Defined Function

Sketch the graph of

\[ f(x) = \begin{cases} 
2x + 3, & x \leq 1 \\
-x + 4, & x > 1
\end{cases} \]

**Solution**

This piecewise-defined function is composed of two linear functions. At \( x = 1 \) and to the left of \( x = 1 \) the graph is the line \( y = 2x + 3 \), and to the right of \( x = 1 \) the graph is the line \( y = -x + 4 \), as shown in Figure 1.74. Notice that the point \((1,5)\) is a solid dot and the point \((1,3)\) is an open dot. This is because \( f(1) = 2(1) + 3 = 5 \).

**Checkpoint**  Now try Exercise 57.

**Parent Functions**

The eight graphs shown in Figure 1.75 represent the most commonly used functions in algebra. Familiarity with the basic characteristics of these simple graphs will help you analyze the shapes of more complicated graphs—in particular, graphs obtained from these graphs by the rigid and nonrigid transformations studied in the next section.
1.6 EXERCISES

VOCABULARY

In Exercises 1–9, match each function with its name.

1. \( f(x) = |x| \)
2. \( f(x) = x \)
3. \( f(x) = 1/x \)
4. \( f(x) = x^2 \)
5. \( f(x) = \sqrt{x} \)
6. \( f(x) = c \)
7. \( f(x) = |x| \)
8. \( f(x) = x^3 \)
   (a) squaring function
   (b) square root function
   (c) cubic function
   (d) linear function
   (e) constant function
   (f) absolute value function
   (g) greatest integer function
   (h) reciprocal function
   (i) identity function

10. Fill in the blank: The constant function and the identity function are two special types of ________ functions.

SKILLS AND APPLICATIONS

In Exercises 11–18, (a) write the linear function \( f \) such that it has the indicated function values and (b) sketch the graph of the function.

11. \( f(1) = 4, f(0) = 6 \)
12. \( f(-3) = -8, f(1) = 2 \)
13. \( f(5) = -4, f(-2) = 17 \)
14. \( f(3) = 9, f(-1) = -11 \)
15. \( f(-5) = -1, f(5) = -1 \)
16. \( f(-10) = 12, f(16) = -1 \)
17. \( f(\frac{1}{2}) = -6, f(4) = -3 \)
18. \( f(\frac{3}{2}) = -\frac{1}{2}, f(-4) = -11 \)

In Exercises 19–42, use a graphing utility to graph the function. Be sure to choose an appropriate viewing window.

19. \( f(x) = 0.8 - x \)
20. \( f(x) = 2.5x - 4.25 \)
21. \( f(x) = -\frac{1}{6}x - \frac{5}{2} \)
22. \( f(x) = \frac{5}{6} - \frac{3}{2}x \)
23. \( g(x) = -2x^2 \)
24. \( h(x) = 1.5 - x^2 \)
25. \( f(x) = 3x^2 - 1.75 \)
26. \( f(x) = 0.5x^2 + 2 \)
27. \( f(x) = x^3 - 1 \)
28. \( f(x) = 8 - x^3 \)
29. \( f(x) = (x - 1)^3 + 2 \)
30. \( g(x) = 2(x + 3)^3 + 1 \)
31. \( f(x) = 4\sqrt{x} \)
32. \( f(x) = 4 - 2\sqrt{x} \)
33. \( g(x) = 2 - \sqrt{x + 4} \)
34. \( h(x) = \sqrt{x + 2} + 3 \)
35. \( f(x) = -1/x \)
36. \( f(x) = 4 + (1/x) \)
37. \( h(x) = 1/(x + 2) \)
38. \( k(x) = 1/(x - 3) \)
39. \( g(x) = |x| - 5 \)
40. \( h(x) = 3 - |x| \)
41. \( f(x) = |x + 4| \)
42. \( f(x) = |x - 1| \)

In Exercises 43–50, evaluate the function for the indicated values.

43. \( f(x) = \lfloor x \rfloor \)
   (a) \( f(2.1) \)
   (b) \( f(2.9) \)
   (c) \( f(-3.1) \)
   (d) \( f(\frac{4}{3}) \)
44. \( g(x) = \lfloor 2x \rfloor \)
   (a) \( g(-3) \)
   (b) \( g(0.25) \)
   (c) \( g(9.5) \)
   (d) \( g(\frac{11}{3}) \)

45. \( h(x) = \lfloor x + 3 \rfloor \)
   (a) \( h(-2) \)
   (b) \( h(\frac{1}{2}) \)
   (c) \( h(4.2) \)
   (d) \( h(-21.6) \)
46. \( f(x) = \lfloor x \rfloor + 7 \)
   (a) \( f(0) \)
   (b) \( f(-1.5) \)
   (c) \( f(6) \)
   (d) \( f(\frac{4}{3}) \)
47. \( h(x) = \lfloor 3x - 1 \rfloor \)
   (a) \( h(2.5) \)
   (b) \( h(-3.2) \)
   (c) \( h(\frac{7}{2}) \)
   (d) \( h(-\frac{21}{4}) \)
48. \( k(x) = \lfloor \frac{1}{2}x + 6 \rfloor \)
   (a) \( k(5) \)
   (b) \( k(-6.1) \)
   (c) \( k(0.1) \)
   (d) \( k(15) \)
49. \( g(x) = \lfloor 3x - 2 \rfloor + 5 \)
   (a) \( g(-2.7) \)
   (b) \( g(-1) \)
   (c) \( g(0.8) \)
   (d) \( g(14.5) \)
50. \( g(x) = -\lfloor x + 4 \rfloor + 6 \)
   (a) \( g(\frac{1}{3}) \)
   (b) \( g(9) \)
   (c) \( g(-4) \)
   (d) \( g(\frac{1}{2}) \)

In Exercises 51–56, sketch the graph of the function.

51. \( g(x) = -\lfloor x \rfloor \)
52. \( g(x) = 4\lfloor x \rfloor \)
53. \( g(x) = \lfloor x \rfloor - 2 \)
54. \( g(x) = \lfloor x \rfloor - 1 \)
55. \( g(x) = \lfloor x + 1 \rfloor \)
56. \( g(x) = \lfloor x - 3 \rfloor \)

In Exercises 57–64, graph the function.

57. \( f(x) = \begin{cases} 
2x + 3, & x < 0 \\
3 - x, & x \geq 0
\end{cases} \)
58. \( g(x) = \begin{cases} 
x + 6, & x \leq -4 \\
\frac{1}{2}x - 4, & x > -4
\end{cases} \)
59. \( f(x) = \begin{cases} 
\sqrt{4 + x}, & x < 0 \\
\sqrt{4 - x}, & x \geq 0
\end{cases} \)
60. \( f(x) = \begin{cases} 
1 - (x - 1)^2, & x \leq 2 \\
\sqrt{x - 2}, & x > 2
\end{cases} \)
61. \( f(x) = \begin{cases} 
x^2 + 5, & x \leq 1 \\
-x^2 + 4x + 3, & x > 1
\end{cases} \)

62. \( h(x) = \begin{cases} 
3 - x^2, & x < 0 \\
1 - x^2, & x \geq 0 
\end{cases} \)

63. \( h(x) = \begin{cases} 
3 + x, & -2 \leq x < 0 \\
x^2 + 1, & x \geq 0 
\end{cases} \)

64. \( k(x) = \begin{cases} 
2x + 1, & x \leq -1 \\
x^2 - 1, & -1 < x \leq 1 \\
1 - x^2, & x > 1 
\end{cases} \)

In Exercises 65–68, (a) use a graphing utility to graph the function, (b) state the domain and range of the function, and (c) describe the pattern of the graph.

65. \( s(x) = 2\left(\frac{1}{2}x - \left\lfloor \frac{1}{2}x \right\rfloor\right) \) 66. \( g(x) = 2\left(\frac{1}{2}x - \left\lfloor \frac{1}{2}x \right\rfloor\right)^2 \)

67. \( h(x) = 4\left(\frac{1}{2}x - \left\lfloor \frac{1}{2}x \right\rfloor\right) \) 68. \( k(x) = 4\left(\frac{1}{2}x - \left\lfloor \frac{1}{2}x \right\rfloor\right)^2 \)

69. DELIVERY CHARGES The cost of sending an overnight package from Los Angeles to Miami is $23.40 for a package weighing up to but not including 1 pound and $3.75 for each additional pound or portion of a pound. A model for the total cost \( C \) (in dollars) of sending the package is \( C = 23.40 + 3.75\left\lfloor x \right\rfloor, \) where \( x \) is the weight in pounds.

(a) Sketch a graph of the model.

(b) Determine the cost of sending a package that weighs 9.25 pounds.

70. DELIVERY CHARGES The cost of sending an overnight package from New York to Atlanta is $22.65 for a package weighing up to but not including 1 pound and $3.70 for each additional pound or portion of a pound.

(a) Use the greatest integer function to create a model for the cost \( C \) of overnight delivery of a package weighing \( x \) pounds, \( x > 0. \)

(b) Sketch the graph of the function.

71. WAGES A mechanic is paid $14.00 per hour for regular time and time-and-a-half for overtime. The weekly wage function is given by

\[ W(h) = \begin{cases} 
14h, & 0 < h \leq 40 \\
21(h - 40) + 560, & h > 40 
\end{cases} \]

where \( h \) is the number of hours worked in a week.

(a) Evaluate \( W(30), W(40), W(45), \) and \( W(50). \)

(b) The company increased the regular work week to 45 hours. What is the new weekly wage function?

72. SNOWSTORM During a nine-hour snowstorm, it snows at a rate of 1 inch per hour for the first 2 hours, at a rate of 2 inches per hour for the next 6 hours, and at a rate of 0.5 inch per hour for the final hour. Write and graph a piecewise-defined function that gives the depth of the snow during the snowstorm. How many inches of snow accumulated from the storm?

73. REVENUE The table shows the monthly revenue \( y \) (in thousands of dollars) of a landscaping business for each month of the year 2008, with \( x = 1 \) representing January.

<table>
<thead>
<tr>
<th>Month, ( x )</th>
<th>Revenue, ( y )</th>

</tbody>
</table>

A mathematical model that represents these data is

\[ f(x) = \begin{cases} 
-1.97x + 26.3, & 0 < x \leq 40 \\
0.505x^2 - 1.47x + 6.3, & x > 40 
\end{cases} \]

(a) Use a graphing utility to graph the model. What is the domain of each part of the piecewise-defined function? How can you tell? Explain your reasoning.

(b) Find \( f(5) \) and \( f(11), \) and interpret your results in the context of the problem.

(c) How do the values obtained from the model in part (a) compare with the actual data values?

EXPLORATION

TRUE OR FALSE? In Exercises 74 and 75, determine whether the statement is true or false. Justify your answer.

74. A piecewise-defined function will always have at least one \( x \)-intercept or at least one \( y \)-intercept.

75. A linear equation will always have an \( x \)-intercept and a \( y \)-intercept.

76. CAPSTONE For each graph of \( f \) shown in Figure 1.75, do the following.

(a) Find the domain and range of \( f. \)

(b) Find the \( x \)- and \( y \)-intercepts of the graph of \( f. \)

(c) Determine the intervals over which \( f \) is increasing, decreasing, or constant.

(d) Determine whether \( f \) is even, odd, or neither. Then describe the symmetry.
Section 1.7 Transformations of Functions

1.7 TRANSFORMATIONS OF FUNCTIONS

What you should learn
• Use vertical and horizontal shifts to sketch graphs of functions.
• Use reflections to sketch graphs of functions.
• Use nonrigid transformations to sketch graphs of functions.

Why you should learn it
Transformations of functions can be used to model real-life applications. For instance, Exercise 79 on page 81 shows how a transformation of a function can be used to model the total numbers of miles driven by vans, pickups, and sport utility vehicles in the United States.

WARNING / CAUTION
In items 3 and 4, be sure you see that $h(x) = f(x - c)$ corresponds to a right shift and $h(x) = f(x + c)$ corresponds to a left shift for $c > 0$.

Shifting Graphs
Many functions have graphs that are simple transformations of the parent graphs summarized in Section 1.6. For example, you can obtain the graph of

$h(x) = x^2 + 2$

by shifting the graph of $f(x) = x^2$ upward two units, as shown in Figure 1.76. In function notation, $h$ and $f$ are related as follows.

$h(x) = x^2 + 2 = f(x) + 2$  Upward shift of two units

Similarly, you can obtain the graph of

$g(x) = (x - 2)^2$

by shifting the graph of $f(x) = x^2$ to the right two units, as shown in Figure 1.77. In this case, the functions $g$ and $f$ have the following relationship.

$g(x) = (x - 2)^2 = f(x - 2)$  Right shift of two units

The following list summarizes this discussion about horizontal and vertical shifts.

Vertical and Horizontal Shifts
Let $c$ be a positive real number. Vertical and horizontal shifts in the graph of $y = f(x)$ are represented as follows.

1. Vertical shift $c$ units upward: $h(x) = f(x) + c$
2. Vertical shift $c$ units downward: $h(x) = f(x) - c$
3. Horizontal shift $c$ units to the right: $h(x) = f(x - c)$
4. Horizontal shift $c$ units to the left: $h(x) = f(x + c)$
Some graphs can be obtained from combinations of vertical and horizontal shifts, as demonstrated in Example 1(b). Vertical and horizontal shifts generate a family of functions, each with the same shape but at different locations in the plane.

**Example 1 Shifts in the Graphs of a Function**

Use the graph of \( f(x) = x^3 \) to sketch the graph of each function.

a. \( g(x) = x^3 - 1 \)  
   b. \( h(x) = (x + 2)^3 + 1 \)

**Solution**

a. Relative to the graph of \( f(x) = x^3 \), the graph of \( g(x) = x^3 - 1 \) is a downward shift of one unit, as shown in Figure 1.78.

![Figure 1.78](image)

b. Relative to the graph of \( f(x) = x^3 \), the graph of \( h(x) = (x + 2)^3 + 1 \) involves a left shift of two units and an upward shift of one unit, as shown in Figure 1.79.

![Figure 1.79](image)

**Study Tip**

In Example 1(a), note that \( g(x) = f(x) - 1 \) and that in Example 1(b), \( h(x) = f(x + 2) + 1 \).

**CHECKPOINT** Now try Exercise 7.

In Figure 1.79, notice that the same result is obtained if the vertical shift precedes the horizontal shift or if the horizontal shift precedes the vertical shift.
Reflecting Graphs

The second common type of transformation is a reflection. For instance, if you consider the $x$-axis to be a mirror, the graph of

$$h(x) = -x^2$$

is the mirror image (or reflection) of the graph of

$$f(x) = x^2,$$

as shown in Figure 1.80.

Reflections in the Coordinate Axes

Reflections in the coordinate axes of the graph of $y = f(x)$ are represented as follows.

1. Reflection in the $x$-axis: $h(x) = -f(x)$
2. Reflection in the $y$-axis: $h(x) = f(-x)$

Example 2 Finding Equations from Graphs

The graph of the function given by

$$f(x) = x^4$$

is shown in Figure 1.81. Each of the graphs in Figure 1.82 is a transformation of the graph of $f$. Find an equation for each of these functions.

Solution

a. The graph of $g$ is a reflection in the $x$-axis followed by an upward shift of two units of the graph of $f(x) = x^4$. So, the equation for $g$ is

$$g(x) = -x^4 + 2.$$  

b. The graph of $h$ is a horizontal shift of three units to the right followed by a reflection in the $x$-axis of the graph of $f(x) = x^4$. So, the equation for $h$ is

$$h(x) = -(x - 3)^4.$$  

CHECKPOINT Now try Exercise 15.
Chapter 1 Functions and Their Graphs

Example 3 Reflections and Shifts

Compare the graph of each function with the graph of \( f(x) = \sqrt{x} \).

a. \( g(x) = -\sqrt{x} \)  
   b. \( h(x) = \sqrt{-x} \)  
   c. \( k(x) = -\sqrt{x + 2} \)

Algebraic Solution

a. The graph of \( g \) is a reflection of the graph of \( f \) in the \( x \)-axis because
   \[ g(x) = -\sqrt{x} = -f(x). \]

b. The graph of \( h \) is a reflection of the graph of \( f \) in the \( y \)-axis because
   \[ h(x) = \sqrt{-x} = f(-x). \]

c. The graph of \( k \) is a left shift of two units followed by a reflection in the \( x \)-axis because
   \[ k(x) = -\sqrt{x + 2} = -f(x + 2). \]

Graphical Solution

a. Graph \( f \) and \( g \) on the same set of coordinate axes. From the graph in Figure 1.83, you can see that the graph of \( g \) is a reflection of the graph of \( f \) in the \( x \)-axis.

b. Graph \( f \) and \( h \) on the same set of coordinate axes. From the graph in Figure 1.84, you can see that the graph of \( h \) is a reflection of the graph of \( f \) in the \( y \)-axis.

c. Graph \( f \) and \( k \) on the same set of coordinate axes. From the graph in Figure 1.85, you can see that the graph of \( k \) is a left shift of two units of the graph of \( f \), followed by a reflection in the \( x \)-axis.

When sketching the graphs of functions involving square roots, remember that the domain must be restricted to exclude negative numbers inside the radical. For instance, here are the domains of the functions in Example 3.

Domain of \( g(x) = -\sqrt{x} \): \( x \geq 0 \)
Domain of \( h(x) = \sqrt{-x} \): \( x \leq 0 \)
Domain of \( k(x) = -\sqrt{x + 2} \): \( x \geq -2 \)
Nonrigid Transformations

Horizontal shifts, vertical shifts, and reflections are **rigid transformations** because the basic shape of the graph is unchanged. These transformations change only the position of the graph in the coordinate plane. **Nonrigid transformations** are those that cause a distortion—a change in the shape of the original graph. For instance, a nonrigid transformation of the graph of $y = f(x)$ is represented by $g(x) = cf(x)$, where the transformation is a **vertical stretch** if $c > 1$ and a **vertical shrink** if $0 < c < 1$. Another nonrigid transformation of the graph of $y = f(x)$ is represented by $h(x) = f(cx)$, where the transformation is a **horizontal shrink** if $c > 1$ and a **horizontal stretch** if $0 < c < 1$.

**Example 4**  
**Nonrigid Transformations**

Compare the graph of each function with the graph of $f(x) = |x|$.

a. $h(x) = 3|x|$  
b. $g(x) = \frac{1}{3}|x|$

**Solution**

a. Relative to the graph of $f(x) = |x|$, the graph of $h(x) = 3|x| = 3f(x)$ is a vertical stretch (each y-value is multiplied by 3) of the graph of $f$. (See Figure 1.86.)

b. Similarly, the graph of $g(x) = \frac{1}{3}|x| = \frac{1}{3}f(x)$ is a vertical shrink (each y-value is multiplied by $\frac{1}{3}$) of the graph of $f$. (See Figure 1.87.)

**Example 5**  
**Nonrigid Transformations**

Compare the graph of each function with the graph of $f(x) = 2 - x^3$.

a. $g(x) = f(2x)$  
b. $h(x) = f(\frac{1}{2}x)$

**Solution**

a. Relative to the graph of $f(x) = 2 - x^3$, the graph of $g(x) = f(2x) = 2 - (2x)^3 = 2 - 8x^3$ is a horizontal shrink ($c > 1$) of the graph of $f$. (See Figure 1.88.)

b. Similarly, the graph of $h(x) = f(\frac{1}{2}x) = 2 - (\frac{1}{2}x)^3 = 2 - \frac{1}{8}x^3$ is a horizontal stretch ($0 < c < 1$) of the graph of $f$. (See Figure 1.89.)

**CHECK Point**  
Now try Exercise 29.
1.7 EXERCISES

VOCABULARY
In Exercises 1–5, fill in the blanks.

1. Horizontal shifts, vertical shifts, and reflections are called ______ transformations.

2. A reflection in the x-axis of \( y = f(x) \) is represented by \( h(x) = \ldots \), while a reflection in the y-axis of \( y = f(x) \) is represented by \( h(x) = \ldots \).

3. Transformations that cause a distortion in the shape of the graph of \( y = f(x) \) are called ______ transformations.

4. A nonrigid transformation of \( y = f(x) \) represented by \( h(x) = \ldots f(cx) \) is a ______ ______ if \( c > 1 \) and a ______ ______ if \( 0 < c < 1 \).

5. A nonrigid transformation of \( y = f(x) \) represented by \( g(x) = \ldots f(x) \) is a ______ ______ if \( c > 1 \) and a ______ ______ if \( 0 < c < 1 \).

6. Match the rigid transformation of \( y = f(x) \) with the correct representation of the graph of \( h \), where \( c > 0 \).

(a) \( h(x) = f(x) + c \) (i) A horizontal shift of \( f, c \) units to the right
(b) \( h(x) = f(x) - c \) (ii) A vertical shift of \( f, c \) units downward
(c) \( h(x) = f(x + c) \) (iii) A horizontal shift of \( f, c \) units to the left
(d) \( h(x) = f(x - c) \) (iv) A vertical shift of \( f, c \) units upward

SKILLS AND APPLICATIONS

7. For each function, sketch (on the same set of coordinate axes) a graph of each function for \( c = -1, 1, \) and 3.

(a) \( f(x) = |x| + c \)
(b) \( f(x) = |x - c| \)
(c) \( f(x) = |x + 4| + c \)

8. For each function, sketch (on the same set of coordinate axes) a graph of each function for \( c = -3, -1, 1, \) and 3.

(a) \( f(x) = \sqrt{x} + c \)
(b) \( f(x) = \sqrt{x - c} \)
(c) \( f(x) = \sqrt{x - 3} + c \)

9. For each function, sketch (on the same set of coordinate axes) a graph of each function for \( c = -2, 0, \) and 2.

(a) \( f(x) = \lfloor x \rfloor + c \)
(b) \( f(x) = \lfloor x + c \rfloor \)
(c) \( f(x) = \lfloor x - 1 \rfloor + c \)

10. For each function, sketch (on the same set of coordinate axes) a graph of each function for \( c = -3, -1, 1, \) and 3.

(a) \( f(x) = \begin{cases} x^2 + c, & x < 0 \\ -x^2 + c, & x \geq 0 \end{cases} \)
(b) \( f(x) = \begin{cases} (x + c)^2, & x < 0 \\ -(x + c)^2, & x \geq 0 \end{cases} \)

In Exercises 11–14, use the graph of \( f \) to sketch each graph. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

11. (a) \( y = f(x) + 2 \)
(b) \( y = f(x - 2) \)
(c) \( y = 2f(x) \)
(d) \( y = -f(x) \)
(e) \( y = f(x + 3) \)
(f) \( y = f(-x) \)
(g) \( y = f(\frac{x}{2}) \)

12. (a) \( y = f(-x) \)
(b) \( y = f(x) + 4 \)
(c) \( y = 2f(x) \)
(d) \( y = -f(x - 4) \)
(e) \( y = f(x) - 3 \)
(f) \( y = -f(x) - 1 \)
(g) \( y = f(2x) \)

13. (a) \( y = f(x) - 1 \)
(b) \( y = f(x - 1) \)
(c) \( y = f(-x) \)
(d) \( y = f(x + 1) \)
(e) \( y = -f(x - 2) \)
(f) \( y = \frac{1}{2}f(x) \)
(g) \( y = f(2x) \)

14. (a) \( y = f(x - 5) \)
(b) \( y = -f(x) + 3 \)
(c) \( y = \frac{1}{2}f(x) \)
(d) \( y = -f(x + 1) \)
(e) \( y = f(-x) \)
(f) \( y = f(x) - 10 \)
(g) \( y = f(\frac{x}{3}) \)
15. Use the graph of \( f(x) = x^2 \) to write an equation for each function whose graph is shown.
   (a)  
   ![Graph of a quadratic function]
   (b)  
   ![Graph of a quadratic function]
   (c)  
   ![Graph of a quadratic function]
   (d)  
   ![Graph of a quadratic function]

16. Use the graph of \( f(x) = x^3 \) to write an equation for each function whose graph is shown.
   (a)  
   ![Graph of a cubic function]
   (b)  
   ![Graph of a cubic function]
   (c)  
   ![Graph of a cubic function]
   (d)  
   ![Graph of a cubic function]

17. Use the graph of \( f(x) = |x| \) to write an equation for each function whose graph is shown.
   (a)  
   ![Graph of an absolute value function]
   (b)  
   ![Graph of an absolute value function]
   (c)  
   ![Graph of an absolute value function]
   (d)  
   ![Graph of an absolute value function]

18. Use the graph of \( f(x) = \sqrt{x} \) to write an equation for each function whose graph is shown.
   (a)  
   ![Graph of a square root function]
   (b)  
   ![Graph of a square root function]
   (c)  
   ![Graph of a square root function]
   (d)  
   ![Graph of a square root function]

In Exercises 19–24, identify the parent function and the transformation shown in the graph. Write an equation for the function shown in the graph.

19.  
   ![Graph of a transformed function]

20.  
   ![Graph of a transformed function]
In Exercises 25–54, g is related to one of the parent functions described in Section 1.6. (a) Identify the parent function f. (b) Describe the sequence of transformations from f to g. (c) Sketch the graph of g. (d) Use function notation to write g in terms of f.

25. \( g(x) = 12 - x^2 \)  
26. \( g(x) = (x - 8)^2 \)  
27. \( g(x) = x^4 + 7 \)  
28. \( g(x) = -x^3 - 1 \)  
29. \( g(x) = \frac{2}{3}x^2 + 4 \)  
30. \( g(x) = 2(x - 7)^2 \)  
31. \( g(x) = 2 - (x + 5)^2 \)  
32. \( g(x) = -(x + 10)^2 + 5 \)  
33. \( g(x) = 3 + 2(x - 4)^2 \)  
34. \( g(x) = -\frac{1}{2}(x + 2)^2 - 2 \)  
35. \( g(x) = \sqrt[3]{x} \)  
36. \( g(x) = \sqrt[3]{x} \)  
37. \( g(x) = (x - 1)^3 + 2 \)  
38. \( g(x) = (x + 3)^3 - 10 \)  
39. \( g(x) = 3(x - 2)^3 \)  
40. \( g(x) = -\frac{1}{2}(x + 1)^3 \)  
41. \( g(x) = -|x| - 2 \)  
42. \( g(x) = 6 - |x + 5| \)  
43. \( g(x) = -|x + 4| + 8 \)  
44. \( g(x) = |-x + 3| + 9 \)  
45. \( g(x) = -2|x - 1| - 4 \)  
46. \( g(x) = \frac{1}{2}|x - 2| - 3 \)  
47. \( g(x) = 3 - |x| \)  
48. \( g(x) = 2|x + 5| \)  
49. \( g(x) = \sqrt[3]{x} - 9 \)  
50. \( g(x) = \sqrt[3]{x} + 4 + 8 \)  
51. \( g(x) = \sqrt{7 - x} - 2 \)  
52. \( g(x) = -\frac{1}{7}\sqrt[3]{x + 3} - 1 \)  
53. \( g(x) = \sqrt{\frac{1}{2}x} - 4 \)  
54. \( g(x) = \sqrt[3]{3x} + 1 \)

In Exercises 55–62, write an equation for the function that is described by the given characteristics.

55. The shape of \( f(x) = x^2 \), but shifted three units to the right and seven units downward
56. The shape of \( f(x) = x^2 \), but shifted two units to the left, nine units upward, and reflected in the x-axis
57. The shape of \( f(x) = x^3 \), but shifted 13 units to the right
58. The shape of \( f(x) = x^3 \), but shifted six units to the left, six units downward, and reflected in the y-axis
59. The shape of \( f(x) = |x| \), but shifted 12 units upward and reflected in the x-axis
60. The shape of \( f(x) = |x| \), but shifted four units to the left and eight units downward
61. The shape of \( f(x) = \sqrt{x} \), but shifted six units to the left and reflected in both the x-axis and the y-axis
62. The shape of \( f(x) = \sqrt{x} \), but shifted nine units downward and reflected in both the x-axis and the y-axis
63. Use the graph of \( f(x) = x^2 \) to write an equation for each function whose graph is shown.
   (a) 
   (b) 
64. Use the graph of \( f(x) = x^3 \) to write an equation for each function whose graph is shown.
   (a) 
   (b) 
65. Use the graph of \( f(x) = |x| \) to write an equation for each function whose graph is shown.
   (a) 
   (b) 
66. Use the graph of \( f(x) = \sqrt[3]{x} \) to write an equation for each function whose graph is shown.
   (a) 
   (b)
In Exercises 67–72, identify the parent function and the transformation shown in the graph. Write an equation for the function shown in the graph. Then use a graphing utility to verify your answer.

67. 68. 69. 70. 71. 72.

GRAPHICAL ANALYSIS In Exercises 73–76, use the viewing window shown to write a possible equation for the transformation of the parent function.

73. 74. 75. 76.

GRAPHICAL REASONING In Exercises 77 and 78, use the graph of f to sketch the graph of g. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

77. (a) \( g(x) = f(x) + 2 \)  (b) \( g(x) = f(x) - 1 \)
(c) \( g(x) = f(-x) \)  (d) \( g(x) = -2f(x) \)
(e) \( g(x) = f(4x) \)  (f) \( g(x) = f\left(\frac{1}{2}x\right) \)

78. (a) \( g(x) = f(x) - 5 \)  (b) \( g(x) = f(x) + \frac{1}{2} \)
(c) \( g(x) = f(-x) \)  (d) \( g(x) = -4f(x) \)
(e) \( g(x) = f(2x) + 1 \)  (f) \( g(x) = f\left(\frac{1}{4}x\right) - 2 \)

79. MILES DRIVEN The total numbers of miles \( M \) (in billions) driven by vans, pickups, and SUVs (sport utility vehicles) in the United States from 1990 through 2006 can be approximated by the function

\[
M = 527 + 128.0\sqrt{t}, \quad 0 \leq t \leq 16
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 1990. (Source: U.S. Federal Highway Administration)

(a) Describe the transformation of the parent function \( f(x) = \sqrt{x} \). Then use a graphing utility to graph the function over the specified domain.

(b) Find the average rate of change of the function from 1990 to 2006. Interpret your answer in the context of the problem.

(c) Rewrite the function so that \( t = 0 \) represents 2000. Explain how you got your answer.

(d) Use the model from part (c) to predict the number of miles driven by vans, pickups, and SUVs in 2012. Does your answer seem reasonable? Explain.
80. **MARRIED COUPLES** The numbers \( N \) (in thousands) of married couples with stay-at-home mothers from 2000 through 2007 can be approximated by the function

\[
N = -24.70(t - 5.99)^2 + 5617, \quad 0 \leq t \leq 7
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. (Source: U.S. Census Bureau)

(a) Describe the transformation of the parent function \( f(x) = x^2 \). Then use a graphing utility to graph the function over the specified domain.

(b) Find the average rate of the change of the function from 2000 to 2007. Interpret your answer in the context of the problem.

(c) Use the model to predict the number of married couples with stay-at-home mothers in 2015. Does your answer seem reasonable? Explain.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 81–84, determine whether the statement is true or false. Justify your answer.

81. The graph of \( y = f(-x) \) is a reflection of the graph of \( y = f(x) \) in the x-axis.

82. The graph of \( y = -f(x) \) is a reflection of the graph of \( y = f(x) \) in the y-axis.

83. The graphs of

\[
f(x) = |x| + 6
\]

and

\[
f(x) = |-x| + 6
\]

are identical.

84. If the graph of the parent function \( f(x) = x^2 \) is shifted six units to the right, three units upward, and reflected in the x-axis, then the point \((-2, 19)\) will lie on the graph of the transformation.

85. **DESCRIBING PROFITS** Management originally predicted that the profits from the sales of a new product would be approximated by the graph of the function \( f \) shown. The actual profits are shown by the function \( g \) along with a verbal description. Use the concepts of transformations of graphs to write \( g \) in terms of \( f \).

(a) The profits were only three-fourths as large as expected.

(b) The profits were consistently \$10,000 greater than predicted.

(c) There was a two-year delay in the introduction of the product. After sales began, profits grew as expected.

86. **THINK ABOUT IT** You can use either of two methods to graph a function: plotting points or translating a parent function as shown in this section. Which method of graphing do you prefer to use for each function? Explain.

(a) \( f(x) = 3x^2 - 4x + 1 \)

(b) \( f(x) = 2(x - 1)^2 - 6 \)

87. The graph of \( y = f(x) \) passes through the points \((0, 1)\), \((1, 2)\), and \((2, 3)\). Find the corresponding points on the graph of \( y = f(x + 2) - 1 \).

88. Use a graphing utility to graph \( f, g, \) and \( h \) in the same viewing window. Before looking at the graphs, try to predict how the graphs of \( g \) and \( h \) relate to the graph of \( f \).

(a) \( f(x) = x^2 \), \( g(x) = (x - 4)^2 \),

\[
h(x) = (x - 4)^2 + 3
\]

(b) \( f(x) = x^2 \), \( g(x) = (x + 1)^2 \),

\[
h(x) = (x + 1)^2 - 2
\]

(c) \( f(x) = x^2 \), \( g(x) = (x + 4)^2 \),

\[
h(x) = (x + 4)^2 + 2
\]

89. Reverse the order of transformations in Example 2(a). Do you obtain the same graph? Do the same for Example 2(b). Do you obtain the same graph? Explain.

90. **CAPSTONE** Use the fact that the graph of \( y = f(x) \) is increasing on the intervals \((-\infty, -1)\) and \((2, \infty)\) and decreasing on the interval \((-1, 2)\) to find the intervals on which the graph is increasing and decreasing. If not possible, state the reason.

(a) \( y = f(-x) \) \quad (b) \( y = -f(x) \) \quad (c) \( y = \frac{1}{2}f(x) \)

(d) \( y = -f(x - 1) \) \quad (e) \( y = f(x - 2) + 1 \)
Combinations of Functions: Composite Functions

Arithmetic Combinations of Functions

Just as two real numbers can be combined by the operations of addition, subtraction, multiplication, and division to form other real numbers, **two functions** can be combined to create new functions. For example, the functions given by \( f(x) = 2x - 3 \) and \( g(x) = x^2 - 1 \) can be combined to form the sum, difference, product, and quotient of \( f \) and \( g \).

\[
\begin{align*}
  f(x) + g(x) &= (2x - 3) + (x^2 - 1) \\
  &= x^2 + 2x - 4 \quad \text{Sum}
\end{align*}
\]

\[
\begin{align*}
  f(x) - g(x) &= (2x - 3) - (x^2 - 1) \\
  &= -x^2 + 2x - 2 \quad \text{Difference}
\end{align*}
\]

\[
\begin{align*}
  f(x)g(x) &= (2x - 3)(x^2 - 1) \\
  &= 2x^3 - 3x^2 - 2x + 3 \quad \text{Product}
\end{align*}
\]

\[
\begin{align*}
  \frac{f(x)}{g(x)} &= \frac{2x - 3}{x^2 - 1}, \quad x \neq \pm 1 \quad \text{Quotient}
\end{align*}
\]

The domain of an **arithmetic combination** of functions \( f \) and \( g \) consists of all real numbers that are common to the domains of \( f \) and \( g \). In the case of the quotient \( \frac{f(x)}{g(x)} \), there is the further restriction that \( g(x) \neq 0 \).

**Sum, Difference, Product, and Quotient of Functions**

Let \( f \) and \( g \) be two functions with overlapping domains. Then, for all \( x \) common to both domains, the **sum**, **difference**, **product**, and **quotient** of \( f \) and \( g \) are defined as follows.

1. **Sum**: \( (f + g)(x) = f(x) + g(x) \)
2. **Difference**: \( (f - g)(x) = f(x) - g(x) \)
3. **Product**: \( (fg)(x) = f(x) \cdot g(x) \)
4. **Quotient**: \( \left( \frac{f}{g} \right)(x) = \frac{f(x)}{g(x)}, \quad g(x) \neq 0 \)

**Example 1** Finding the Sum of Two Functions

Given \( f(x) = 2x + 1 \) and \( g(x) = x^2 + 2x - 1 \), find \( (f + g)(x) \). Then evaluate the sum when \( x = 3 \).

**Solution**

\[
(f + g)(x) = f(x) + g(x) = (2x + 1) + (x^2 + 2x - 1) = x^2 + 4x
\]

When \( x = 3 \), the value of this sum is

\[
(f + g)(3) = 3^2 + 4(3) = 21.
\]

**Check Point** Now try Exercise 9(a).
Example 2 Finding the Difference of Two Functions

Given \( f(x) = 2x + 1 \) and \( g(x) = x^2 + 2x - 1 \), find \((f - g)(x)\). Then evaluate the difference when \( x = 2 \).

Solution

The difference of \( f \) and \( g \) is

\[
(f - g)(x) = f(x) - g(x) = (2x + 1) - (x^2 + 2x - 1) = -x^2 + 2.
\]

When \( x = 2 \), the value of this difference is

\[
(f - g)(2) = -(2)^2 + 2 = -2.
\]

CHECKPOINT Now try Exercise 9(b).

Example 3 Finding the Product of Two Functions

Given \( f(x) = x^2 \) and \( g(x) = x - 3 \), find \((fg)(x)\). Then evaluate the product when \( x = 4 \).

Solution

\[
(fg)(x) = f(x)g(x) = (x^2)(x - 3) = x^3 - 3x^2
\]

When \( x = 4 \), the value of this product is

\[
(fg)(4) = 4^3 - 3(4)^2 = 16.
\]

CHECKPOINT Now try Exercise 9(c).

In Examples 1–3, both \( f \) and \( g \) have domains that consist of all real numbers. So, the domains of \( f + g \), \( f - g \), and \( fg \) are also the set of all real numbers. Remember that any restrictions on the domains of \( f \) and \( g \) must be considered when forming the sum, difference, product, or quotient of \( f \) and \( g \).

Example 4 Finding the Quotients of Two Functions

Find \((f/g)(x)\) and \((g/f)(x)\) for the functions given by \( f(x) = \sqrt{x} \) and \( g(x) = \sqrt{4 - x^2} \). Then find the domains of \( f/g \) and \( g/f \).

Solution

The quotient of \( f \) and \( g \) is

\[
\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)} = \frac{\sqrt{x}}{\sqrt{4 - x^2}}
\]

and the quotient of \( g \) and \( f \) is

\[
\left(\frac{g}{f}\right)(x) = \frac{g(x)}{f(x)} = \frac{\sqrt{4 - x^2}}{\sqrt{x}}.
\]

The domain of \( f \) is \([0, \infty)\) and the domain of \( g \) is \([-2, 2]\). The intersection of these domains is \([0, 2]\). So, the domains of \( f/g \) and \( g/f \) are as follows.

Domain of \( f/g \): \([0, 2)\) .Domain of \( g/f \): \((0, 2]\)

CHECKPOINT Now try Exercise 9(d).
Composition of Functions

Another way of combining two functions is to form the composition of one with the other. For instance, if \( f(x) = x^2 \text{ and } g(x) = x + 1 \), the composition of \( f \) with \( g \) is
\[
f(g(x)) = f(x + 1) = (x + 1)^2.
\]
This composition is denoted as \( f \circ g \) and reads as “\( f \) composed with \( g \).”

Definition of Composition of Two Functions

The composition of the function \( f \) with the function \( g \) is
\[
(f \circ g)(x) = f(g(x)).
\]
The domain of \( f \circ g \) is the set of all \( x \) in the domain of \( g \) such that \( g(x) \) is in the domain of \( f \). (See Figure 1.90.)

Example 5 Composition of Functions

Given \( f(x) = x + 2 \) and \( g(x) = 4 - x^2 \), find the following.

a. \((f \circ g)(x)\)  
b. \((g \circ f)(x)\)  
c. \((g \circ f)(-2)\)

Solution

a. The composition of \( f \) with \( g \) is as follows.
\[
(f \circ g)(x) = f(g(x))
\]
\[
= f(4 - x^2)
\]
\[
= (4 - x^2)^2
\]
\[
= 16 - 8x^2 + x^4
\]

b. The composition of \( g \) with \( f \) is as follows.
\[
(g \circ f)(x) = g(f(x))
\]
\[
= g(x + 2)
\]
\[
= 4 - (x + 2)^2
\]
\[
= 4 - x^2 - 4x - 4
\]
\[
= -x^2 - 4x
\]

Note that, in this case, \((f \circ g)(x) \neq (g \circ f)(x)\).

b. Using the result of part (b), you can write the following.
\[
(g \circ f)(-2) = -(-2)^2 - 4(-2)
\]
\[
= 4
\]

Now try Exercise 37.
Example 6  Finding the Domain of a Composite Function

Find the domain of \((f \circ g)(x)\) for the functions given by
\[ f(x) = x^2 - 9 \quad \text{and} \quad g(x) = \sqrt{9 - x^2}. \]

**Algebraic Solution**

The composition of the functions is as follows.
\[
(f \circ g)(x) = f(g(x)) = f(\sqrt{9 - x^2}) = (\sqrt{9 - x^2})^2 - 9 = 9 - x^2 - 9 = -x^2.
\]

From this, it might appear that the domain of the composition is the set of all real numbers. This, however, is not true. Because the domain of \(f\) is the set of all real numbers and the domain of \(g\) is \([-3, 3]\), the domain of \(f \circ g\) is \([-3, 3]\).

**Graphical Solution**

You can use a graphing utility to graph the composition of the functions \((f \circ g)(x)\) as \(y = (\sqrt{9 - x^2})^2 - 9\). Enter the functions as follows.
\[
y_1 = \sqrt{9 - x^2} \quad y_2 = y_1^2 - 9
\]

Graph \(y_2\), as shown in Figure 1.91. Use the trace feature to determine that the \(x\)-coordinates of points on the graph extend from \(-3\) to \(3\). So, you can graphically estimate the domain of \(f \circ g\) to be \([-3, 3]\).

![Figure 1.91](image)

In Examples 5 and 6, you formed the composition of two given functions. In calculus, it is also important to be able to identify two functions that make up a given composite function. For instance, the function \(h\) given by \(h(x) = (3x - 5)^3\) is the composition of \(f\) with \(g\), where \(f(x) = x^3\) and \(g(x) = 3x - 5\). That is,
\[
h(x) = (3x - 5)^3 = [g(x)]^3 = f(g(x)).
\]

Basically, to “decompose” a composite function, look for an “inner” function and an “outer” function. In the function \(h\) above, \(g(x) = 3x - 5\) is the inner function and \(f(x) = x^3\) is the outer function.

Example 7  Decomposing a Composite Function

Write the function given by \(h(x) = \frac{1}{(x - 2)^2}\) as a composition of two functions.

**Solution**

One way to write \(h\) as a composition of two functions is to take the inner function to be \(g(x) = x - 2\) and the outer function to be
\[
f(x) = \frac{1}{x^2} = x^{-2}.
\]

Then you can write
\[
h(x) = \frac{1}{(x - 2)^2} = (x - 2)^{-2} = f(x - 2) = f(g(x)).
\]

**CHECKPOINT** Now try Exercise 53.
Application

**Example 8**  Bacteria Count

The number \( N \) of bacteria in a refrigerated food is given by

\[
N(T) = 20T^2 - 80T + 500, \quad 2 \leq T \leq 14
\]

where \( T \) is the temperature of the food in degrees Celsius. When the food is removed from refrigeration, the temperature of the food is given by

\[
T(t) = 4t + 2, \quad 0 \leq t \leq 3
\]

where \( t \) is the time in hours. (a) Find the composition \( N(T(t)) \) and interpret its meaning in context. (b) Find the time when the bacteria count reaches 2000.

**Solution**

a. \( N(T(t)) = 20(4t + 2)^2 - 80(4t + 2) + 500 \)
   \[
   = 20(16t^2 + 16t + 4) - 320t - 160 + 500
   \]
   \[
   = 320t^2 + 320t + 80 - 320t - 160 + 500
   \]
   \[
   = 320t^2 + 420
   \]

The composite function \( N(T(t)) \) represents the number of bacteria in the food as a function of the amount of time the food has been out of refrigeration.

b. The bacteria count will reach 2000 when \( 320t^2 + 420 = 2000 \). Solve this equation to find that the count will reach 2000 when \( t \approx 2.2 \) hours. When you solve this equation, note that the negative value is rejected because it is not in the domain of the composite function.

**Classroom Discussion**

Analyzing Arithmetic Combinations of Functions

a. Use the graphs of \( f \) and \( (f + g) \) in Figure 1.92 to make a table showing the values of \( g(x) \) when \( x = 1, 2, 3, 4, 5, \) and 6. Explain your reasoning.

b. Use the graphs of \( f \) and \( (f - h) \) in Figure 1.92 to make a table showing the values of \( h(x) \) when \( x = 1, 2, 3, 4, 5, \) and 6. Explain your reasoning.
1.8 EXERCISES

VOCABULARY: Fill in the blanks.

1. Two functions \(f\) and \(g\) can be combined by the arithmetic operations of ________, ________, ________, and ________ to create new functions.

2. The ________ of the function \(f\) with \(g\) is \((f \circ g)(x) = f(g(x))\).

3. The domain of \((f \circ g)\) is all \(x\) in the domain of \(g\) such that ________ is in the domain of \(f\).

4. To decompose a composite function, look for an ________ function and an ________ function.

SKILLS AND APPLICATIONS

In Exercises 5–8, use the graphs of \(f\) and \(g\) to graph \(h(x) = (f + g)(x)\). To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

5. ![Graph of f and g](image1)

6. ![Graph of f and g](image2)

7. ![Graph of f and g](image3)

8. ![Graph of f and g](image4)

In Exercises 9–16, find (a) \((f + g)(x)\), (b) \((f - g)(x)\), (c) \((fg)(x)\), and (d) \((f/g)(x)\). What is the domain of \(f\) and \(g\)?

9. \(f(x) = x + 2, \quad g(x) = x - 2\)
10. \(f(x) = 2x - 5, \quad g(x) = 2 - x\)
11. \(f(x) = x^2, \quad g(x) = 4x - 5\)
12. \(f(x) = 3x + 1, \quad g(x) = 5x - 4\)
13. \(f(x) = x^2 + 6, \quad g(x) = \sqrt{1 - x}\)
14. \(f(x) = \sqrt{x^2 - 4}, \quad g(x) = \frac{x^2}{x^2 + 1}\)
15. \(f(x) = \frac{1}{x}, \quad g(x) = \frac{1}{x^2}\)
16. \(f(x) = \frac{x}{x + 1}, \quad g(x) = x^3\)

In Exercises 17–28, evaluate the indicated function for \(f(x) = x^2 + 1\) and \(g(x) = x - 4\).

17. \((f + g)(2)\)  
18. \((f - g)(-1)\)  
19. \((f - g)(0)\)  
20. \((f + g)(1)\)
21. \((f - g)(3)\)  
22. \((f + g)(t - 2)\)
23. \((fg)(6)\)  
24. \((fg)(-6)\)
25. \((f/g)(5)\)  
26. \((f/g)(0)\)
27. \((f/g)(-1) - g(3)\)  
28. \((fg)(5) + f(4)\)

In Exercises 29–32, graph the functions \(f\), \(g\), and \(f + g\) on the same set of coordinate axes.

29. \(f(x) = \frac{1}{2}x, \quad g(x) = x - 1\)
30. \(f(x) = \frac{1}{3}x, \quad g(x) = -x + 4\)
31. \(f(x) = x^2, \quad g(x) = -2x\)
32. \(f(x) = 4 - x^2, \quad g(x) = x\)

GRAPHICAL REASONING In Exercises 33–36, use a graphing utility to graph \(f\), \(g\), and \(f + g\) in the same viewing window. Which function contributes most to the magnitude of the sum when \(0 \leq x \leq 2\)? Which function contributes most to the magnitude of the sum when \(x > 6\)?

33. \(f(x) = 3x, \quad g(x) = -\frac{x^3}{10}\)
34. \(f(x) = \frac{x}{2}, \quad g(x) = \sqrt{x}\)
35. \(f(x) = 3x + 2, \quad g(x) = -\sqrt{x + 5}\)
36. \(f(x) = x^2 - \frac{1}{2}, \quad g(x) = -3x^2 - 1\)

In Exercises 37–40, find (a) \(f \circ g\), (b) \(g \circ f\), and (c) \(g \circ g\).

37. \(f(x) = x^2, \quad g(x) = x - 1\)
38. \(f(x) = 3x + 5, \quad g(x) = 5 - x\)
39. \(f(x) = \frac{x}{x - 1}, \quad g(x) = x^3 + 1\)
40. \(f(x) = x^3, \quad g(x) = \frac{1}{x}\)

In Exercises 41–48, find (a) \(f \circ g\) and (b) \(g \circ f\). Find the domain of each function and each composite function.

41. \(f(x) = \sqrt{x + 4}, \quad g(x) = x^2\)
42. \(f(x) = \frac{x}{x - 3}, \quad g(x) = x^3 + 1\)
In Exercises 49–52, use the graphs of \( f \) and \( g \) to evaluate the functions.

49. (a) \((f + g)(3)\)  
   (b) \((f/g)(2)\)
50. (a) \((f - g)(1)\)  
   (b) \((f/g)(4)\)
51. (a) \((f \cdot g)(2)\)  
   (b) \((g \cdot f)(2)\)
52. (a) \((f \cdot g)(1)\)  
   (b) \((g \cdot f)(3)\)

In Exercises 53–60, find two functions \( f \) and \( g \) such that \((f \cdot g)(x) = h(x)\). (There are many correct answers.)

53. \(h(x) = (2x + 1)^2\)  
   54. \(h(x) = (1 - x)^3\)
55. \(h(x) = \sqrt{x^2 - 4}\)  
   56. \(h(x) = \sqrt{9 - x}\)
57. \(h(x) = \frac{1}{x + 2}\)  
   58. \(h(x) = \frac{4}{(5x + 2)^2}\)
59. \(h(x) = \frac{-x^2 + 3}{4 - x^2}\)  
   60. \(h(x) = \frac{27x^3 + 6x}{10 - 27x^3}\)

61. **STOPPING DISTANCE** The research and development department of an automobile manufacturer has determined that when a driver is required to stop quickly to avoid an accident, the distance (in feet) the car travels during the driver’s reaction time is given by \( R(x) = \frac{1}{4}x \), where \( x \) is the speed of the car in miles per hour. The distance (in feet) traveled while the driver is braking is given by \( B(x) = \frac{1}{16}x^2 \).

(a) Find the function that represents the total stopping distance \( T \).

(b) Graph the functions \( R, B, \) and \( T \) on the same set of coordinate axes for \( 0 \leq x \leq 60 \).

(c) Which function contributes most to the magnitude of the sum at higher speeds? Explain.

62. **SALES** From 2003 through 2008, the sales \( R_1 \) (in thousands of dollars) for one of two restaurants owned by the same parent company can be modeled by:

\[
R_1 = 480 - 8t - 0.8t^2, \quad t = 3, 4, 5, 6, 7, 8
\]

where \( t = 3 \) represents 2003. During the same six-year period, the sales \( R_2 \) (in thousands of dollars) for the second restaurant can be modeled by:

\[
R_2 = 254 + 0.78t, \quad t = 3, 4, 5, 6, 7, 8.
\]

(a) Write a function \( R_3 \) that represents the total sales of the two restaurants owned by the same parent company.

(b) Use a graphing utility to graph \( R_1, R_2, \) and \( R_3 \) in the same viewing window.

63. **VITAL STATISTICS** Let \( b(t) \) be the number of births in the United States in year \( t \), and let \( d(t) \) represent the number of deaths in the United States in year \( t \), where \( t = 0 \) corresponds to 2000.

(a) If \( p(t) \) is the population of the United States in year \( t \), find the function \( c(t) \) that represents the percent change in the population of the United States.

(b) Interpret the value of \( c(5) \).

64. **PETS** Let \( d(t) \) be the number of dogs in the United States in year \( t \), and let \( c(t) \) be the number of cats in the United States in year \( t \), where \( t = 0 \) corresponds to 2000.

(a) Find the function \( p(t) \) that represents the total number of dogs and cats in the United States.

(b) Interpret the value of \( p(5) \).

(c) Let \( n(t) \) represent the population of the United States in year \( t \), where \( t = 0 \) corresponds to 2000. Find and interpret

\[
h(t) = \frac{p(t)}{n(t)}.
\]

65. **MILITARY PERSONNEL** The total numbers of Navy personnel \( N \) (in thousands) and Marines personnel \( M \) (in thousands) from 2000 through 2007 can be approximated by the models

\[
N(t) = 0.192t^3 - 3.88t^2 + 12.9t + 372
\]

and

\[
M(t) = 0.035t^3 - 0.23t^2 + 1.7t + 172
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. **(Source: Department of Defense)**

(a) Find and interpret \( (N + M)(t) \). Evaluate this function for \( t = 0, 6, \) and 12.

(b) Find and interpret \( (N - M)(t) \). Evaluate this function for \( t = 0, 6, \) and 12.
66. **SPORTS** The numbers of people playing tennis \( T \) (in millions) in the United States from 2000 through 2007 can be approximated by the function
\[
T(t) = 0.0233t^4 - 0.3408t^3 + 1.556t^2 - 1.86t + 22.8
\]
and the U.S. population \( P \) (in millions) from 2000 through 2007 can be approximated by the function \( P(t) = 2.78t + 282.5 \), where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. (Source: Tennis Industry Association, U.S. Census Bureau)

(a) Find and interpret \( h(t) = \frac{T(t)}{P(t)} \).

(b) Evaluate the function in part (a) for \( t = 0, 3, \) and 6.

**BIRTHS AND DEATHS** In Exercises 67 and 68, use the table, which shows the total numbers of births \( B \) (in thousands) and deaths \( D \) (in thousands) in the United States from 1990 through 2006. (Source: U.S. Census Bureau)

<table>

</table>

The models for these data are
\[
B(t) = -0.197t^3 + 8.96t^2 - 90.0t + 4180
\]
and
\[
D(t) = -1.21t^2 + 38.0t + 2137
\]
where \( t \) represents the year, with \( t = 0 \) corresponding to 1990.

67. Find and interpret \( (B - D)(t) \).

68. Evaluate \( B(t), D(t), \) and \( (B - D)(t) \) for the years 2010 and 2012. What does each function value represent?

69. **GRAPHICAL REASONING** An electronically controlled thermostat in a home is programmed to lower the temperature automatically during the night. The temperature in the house \( T \) (in degrees Fahrenheit) is given in terms of \( t \), the time in hours on a 24-hour clock (see figure).

(a) Explain why \( T \) is a function of \( t \).

(b) Approximate \( T(4) \) and \( T(15) \).

(c) The thermostat is reprogrammed to produce a temperature \( H \) for which \( H(t) = T(t - 1) \). How does this change the temperature?

(d) The thermostat is reprogrammed to produce a temperature \( H \) for which \( H(t) = T(t) - 1 \). How does this change the temperature?

(e) Write a piecewise-defined function that represents the graph.

70. **GEOMETRY** A square concrete foundation is prepared as a base for a cylindrical tank (see figure).

(a) Write the radius \( r \) of the tank as a function of the length \( x \) of the sides of the square.

(b) Write the area \( A \) of the circular base of the tank as a function of the radius \( r \).

(c) Find and interpret \( (A + r)(x) \).

71. **ripples** A pebble is dropped into a calm pond, causing ripples in the form of concentric circles. The radius \( r \) (in feet) of the outer ripple is \( r(t) = 0.6t \), where \( t \) is the time in seconds after the pebble strikes the water. The area \( A \) of the circle is given by the function \( A(r) = \pi r^2 \). Find and interpret \( (A + r)(t) \).

72. **pollution** The spread of a contaminant is increasing in a circular pattern on the surface of a lake. The radius of the contaminant can be modeled by \( r(t) = 5.25\sqrt{t} \), where \( r \) is the radius in meters and \( t \) is the time in hours since contamination.
(a) Find a function that gives the area \( A \) of the circular leak in terms of the time \( t \) since the spread began.
(b) Find the size of the contaminated area after 36 hours.
(c) Find when the size of the contaminated area is 6250 square meters.

**73. BACTERIA COUNT** The number \( N \) of bacteria in a refrigerated food is given by

\[
N(T) = 10T^2 - 20T + 600, \quad 1 \leq T \leq 20
\]

where \( T \) is the temperature of the food in degrees Celsius. When the food is removed from refrigeration, the temperature of the food is given by

\[
T(t) = 3t + 2, \quad 0 \leq t \leq 6
\]

where \( t \) is the time in hours.

(a) Find the composition \( N(T(t)) \) and interpret its meaning in context.
(b) Find the bacteria count after 0.5 hour.
(c) Find the time when the bacteria count reaches 1500.

**74. COST** The weekly cost \( C \) of producing \( x \) units in a manufacturing process is given by \( C(x) = 60x + 750 \). The number of units \( x \) produced in \( t \) hours is given by \( x(t) = 50t \).

(a) Find and interpret \( (C \circ x)(t) \).
(b) Find the cost of the units produced in 4 hours.
(c) Find the time that must elapse in order for the cost to increase to \$15,000.

**75. SALARY** You are a sales representative for a clothing manufacturer. You are paid an annual salary, plus a bonus of 3% of your sales over \$500,000. Consider the two functions given by \( f(x) = x - 500,000 \) and \( g(x) = 0.03x \). If \( x \) is greater than \$500,000, which of the following represents your bonus? Explain your reasoning.

(a) \( f(g(x)) \)  
(b) \( g(f(x)) \)

**76. CONSUMER AWARENESS** The suggested retail price of a new hybrid car is \( p \) dollars. The dealership advertises a factory rebate of \$2000 and a 10% discount.

(a) Write a function \( R \) in terms of \( p \) giving the cost of the hybrid car after receiving the rebate from the factory.
(b) Write a function \( S \) in terms of \( p \) giving the cost of the hybrid car after receiving the dealership discount.
(c) Form the composite functions \((R \circ S)(p)\) and \((S \circ R)(p)\) and interpret each.
(d) Find \((R \circ S)(20,500)\) and \((S \circ R)(20,500)\). Which yields the lower cost for the hybrid car? Explain.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 77 and 78, determine whether the statement is true or false. Justify your answer.

77. If \( f(x) = x + 1 \) and \( g(x) = 6x \), then

\[
(f \circ g)(x) = (g \circ f)(x)
\]

78. If you are given two functions \( f(x) \) and \( g(x) \), you can calculate \( (f \circ g)(x) \) if and only if the range of \( g \) is a subset of the domain of \( f \).

In Exercises 79 and 80, three siblings are of three different ages. The oldest is twice the age of the middle sibling, and the middle sibling is six years older than one-half the age of the youngest.

79. (a) Write a composite function that gives the oldest sibling’s age in terms of the youngest. Explain how you arrived at your answer.
(b) If the oldest sibling is 16 years old, find the ages of the other two siblings.
80. (a) Write a composite function that gives the youngest sibling’s age in terms of the oldest. Explain how you arrived at your answer.
(b) If the youngest sibling is two years old, find the ages of the other two siblings.

**81. PROOF** Prove that the product of two odd functions is an even function, and that the product of two even functions is an even function.

**82. CONJECTURE** Use examples to hypothesize whether the product of an odd function and an even function is even or odd. Then prove your hypothesis.

**83. PROOF**

(a) Given a function \( f \), prove that \( g(x) = \text{even} \) and \( h(x) = \text{odd} \), where \( g(x) = \frac{1}{2}(f(x) + f(-x)) \) and \( h(x) = \frac{1}{2}(f(x) - f(-x)) \).

(b) Use the result of part (a) to prove that any function can be written as a sum of even and odd functions. \([\text{Hint: Add the two equations in part (a).}]\)

(c) Use the result of part (b) to write each function as a sum of even and odd functions.

\[
f(x) = x^2 - 2x + 1, \quad k(x) = \frac{1}{x + 1}
\]

**84. CAPSTONE** Consider the functions \( f(x) = x^2 \) and \( g(x) = \sqrt{x} \).

(a) Find \( f/g \) and its domain.
(b) Find \( f \circ g \) and \( g \circ f \). Find the domain of each composite function. Are they the same? Explain.
1.9 Inverse Functions

Inverse Functions

Recall from Section 1.4 that a function can be represented by a set of ordered pairs. For instance, the function $f(x) = x + 4$ from the set $A = \{1, 2, 3, 4\}$ to the set $B = \{5, 6, 7, 8\}$ can be written as follows.

$$f(x) = x + 4: \{(1, 5), (2, 6), (3, 7), (4, 8)\}$$

In this case, by interchanging the first and second coordinates of each of these ordered pairs, you can form the inverse function of $f$, which is denoted by $f^{-1}$. It is a function from the set $B$ to the set $A$, and can be written as follows.

$$f^{-1}(x) = x - 4: \{(5, 1), (6, 2), (7, 3), (8, 4)\}$$

Note that the domain of $f$ is equal to the range of $f^{-1}$, and vice versa, as shown in Figure 1.93. Also note that the functions $f$ and $f^{-1}$ have the effect of “undoing” each other. In other words, when you form the composition of $f$ with $f^{-1}$ or the composition of $f^{-1}$ with $f$, you obtain the identity function.

$$f(f^{-1}(x)) = f(x - 4) = (x - 4) + 4 = x$$

$$f^{-1}(f(x)) = f^{-1}(x + 4) = (x + 4) - 4 = x$$

Example 1 Finding Inverse Functions Informally

Find the inverse function of $f(x) = 4x$. Then verify that both $f(f^{-1}(x))$ and $f^{-1}(f(x))$ are equal to the identity function.

Solution

The function $f$ multiplies each input by 4. To “undo” this function, you need to divide each input by 4. So, the inverse function of $f(x) = 4x$ is

$$f^{-1}(x) = \frac{x}{4}$$

You can verify that both $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$ as follows.

$$f(f^{-1}(x)) = f\left(\frac{x}{4}\right) = 4\left(\frac{x}{4}\right) = x$$

$$f^{-1}(f(x)) = f^{-1}(4x) = \frac{4x}{4} = x$$

CHECKPOINT Now try Exercise 7.
Definition of Inverse Function

Let \( f \) and \( g \) be two functions such that
\[
f(g(x)) = x \quad \text{for every } x \text{ in the domain of } g
\]
and
\[
g(f(x)) = x \quad \text{for every } x \text{ in the domain of } f.
\]
Under these conditions, the function \( g \) is the inverse function of the function \( f \). The function \( g \) is denoted by \( f^{-1} \) (read “\( f \)-inverse”). So,
\[
f(f^{-1}(x)) = x \quad \text{and} \quad f^{-1}(f(x)) = x.
\]
The domain of \( f \) must be equal to the range of \( f^{-1} \), and the range of \( f \) must be equal to the domain of \( f^{-1} \).

Do not be confused by the use of \(-1\) to denote the inverse function \( f^{-1} \). In this text, whenever \( f^{-1} \) is written, it always refers to the inverse function of the function \( f \) and not to the reciprocal of \( f(x) \).

If the function \( g \) is the inverse function of the function \( f \), it must also be true that the function \( f \) is the inverse function of the function \( g \). For this reason, you can say that the functions \( f \) and \( g \) are inverse functions of each other.

Example 2  Verifying Inverse Functions

Which of the functions is the inverse function of \( f(x) = \frac{5}{x - 2} \)?

\[
g(x) = \frac{x - 2}{5} \quad h(x) = \frac{5}{x} + 2
\]

Solution

By forming the composition of \( f \) with \( g \), you have
\[
f(g(x)) = f\left(\frac{x - 2}{5}\right) = \frac{5}{\left(\frac{x - 2}{5}\right) - 2} = \frac{25}{x - 12} \neq x.
\]

Because this composition is not equal to the identity function \( x \), it follows that \( g \) is not the inverse function of \( f \). By forming the composition of \( f \) with \( h \), you have
\[
f(h(x)) = f\left(\frac{5}{x} + 2\right) = \frac{5}{\left(\frac{5}{x} + 2\right) - 2} = \frac{5}{\left(\frac{5}{x}\right)} = x.
\]

So, it appears that \( h \) is the inverse function of \( f \). You can confirm this by showing that the composition of \( h \) with \( f \) is also equal to the identity function, as shown below.
\[
h(f(x)) = h\left(\frac{5}{x - 2}\right) = \frac{5}{\left(\frac{5}{x - 2}\right)} + 2 = x - 2 + 2 = x
\]

CHECK Point  Now try Exercise 19.
The Graph of an Inverse Function

The graphs of a function \( f \) and its inverse function \( f^{-1} \) are related to each other in the following way. If the point \((a, b)\) lies on the graph of \( f \), then the point \((b, a)\) must lie on the graph of \( f^{-1} \), and vice versa. This means that the graph of \( f^{-1} \) is a reflection of the graph of \( f \) in the line \( y = x \), as shown in Figure 1.94.

**Example 3** Finding Inverse Functions Graphically

Sketch the graphs of the inverse functions \( f(x) = 2x - 3 \) and \( f^{-1}(x) = \frac{1}{2}(x + 3) \) on the same rectangular coordinate system and show that the graphs are reflections of each other in the line \( y = x \).

**Solution**

The graphs of \( f \) and \( f^{-1} \) are shown in Figure 1.95. It appears that the graphs are reflections of each other in the line \( y = x \). You can further verify this reflective property by testing a few points on each graph. Note in the following list that if the point \((a, b)\) is on the graph of \( f \), the point \((b, a)\) is on the graph of \( f^{-1} \).

**Graph of** \( f(x) = 2x - 3 \)  
- \((-1, -5)\)  
- \((0, -3)\)  
- \((1, -1)\)  
- \((2, 1)\)  
- \((3, 3)\)

**Graph of** \( f^{-1}(x) = \frac{1}{2}(x + 3) \)  
- \((-5, -1)\)  
- \((-3, 0)\)  
- \((-1, 1)\)  
- \((1, 2)\)  
- \((3, 3)\)

**Example 4** Finding Inverse Functions Graphically

Sketch the graphs of the inverse functions \( f(x) = x^2 \) (\( x \geq 0 \)) and \( f^{-1}(x) = \sqrt{x} \) on the same rectangular coordinate system and show that the graphs are reflections of each other in the line \( y = x \).

**Solution**

The graphs of \( f \) and \( f^{-1} \) are shown in Figure 1.96. It appears that the graphs are reflections of each other in the line \( y = x \). You can further verify this reflective property by testing a few points on each graph. Note in the following list that if the point \((a, b)\) is on the graph of \( f \), the point \((b, a)\) is on the graph of \( f^{-1} \).

**Graph of** \( f(x) = x^2 \), \( x \geq 0 \)  
- \((0, 0)\)  
- \((1, 1)\)  
- \((2, 4)\)  
- \((3, 9)\)

**Graph of** \( f^{-1}(x) = \sqrt{x} \)  
- \((0, 0)\)  
- \((1, 1)\)  
- \((4, 2)\)  
- \((9, 3)\)

Try showing that \( f(f^{-1}(x)) = x \) and \( f^{-1}(f(x)) = x \).

**CHECKPOINT** Now try Exercise 25.

**CHECKPOINT** Now try Exercise 27.
One-to-One Functions

The reflective property of the graphs of inverse functions gives you a nice geometric test for determining whether a function has an inverse function. This test is called the Horizontal Line Test for inverse functions.

**Horizontal Line Test for Inverse Functions**

A function \( f \) has an inverse function if and only if no horizontal line intersects the graph of \( f \) at more than one point.

If no horizontal line intersects the graph of \( f \) at more than one point, then no \( y \)-value is matched with more than one \( x \)-value. This is the essential characteristic of what are called one-to-one functions.

One-to-One Functions

A function \( f \) is one-to-one if each value of the dependent variable corresponds to exactly one value of the independent variable. A function \( f \) has an inverse function if and only if \( f \) is one-to-one.

Consider the function given by \( f(x) = x^3 - 1 \). The table on the left is a table of values for \( f(x) = x^3 \). The table of values on the right is made up by interchanging the columns of the first table. The table on the right does not represent a function because the input \( x = 4 \) is matched with two different outputs: \( y = -2 \) and \( y = 2 \). So, \( f(x) = x^3 \) is not one-to-one and does not have an inverse function.

**Example 5** Applying the Horizontal Line Test

a. The graph of the function given by \( f(x) = x^3 - 1 \) is shown in Figure 1.97. Because no horizontal line intersects the graph of \( f \) at more than one point, you can conclude that \( f \) is a one-to-one function and does have an inverse function.

b. The graph of the function given by \( f(x) = x^2 - 1 \) is shown in Figure 1.98. Because it is possible to find a horizontal line that intersects the graph of \( f \) at more than one point, you can conclude that \( f \) is not a one-to-one function and does not have an inverse function.

**CHECKpoint** Now try Exercise 39.
Finding Inverse Functions Algebraically

For simple functions (such as the one in Example 1), you can find inverse functions by inspection. For more complicated functions, however, it is best to use the following guidelines. The key step in these guidelines is Step 3—interchanging the roles of \( x \) and \( y \). This step corresponds to the fact that inverse functions have ordered pairs with the coordinates reversed.

Finding an Inverse Function

1. Use the Horizontal Line Test to decide whether \( f \) has an inverse function.
2. In the equation for \( f(x) \), replace \( f(x) \) by \( y \).
3. Interchange the roles of \( x \) and \( y \), and solve for \( y \).
4. Replace \( y \) by \( f^{-1}(x) \) in the new equation.
5. Verify that \( f \) and \( f^{-1} \) are inverse functions of each other by showing that the domain of \( f \) is equal to the range of \( f^{-1} \), the range of \( f \) is equal to the domain of \( f^{-1} \), and \( f(f^{-1}(x)) = x \) and \( f^{-1}(f(x)) = x \).

Example 6  Finding an Inverse Function Algebraically

Find the inverse function of

\[
  f(x) = \frac{5 - 3x}{2}
\]

Solution

The graph of \( f \) is a line, as shown in Figure 1.99. This graph passes the Horizontal Line Test. So, you know that \( f \) is one-to-one and has an inverse function.

\[
  f(x) = \frac{5 - 3x}{2} \quad \text{Write original function.}
\]

\[
  y = \frac{5 - 3x}{2} \quad \text{Replace } f(x) \text{ by } y.
\]

\[
  x = \frac{5 - 3y}{2} \quad \text{Interchange } x \text{ and } y.
\]

\[
  2x = 5 - 3y \quad \text{Multiply each side by 2.}
\]

\[
  3y = 5 - 2x \quad \text{Isolate the } y\text{-term.}
\]

\[
  y = \frac{5 - 2x}{3} \quad \text{Solve for } y.
\]

\[
  f^{-1}(x) = \frac{5 - 2x}{3} \quad \text{Replace } y \text{ by } f^{-1}(x).
\]

Note that both \( f \) and \( f^{-1} \) have domains and ranges that consist of the entire set of real numbers. Check that \( f(f^{-1}(x)) = x \) and \( f^{-1}(f(x)) = x \).

CHECKPOINT  Now try Exercise 63.
Section 1.9 Inverse Functions

Example 7 Finding an Inverse Function

Find the inverse function of

\[ f(x) = \sqrt{2x - 3}. \]

Solution

The graph of \( f \) is a curve, as shown in Figure 1.100. Because this graph passes the Horizontal Line Test, you know that \( f \) is one-to-one and has an inverse function.

\[
\begin{align*}
  f(x) &= \sqrt{2x - 3} & \text{Write original function.} \\
  y &= \sqrt{2x - 3} & \text{Replace } f(x) \text{ by } y. \\
  x &= \sqrt{2y - 3} & \text{Interchange } x \text{ and } y. \\
  x^2 &= 2y - 3 & \text{Square each side.} \\
  2y &= x^2 + 3 & \text{Isolate } y. \\
  y &= \frac{x^2 + 3}{2} & \text{Solve for } y. \\
  f^{-1}(x) &= \frac{x^2 + 3}{2}, \quad x \geq 0 & \text{Replace } y \text{ by } f^{-1}(x).
\end{align*}
\]

The graph of \( f^{-1} \) in Figure 1.100 is the reflection of the graph of \( f \) in the line \( y = x \). Note that the range of \( f \) is the interval \([0, \infty)\), which implies that the domain of \( f^{-1} \) is the interval \([0, \infty)\). Moreover, the domain of \( f \) is the interval \([\frac{3}{2}, \infty)\), which implies that the range of \( f^{-1} \) is the interval \([\frac{3}{2}, \infty)\). Verify that \( f(f^{-1}(x)) = x \) and \( f^{-1}(f(x)) = x \).

CHECKPOINT Now try Exercise 69.

Classroom Discussion

The Existence of an Inverse Function Write a short paragraph describing why the following functions do or do not have inverse functions.

a. Let \( x \) represent the retail price of an item (in dollars), and let \( f(x) \) represent the sales tax on the item. Assume that the sales tax is 6% of the retail price and that the sales tax is rounded to the nearest cent. Does this function have an inverse function? (Hint: Can you undo this function? For instance, if you know that the sales tax is $0.12, can you determine exactly what the retail price is?)

b. Let \( x \) represent the temperature in degrees Celsius, and let \( f(x) \) represent the temperature in degrees Fahrenheit. Does this function have an inverse function? (Hint: The formula for converting from degrees Celsius to degrees Fahrenheit is \( F = \frac{9}{5}C + 32 \).)
1.9 EXERCISES

VOCABULARY: Fill in the blanks.
1. If the composite functions \( f(g(x)) \) and \( g(f(x)) \) both equal \( x \), then the function \( g \) is the ______ function of \( f \).
2. The inverse function of \( f \) is denoted by ______.
3. The domain of \( f \) is the ______ of \( f^{-1} \), and the ______ of \( f^{-1} \) is the range of \( f \).
4. The graphs of \( f \) and \( f^{-1} \) are reflections of each other in the line ______.
5. A function \( f \) is ______ if each value of the dependent variable corresponds to exactly one value of the independent variable.
6. A graphical test for the existence of an inverse function of \( f \) is called the ______ Line Test.

SKILLS AND APPLICATIONS

In Exercises 7–14, find the inverse function of \( f \) informally. Verify that \( f(f^{-1}(x)) = x \) and \( f^{-1}(f(x)) = x \).

7. \( f(x) = 6x \)  
8. \( f(x) = \frac{1}{3}x \)
9. \( f(x) = x + 9 \)  
10. \( f(x) = x - 4 \)
11. \( f(x) = 3x + 1 \)  
12. \( f(x) = \frac{x - 1}{5} \)
13. \( f(x) = \sqrt{x} \)  
14. \( f(x) = x^3 \)

In Exercises 15–18, match the graph of the function with the graph of its inverse function. [The graphs of the inverse functions are labeled (a), (b), (c), and (d).]

17. \( \begin{array}{c}
\text{(a)} \\
\text{(b)} \\
\text{(c)} \\
\text{(d)} \\
\end{array} \)  
18. \( \begin{array}{c}
\text{(a)} \\
\text{(b)} \\
\text{(c)} \\
\text{(d)} \\
\end{array} \)

In Exercises 19–22, verify that \( f \) and \( g \) are inverse functions.

19. \( f(x) = -\frac{7}{2}x - 3, \quad g(x) = -\frac{2x + 6}{7} \)
20. \( f(x) = \frac{x - 9}{4}, \quad g(x) = 4x + 9 \)
21. \( f(x) = x^3 + 5, \quad g(x) = \sqrt[3]{x - 5} \)
22. \( f(x) = \frac{x^3}{2}, \quad g(x) = \sqrt[3]{2x} \)

In Exercises 23–34, show that \( f \) and \( g \) are inverse functions (a) algebraically and (b) graphically.

23. \( f(x) = 2x, \quad g(x) = \frac{x}{2} \)
24. \( f(x) = x - 5, \quad g(x) = x + 5 \)
25. \( f(x) = 7x + 1, \quad g(x) = \frac{x - 1}{7} \)
26. \( f(x) = 3 - 4x, \quad g(x) = \frac{3 - x}{4} \)
27. \( f(x) = \frac{x^3}{8}, \quad g(x) = 2\sqrt[3]{x} \)
28. \( f(x) = \frac{1}{x}, \quad g(x) = \frac{1}{x} \)
29. \( f(x) = \sqrt{x - 4}, \quad g(x) = x^2 + 4, \quad x \geq 0 \)
30. \( f(x) = 1 - x^3, \quad g(x) = \sqrt[3]{1 - x} \)
31. \( f(x) = 9 - x^2, \quad x \geq 0, \quad g(x) = \sqrt[3]{9 - x}, \quad x \leq 9 \)
32. \( f(x) = \frac{1}{1 + x^4}, \ x \geq 0, \ \ g(x) = \frac{1 - x}{x}, \ 0 < x \leq 1 \)

33. \( f(x) = \frac{x - 1}{x + 5}, \ \ g(x) = -\frac{5x + 1}{x - 1} \)

34. \( f(x) = \frac{x + 3}{x - 2}, \ \ g(x) = \frac{2x + 3}{x - 1} \)

In Exercises 35 and 36, does the function have an inverse function?

35. | \( x \) | -1 | 0 | 1 | 2 | 3 | 4 |
   | \hline
   | \( f(x) \) | -2 | 1 | 2 | 1 | -2 | -6 |

36. | \( x \) | -3 | -2 | -1 | 0 | 2 | 3 |
   | \hline
   | \( f(x) \) | 10 | 6 | 4 | 1 | -3 | -10 |

In Exercises 37 and 38, use the table of values for \( y = f(x) \) to complete a table for \( y = f^{-1}(x) \).

37. | \( x \) | -2 | -1 | 0 | 1 | 2 | 3 |
   | \hline
   | \( f(x) \) | -2 | 0 | 2 | 4 | 6 | 8 |

38. | \( x \) | -3 | -2 | -1 | 0 | 1 | 2 |
   | \hline
   | \( f(x) \) | -10 | -7 | -4 | -1 | 2 | 5 |

In Exercises 39–42, does the function have an inverse function?

39. In Exercises 43–48, use a graphing utility to graph the function, and use the Horizontal Line Test to determine whether the function is one-to-one and so has an inverse function.

43. \( g(x) = \frac{4 - x}{6} \)

44. \( f(x) = 10 \)

45. \( h(x) = |x + 4| - |x - 4| \)

46. \( g(x) = (x + 5)^3 \)

47. \( f(x) = -2x\sqrt{16 - x^2} \)

48. \( f(x) = \frac{1}{8}(x + 2)^2 - 1 \)

In Exercises 49–62, (a) find the inverse function of \( f \), (b) graph both \( f \) and \( f^{-1} \) on the same set of coordinate axes, (c) describe the relationship between the graphs of \( f \) and \( f^{-1} \), and (d) state the domain and range of \( f \) and \( f^{-1} \).

49. \( f(x) = 2x - 3 \)

50. \( f(x) = 3x + 1 \)

51. \( f(x) = x^4 - 2 \)

52. \( f(x) = x^3 + 1 \)

53. \( f(x) = \sqrt[4]{4 - x^2}, \ 0 \leq x \leq 2 \)

54. \( f(x) = x^2 - 2, \ x \leq 0 \)

55. \( f(x) = \frac{4}{x} \)

56. \( f(x) = \frac{-2}{x} \)

57. \( f(x) = \frac{x + 1}{x - 2} \)

58. \( f(x) = \frac{x - 3}{x + 2} \)

59. \( f(x) = \frac{x}{\sqrt{x} - 1} \)

60. \( f(x) = x^{1/5} \)

61. \( f(x) = \frac{6x + 4}{4x + 5} \)

62. \( f(x) = \frac{8x - 4}{2x + 6} \)

In Exercises 63–76, determine whether the function has an inverse function. If it does, find the inverse function.

63. \( f(x) = x^4 \)

64. \( f(x) = \frac{1}{x^2} \)

65. \( g(x) = \frac{x}{8} \)

66. \( f(x) = 3x + 5 \)

67. \( p(x) = -4 \)

68. \( f(x) = \frac{3x + 4}{5} \)

69. \( f(x) = (x + 3)^2, \ x \leq -3 \)

70. \( g(x) = (x - 5)^2 \)

71. \( f(x) = \begin{cases} x + 3, & x < 0 \\ 6 - x, & x \geq 0 \end{cases} \)

72. \( f(x) = \begin{cases} -x, & x \leq 0 \\ x^2 - 3x, & x > 0 \end{cases} \)

73. \( h(x) = \frac{-4}{x^2} \)

74. \( f(x) = |x - 2|, \ x \leq 2 \)

75. \( f(x) = \sqrt{2x + 3} \)

76. \( f(x) = \sqrt{x - 2} \)
Think About It  In Exercises 77–86, restrict the domain of the function f so that the function is one-to-one and has an inverse function. Then find the inverse function f⁻¹. State the domains and ranges of f and f⁻¹. Explain your results. (There are many correct answers.)

77. \( f(x) = (x - 2)^2 \)
78. \( f(x) = 1 - x^4 \)
79. \( f(x) = |x + 2| \)
80. \( f(x) = |x - 5| \)
81. \( f(x) = (x + 6)^2 \)
82. \( f(x) = (x - 4)^2 \)
83. \( f(x) = -2x^2 + 5 \)
84. \( f(x) = \frac{1}{2}x^2 - 1 \)
85. \( f(x) = |x - 4| + 1 \)
86. \( f(x) = -|x - 1| - 2 \)

In Exercises 87–92, use the functions given by \( f(x) = \frac{3}{4}x - 3 \) and \( g(x) = x^3 \) to find the indicated value or function.

87. \( (f^{-1} \circ g^{-1})(1) \)
88. \( (g^{-1} \circ f^{-1})(-3) \)
89. \( (f^{-1} \circ f^{-1})(6) \)
90. \( (g^{-1} \circ g^{-1})(-4) \)
91. \( (f \circ g)^{-1} \)
92. \( g^{-1} \circ f^{-1} \)

In Exercises 93–96, use the functions given by \( f(x) = x + 4 \) and \( g(x) = 2x - 5 \) to find the specified function.

93. \( g^{-1} \circ f^{-1} \)
94. \( f^{-1} \circ g^{-1} \)
95. \( (f \circ g)^{-1} \)
96. \( (g \circ f)^{-1} \)

Shoe Sizes  The table shows men’s shoe sizes in the United States and the corresponding European shoe sizes. Let \( y = f(x) \) represent the function that gives the men’s European shoe size in terms of \( x \), the men’s U.S. size.

<table>
<thead>
<tr>

(a) Does \( P^{-1} \) exist?
(b) If \( P^{-1} \) exists, what does it represent in the context of the problem?
(c) If \( P^{-1} \) exists, find \( P^{-1}(357.5) \).
(d) If the table was extended to 2050 and if the projected population of the U.S. for that year was 373.5 million, would \( P^{-1} \) exist? Explain.

101. **HOURLY WAGE** Your wage is \( \$10.00 \) per hour plus \( \$0.75 \) for each unit produced per hour. So, your hourly wage \( y \) in terms of the number of units produced \( x \) is \( y = 10 + 0.75x \).

(a) Find the inverse function. What does each variable represent in the inverse function?
(b) Determine the number of units produced when your hourly wage is \( \$24.25 \).

102. **DIESEL MECHANICS** The function given by

\[
y = 0.033x^2 + 245.50, \quad 0 < x < 100
\]

approximates the exhaust temperature \( y \) in degrees Fahrenheit, where \( x \) is the percent load for a diesel engine.

(a) Find the inverse function. What does each variable represent in the inverse function?
(b) Use a graphing utility to graph the inverse function.
(c) The exhaust temperature of the engine must not exceed 500 degrees Fahrenheit. What is the percent load interval?

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 103 and 104, determine whether the statement is true or false. Justify your answer.

103. If \( f \) is an even function, then \( f^{-1} \) exists.
104. If the inverse function of \( f \) exists and the graph of \( f \) has a \( y \)-intercept, then the \( y \)-intercept of \( f \) is an \( x \)-intercept of \( f^{-1} \).

105. **PROOF** Prove that if \( f \) and \( g \) are one-to-one functions, then \( (f \circ g)^{-1}(x) = (g^{-1} \circ f^{-1})(x) \).

106. **PROOF** Prove that if \( f \) is a one-to-one odd function, then \( f^{-1} \) is an odd function.

In Exercises 107 and 108, use the graph of the function \( f \) to create a table of values for the given points. Then create a second table that can be used to find \( f^{-1} \), and sketch the graph of \( f^{-1} \) if possible.

107. 

*Graph of f*

108. 

*Graph of f*

In Exercises 109–112, determine if the situation could be represented by a one-to-one function. If so, write a statement that describes the inverse function.

109. The number of miles \( n \) a marathon runner has completed in terms of the time \( t \) in hours
110. The population \( p \) of South Carolina in terms of the year \( t \) from 1960 through 2008
111. The depth of the tide \( d \) at a beach in terms of the time \( t \) over a 24-hour period
112. The height \( h \) in inches of a human born in the year 2000 in terms of his or her age \( n \) in years.

113. **THINK ABOUT IT** The function given by

\[
f(x) = k(2 - x - x^3)
\]

has an inverse function, and \( f^{-1}(3) = -2 \). Find \( k \).

114. **THINK ABOUT IT** Consider the functions given by

\[
f(x) = x + 2 \quad \text{and} \quad f^{-1}(x) = x - 2
\]

Evaluate \( f(f^{-1}(x)) \) and \( f^{-1}(f(x)) \) for the indicated values of \( x \). What can you conclude about the functions?

<table>
<thead>
<tr>
<th>( x )</th>
<th>-10</th>
<th>0</th>
<th>7</th>
<th>45</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(f^{-1}(x)) )</td>
<td>( f^{-1}(f(x)) )</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

115. **THINK ABOUT IT** Restrict the domain of \( f(x) = x^2 + 1 \) to \( x \geq 0 \). Use a graphing utility to graph the function. Does the restricted function have an inverse function? Explain.

116. **CAPSTONE** Describe and correct the error.

Given \( f(x) = \sqrt{x} - 6 \), then \( f^{-1}(x) = \frac{1}{\sqrt{x} - 6} \)
**Introduction**

You have already studied some techniques for fitting models to data. For instance, in Section 1.3, you learned how to find the equation of a line that passes through two points. In this section, you will study other techniques for fitting models to data: *least squares regression* and *direct and inverse variation*. The resulting models are either polynomial functions or rational functions. (Rational functions will be studied in Chapter 2.)

**Example 1  A Mathematical Model**

The populations *y* (in millions) of the United States from 2000 through 2007 are shown in the table.  
(Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>
<th>Population, <em>y</em></th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>282.4</td>
</tr>
<tr>
<td>2001</td>
<td>285.3</td>
</tr>
<tr>
<td>2002</td>
<td>288.2</td>
</tr>
<tr>
<td>2003</td>
<td>290.9</td>
</tr>
<tr>
<td>2004</td>
<td>293.6</td>
</tr>
<tr>
<td>2005</td>
<td>296.3</td>
</tr>
<tr>
<td>2006</td>
<td>299.2</td>
</tr>
<tr>
<td>2007</td>
<td>302.0</td>
</tr>
</tbody>
</table>

A linear model that approximates the data is  

\[ y = 2.78t + 282.5 \]

for 0 ≤ *t* ≤ 7, where *t* is the year, with *t* = 0 corresponding to 2000. Plot the actual data and the model on the same graph. How closely does the model represent the data?

**Solution**

The actual data are plotted in Figure 1.101, along with the graph of the linear model. From the graph, it appears that the model is a “good fit” for the actual data. You can see how well the model fits by comparing the actual values of *y* with the values of *y* given by the model. The values given by the model are labeled *y*\(^*\) in the table below.

<table>
<thead>
<tr>
<th><em>t</em></th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>

<td>296.3</td>
<td>299.2</td>
<td>302.0</td>
</tr>
<tr>
<td><em>y</em>(^*)</td>
<td>282.5</td>
<td>285.3</td>
<td>288.1</td>
<td>290.8</td>
<td>293.6</td>
<td>296.4</td>
<td>299.2</td>
<td>302.0</td>
</tr>
</tbody>
</table>

Note in Example 1 that you could have chosen any two points to find a line that fits the data. However, the given linear model was found using the *regression* feature of a graphing utility and is the line that *best* fits the data. This concept of a “best-fitting” line is discussed on the next page.
Least Squares Regression and Graphing Utilities

So far in this text, you have worked with many different types of mathematical models that approximate real-life data. In some instances the model was given (as in Example 1), whereas in other instances you were asked to find the model using simple algebraic techniques or a graphing utility.

To find a model that approximates the data most accurately, statisticians use a measure called the sum of square differences, which is the sum of the squares of the differences between actual data values and model values. The “best-fitting” linear model, called the least squares regression line, is the one with the least sum of square differences. Recall that you can approximate this line visually by plotting the data points and drawing the line that appears to fit best—or you can enter the data points into a calculator or computer and use the linear regression feature of the calculator or computer. When you use the regression feature of a graphing calculator or computer program, you will notice that the program may also output an “r-value.” This r-value is the correlation coefficient of the data and gives a measure of how well the model fits the data. The closer the value of r is to 1, the better the fit.

**Example 2** Finding a Least Squares Regression Line

The data in the table show the outstanding household credit market debt $D$ (in trillions of dollars) from 2000 through 2007. Construct a scatter plot that represents the data and find the least squares regression line for the data. (Source: Board of Governors of the Federal Reserve System)

<table>
<thead>
<tr>
<th>Year (0 ↔ 2000)</th>
<th>Household credit market debt, $D$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>7.0</td>
</tr>
<tr>
<td>2001</td>
<td>7.7</td>
</tr>
<tr>
<td>2002</td>
<td>8.5</td>
</tr>
<tr>
<td>2003</td>
<td>9.5</td>
</tr>
<tr>
<td>2004</td>
<td>10.6</td>
</tr>
<tr>
<td>2005</td>
<td>11.8</td>
</tr>
<tr>
<td>2006</td>
<td>12.9</td>
</tr>
<tr>
<td>2007</td>
<td>13.8</td>
</tr>
</tbody>
</table>

**Solution**

Let $t = 0$ represent 2000. The scatter plot for the points is shown in Figure 1.102. Using the regression feature of a graphing utility, you can determine that the equation of the least squares regression line is

$$ D = 1.01t + 6.7. $$

To check this model, compare the actual $D$-values with the $D$-values given by the model, which are labeled $D*$ in the table at the left. The correlation coefficient for this model is $r \approx 0.997$, which implies that the model is a good fit.

Now try Exercise 17.
Direct Variation

There are two basic types of linear models. The more general model has a
\(y\)-intercept that is nonzero.

\[ y = mx + b, \quad b \neq 0 \]

The simpler model

\[ y = kx \]

has a \(y\)-intercept that is zero. In the simpler model, \(y\) is said to vary directly as \(x\), or to be directly proportional to \(x\).

Direct Variation

The following statements are equivalent.

1. \(y\) varies directly as \(x\).
2. \(y\) is directly proportional to \(x\).
3. \(y = kx\) for some nonzero constant \(k\).

\(k\) is the constant of variation or the constant of proportionality.

Example 3  Direct Variation

In Pennsylvania, the state income tax is directly proportional to gross income. You are working in Pennsylvania and your state income tax deduction is $46.05 for a gross monthly income of $1500. Find a mathematical model that gives the Pennsylvania state income tax in terms of gross income.

Solution

**Verbal Model:**

State income tax = \(k \cdot\) Gross income

**Labels:**

State income tax = \(y\) (dollars)

Gross income = \(x\) (dollars)

Income tax rate = \(k\) (percent in decimal form)

**Equation:**

\[ y = kx \]

To solve for \(k\), substitute the given information into the equation \(y = kx\), and then solve for \(k\).

\[ y = kx \quad \text{Write direct variation model.} \]

\[ 46.05 = k(1500) \quad \text{Substitute } y = 46.05 \text{ and } x = 1500. \]

\[ 0.0307 = k \quad \text{Simplify.} \]

So, the equation (or model) for state income tax in Pennsylvania is

\[ y = 0.0307x. \]

In other words, Pennsylvania has a state income tax rate of 3.07% of gross income. The graph of this equation is shown in Figure 1.103.

**CHECKPOINT** Now try Exercise 43.
**Direct Variation as an $n$th Power**

Another type of direct variation relates one variable to a power of another variable. For example, in the formula for the area of a circle

$$ A = \pi r^2 $$

the area $A$ is directly proportional to the square of the radius $r$. Note that for this formula, $\pi$ is the constant of proportionality.

**Study Tip**

Note that the direct variation model $y = kx$ is a special case of $y = kx^n$ with $n = 1$.

---

**Example 4** Direct Variation as $n$th Power

The distance a ball rolls down an inclined plane is directly proportional to the square of the time it rolls. During the first second, the ball rolls 8 feet. (See Figure 1.104.)

a. Write an equation relating the distance traveled to the time.

b. How far will the ball roll during the first 3 seconds?

**Solution**

a. Letting $d$ be the distance (in feet) the ball rolls and letting $t$ be the time (in seconds), you have

$$ d = kt^2. $$

Now, because $d = 8$ when $t = 1$, you can see that $k = 8$, as follows.

$$ d = kt^2 $$

$$ 8 = k(1)^2 $$

$$ 8 = k $$

So, the equation relating distance to time is

$$ d = 8t^2. $$

b. When $t = 3$, the distance traveled is $d = 8(3)^2 = 8(9) = 72$ feet.

**CHECK Point** Now try Exercise 75.

In Examples 3 and 4, the direct variations are such that an *increase* in one variable corresponds to an *increase* in the other variable. This is also true in the model

$$ d = \frac{1}{2}F, F > 0, $$

where an increase in $F$ results in an increase in $d$. You should not, however, assume that this always occurs with direct variation. For example, in the model $y = -3x$, an increase in $x$ results in a *decrease* in $y$, and yet $y$ is said to vary directly as $x$. 

Inverse Variation

The following statements are equivalent.

1. \( y \) varies inversely as \( x \).  
2. \( y \) is inversely proportional to \( x \).  
3. \( y = \frac{k}{x} \) for some constant \( k \).

If \( x \) and \( y \) are related by an equation of the form \( y = \frac{k}{x^n} \), then \( y \) varies inversely as the \( n \)th power of \( x \) (or \( y \) is inversely proportional to the \( n \)th power of \( x \)).

Some applications of variation involve problems with both direct and inverse variation in the same model. These types of models are said to have combined variation.

Example 5  
Direct and Inverse Variation

A gas law states that the volume of an enclosed gas varies directly as the temperature and inversely as the pressure, as shown in Figure 1.105. The pressure of a gas is 0.75 kilogram per square centimeter when the temperature is 294 K and the volume is 8000 cubic centimeters. (a) Write an equation relating pressure, temperature, and volume. (b) Find the pressure when the temperature is 300 K and the volume is 7000 cubic centimeters.

Solution

a. Let \( V \) be volume (in cubic centimeters), let \( P \) be pressure (in kilograms per square centimeter), and let \( T \) be temperature (in Kelvin). Because \( V \) varies directly as \( T \) and inversely as \( P \), you have

\[
V = \frac{kT}{P}.
\]

Now, because \( P = 0.75 \) when \( T = 294 \) and \( V = 8000 \), you have

\[
8000 = \frac{k(294)}{0.75}
\]

\[
k = \frac{6000}{294} = \frac{1000}{49}.
\]

So, the equation relating pressure, temperature, and volume is

\[
V = \frac{1000}{49} \left(\frac{T}{P}\right).
\]

b. When \( T = 300 \) and \( V = 7000 \), the pressure is

\[
P = \frac{1000}{49} \left(\frac{300}{7000}\right) = \frac{300}{343} \approx 0.87 \text{ kilogram per square centimeter}.
\]

Now try Exercise 77.
Joint Variation

In Example 5, note that when a direct variation and an inverse variation occur in the same statement, they are coupled with the word “and.” To describe two different direct variations in the same statement, the word jointly is used.

Joint Variation

The following statements are equivalent.
1. \( z \) varies jointly as \( x \) and \( y \).
2. \( z \) is jointly proportional to \( x \) and \( y \).
3. \( z = kxy \) for some constant \( k \).

If \( x, y, \) and \( z \) are related by an equation of the form
\[
z = kx^ny^m
\]
then \( z \) varies jointly as the \( n \)th power of \( x \) and the \( m \)th power of \( y \).

Example 6 Joint Variation

The simple interest for a certain savings account is jointly proportional to the time and the principal. After one quarter (3 months), the interest on a principal of $5000 is $43.75.

a. Write an equation relating the interest, principal, and time.
b. Find the interest after three quarters.

Solution

a. Let \( I \) = interest (in dollars), \( P \) = principal (in dollars), and \( t \) = time (in years). Because \( I \) is jointly proportional to \( P \) and \( t \), you have
\[
I = kPt
\]
For \( I = 43.75 \), \( P = 5000 \), and \( t = \frac{1}{4} \), you have
\[
43.75 = k(5000)(\frac{1}{4})
\]
which implies that \( k = 4(43.75)/5000 = 0.035 \). So, the equation relating interest, principal, and time is
\[
I = 0.035Pt
\]
which is the familiar equation for simple interest where the constant of proportionality, 0.035, represents an annual interest rate of 3.5%.

b. When \( P = 5000 \) and \( t = \frac{1}{4} \), the interest is
\[
I = (0.035)(5000)(\frac{3}{4})
\]
\[
= 131.25.
\]

Now try Exercise 79.
1.10 EXERCISES

VOCABULARY: Fill in the blanks.
1. Two techniques for fitting models to data are called direct ________ and least squares ________.
2. Statisticians use a measure called ________ of________  ________ to find a model that approximates a set of data most accurately.
3. The linear model with the least sum of square differences is called the ________  ________  ________ line.
4. An r-value of a set of data, also called a ________  ________, gives a measure of how well a model fits a set of data.
5. Direct variation models can be described as “y varies directly as x,” or “y is ________  ________ to x.”
6. In direct variation models of the form y = kx, k is called the ________ of ________.
7. The direct variation model can be described as “y varies directly as the th power of “ or “y is ________  ________ to the th power of “
8. The mathematical model y = $\frac{k}{x}$ is an example of ________ variation.
9. Mathematical models that involve both direct and inverse variation are said to have ________ variation.
10. The joint variation model z = kxy can be described as “z varies jointly as x and y,” or “z is ________  ________ to x and y.”

SKILLS AND APPLICATIONS

11. EMPLOYMENT The total numbers of people (in thousands) in the U.S. civilian labor force from 1992 through 2007 are given by the following ordered pairs.

<table>

27. \( k = 2 \)  
28. \( k = 5 \)

29. \( k = 10 \)  
30. \( k = 20 \)

In Exercises 31–34, determine whether the variation model is of the form \( y = kx \) or \( y = k/x \), and find \( k \). Then write a model that relates \( y \) and \( x \).

31.  
32.  
33.  
34.  

**DIRECT VARIATION** In Exercises 35–38, assume that \( y \) is directly proportional to \( x \). Use the given \( x \)-value and \( y \)-value to find a linear model that relates \( y \) and \( x \).

35. \( x = 5, y = 12 \)  
36. \( x = 2, y = 14 \)

37. \( x = 10, y = 2050 \)  
38. \( x = 6, y = 580 \)

**SIMPLE INTEREST** The simple interest on an investment is directly proportional to the amount of the investment. By investing $3250 in a certain bond issue, you obtained an interest payment of $113.75 after 1 year. Find a mathematical model that gives the interest \( I \) for this bond issue after 1 year in terms of the amount invested \( P \).

**SIMPLE INTEREST** The simple interest on an investment is directly proportional to the amount of the investment. By investing $6500 in a municipal bond, you obtained an interest payment of $211.25 after 1 year. Find a mathematical model that gives the interest \( I \) for this municipal bond after 1 year in terms of the amount invested \( P \).

**MEASUREMENT** On a yardstick with scales in inches and centimeters, you notice that 13 inches is approximately the same length as 33 centimeters. Use this information to find a mathematical model that relates centimeters \( y \) to inches \( x \). Then use the model to find the numbers of centimeters in 10 inches and 20 inches.

**MEASUREMENT** When buying gasoline, you notice that 14 gallons of gasoline is approximately the same amount of gasoline as 53 liters. Use this information to find a linear model that relates liters \( y \) to gallons \( x \). Then use the model to find the numbers of liters in 5 gallons and 25 gallons.
43. **TAXES** Property tax is based on the assessed value of a property. A house that has an assessed value of $150,000 has a property tax of $5520. Find a mathematical model that gives the amount of property tax \( y \) in terms of the assessed value \( x \) of the property. Use the model to find the property tax on a house that has an assessed value of $225,000.

44. **TAXES** State sales tax is based on retail price. An item that sells for $189.99 has a sales tax of $11.40. Find a mathematical model that gives the amount of sales tax in terms of the retail price. Use the model to find the sales tax on a $639.99 purchase.

**HOOKE’S LAW** In Exercises 45–48, use Hooke’s Law for springs, which states that the distance a spring is stretched (or compressed) varies directly as the force on the spring.

45. A force of 265 newtons stretches a spring 0.15 meter (see figure).

(a) How far will a force of 90 newtons stretch the spring?

(b) What force is required to stretch the spring 0.1 meter?

46. A force of 220 newtons stretches a spring 0.12 meter. What force is required to stretch the spring 0.16 meter?

47. The coiled spring of a toy supports the weight of a child. The spring is compressed a distance of 1.9 inches by the weight of a 25-pound child. The toy will not work properly if its spring is compressed more than 3 inches. What is the weight of the heaviest child who should be allowed to use the toy?

48. An overhead garage door has two springs, one on each side of the door (see figure). A force of 15 pounds is required to stretch each spring 1 foot. Because of a pulley system, the springs stretch only one-half the distance the door travels. The door moves a total of 8 feet, and the springs are at their natural length when the door is open. Find the combined lifting force applied to the door by the springs when the door is closed.

In Exercises 49–58, find a mathematical model for the verbal statement.

49. \( A \) varies directly as the square of \( r \).

50. \( V \) varies directly as the cube of \( e \).

51. \( y \) varies inversely as the square of \( x \).

52. \( h \) varies inversely as the square root of \( s \).

53. \( F \) varies directly as \( g \) and inversely as \( r^2 \).

54. \( z \) is jointly proportional to the square of \( x \) and the cube of \( y \).

55. **BOYLE’S LAW**: For a constant temperature, the pressure \( P \) of a gas is inversely proportional to the volume \( V \) of the gas.

56. **NEWTON’S LAW OF COOLING**: The rate of change \( R \) of the temperature of an object is proportional to the difference between the temperature \( T \) of the object and the temperature \( T_e \) of the environment in which the object is placed.

57. **NEWTON’S LAW OF UNIVERSAL GRAVITATION**: The gravitational attraction \( F \) between two objects of masses \( m_1 \) and \( m_2 \) is proportional to the product of the masses and inversely proportional to the square of the distance \( r \) between the objects.

58. **LOGISTIC GROWTH**: The rate of growth \( R \) of a population is jointly proportional to the size \( S \) of the population and the difference between \( S \) and the maximum population size \( L \) that the environment can support.

In Exercises 59–66, write a sentence using the variation terminology of this section to describe the formula.

59. **Area of a triangle**: \( A = \frac{1}{2}bh \)

60. **Area of a rectangle**: \( A = lw \)

61. **Area of an equilateral triangle**: \( A = \left( \sqrt{3}s^2 \right)/4 \)

62. **Surface area of a sphere**: \( S = 4\pi r^2 \)

63. **Volume of a sphere**: \( V = \frac{4}{3}\pi r^3 \)

64. **Volume of a right circular cylinder**: \( V = \pi r^2 h \)

65. **Average speed**: \( v = \frac{d}{t} \)

66. **Free vibrations**: \( \omega = \sqrt{\frac{k}{m}} \)
In Exercises 67–74, find a mathematical model representing the statement. (In each case, determine the constant of proportionality.)

67. $A$ varies directly as $r^2$. ($A = 9\pi$ when $r = 3$.)
68. $y$ varies inversely as $x$. ($y = 3$ when $x = 25$.)
69. $y$ is inversely proportional to $x$. ($y = 7$ when $x = 4$.)
70. $z$ varies jointly as $x$ and $y$. ($z = 64$ when $x = 4$ and $y = 8$.)
71. $F$ is jointly proportional to $r$ and the third power of $s$. ($F = 4158$ when $r = 11$ and $s = 3$.)
72. $P$ varies directly as $x$ and inversely as the square of $y$. ($P = \frac{28}{7}$ when $x = 42$ and $y = 9$.)
73. $z$ varies directly as the square of $x$ and inversely as $y$. ($z = 6$ when $x = 6$ and $y = 4$.)
74. $v$ varies jointly as $p$ and $q$ and inversely as the square of $s$. ($v = 1.5$ when $p = 4.1$, $q = 6.3$, and $s = 1.2$.)

ECOLOGY In Exercises 75 and 76, use the fact that the diameter of the largest particle that can be moved by a stream varies approximately directly as the square of the velocity of the stream.

75. A stream with a velocity of $0.02$ mile per hour can move coarse sand particles about 0.02 inch in diameter. Approximate the velocity required to carry particles 0.12 inch in diameter.
76. A stream of velocity $v$ can move particles of diameter $d$ or less. By what factor does $d$ increase when the velocity is doubled?

RESISTANCE In Exercises 77 and 78, use the fact that the resistance of a wire carrying an electrical current is directly proportional to its length and inversely proportional to its cross-sectional area.

77. If #28 copper wire (which has a diameter of 0.0126 inch) has a resistance of 66.17 ohms per thousand feet, what length of #28 copper wire will produce a resistance of 33.5 ohms?
78. A 14-foot piece of copper wire produces a resistance of 0.05 ohm. Use the constant of proportionality from Exercise 77 to find the diameter of the wire.

WORK The work $W$ (in joules) done when lifting an object varies jointly with the mass $m$ (in kilograms) of the object and the height $h$ (in meters) that the object is lifted. The work done when a 120-kilogram object is lifted 1.8 meters is 2116.8 joules. How much work is done when lifting a 100-kilogram object 1.5 meters?

80. MUSIC The frequency of vibrations of a piano string varies directly as the square root of the tension on the string and inversely as the length of the string. The middle A string has a frequency of 440 vibrations per second. Find the frequency of a string that has 1.25 times as much tension and is 1.2 times as long.

81. FLUID FLOW The velocity $v$ of a fluid flowing in a conduit is inversely proportional to the cross-sectional area of the conduit. (Assume that the volume of the flow per unit of time is held constant.) Determine the change in the velocity of water flowing from a hose when a person places a finger over the end of the hose to decrease its cross-sectional area by 25%.

82. BEAM LOAD The maximum load that can be safely supported by a horizontal beam varies jointly as the width of the beam and the square of its depth, and inversely as the length of the beam. Determine the changes in the maximum safe load under the following conditions.
   (a) The width and length of the beam are doubled.
   (b) The width and depth of the beam are doubled.
   (c) All three of the dimensions are doubled.
   (d) The depth of the beam is halved.

83. DATA ANALYSIS: OCEAN TEMPERATURES An oceanographer took readings of the water temperatures $C$ (in degrees Celsius) at several depths $d$ (in meters). The data collected are shown in the table.

<table>
<thead>
<tr>
<th>Depth, $d$</th>
<th>Temperature, $C$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>4.2°C</td>
</tr>
<tr>
<td>2000</td>
<td>1.9°C</td>
</tr>
<tr>
<td>3000</td>
<td>1.4°C</td>
</tr>
<tr>
<td>4000</td>
<td>1.2°C</td>
</tr>
<tr>
<td>5000</td>
<td>0.9°C</td>
</tr>
</tbody>
</table>

   (a) Sketch a scatter plot of the data.
   (b) Does it appear that the data can be modeled by the inverse variation model $C = k/d$? If so, find $k$ for each pair of coordinates.
   (c) Determine the mean value of $k$ from part (b) to find the inverse variation model $C = k/d$.
   (d) Use a graphing utility to plot the data points and the inverse model from part (c).
   (e) Use the model to approximate the depth at which the water temperature is 3°C.
84. DATA ANALYSIS: PHYSICS EXPERIMENT  An experiment in a physics lab requires a student to measure the compressed lengths $y$ (in centimeters) of a spring when various forces of $F$ pounds are applied. The data are shown in the table.

<table>
<thead>
<tr>
<th>Force, $F$</th>
<th>Length, $y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>

<tr>
<td>8</td>
<td>4.6</td>
</tr>
<tr>
<td>10</td>
<td>5.75</td>
</tr>
<tr>
<td>12</td>
<td>6.9</td>
</tr>
</tbody>
</table>

(a) Sketch a scatter plot of the data.
(b) Does it appear that the data can be modeled by Hooke’s Law? If so, estimate $k$. (See Exercises 45–48.)
(c) Use the model in part (b) to approximate the force required to compress the spring 9 centimeters.

85. DATA ANALYSIS: LIGHT INTENSITY  A light probe is located $x$ centimeters from a light source, and the intensity (in microwatts per square centimeter) of the light is measured. The results are shown as ordered pairs $(x, y)$.

<table>
<thead>
<tr>
<th>$x$</th>
<th>$y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>0.1881</td>
</tr>
<tr>
<td>34</td>

</tr>
<tr>
<td>42</td>
<td>0.0998</td>
</tr>
<tr>
<td>46</td>
<td>0.0775</td>
</tr>
<tr>
<td>50</td>
<td>0.0645</td>
</tr>
</tbody>
</table>

A model for the data is $y = 262.76/x^{1.2}$.

(a) Use a graphing utility to plot the data points and the model in the same viewing window.
(b) Use the model to approximate the light intensity 25 centimeters from the light source.

86. ILLUMINATION  The illumination from a light source varies inversely as the square of the distance from the light source. When the distance from a light source is doubled, how does the illumination change? Discuss this model in terms of the data given in Exercise 85. Give a possible explanation of the difference.

EXPLORATION

TRUE OR FALSE?  In Exercises 87 and 88, decide whether the statement is true or false. Justify your answer.

87. In the equation for kinetic energy, $E = \frac{1}{2}mv^2$, the amount of kinetic energy $E$ is directly proportional to the mass $m$ of an object and the square of its velocity $v$.

88. If the correlation coefficient for a least squares regression line is close to $-1$, the regression line cannot be used to describe the data.

89. Discuss how well the data shown in each scatter plot can be approximated by a linear model.

90. WRITING  A linear model for predicting prize winnings at a race is based on data for 3 years. Write a paragraph discussing the potential accuracy or inaccuracy of such a model.

91. WRITING  Suppose the constant of proportionality is positive and $y$ varies directly as $x$. When one of the variables increases, how will the other change? Explain your reasoning.

92. WRITING  Suppose the constant of proportionality is positive and $y$ varies inversely as $x$. When one of the variables increases, how will the other change? Explain your reasoning.

93. WRITING  (a) Given that $y$ varies inversely as the square of $x$ and $x$ is doubled, how will $y$ change? Explain.
(b) Given that $y$ varies directly as the square of $x$ and $x$ is doubled, how will $y$ change? Explain.

94. CAPSTONE  The prices of three sizes of pizza at a pizza shop are as follows.

9-inch: $8.78, 12-inch: $11.78, 15-inch: $14.18

You would expect that the price of a certain size of pizza would be directly proportional to its surface area. Is that the case for this pizza shop? If not, which size of pizza is the best buy?

PROJECT: FRAUD AND IDENTITY THEFT  To work an extended application analyzing the numbers of fraud complaints and identity theft victims in the United States in 2007, visit this text’s website at academic.cengage.com.

## Chapter Summary

### What Did You Learn?

<table>
<thead>
<tr>
<th>Section</th>
<th>Explanation/Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.1</td>
<td>Plot points in the Cartesian plane (p. 2). For an ordered pair ((x, y)), the x-coordinate is the directed distance from the y-axis to the point, and the y-coordinate is the directed distance from the x-axis to the point.</td>
</tr>
<tr>
<td>1.2</td>
<td>Use the Distance Formula (p. 4) and the Midpoint Formula (p. 5). <strong>Distance Formula:</strong> (d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}) <strong>Midpoint Formula:</strong> Midpoint (= \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right))</td>
</tr>
<tr>
<td>1.3</td>
<td>Use a coordinate plane to model and solve real-life problems (p. 6). The coordinate plane can be used to find the length of a football pass (See Example 6).</td>
</tr>
<tr>
<td>1.4</td>
<td>Sketch graphs of equations, find x- and y-intercepts of graphs (p. 16), and use symmetry to sketch graphs of equations (p. 17). To graph an equation, make a table of values, plot the points, and connect the points with a smooth curve or line. To find x-intercepts, let (y) be zero and solve for (x). To find y-intercepts, let (x) be zero and solve for (y). Graphs can have symmetry with respect to one of the coordinate axes or with respect to the origin.</td>
</tr>
<tr>
<td>1.5</td>
<td>Find equations of and sketch graphs of circles (p. 19). The point ((x, y)) lies on the circle of radius (r) and center ((h, k)) if and only if ((x - h)^2 + (y - k)^2 = r^2).</td>
</tr>
<tr>
<td>1.6</td>
<td>Use graphs of equations in solving real-life problems (p. 20). The graph of an equation can be used to estimate the recommended weight for a man. (See Example 9.)</td>
</tr>
<tr>
<td>1.7</td>
<td>Use slope to graph linear equations in two variables (p. 24). The graph of the equation (y = mx + b) is a line whose slope is (m) and whose y-intercept is ((0, b)).</td>
</tr>
<tr>
<td>1.8</td>
<td>Find the slope of a line given two points on the line (p. 26). The slope (m) of the nonvertical line through ((x_1, y_1)) and ((x_2, y_2)) is (m = \frac{y_2 - y_1}{x_2 - x_1}), where (x_1 \neq x_2).</td>
</tr>
<tr>
<td>1.9</td>
<td>Write linear equations in two variables (p. 28). The equation of the line with slope (m) passing through the point ((x_1, y_1)) is (y - y_1 = m(x - x_1)).</td>
</tr>
<tr>
<td>1.10</td>
<td>Use slope to identify parallel and perpendicular lines (p. 29). <strong>Parallel lines:</strong> Slopes are equal. <strong>Perpendicular lines:</strong> Slopes are negative reciprocals of each other.</td>
</tr>
<tr>
<td>1.11</td>
<td>Use slope and linear equations in two variables to model and solve real-life problems (p. 30). A linear equation in two variables can be used to describe the book value of exercise equipment in a given year. (See Example 7.)</td>
</tr>
<tr>
<td>1.12</td>
<td>Determine whether relations between two variables are functions (p. 39). A function (f) from a set (A) (domain) to a set (B) (range) is a relation that assigns to each element (x) in the set (A) exactly one element (y) in the set (B).</td>
</tr>
<tr>
<td>1.13</td>
<td>Use function notation, evaluate functions, and find domains (p. 41). <strong>Equation:</strong> (f(x) = 5 - x^2) (f(2) = 5 - 2^2 = 1) <strong>Domain of (f(x)):</strong> (5 - x^2): All real numbers</td>
</tr>
<tr>
<td>1.14</td>
<td>Use functions to model and solve real-life problems (p. 45). A function can be used to model the number of alternative-fueled vehicles in the United States (See Example 10.)</td>
</tr>
<tr>
<td>1.15</td>
<td>Evaluate difference quotients (p. 46). <strong>Difference quotient:</strong> (\frac{f(x + h) - f(x)}{h}, h \neq 0)</td>
</tr>
<tr>
<td>1.16</td>
<td>Use the Vertical Line Test for functions (p. 55). A graph represents a function if and only if no vertical line intersects the graph at more than one point.</td>
</tr>
<tr>
<td>1.17</td>
<td>Find the zeros of functions (p. 56). <strong>Zeros of (f(x)):</strong> (x)-values for which (f(x) = 0)</td>
</tr>
</tbody>
</table>
## What Did You Learn?

<table>
<thead>
<tr>
<th>Section</th>
<th>Explanation/Examples</th>
<th>Review Exercises</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Section 1.5</strong></td>
<td>Identify even and odd functions (p. 60).</td>
<td>Even: For each ( x ) in the domain of ( f ), ( f(-x) = f(x) ). Odd: For each ( x ) in the domain of ( f ), ( f(-x) = -f(x) ).</td>
</tr>
<tr>
<td><strong>Section 1.6</strong></td>
<td>Identify and graph different types of functions (p. 66), and recognize graphs of parent function (p. 70).</td>
<td>Linear: ( f(x) = ax + b ); Squaring: ( f(x) = x^2 ); Cubic: ( f(x) = x^3 );</td>
</tr>
<tr>
<td><strong>Section 1.7</strong></td>
<td>Use vertical and horizontal shifts (p. 73), reflections (p. 75), and nonrigid transformations (p. 77) to sketch graphs of functions.</td>
<td>Vertical shifts: ( h(x) = f(x) + c ) or ( h(x) = f(x) - c ) Vertical shifts: ( h(x) = f(x + c) ) or ( h(x) = f(x - c) ) Reflection in x-axis: ( h(x) = -f(x) ) Reflection in y-axis: ( h(x) = f(-x) ) Nonrigid transformations: ( h(x) = cf(x) ) or ( h(x) = f(cx) )</td>
</tr>
<tr>
<td><strong>Section 1.8</strong></td>
<td>Add, subtract, multiply, and divide functions (p. 83), and find the compositions of functions (p. 85).</td>
<td>( (f + g)(x) = f(x) + g(x) ) ( (f - g)(x) = f(x) - g(x) ) ( (fg)(x) = f(x) \cdot g(x) ) ( (f/g)(x) = f(x)/g(x), g(x) \neq 0 ) Composition of Functions: ( (f \cdot g)(x) = f(g(x)) )</td>
</tr>
<tr>
<td><strong>Section 1.9</strong></td>
<td>Use combinations and compositions of functions to model and solve real-life problems (p. 87).</td>
<td>A composite function can be used to represent the number of bacteria in food as a function of the amount of time the food has been out of refrigeration. (See Example 8.)</td>
</tr>
<tr>
<td><strong>Section 1.10</strong></td>
<td>Find inverse functions informally and verify that two functions are inverse functions of each other (p. 92).</td>
<td>Let ( f ) and ( g ) be two functions such that ( f(g(x)) = x ) for every ( x ) in the domain of ( g ) and ( g(f(x)) = x ) for every ( x ) in the domain of ( f ). Under these conditions, the function ( g ) is the inverse function of the function ( f ).</td>
</tr>
<tr>
<td><strong>Section 1.11</strong></td>
<td>Use graphs of functions to determine whether functions have inverse functions (p. 94).</td>
<td>If the point ((a, b)) lies on the graph of ( f ), then the point ((b, a)) must lie on the graph of ( f^{-1} ), and vice versa. In short, ( f^{-1} ) is a reflection of ( f ) in the line ( y = x ).</td>
</tr>
<tr>
<td><strong>Section 1.12</strong></td>
<td>Use the Horizontal Line Test to determine if functions are one-to-one (p. 95).</td>
<td>Horizontal Line Test for Inverse Functions A function ( f ) has an inverse function if and only if no horizontal line intersects ( f ) at more than one point.</td>
</tr>
<tr>
<td><strong>Section 1.13</strong></td>
<td>Find inverse functions algebraically (p. 96).</td>
<td>To find inverse functions, replace ( f(x) ) by ( y ), interchange the roles of ( x ) and ( y ), and solve for ( y ). Replace ( y ) by ( f^{-1}(x) ).</td>
</tr>
<tr>
<td><strong>Section 1.14</strong></td>
<td>Use mathematical models to approximate sets of data points (p. 102), and use the regression feature of a graphing utility to find the equation of a least squares regression line (p. 103).</td>
<td>To see how well a model fits a set of data, compare the actual values and model values of ( y ). The sum of square differences is the sum of the squares of the differences between actual data values and model values. The least squares regression line is the linear model with the least sum of square differences.</td>
</tr>
<tr>
<td><strong>Section 1.15</strong></td>
<td>Write mathematical models for direct variation, direct variation as an nth power, inverse variation, and joint variation (pp. 104–107).</td>
<td>Direct variation: ( y = kx ) for some nonzero constant ( k ) Direct variation as an nth power: ( y = kx^n ) for some constant ( k ) Inverse variation: ( y = k/x ) for some constant ( k ) Joint variation: ( z = kxy ) for some constant ( k )</td>
</tr>
</tbody>
</table>
In Exercises 1 and 2, plot the points in the Cartesian plane.
1. \((5, 5), (-2, 0), (-3, 6), (-1, -7)\)
2. \((0, 6), (8, 1), (4, -2), (-3, -3)\)

In Exercises 3 and 4, determine the quadrant(s) in which \((x, y)\) is located so that the condition(s) is (are) satisfied.
3. \(x > 0\) and \(y = -2\)
4. \(xy = 4\)

In Exercises 5–8, (a) plot the points, (b) find the distance between the points, and (c) find the midpoint of the line segment joining the points.
5. \((-3, 8), (1, 5)\)
6. \((-2, 6), (4, -3)\)
7. \((5.6, 0), (0, 8.2)\)
8. \((1.8, 7.4), (-0.6, -14.5)\)

In Exercises 9 and 10, the polygon is shifted to a new position in the plane. Find the coordinates of the vertices of the polygon in its new position.
9. Original coordinates of vertices:
   \((4, 8), (6, 8), (4, 3), (6, 3)\)
   Shift: eight units downward, four units to the left
10. Original coordinates of vertices:
    \((0, 1), (3, 3), (0, 5), (-3, 3)\)
    Shift: three units upward, two units to the left

11. **SALES** Starbucks had annual sales of $2.17 billion in 2000 and $10.38 billion in 2008. Use the Midpoint Formula to estimate the sales in 2004. (Source: Starbucks Corp.)

12. **METEOROLOGY** The apparent temperature is a measure of relative discomfort to a person from heat and high humidity. The table shows the actual temperatures \(x\) (in degrees Fahrenheit) versus the apparent temperatures \(y\) (in degrees Fahrenheit) for a relative humidity of 75%.

<table>
<thead>
<tr>
<th>(x)</th>
<th>70</th>
<th>75</th>
<th>80</th>
<th>85</th>
<th>90</th>
<th>95</th>
<th>100</th>
</tr>
</thead>
<tbody>

<td>70</td>
<td>77</td>
<td>85</td>
<td>95</td>
<td>109</td>
<td>130</td>
<td>150</td>
</tr>
</tbody>
</table>

(a) Sketch a scatter plot of the data shown in the table.
(b) Find the change in the apparent temperature when the actual temperature changes from 70°F to 100°F.

In Exercises 13–16, complete a table of values. Use the solution points to sketch the graph of the equation.
13. \(y = 3x - 5\)
14. \(y = -\frac{1}{2}x + 2\)
15. \(y = x^2 - 3x\)
16. \(y = 2x^2 - x - 9\)

In Exercises 17–22, sketch the graph by hand.
17. \(y - 2x - 3 = 0\)
18. \(3x + 2y + 6 = 0\)
19. \(y = \sqrt{5 - x}\)
20. \(y = \sqrt{x + 2}\)
21. \(y + 2x^2 = 0\)
22. \(y = x^2 - 4x\)

In Exercises 23–26, find the \(x\)- and \(y\)-intercepts of the graph of the equation.
23. \(y = 2x + 7\)
24. \(y = |x + 1| - 3\)
25. \(y = (x - 3)^2 - 4\)
26. \(y = x\sqrt{4 - x^2}\)

In Exercises 27–34, identify any intercepts and test for symmetry. Then sketch the graph of the equation.
27. \(y = -4x + 1\)
28. \(y = 5x - 6\)
29. \(y = 5 - x^2\)
30. \(y = x^2 - 10\)
31. \(y = x^3 + 3\)
32. \(y = -6 - x^3\)
33. \(y = \sqrt{x^2 + 5}\)
34. \(y = |x| + 9\)

In Exercises 35–40, find the center and radius of the circle and sketch its graph.
35. \(x^2 + y^2 = 9\)
36. \(x^2 + y^2 = 4\)
37. \((x + 2)^2 + y^2 = 16\)
38. \(x^2 + (y - 8)^2 = 81\)
39. \((x - \frac{1}{2})^2 + (y + 1)^2 = 36\)
40. \((x + 4)^2 + (y - \frac{3}{2})^2 = 100\)

41. Find the standard form of the equation of the circle for which the endpoints of a diameter are \((0, 0)\) and \((4, -6)\).
42. Find the standard form of the equation of the circle for which the endpoints of a diameter are \((-2, -3)\) and \((4, -10)\).

43. **NUMBER OF STORES** The numbers \(N\) of Walgreen stores for the years 2000 through 2008 can be approximated by the model
\[N = 439.9t + 2987, \quad 0 \leq t \leq 8\]
where \(t\) represents the year, with \(t = 0\) corresponding to 2000. (Source: Walgreen Co.)

(a) Sketch a graph of the model.
(b) Use the graph to estimate the year in which the number of stores was 6500.
44. PHYSICS  The force $F$ (in pounds) required to stretch a spring $x$ inches from its natural length (see figure) is
$$F = \frac{5}{4}x, \quad 0 \leq x \leq 20.$$

(a) Use the model to complete the table.

<table>
<thead>
<tr>
<th>$x$</th>
<th>Force, $F$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
<tr>
<td>20</td>
<td></td>
</tr>
</tbody>
</table>

(b) Sketch a graph of the model.

(c) Use the graph to estimate the force necessary to stretch the spring 10 inches.

1.3 In Exercises 45–48, find the slope and $y$-intercept (if possible) of the equation of the line. Sketch the line.

45. \(y = 6\)  
46. \(x = -3\)
47. \(y = 3x + 13\)  
48. \(y = -10x + 9\)

In Exercises 49–52, plot the points and find the slope of the line passing through the pair of points.

49. \((6, 4), (-3, -4)\)  
50. \((\frac{3}{2}, 1), (5, \frac{5}{2})\)
51. \((-4.5, 6), (2.1, 3)\)  
52. \((-3, 2), (8, 2)\)

In Exercises 53–56, find the slope-intercept form of the equation of the line that passes through the given point and has the indicated slope. Sketch the line.

<table>
<thead>
<tr>
<th>Point</th>
<th>Slope</th>
</tr>
</thead>
<tbody>
<tr>
<td>53. ((3, 0))</td>
<td>(m = \frac{2}{3})</td>
</tr>
<tr>
<td>54. ((-8, 5))</td>
<td>(m = 0)</td>
</tr>
<tr>
<td>55. ((10, -3))</td>
<td>(m = -\frac{1}{2})</td>
</tr>
<tr>
<td>56. ((12, -6))</td>
<td>(m) is undefined.</td>
</tr>
</tbody>
</table>

In Exercises 57–60, find the slope-intercept form of the equation of the line passing through the points.

57. \((0, 0), (0, 10)\)  
58. \((2, -1), (4, -1)\)
59. \((-1, 0), (6, 2)\)  
60. \((11, -2), (6, -1)\)

In Exercises 61 and 62, write the slope-intercept forms of the equations of the lines through the given point (a) parallel to the given line and (b) perpendicular to the given line.

<table>
<thead>
<tr>
<th>Point</th>
<th>Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>61. ((3, -2))</td>
<td>(5x - 4y = 8)</td>
</tr>
</tbody>
</table>
| 62. \((-8, 3)\) | \(2x + 3y = 5\)

RATE OF CHANGE  In Exercises 63 and 64, you are given the dollar value of a product in 2010 and the rate at which the value of the product is expected to change during the next 5 years. Use this information to write a linear equation that gives the dollar value $V$ of the product in terms of the year $t$. (Let $t = 10$ represent 2010.)

<table>
<thead>
<tr>
<th>2010 Value</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>$63. $12,500</td>
<td>$850 decrease per year</td>
</tr>
<tr>
<td>$64. $72,950</td>
<td>$5.15 increase per year</td>
</tr>
</tbody>
</table>

1.4 In Exercises 65–68, determine whether the equation represents $y$ as a function of $x$.

65. \(16x - y^2 = 0\)  
66. \(2x - y - 3 = 0\)
67. \(y = \sqrt{1 - x}\)  
68. \(|y| = x + 2\)

In Exercises 69 and 70, evaluate the function at each specified value of the independent variable and simplify.

69. \(f(x) = x^2 + 1\)  
(a) \(f(2)\)  
(b) \(f(-4)\)  
(c) \(f(2)^2\)  
(d) \(f(t + 1)\)
70. \(h(x) = \begin{cases} 2x + 1, & x \leq -1 \\ x^2 + 2, & x > -1 \end{cases}\)  
(a) \(h(-2)\)  
(b) \(h(-1)\)  
(c) \(h(0)\)  
(d) \(h(2)\)

In Exercises 71–74, find the domain of the function. Verify your result with a graph.

71. \(f(x) = \sqrt{25 - x^2}\)  
72. \(g(x) = \frac{5x + 5}{3x - 9}\)  
73. \(h(x) = \frac{x}{x^2 - x - 6}\)  
74. \(h(t) = \lvert t + 1 \rvert\)

75. PHYSICS  The velocity of a ball projected upward from ground level is given by $v(t) = -32t + 48$, where $t$ is the time in seconds and $v$ is the velocity in feet per second.

(a) Find the velocity when $t = 1$.
(b) Find the time when the ball reaches its maximum height. \([Hint: Find the time when \(v(t) = 0\)]\)
(c) Find the velocity when $t = 2$. 
76. **MIXTURE PROBLEM** From a full 50-liter container of a 40% concentration of acid, $x$ liters is removed and replaced with 100% acid.

(a) Write the amount of acid in the final mixture as a function of $x$.

(b) Determine the domain and range of the function.

(c) Determine $x$ if the final mixture is 50% acid.

In Exercises 77 and 78, find the difference quotient and simplify your answer.

77. $f(x) = 2x^2 + 3x - 1$, \( \frac{f(x + h) - f(x)}{h}, \quad h \neq 0 \)

78. $f(x) = x^3 - 5x^2 + x$, \( \frac{f(x + h) - f(x)}{h}, \quad h \neq 0 \)

1.5 In Exercises 79–82, use the Vertical Line Test to determine whether $y$ is a function of $x$. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

79. $y = (x - 3)^2$

80. $y = -\frac{3}{5}x^3 - 2x + 1$

81. $x - 4 = y^2$

82. $x = -|4 - y|$

In Exercises 83–86, find the zeros of the function algebraically.

83. $f(x) = 3x^2 - 16x + 21$

84. $f(x) = 5x^2 + 4x - 1$

85. $f(x) = \frac{8x + 3}{11 - x}$

86. $f(x) = x^3 - x^2 - 25x + 25$

In Exercises 87 and 88, use a graphing utility to graph the function and visually determine the intervals over which the function is increasing, decreasing, or constant.

87. $f(x) = |x| + |x + 1|$

88. $f(x) = (x^2 - 4)^2$

In Exercises 89–92, use a graphing utility to graph the function and approximate any relative minimum or relative maximum values.

89. $f(x) = -x^2 + 2x + 1$

90. $f(x) = x^4 - 4x^2 - 2$

91. $f(x) = x^3 - 6x^4$

92. $f(x) = x^3 - 4x^2 - 1$

In Exercises 93–96, find the average rate of change of the function from $x_1$ to $x_2$.

93. $f(x) = -x^2 + 8x - 4$, $x_1 = 0, x_2 = 4$

94. $f(x) = x^3 + 12x - 2$, $x_1 = 0, x_2 = 4$

95. $f(x) = 2 - \sqrt{x + 1}$, $x_1 = 3, x_2 = 7$

96. $f(x) = 1 - \sqrt{x + 3}$, $x_1 = 1, x_2 = 6$

In Exercises 97–100, determine whether the function is even, odd, or neither.

97. $f(x) = x^3 + 4x - 7$

98. $f(x) = x^4 - 20x^2$

99. $f(x) = 2x\sqrt{x^2 + 3}$

100. $f(x) = \sqrt[5]{6x^2}$

1.6 In Exercises 101 and 102, write the linear function $f$ such that it has the indicated function values. Then sketch the graph of the function.

101. $f(2) = -6, f(-1) = 3$

102. $f(0) = -5, f(4) = -8$

In Exercises 103–112, graph the function.

103. $f(x) = 3 - x^2$

104. $h(x) = x^3 - 2$

105. $f(x) = -\sqrt{x}$

106. $f(x) = \sqrt{x + 1}$

107. $g(x) = \frac{3}{x}$

108. $g(x) = \frac{1}{x + 5}$

109. $f(x) = [x] + 2$

110. $g(x) = [x + 4]$

111. $f(x) = \begin{cases} 5x - 3, & x \geq -1 \\ -4x + 5, & x < -1 \\ x^2 - 2, & x < -2 \end{cases}$

112. $f(x) = \begin{cases} 5, & -2 \leq x \leq 0 \\ 8x - 5, & x > 0 \end{cases}$
In Exercises 113 and 114, the figure shows the graph of a transformed parent function. Identify the parent function.

113. [Graph of a transformed function]

114. [Graph of another transformed function]

1.7 In Exercises 115–128, h is related to one of the parent functions described in this chapter. (a) Identify the parent function f. (b) Describe the sequence of transformations from f to h. (c) Sketch the graph of h. (d) Use function notation to write h in terms of f.

115. $h(x) = x^2 - 9$
116. $h(x) = (x - 2)^3 + 2$
117. $h(x) = -\sqrt{x} + 4$
118. $h(x) = |x + 3| - 5$
119. $h(x) = -(x + 2)^2 + 3$
120. $h(x) = \frac{2}{3}(x - 1)^2 - 2$
121. $h(x) = 2x + 6$
122. $h(x) = -\sqrt{x} + 1 + 9$
123. $h(x) = -|x - 4| + 6$
124. $h(x) = -(x + 1)^2 - 3$
125. $h(x) = 5[x - 9]$
126. $h(x) = -\frac{1}{2}x^3$
127. $h(x) = -2\sqrt{x - 4}$
128. $h(x) = \frac{1}{2}|x| - 1$

1.8 In Exercises 129 and 130, find (a) $(f + g)(x)$, (b) $(f - g)(x)$, (c) $(fg)(x)$, and (d) $(f \circ g)(x)$. What is the domain of $fg$?

129. $f(x) = x^2 + 3$, $g(x) = 2x - 1$
130. $f(x) = x^2 - 4$, $g(x) = \sqrt{3 - x}$

In Exercises 131 and 132, find (a) $f \circ g$ and (b) $g \circ f$. Find the domain of each function and each composite function.

131. $f(x) = \frac{1}{2}x - 3$, $g(x) = 3x + 1$
132. $f(x) = x^3 - 4$, $g(x) = \sqrt{x + 7}$

133. In Exercises 133 and 134, find two functions $f$ and $g$ such that $(f \circ g)(x) = h(x)$. (There are many correct answers.)

133. $h(x) = (1 - 2x)^3$
134. $h(x) = \sqrt{x} + 2$

135. PHONE EXPENDITURES The average annual expenditures (in dollars) for residential $r(t)$ and cellular $c(t)$ phone services from 2001 through 2006 can be approximated by the functions $r(t) = 27.5t + 705$ and $c(t) = 151.3t + 151$, where $t$ represents the year, with $t = 1$ corresponding to 2001. (Source: Bureau of Labor Statistics)

(a) Find and interpret $(r + c)(t)$.

1.9 In Exercises 137 and 138, find the inverse function of f informally. Verify that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

137. $f(x) = 3x + 8$
138. $f(x) = \frac{x - 4}{5}$

In Exercises 139 and 140, determine whether the function has an inverse function.

139. [Graph of a function]

140. [Graph of another function]

In Exercises 141–144, use a graphing utility to graph the function, and use the Horizontal Line Test to determine whether the function is one-to-one and so has an inverse function.

141. $f(x) = 4 - \frac{1}{2}x$
142. $f(x) = (x - 1)^2$
143. $h(t) = \frac{2}{t - 3}$
144. $g(x) = \sqrt{x} + 6$

In Exercises 145–148, (a) find the inverse function of $f$, (b) graph both $f$ and $f^{-1}$ on the same set of coordinate axes, (c) describe the relationship between the graphs of $f$ and $f^{-1}$, and (d) state the domains and ranges of $f$ and $f^{-1}$.

145. $f(x) = \frac{1}{2}x - 3$
146. $f(x) = 5x - 7$
147. $f(x) = \sqrt{x} + 1$
148. $f(x) = x^3 + 2$

In Exercises 149 and 150, restrict the domain of the function $f$ to an interval over which the function is increasing and determine $f^{-1}$ over that interval.

149. $f(x) = 2(x - 4)^2$
150. $f(x) = |x - 2|$
151. COMPACT DISCS The values \( V \) (in billions of dollars) of shipments of compact discs in the United States from 2000 through 2007 are shown in the table. A linear model that approximates these data is
\[
V = -0.742t + 13.62
\]
where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. (Source: Recording Industry Association of America)

<table>
<thead>
<tr>
<th>Year</th>
<th>Value, ( V )</th>

</tbody>
</table>

(a) Use a graphing utility to create a scatter plot of the data. Let \( t \) represent the year, with \( t = 3 \) corresponding to 2003.

(b) Use the regression feature of the graphing utility to find the equation of the least squares regression line that fits the data. Then graph the model and the scatter plot you found in part (a) in the same viewing window. How closely does the model represent the data?

(c) Use the model to estimate the projected number of hours of television usage in 2020.

(d) Interpret the meaning of the slope of the linear model in the context of the problem.

153. MEASUREMENT You notice a billboard indicating that it is 2.5 miles or 4 kilometers to the next restaurant of a national fast-food chain. Use this information to find a mathematical model that relates miles to kilometers. Then use the model to find the numbers of kilometers in 2 miles and 10 miles.

154. ENERGY The power \( P \) produced by a wind turbine is proportional to the cube of the wind speed. A wind speed of 27 miles per hour produces a power output of 750 kilowatts. Find the output for a wind speed of 40 miles per hour.

155. FRICIONAL FORCE The frictional force \( F \) between the tires and the road required to keep a car on a curved section of a highway is directly proportional to the square of the speed \( s \) of the car. If the speed of the car is doubled, the force will change by what factor?

156. DEMAND A company has found that the daily demand \( x \) for its boxes of chocolates is inversely proportional to the price \( p \). When the price is $5, the demand is 800 boxes. Approximate the demand when the price is increased to $6.

157. TRAVEL TIME The travel time between two cities is inversely proportional to the average speed. A train travels between the cities in 3 hours at an average speed of 65 miles per hour. How long would it take to travel between the cities at an average speed of 80 miles per hour?

158. COST The cost of constructing a wooden box with a square base varies jointly as the height of the box and the square of the width of the box. A box of height 16 inches and width 6 inches costs $28.80. How much would a box of height 14 inches and width 8 inches cost?

EXPLORATION

TRUE OR FALSE? In Exercises 159 and 160, determine whether the statement is true or false. Justify your answer.

159. Relative to the graph of \( f(x) = \sqrt{x} \), the function given by \( h(x) = -\sqrt{x} + 9 - 13 \) is shifted 9 units to the left and 13 units downward, then reflected in the \( x \)-axis.

160. If \( f \) and \( g \) are two inverse functions, then the domain of \( g \) is equal to the range of \( f \).

161. WRITING Explain the difference between the Vertical Line Test and the Horizontal Line Test.

162. WRITING Explain how to tell whether a relation between two variables is a function.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Plot the points \((-2, 5)\) and \((6, 0)\). Find the coordinates of the midpoint of the line segment joining the points and the distance between the points.

2. A cylindrical can has a volume of \(600\) cubic centimeters and a radius of \(4\) centimeters. Find the height of the can.

In Exercises 3–5, use intercepts and symmetry to sketch the graph of the equation.

3. \(y = 3 - 5x\)  
4. \(y = 4 - |x|\)  
5. \(y = x^2 - 1\)

6. Write the standard form of the equation of the circle shown at the left.

In Exercises 7 and 8, find the slope-intercept form of the equation of the line passing through the points.

7. \((2, -3), (-4, 9)\)  
8. \((3, 0.8), (7, -6)\)

9. Find equations of the lines that pass through the point \((0, 4)\) and are (a) parallel to and (b) perpendicular to the line \(5x + 2y = 3\).

10. Evaluate \(f(x) = \sqrt[3]{x^2 + 9} / (x^2 - 81)\) at each value: (a) \(f(7)\)  (b) \(f(-5)\)  (c) \(f(x + 9)\).

11. Find the domain of \(f(x) = 10 - \sqrt{3 - x}\).

In Exercises 12–14, (a) find the zeros of the function, (b) use a graphing utility to graph the function, (c) approximate the intervals over which the function is increasing, decreasing, or constant, and (d) determine whether the function is even, odd, or neither.

12. \(f(x) = 2x^6 + 5x^4 - x^2\)  
13. \(f(x) = 4x\sqrt{3 - x}\)  
14. \(f(x) = |x + 5|\)

15. Sketch the graph of \(f(x) = \begin{cases} 3x + 7, & x \leq -3 \\ 4x^2 - 1, & x > -3 \end{cases}\).

In Exercises 16–18, identify the parent function in the transformation. Then sketch a graph of the function.

16. \(h(x) = -|x|\)  
17. \(h(x) = -\sqrt{x + 5} + 8\)  
18. \(h(x) = -2(x - 5)^3 + 3\)

In Exercises 19 and 20, find (a) \((f + g)(x)\), (b) \((f - g)(x)\), (c) \((fg)(x)\), (d) \((f \circ g)(x)\), (e) \((f \cdot g)(x)\), and (f) \((g \circ f)(x)\).

19. \(f(x) = 3x^2 - 7, \quad g(x) = -x^2 - 4x + 5\)

20. \(f(x) = 1/x, \quad g(x) = 2\sqrt{x}\)

In Exercises 21–23, determine whether or not the function has an inverse function, and if so, find the inverse function.

21. \(f(x) = x^3 + 8\)  
22. \(f(x) = |x^2 - 3| + 6\)  
23. \(f(x) = 3x\sqrt{x}\)

In Exercises 24–26, find a mathematical model representing the statement. (In each case, determine the constant of proportionality.)

24. \(v\) varies directly as the square root of \(s\). \((v = 24\) when \(s = 16)\)

25. \(A\) varies jointly as \(x\) and \(y\). \((A = 500\) when \(x = 15\) and \(y = 8)\)

26. \(b\) varies inversely as \(a\). \((b = 32\) when \(a = 1.5)\)
PROOFS IN MATHEMATICS

What does the word *proof* mean to you? In mathematics, the word *proof* is used to mean simply a valid argument. When you are proving a statement or theorem, you must use facts, definitions, and accepted properties in a logical order. You can also use previously proved theorems in your proof. For instance, the Distance Formula is used in the proof of the Midpoint Formula below. There are several different proof methods, which you will see in later chapters.

**The Midpoint Formula (p. 5)**
The midpoint of the line segment joining the points \((x_1, y_1)\) and \((x_2, y_2)\) is given by the Midpoint Formula

\[
\text{Midpoint} = \left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right).
\]

**Proof**
Using the figure, you must show that \(d_1 = d_2\) and \(d_1 + d_2 = d_3\).

By the Distance Formula, you obtain

\[
d_1 = \sqrt{\left( \frac{x_1 + x_2}{2} - x_1 \right)^2 + \left( \frac{y_1 + y_2}{2} - y_1 \right)^2}
\]

\[
= \frac{1}{2} \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}
\]

\[
d_2 = \sqrt{\left( \frac{x_2 + x_1}{2} - x_2 \right)^2 + \left( \frac{y_1 + y_2}{2} - y_2 \right)^2}
\]

\[
= \frac{1}{2} \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}
\]

\[
d_3 = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}
\]

So, it follows that \(d_1 = d_2\) and \(d_1 + d_2 = d_3\).
1. As a salesperson, you receive a monthly salary of $2000, plus a commission of 7% of sales. You are offered a new job at $2300 per month, plus a commission of 5% of sales.
   (a) Write a linear equation for your current monthly wage $W_1$ in terms of your monthly sales $S$.
   (b) Write a linear equation for the monthly wage $W_2$ of your new job offer in terms of the monthly sales $S$.
   (c) Use a graphing utility to graph both equations in the same viewing window. Find the point of intersection. What does it signify?
   (d) You think you can sell $20,000 per month. Should you change jobs? Explain.

2. For the numbers 2 through 9 on a telephone keypad (see figure), create two relations: one mapping numbers onto letters, and the other mapping letters onto numbers. Are both relations functions? Explain.

3. What can be said about the sum and difference of each of the following?
   (a) Two even functions  
   (b) Two odd functions  
   (c) An odd function and an even function  

4. The two functions given by
   \[ f(x) = x \quad \text{and} \quad g(x) = -x \]
   are their own inverse functions. Graph each function and explain why this is true. Graph other linear functions that are their own inverse functions. Find a general formula for a family of linear functions that are their own inverse functions.

5. Prove that a function of the following form is even.
   \[ y = a_2x^{2a} + a_{2a-2}x^{2a-2} + \cdots + a_1x^2 + a_0 \]

6. A miniature golf professional is trying to make a hole-in-one on the miniature golf green shown. A coordinate plane is placed over the golf green. The golf ball is at the point $(2.5, 2)$ and the hole is at the point $(9.5, 2)$. The professional wants to bank the ball off the side wall of the green at the point $(x, y)$. Find the coordinates of the point $(x, y)$. Then write an equation for the path of the ball.

7. At 2:00 P.M. on April 11, 1912, the Titanic left Cobh, Ireland, on her voyage to New York City. At 11:40 P.M. on April 14, the Titanic struck an iceberg and sank, having covered only about 2100 miles of the approximately 3400-mile trip.
   (a) What was the total duration of the voyage in hours?
   (b) What was the average speed in miles per hour?
   (c) Write a function relating the distance of the Titanic from New York City and the number of hours traveled. Find the domain and range of the function.
   (d) Graph the function from part (c).

8. Consider the function given by $f(x) = -x^2 + 4x - 3$. Find the average rate of change of the function from $x_1$ to $x_2$.
   (a) $x_1 = 1, x_2 = 2$  
   (b) $x_1 = 1, x_2 = 1.5$  
   (c) $x_1 = 1, x_2 = 1.25$  
   (d) $x_1 = 1, x_2 = 1.125$  
   (e) $x_1 = 1, x_2 = 1.0625$  
   (f) Does the average rate of change seem to be approaching one value? If so, what value?
   (g) Find the equations of the secant lines through the points $(x_1, f(x_1))$ and $(x_2, f(x_2))$ for parts (a)–(e).
   (h) Find the equation of the line through the point $(1, f(1))$ using your answer from part (f) as the slope of the line.

9. Consider the functions given by $f(x) = 4x$ and $g(x) = x + 6$.
   (a) Find $(f \circ g)(x)$.  
   (b) Find $(f \circ g)^{-1}(x)$.
   (c) Find $f^{-1}(x)$ and $g^{-1}(x)$.
   (d) Find $(g^{-1} \circ f^{-1})(x)$ and compare the result with that of part (b).
   (e) Repeat parts (a) through (d) for $f(x) = x^3 + 1$ and $g(x) = 2x$.
   (f) Write two one-to-one functions $f$ and $g$, and repeat parts (a) through (d) for these functions.
   (g) Make a conjecture about $(f \circ g)^{-1}(x)$ and $(g^{-1} \circ f^{-1})(x)$. 

123
10. You are in a boat 2 miles from the nearest point on the coast. You are to travel to a point 3 miles down the coast and 1 mile inland (see figure). You can row at 2 miles per hour and you can walk at 4 miles per hour.

(a) Write the total time \( T \) of the trip as a function of \( x \).
(b) Determine the domain of the function.
(c) Use a graphing utility to graph the function. Be sure to choose an appropriate viewing window.
(d) Use the zoom and trace features to find the value of \( x \) that minimizes \( T \).
(e) Write a brief paragraph interpreting these values.

11. The Heaviside function \( H(x) \) is widely used in engineering applications. (See figure.) To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

\[
H(x) = \begin{cases} 
1, & x \geq 0 \\
0, & x < 0 
\end{cases}
\]

Sketch the graph of each function by hand.
(a) \( H(x - 2) \)  (b) \( H(x - 2) \)  (c) \( -H(x) \)
(d) \( H(-x) \)  (e) \( \frac{1}{2}H(x) \)  (f) \( -H(x - 2) + 2 \)

12. Let \( f(x) = \frac{1}{1 - x} \).
(a) What are the domain and range of \( f \)?
(b) Find \( f(f(x)) \). What is the domain of this function?
(c) Find \( f(f(f(x))) \). Is the graph a line? Why or why not?

13. Show that the Associative Property holds for compositions of functions—that is,
\[
(f \circ (g \circ h))(x) = ((f \circ g) \circ h)(x).
\]

14. Consider the graph of the function \( f \) shown in the figure. Use this graph to sketch the graph of each function. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.
(a) \( f(x + 1) \)  (b) \( f(x) + 1 \)  (c) \( 2f(x) \)  (d) \( f(-x) \)
(e) \( -f(x) \)  (f) \( |f(x)| \)  (g) \( f(|x|) \)

15. Use the graphs of \( f \) and \( f^{-1} \) to complete each table of function values.
Polynomial and Rational Functions

2.1 Quadratic Functions and Models
2.2 Polynomial Functions of Higher Degree
2.3 Polynomial and Synthetic Division
2.4 Complex Numbers
2.5 Zeros of Polynomial Functions
2.6 Rational Functions
2.7 Nonlinear Inequalities

In Mathematics
Functions defined by polynomial expressions are called polynomial functions, and functions defined by rational expressions are called rational functions.

In Real Life
Polynomial and rational functions are often used to model real-life phenomena. For instance, you can model the per capita cigarette consumption in the United States with a polynomial function. You can use the model to determine whether the addition of cigarette warnings affected consumption. (See Exercise 85, page 134.)

IN CAREERS
There are many careers that use polynomial and rational functions. Several are listed below.

• Architect
  Exercise 82, page 134

• Forester
  Exercise 103, page 148

• Chemist
  Example 80, page 192

• Safety Engineer
  Exercise 78, page 203
2.1 Quadratic Functions and Models

The Graph of a Quadratic Function

In this and the next section, you will study the graphs of polynomial functions. In Section 1.6, you were introduced to the following basic functions.

- Linear function: \( f(x) = ax + b \)
- Constant function: \( f(x) = c \)
- Squaring function: \( f(x) = x^2 \)

These functions are examples of polynomial functions. Polynomial functions are classified by degree. For instance, a constant function with \( a_n = 0 \) has degree 0, and a linear function with \( a = 0 \) has degree 1. In this section, you will study second-degree polynomial functions, which are called quadratic functions.

For instance, each of the following functions is a quadratic function.

- \( f(x) = x^2 + 6x + 2 \)
- \( g(x) = 2(x + 1)^2 - 3 \)
- \( h(x) = 9 + \frac{1}{2}x^2 \)
- \( k(x) = -3x^2 + 4 \)
- \( m(x) = (x - 2)(x + 1) \)

Note that the squaring function is a simple quadratic function that has degree 2.

Definition of Quadratic Function

Let \( a, b, \) and \( c \) be real numbers with \( a \neq 0 \). The function given by

\[
f(x) = ax^2 + bx + c
\]

is called a quadratic function. The graph of a quadratic function is a special type of “U”-shaped curve called a parabola. Parabolas occur in many real-life applications—especially those involving reflective properties of satellite dishes and flashlight reflectors. You will study these properties in Section 10.2.
All parabolas are symmetric with respect to a line called the **axis of symmetry**, or simply the **axis** of the parabola. The point where the axis intersects the parabola is the **vertex** of the parabola, as shown in Figure 2.1. If the leading coefficient is positive, the graph of

\[ f(x) = ax^2 + bx + c \]

is a parabola that opens upward. If the leading coefficient is negative, the graph of

\[ f(x) = ax^2 + bx + c \]

is a parabola that opens downward.

The simplest type of quadratic function is

\[ f(x) = ax^2. \]

Its graph is a parabola whose vertex is (0, 0). If \( a > 0 \), the vertex is the point with the **minimum** y-value on the graph, and if \( a < 0 \), the vertex is the point with the **maximum** y-value on the graph, as shown in Figure 2.2.

When sketching the graph of \( f(x) = ax^2 \), it is helpful to use the graph of \( y = x^2 \) as a reference, as discussed in Section 1.7.
Example 1  Sketching Graphs of Quadratic Functions

a. Compare the graphs of \( y = x^2 \) and \( f(x) = \frac{1}{4}x^2 \).
b. Compare the graphs of \( y = x^2 \) and \( g(x) = 2x^2 \).

Solution

a. Compared with each output of \( f(x) = \frac{1}{4}x^2 \) “shrinks” by a factor of \( \frac{1}{4} \), creating the broader parabola shown in Figure 2.3.
b. Compared with each output of \( g(x) = 2x^2 \) “stretches” by a factor of 2, creating the narrower parabola shown in Figure 2.4.

In Example 1, note that the coefficient \( a \) determines how widely the parabola given by \( f(x) = ax^2 \) opens. If \( |a| \) is small, the parabola opens more widely than if \( |a| \) is large.

Recall from Section 1.7 that the graphs of \( y = f(x + c) \), \( y = f(x) \pm c \), \( y = f(-x) \), and \( y = -f(x) \) are rigid transformations of the graph of \( y = f(x) \). For instance, in Figure 2.5, notice how the graph of \( y = x^2 \) can be transformed to produce the graphs of \( f(x) = -x^2 + 1 \) and \( g(x) = (x + 2)^2 - 3 \).
The Standard Form of a Quadratic Function

The standard form of a quadratic function is $f(x) = a(x-h)^2 + k$. This form is especially convenient for sketching a parabola because it identifies the vertex of the parabola as $(h, k)$.

**Standard Form of a Quadratic Function**

The quadratic function given by

$$f(x) = a(x-h)^2 + k, \quad a \neq 0$$

is in standard form. The graph of $f$ is a parabola whose axis is the vertical line $x = h$ and whose vertex is the point $(h, k)$. If $a > 0$, the parabola opens upward, and if $a < 0$, the parabola opens downward.

To graph a parabola, it is helpful to begin by writing the quadratic function in standard form using the process of completing the square, as illustrated in Example 2. In this example, notice that when completing the square, you add and subtract the square of half the coefficient of $x$ within the parentheses instead of adding the value to each side of the equation as is done in Appendix A.5.

**Example 2  Graphing a Parabola in Standard Form**

Sketch the graph of $f(x) = 2x^2 + 8x + 7$ and identify the vertex and the axis of the parabola.

**Solution**

Begin by writing the quadratic function in standard form. Notice that the first step in completing the square is to factor out any coefficient of $x^2$ that is not 1.

$$f(x) = 2x^2 + 8x + 7$$

Write original function.

$$= 2(x^2 + 4x) + 7$$

Factor 2 out of $x$-terms.

$$= 2(x^2 + 4x + 4 - 4) + 7$$

Add and subtract 4 within parentheses.

$$= (x/2)^2$$

After adding and subtracting 4 within the parentheses, you must now regroup the terms to form a perfect square trinomial. The $-4$ can be removed from inside the parentheses; however, because of the 2 outside of the parentheses, you must multiply $-4$ by 2, as shown below.

$$f(x) = 2(x^2 + 4x + 4) - 2(4) + 7$$

Regroup terms.

$$= 2(x^2 + 4x + 4) - 8 + 7$$

Simplify.

$$= 2(x + 2)^2 - 1$$

Write in standard form.

From this form, you can see that the graph of $f$ is a parabola that opens upward and has its vertex at $(-2, -1)$. This corresponds to a left shift of two units and a downward shift of one unit relative to the graph of $y = 2x^2$, as shown in Figure 2.6. In the figure, you can see that the axis of the parabola is the vertical line through the vertex, $x = -2$.

**Check Point**  Now try Exercise 19.
To find the $x$-intercepts of the graph of $f(x) = ax^2 + bx + c$, you must solve the equation $ax^2 + bx + c = 0$. If $ax^2 + bx + c$ does not factor, you can use the Quadratic Formula to find the $x$-intercepts. Remember, however, that a parabola may not have $x$-intercepts.

**Example 3** Finding the Vertex and $x$-Intercepts of a Parabola

Sketch the graph of $f(x) = -x^2 + 6x - 8$ and identify the vertex and $x$-intercepts.

**Solution**

\[
    f(x) = -x^2 + 6x - 8
\]

Write original function.

\[
    = -(x^2 - 6x) - 8
\]

Factor $-1$ out of $x$-terms.

\[
    = -(x^2 - 6x + 9 - 9) - 8
\]

Add and subtract 9 within parentheses.

\[
    = -(x^2 - 6x + 9) - (-9) - 8
\]

Regroup terms.

\[
    = -(x - 3)^2 - 9 - 8
\]

Write in standard form.

\[
    = -(x - 3)^2 + 1
\]

Write original function.

From this form, you can see that $f$ is a parabola that opens downward with vertex $(3, 1)$. The $x$-intercepts of the graph are determined as follows.

\[
    -(x^2 - 6x + 9) = 0
\]

Factor out $-1$.

\[
    -(x - 2)(x - 4) = 0
\]

Factor.

\[
    x - 2 = 0 \quad \Rightarrow \quad x = 2
\]

Set 1st factor equal to 0.

\[
    x - 4 = 0 \quad \Rightarrow \quad x = 4
\]

Set 2nd factor equal to 0.

So, the $x$-intercepts are $(2, 0)$ and $(4, 0)$, as shown in Figure 2.7.

**Example 4** Writing the Equation of a Parabola

Write the standard form of the equation of the parabola whose vertex is $(1, 2)$ and that passes through the point $(3, -6)$.

**Solution**

Because the vertex of the parabola is at $(h, k) = (1, 2)$, the equation has the form

\[
    f(x) = a(x - 1)^2 + 2.
\]

Substitute for $h$ and $k$ in standard form.

Because the parabola passes through the point $(3, -6)$, it follows that $f(3) = -6$. So,

\[
    f(x) = a(x - 1)^2 + 2
\]

Write in standard form.

\[
    -6 = a(3 - 1)^2 + 2
\]

Substitute $3$ for $x$ and $-6$ for $f(x)$.

\[
    -6 = 4a + 2
\]

Simplify.

\[
    -8 = 4a
\]

Subtract 2 from each side.

\[
    -2 = a
\]

Divide each side by 4.

The equation in standard form is $f(x) = -2(x - 1)^2 + 2$. The graph of $f$ is shown in Figure 2.8.
Finding Minimum and Maximum Values

Many applications involve finding the maximum or minimum value of a quadratic function. By completing the square of the quadratic function \( f(x) = ax^2 + bx + c \), you can rewrite the function in standard form (see Exercise 95).

\[
 f(x) = a\left(x + \frac{b}{2a}\right)^2 + \left(c - \frac{b^2}{4a}\right)
\]

So, the vertex of the graph of \( f \) is \( \left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right) \), which implies the following.

Minimum and Maximum Values of Quadratic Functions

Consider the function \( f(x) = ax^2 + bx + c \) with vertex \( \left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right) \).

1. If \( a > 0 \), \( f \) has a minimum at \( x = -\frac{b}{2a} \). The minimum value is \( f\left(-\frac{b}{2a}\right) \).
2. If \( a < 0 \), \( f \) has a maximum at \( x = -\frac{b}{2a} \). The maximum value is \( f\left(-\frac{b}{2a}\right) \).

**Example 5** The Maximum Height of a Baseball

A baseball is hit at a point 3 feet above the ground at a velocity of 100 feet per second and at an angle of 45° with respect to the ground. The path of the baseball is given by the function \( f(x) = -0.0032x^2 + x + 3 \), where \( f(x) \) is the height of the baseball (in feet) and \( x \) is the horizontal distance from home plate (in feet). What is the maximum height reached by the baseball?

**Algebraic Solution**

For this quadratic function, you have

\[
 f(x) = ax^2 + bx + c \\
 = -0.0032x^2 + x + 3
\]

which implies that \( a = -0.0032 \) and \( b = 1 \). Because \( a < 0 \), the function has a maximum when \( x = -\frac{b}{2a} \).

So, you can conclude that the baseball reaches its maximum height when it is \( x \) feet from home plate, where \( x \) is

\[
 x = -\frac{b}{2a} \\
 = -\frac{1}{2(-0.0032)} \\
= 156.25 \text{ feet.}
\]

At this distance, the maximum height is

\[
 f(156.25) = -0.0032(156.25)^2 + 156.25 + 3 \\
= 81.125 \text{ feet.}
\]

**Graphical Solution**

Use a graphing utility to graph

\[
 y = -0.0032x^2 + x + 3
\]

so that you can see the important features of the parabola. Use the maximum feature (see Figure 2.9) or the zoom and trace features (see Figure 2.10) of the graphing utility to approximate the maximum height on the graph to be \( y \approx 81.125 \) feet at \( x \approx 156.25 \).

**CHECK Point** Now try Exercise 75.
2.1 EXERCISES

VOCABULARY: Fill in the blanks.

1. Linear, constant, and squaring functions are examples of ________ functions.

2. A polynomial function of degree n and leading coefficient $a_n$ is a function of the form
   
   \[ f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0 \]  
   
   where \( n \) is a ________ integer and \( a_n, a_{n-1}, \ldots, a_1, a_0 \) are ________ numbers.

3. A ________ function is a second-degree polynomial function, and its graph is called a ________.

4. The graph of a quadratic function is symmetric about its ________.

5. If the graph of a quadratic function opens upward, then its leading coefficient is ________ and the vertex of the graph is a ________.

6. If the graph of a quadratic function opens downward, then its leading coefficient is ________ and the vertex of the graph is a ________.

SKILLS AND APPLICATIONS

In Exercises 7–12, match the quadratic function with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

(a) \( y = (x - 2)^2 \)
(b) \( y = (x + 4)^2 \)
(c) \( y = x^2 - 2 \)
(d) \( y = -x^2 + 2x + 5 \)
(e) \( y = 4 - (x - 2)^2 \)
(f) \( y = 6 - 2x^2 \)

In Exercises 17–34, sketch the graph of the quadratic function without using a graphing utility. Identify the vertex, axis of symmetry, and x-intercepts(s).

17. \( f(x) = x^2 - 1 \)
18. \( g(x) = x^2 - 8 \)
19. \( f(x) = x^2 + 7 \)
20. \( h(x) = 12 - x^2 \)
21. \( f(x) = \frac{1}{2} x^2 - 4 \)
22. \( f(x) = 16 - \frac{1}{4} x^2 \)
23. \( f(x) = (x + 4)^2 - 3 \)
24. \( f(x) = (x - 6)^2 - 3 \)
25. \( h(x) = x^2 - 8x + 16 \)
26. \( g(x) = x^2 + 2x + 1 \)
27. \( f(x) = x^2 - x + \frac{5}{4} \)
28. \( f(x) = x^2 + 3x + \frac{1}{4} \)
29. \( f(x) = -x^2 + 2x + 5 \)
30. \( f(x) = -x^2 - 4x + 1 \)
31. \( h(x) = 4x^2 - 4x + 21 \)
32. \( f(x) = 2x^2 - x + 1 \)
33. \( f(x) = \frac{1}{4} x^2 - 2x - 12 \)
34. \( f(x) = -\frac{3}{2} x^2 + 3x - 6 \)

In Exercises 35–42, use a graphing utility to graph the quadratic function. Identify the vertex, axis of symmetry, and x-intercepts. Then check your results algebraically by writing the quadratic function in standard form.

35. \( f(x) = -(x^2 + 2x - 3) \)
36. \( f(x) = -(x^2 + x - 30) \)
37. \( g(x) = x^2 + 8x + 11 \)
38. \( f(x) = x^2 + 10x + 14 \)
39. \( f(x) = 2x^2 - 16x + 31 \)
40. \( f(x) = -4x^2 + 24x - 41 \)
41. \( g(x) = \frac{1}{2} x^2 + 4x - 2 \)
42. \( f(x) = \frac{2}{3} (x^2 + 6x - 5) \)
In Exercises 43–46, write an equation for the parabola in standard form.

43. \(y = x^2 - 4x - 5\)

44. \(y = 2x^2 + 5x - 3\)

45. \((-2, 2)\)

46. \((2, 0)\)

In Exercises 47–56, write the standard form of the equation of the parabola that has the indicated vertex and whose graph passes through the given point.

47. Vertex: \((-2, 5)\); point: \((0, 9)\)

48. Vertex: \((4, -1)\); point: \((2, 3)\)

49. Vertex: \((1, -2)\); point: \((-1, 14)\)

50. Vertex: \((2, 3)\); point: \((0, 2)\)

51. Vertex: \((5, 12)\); point: \((7, 15)\)

52. Vertex: \((-2, -2)\); point: \((-1, 0)\)

53. Vertex: \((-\frac{1}{2}, 3)\); point: \((-2, 0)\)

54. Vertex: \((\frac{5}{2}, -2)\); point: \((-2, 4)\)

55. Vertex: \((-\frac{3}{4}, 0)\); point: \((-\frac{7}{2}, -\frac{49}{4})\)

56. Vertex: \((6, 6)\); point: \((\frac{61}{10}, \frac{1}{2})\)

**GRAPHICAL REASONING** In Exercises 57 and 58, determine the x-intercept(s) of the graph visually. Then find the x-intercept(s) algebraically to confirm your results.

57. \(y = x^2 - 4x - 5\)

58. \(y = 2x^2 + 5x - 3\)

In Exercises 59–64, use a graphing utility to graph the quadratic function. Find the x-intercepts of the graph and compare them with the solutions of the corresponding quadratic equation when \(f(x) = 0\).

59. \(f(x) = x^2 - 4x\)

60. \(f(x) = -2x^2 + 10x\)

61. \(f(x) = x^2 - 9x + 18\)

62. \(f(x) = x^2 - 8x - 20\)

63. \(f(x) = 2x^2 - 7x - 30\)

64. \(f(x) = \frac{2}{9}(x^2 + 12x - 45)\)

In Exercises 65–70, find two quadratic functions, one that opens upward and one that opens downward, whose graphs have the given x-intercepts. (There are many correct answers.)

65. \((-1, 0), (3, 0)\)

66. \((-5, 0), (5, 0)\)

67. \((0, 0), (10, 0)\)

68. \((4, 0), (8, 0)\)

69. \((-3, 0), (-\frac{1}{2}, 0)\)

70. \((-\frac{5}{2}, 2), (2, 0)\)

In Exercises 71–74, find two positive real numbers whose product is a maximum.

71. The sum is 110.

72. The sum is 5.

73. The sum of the first and twice the second is 24.

74. The sum of the first and three times the second is 42.

**PATH OF A DIVER** The path of a diver is given by

\[
y = \frac{4}{9}x^2 + \frac{24}{9}x + 12
\]

where \(y\) is the height (in feet) and \(x\) is the horizontal distance from the end of the diving board (in feet). What is the maximum height of the diver?

**HEIGHT OF A BALL** The height \(y\) (in feet) of a punted football is given by

\[
y = \frac{16}{2025}x^2 + \frac{9}{5}x + 1.5
\]

where \(x\) is the horizontal distance (in feet) from the point at which the ball is punted.

(a) How high is the ball when it is punted?

(b) What is the maximum height of the punt?

(c) How long is the punt?

**MINIMUM COST** A manufacturer of lighting fixtures has daily production costs of \(C = 800 - 10x + 0.25x^2\), where \(C\) is the total cost (in dollars) and \(x\) is the number of units produced. How many fixtures should be produced each day to yield a minimum cost?

**MAXIMUM PROFIT** The profit \(P\) (in hundreds of dollars) that a company makes depends on the amount \(x\) (in hundreds of dollars) the company spends on advertising according to the model

\[
P = 230 + 20x - 0.5x^2
\]

What expenditure for advertising will yield a maximum profit?
79. **MAXIMUM REVENUE** The total revenue $R$ earned (in thousands of dollars) from manufacturing handheld video games is given by

$$R(p) = -25p^2 + 1200p$$

where $p$ is the price per unit (in dollars).

(a) Find the revenues when the price per unit is $20, $25, and $30.

(b) Find the unit price that will yield a maximum revenue. What is the maximum revenue? Explain your results.

80. **MAXIMUM REVENUE** The total revenue earned per day (in dollars) from a pet-sitting service is given by

$$R(p) = -12p^2 + 150p$$

where $p$ is the price charged per pet (in dollars).

(a) Find the revenues when the price per pet is $4, $6, and $8.

(b) Find the price that will yield a maximum revenue. What is the maximum revenue? Explain your results.

81. **NUMERICAL, GRAPHICAL, AND ANALYTICAL ANALYSIS** A rancher has 200 feet of fencing to enclose two adjacent rectangular corrals (see figure).

(a) Write the area $A$ of the corrals as a function of $x$.

(b) Create a table showing possible values of $x$ and the corresponding areas of the corral. Use the table to estimate the dimensions that will produce the maximum enclosed area.

(c) Use a graphing utility to graph the area function. Use the graph to approximate the maximum enclosed area.

(d) Write the area function in standard form to find analytically the dimensions that will produce the maximum area.

(e) Compare your results from parts (b), (c), and (d).

82. **GEOMETRY** An indoor physical fitness room consists of a rectangular region with a semicircle on each end. The perimeter of the room is to be a 200-meter single-lane running track.

(a) Draw a diagram that illustrates the problem. Let $x$ and $y$ represent the length and width of the rectangular region, respectively.

(b) Determine the radius of each semicircular end of the room. Determine the distance, in terms of $y$, around the inside edge of each semicircular part of the track.

(c) Use the result of part (b) to write an equation, in terms of $x$ and $y$, for the distance traveled in one lap around the track. Solve for $y$.

(d) Use the result of part (c) to write the area $A$ of the rectangular region as a function of $x$. What dimensions will produce a rectangle of maximum area?

83. **MAXIMUM REVENUE** A small theater has a seating capacity of 2000. When the ticket price is $20, attendance is 1500. For each $1 decrease in price, attendance increases by 100.

(a) Write the revenue $R$ of the theater as a function of ticket price $p$.

(b) What ticket price will yield a maximum revenue? What is the maximum revenue?

84. **MAXIMUM AREA** A Norman window is constructed by adjoining a semicircle to the top of an ordinary rectangular window (see figure). The perimeter of the window is 16 feet.

(a) Write the area $A$ of the window as a function of $x$.

(b) What dimensions will produce a window of maximum area?

85. **GRAPHICAL ANALYSIS** From 1950 through 2005, the per capita consumption $C$ of cigarettes by Americans (age 18 and older) can be modeled by

$$C = 3565.0 + 60.30t - 1.783t^2$$

where $t$ is the year, with $t = 0$ corresponding to 1950.

(Source: Tobacco Outlook Report)

(a) Use a graphing utility to graph the model.

(b) Use the graph of the model to approximate the maximum average annual consumption. Beginning in 1966, all cigarette packages were required by law to carry a health warning. Do you think the warning had any effect? Explain.

(c) In 2005, the U.S. population (age 18 and over) was 296,329,000. Of those, about 59,858,458 were smokers. What was the average annual cigarette consumption per smoker in 2005? What was the average daily cigarette consumption per smoker?
86. DATA ANALYSIS: SALES The sales y (in billions of dollars) for Harley-Davidson from 2000 through 2007 are shown in the table. (Source: U.S. Harley-Davidson, Inc.)

<table>
<thead>
<tr>
<th>Year</th>
<th>Sales, y</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>2.91</td>

<td>5.73</td>
</tr>
</tbody>
</table>

(a) Use a graphing utility to create a scatter plot of the data. Let x represent the year, with x = 0 corresponding to 2000.

(b) Use the regression feature of the graphing utility to find a quadratic model for the data.

(c) Use the graphing utility to graph the model in the same viewing window as the scatter plot. How well does the model fit the data?

(d) Use the trace feature of the graphing utility to approximate the year in which the sales for Harley-Davidson were the greatest.

(e) Verify your answer to part (d) algebraically.

(f) Use the model to predict the sales for Harley-Davidson in 2010.

EXPLORATION

TRUE OR FALSE? In Exercises 87–90, determine whether the statement is true or false. Justify your answer.

87. The function given by \( f(x) = -12x^2 - 1 \) has no x-intercepts.

88. The graphs of \( f(x) = -4x^2 - 10x + 7 \) and \( g(x) = 12x^2 + 30x + 1 \) have the same axis of symmetry.

89. The graph of a quadratic function with a negative leading coefficient will have a maximum value at its vertex.

90. The graph of a quadratic function with a positive leading coefficient will have a minimum value at its vertex.

THINK ABOUT IT In Exercises 91–94, find the values of \( b \) such that the function has the given maximum or minimum value.

91. \( f(x) = -x^2 + bx - 75 \); Maximum value: 25

92. \( f(x) = -x^2 + bx - 16 \); Maximum value: 48

93. \( f(x) = x^2 + bx + 26 \); Minimum value: 10

94. \( f(x) = x^2 + bx - 25 \); Minimum value: -50

95. Write the quadratic function

\[ f(x) = ax^2 + bx + c \]

in standard form to verify that the vertex occurs at

\[ \left( \frac{-b}{2a}, f\left( \frac{-b}{2a} \right) \right). \]

96. CAPSTONE The profit \( P \) (in millions of dollars) for a recreational vehicle retailer is modeled by a quadratic function of the form

\[ P = at^2 + bt + c \]

where \( t \) represents the year. If you were president of the company, which of the models below would you prefer? Explain your reasoning.

(a) \( a \) is positive and \( -b/(2a) \) \leq t.

(b) \( a \) is positive and \( t \leq -b/(2a) \).

(c) \( a \) is negative and \( -b/(2a) \) \leq t.

(d) \( a \) is negative and \( t \leq -b/(2a) \).

97. GRAPHICAL ANALYSIS

(a) Graph \( y = ax^2 \) for \( a = -2, -1, -0.5, 0.5, 1 \) and 2. How does changing the value of \( a \) affect the graph?

(b) Graph \( y = (x - h)^2 \) for \( h = -4, -2, 2, \) and 4. How does changing the value of \( h \) affect the graph?

(c) Graph \( y = x^2 + k \) for \( k = -4, -2, 2, \) and 4. How does changing the value of \( k \) affect the graph?

98. Describe the sequence of transformation from \( f \) to \( g \) given that \( f(x) = x^2 \) and \( g(x) = a(x - h)^2 + k \). (Assume \( a, h, \) and \( k \) are positive.)

99. Is it possible for a quadratic equation to have only one x-intercept? Explain.

100. Assume that the function given by

\[ f(x) = ax^2 + bx + c, \quad a \neq 0 \]

has two real zeros. Show that the x-coordinate of the vertex of the graph is the average of the zeros of \( f \). (Hint: Use the Quadratic Formula.)

PROJECT: HEIGHT OF A BASKETBALL To work an extended application analyzing the height of a basketball after it has been dropped, visit this text’s website at academic.cengage.com.
In this section, you will study basic features of the graphs of polynomial functions. The first feature is that the graph of a polynomial function is **continuous**. Essentially, this means that the graph of a polynomial function has no breaks, holes, or gaps, as shown in Figure 2.11(a). The graph shown in Figure 2.11(b) is an example of a piecewise-defined function that is not continuous.

[FIGURE 2.11](a) Polynomial functions have continuous graphs. (b) Functions with graphs that are not continuous are not polynomial functions.

The second feature is that the graph of a polynomial function has only smooth, rounded turns, as shown in Figure 2.12. A polynomial function cannot have a sharp turn. For instance, the function given by \( f(x) = |x| \), which has a sharp turn at the point \((0, 0)\), as shown in Figure 2.13, is not a polynomial function.

[FIGURE 2.12] Polynomial functions have graphs with smooth, rounded turns. [FIGURE 2.13] Graphs of polynomial functions cannot have sharp turns.

The graphs of polynomial functions of degree greater than 2 are more difficult to analyze than the graphs of polynomials of degree 0, 1, or 2. However, using the features presented in this section, coupled with your knowledge of point plotting, intercepts, and symmetry, you should be able to make reasonably accurate sketches *by hand*.
The polynomial functions that have the simplest graphs are monomials of the form $f(x) = x^n$, where $n$ is an integer greater than zero. From Figure 2.14, you can see that when $n$ is even, the graph is similar to the graph of $y = x^n$, and when $n$ is odd, the graph is similar to the graph of $y = x^n$. Moreover, the greater the value of $n$, the flatter the graph near the origin. Polynomial functions of the form $f(x) = x^n$ are often referred to as power functions.

(a) If $n$ is even, the graph of $y = x^n$ touches the axis at the $x$-intercept. 
(b) If $n$ is odd, the graph of $y = x^n$ crosses the axis at the $x$-intercept.

**FIGURE 2.14**

**Example 1** Sketching Transformations of Polynomial Functions

Sketch the graph of each function.

a. $f(x) = -x^5$

b. $h(x) = (x + 1)^4$

**Solution**

a. Because the degree of $f(x) = -x^5$ is odd, its graph is similar to the graph of $y = x^3$. In Figure 2.15, note that the negative coefficient has the effect of reflecting the graph in the $x$-axis.

b. The graph of $h(x) = (x + 1)^4$, as shown in Figure 2.16, is a left shift by one unit of the graph of $y = x^4$.

**Algebra Help**

You can review the techniques for shifting, reflecting, and stretching graphs in Section 1.7.

**CHECK Point** Now try Exercise 17.
The Leading Coefficient Test

In Example 1, note that both graphs eventually rise or fall without bound as \( x \) moves to the right. Whether the graph of a polynomial function eventually rises or falls can be determined by the function’s degree (even or odd) and by its leading coefficient, as indicated in the Leading Coefficient Test.

**Leading Coefficient Test**

As \( x \) moves without bound to the left or to the right, the graph of the polynomial function \( f(x) = a_n x^n + \cdots + a_1 x + a_0 \) eventually rises or falls in the following manner.

1. When \( n \) is odd:

   - If the leading coefficient is positive \((a_n > 0)\), the graph falls to the left and rises to the right.
   - If the leading coefficient is negative \((a_n < 0)\), the graph rises to the left and falls to the right.

2. When \( n \) is even:

   - If the leading coefficient is positive \((a_n > 0)\), the graph rises to the left and right.
   - If the leading coefficient is negative \((a_n < 0)\), the graph falls to the left and right.

The notation “\( f(x) \rightarrow -\infty \) as \( x \rightarrow -\infty \)” indicates that the graph falls to the left. The notation “\( f(x) \rightarrow \infty \) as \( x \rightarrow \infty \)” indicates that the graph rises to the right.
Applying the Leading Coefficient Test

Describe the right-hand and left-hand behavior of the graph of each function.

\[ a. \quad f(x) = -x^3 + 4x \quad \quad b. \quad f(x) = x^4 - 5x^2 + 4 \quad \quad c. \quad f(x) = x^5 - x \]

**Solution**

a. Because the degree is odd and the leading coefficient is negative, the graph rises to the left and falls to the right, as shown in Figure 2.17.

b. Because the degree is even and the leading coefficient is positive, the graph rises to the left and right, as shown in Figure 2.18.

c. Because the degree is odd and the leading coefficient is positive, the graph falls to the left and rises to the right, as shown in Figure 2.19.

In Example 2, note that the Leading Coefficient Test tells you only whether the graph eventually rises or falls to the right or left. Other characteristics of the graph, such as intercepts and minimum and maximum points, must be determined by other tests.

**Zeros of Polynomial Functions**

It can be shown that for a polynomial function \( f \) of degree \( n \), the following statements are true.

1. The function \( f \) has, at most, \( n \) real zeros. (You will study this result in detail in the discussion of the Fundamental Theorem of Algebra in Section 2.5.)

2. The graph of \( f \) has, at most, \( n - 1 \) turning points. (Turning points, also called relative minima or relative maxima, are points at which the graph changes from increasing to decreasing or vice versa.)

Finding the zeros of polynomial functions is one of the most important problems in algebra. There is a strong interplay between graphical and algebraic approaches to this problem. Sometimes you can use information about the graph of a function to help find its zeros, and in other cases you can use information about the zeros of a function to help sketch its graph. Finding zeros of polynomial functions is closely related to factoring and finding \( x \)-intercepts.
Chapter 2 Polynomial and Rational Functions

In Example 3, note that because the exponent is greater than 1, the factor yields the repeated zero because the exponent is even, the graph touches the -axis at as shown in Figure 2.20.

Real Zeros of Polynomial Functions
If \( f \) is a polynomial function and \( a \) is a real number, the following statements are equivalent.

1. \( x = a \) is a zero of the function \( f \).
2. \( x = a \) is a solution of the polynomial equation \( f(x) = 0 \).
3. \( (x - a) \) is a factor of the polynomial \( f(x) \).
4. \( (a, 0) \) is an \( x \)-intercept of the graph of \( f \).

Example 3 Finding the Zeros of a Polynomial Function

Find all real zeros of

\[ f(x) = -2x^4 + 2x^2. \]

Then determine the number of turning points of the graph of the function.

Algebraic Solution
To find the real zeros of the function, set \( f(x) \) equal to zero and solve for \( x \).

\[
egin{align*}
-2x^4 + 2x^2 &= 0 & \text{Set } f(x) \text{ equal to 0.} \\
-2x^2(x^2 - 1) &= 0 & \text{Remove common monomial factor.} \\
-2x^2(x - 1)(x + 1) &= 0 & \text{Factor completely.}
\end{align*}
\]

So, the real zeros are \( x = 0 \), \( x = 1 \), and \( x = -1 \). Because the function is a fourth-degree polynomial, the graph of \( f \) can have at most \( 4 - 1 = 3 \) turning points.

CHECKPOINT Now try Exercise 35.

Graphical Solution
Use a graphing utility to graph \( y = -2x^4 + 2x^2 \). In Figure 2.20, the graph appears to have zeros at \( (0, 0) \), \( (1, 0) \), and \( (-1, 0) \). Use the zero or root feature, or the zoom and trace features, of the graphing utility to verify these zeros. So, the real zeros are \( x = 0 \), \( x = 1 \), and \( x = -1 \). From the figure, you can see that the graph has three turning points. This is consistent with the fact that a fourth-degree polynomial can have at most three turning points.

In Example 3, note that because the exponent is greater than 1, the factor \(-2x^2\) yields the repeated zero \( x = 0 \). Because the exponent is even, the graph touches the \( x \)-axis at \( x = 0 \), as shown in Figure 2.20.

Repeated Zeros
A factor \((x - a)^k\), \( k > 1 \), yields a repeated zero \( x = a \) of multiplicity \( k \).

1. If \( k \) is odd, the graph crosses the \( x \)-axis at \( x = a \).
2. If \( k \) is even, the graph touches the \( x \)-axis (but does not cross the \( x \)-axis) at \( x = a \).
To graph polynomial functions, you can use the fact that a polynomial function can change signs only at its zeros. Between two consecutive zeros, a polynomial must be entirely positive or entirely negative. (This follows from the Intermediate Value Theorem, which you will study later in this section.) This means that when the real zeros of a polynomial function are put in order, they divide the real number line into intervals in which the function has no sign changes. These resulting intervals are test intervals in which a representative \( x \)-value in the interval is chosen to determine if the value of the polynomial function is positive (the graph lies above the \( x \)-axis) or negative (the graph lies below the \( x \)-axis).

### Example 4 Sketching the Graph of a Polynomial Function

Sketch the graph of \( f(x) = 3x^4 - 4x^3 \).

**Solution**

1. **Apply the Leading Coefficient Test.** Because the leading coefficient is positive and the degree is even, you know that the graph eventually rises to the left and to the right (see Figure 2.21).

2. **Find the Zeros of the Polynomial.** By factoring \( f(x) = 3x^4 - 4x^3 \) as \( f(x) = x^3(3x - 4) \), you can see that the zeros of \( f \) are \( x = 0 \) and \( x = \frac{4}{3} \) (both of odd multiplicity). So, the \( x \)-intercepts occur at \((0, 0)\) and \( \left(\frac{4}{3}, 0\right) \). Add these points to your graph, as shown in Figure 2.21.

3. **Plot a Few Additional Points.** Use the zeros of the polynomial to find the test intervals. In each test interval, choose a representative \( x \)-value and evaluate the polynomial function, as shown in the table.

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative ( x )-value</th>
<th>Value of ( f )</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>( (-\infty, 0) )</td>
<td>(-1)</td>
<td>( f(-1) = 7 )</td>
<td>Positive</td>
<td>((-1, 7))</td>
</tr>
<tr>
<td>( (0, \frac{4}{3}) )</td>
<td>(1)</td>
<td>( f(1) = -1 )</td>
<td>Negative</td>
<td>((1, -1))</td>
</tr>
<tr>
<td>( \left(\frac{4}{3}, \infty\right) )</td>
<td>(1.5)</td>
<td>( f(1.5) = 1.6875 )</td>
<td>Positive</td>
<td>((1.5, 1.6875))</td>
</tr>
</tbody>
</table>

4. **Draw the Graph.** Draw a continuous curve through the points, as shown in Figure 2.22. Because both zeros are of odd multiplicity, you know that the graph should cross the \( x \)-axis at \( x = 0 \) and \( x = \frac{4}{3} \).

---

**TECHNOLOGY**

Example 4 uses an algebraic approach to describe the graph of the function. A graphing utility is a complement to this approach. Remember that an important aspect of using a graphing utility is to find a viewing window that shows all significant features of the graph. For instance, the viewing window in part (a) illustrates all of the significant features of the function in Example 4 while the viewing window in part (b) does not.

---

**WARNING / CAUTION**

If you are unsure of the shape of a portion of the graph of a polynomial function, plot some additional points, such as the point \((0.5, -0.3125)\), as shown in Figure 2.22.

---

**CHECK Point** Now try Exercise 75.
Example 5  Sketching the Graph of a Polynomial Function

Sketch the graph of \( f(x) = -2x^3 + 6x^2 - \frac{9}{2}x. \)

Solution

1. Apply the Leading Coefficient Test. Because the leading coefficient is negative and the degree is odd, you know that the graph eventually rises to the left and falls to the right (see Figure 2.23).

2. Find the Zeros of the Polynomial. By factoring

\[
f(x) = -2x^3 + 6x^2 - \frac{9}{2}x
\]

\[
= -\frac{1}{2}x(4x^2 - 12x + 9)
\]

\[
= -\frac{1}{2}x(2x - 3)^2
\]

you can see that the zeros of \( f \) are \( x = 0 \) (odd multiplicity) and \( x = \frac{3}{2} \) (even multiplicity). So, the \( x \)-intercepts occur at \( (0, 0) \) and \( \left(\frac{3}{2}, 0\right) \). Add these points to your graph, as shown in Figure 2.23.

3. Plot a Few Additional Points. Use the zeros of the polynomial to find the test intervals. In each test interval, choose a representative \( x \)-value and evaluate the polynomial function, as shown in the table.

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative ( x )-value</th>
<th>Value of ( f )</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, \ 0))</td>
<td>-0.5</td>
<td>( f(-0.5) = 4 )</td>
<td>Positive</td>
<td>((-0.5, 4))</td>
</tr>
<tr>
<td>( \left(0,\frac{3}{2}\right))</td>
<td>0.5</td>
<td>( f(0.5) = -1 )</td>
<td>Negative</td>
<td>((0.5, -1))</td>
</tr>
<tr>
<td>( \left(\frac{3}{2}, \infty\right))</td>
<td>2</td>
<td>( f(2) = -1 )</td>
<td>Negative</td>
<td>((2, -1))</td>
</tr>
</tbody>
</table>

4. Draw the Graph. Draw a continuous curve through the points, as shown in Figure 2.24. As indicated by the multiplicities of the zeros, the graph crosses the \( x \)-axis at \((0, 0)\) but does not cross the \( x \)-axis at \( \left(\frac{3}{2}, 0\right) \).

Now try Exercise 77.
The Intermediate Value Theorem

The next theorem, called the **Intermediate Value Theorem**, illustrates the existence of real zeros of polynomial functions. This theorem implies that if \((a, f(a))\) and \((b, f(b))\) are two points on the graph of a polynomial function such that \(f(a) \neq f(b)\), then for any number \(d\) between \(f(a)\) and \(f(b)\) there must be a number \(c\) between \(a\) and \(b\) such that \(f(c) = d\). (See Figure 2.25.)

![Figure 2.25](image)

**Intermediate Value Theorem**

Let \(a\) and \(b\) be real numbers such that \(a < b\). If \(f\) is a polynomial function such that \(f(a) \neq f(b)\), then, in the interval \([a, b]\), \(f\) takes on every value between \(f(a)\) and \(f(b)\).

The Intermediate Value Theorem helps you locate the real zeros of a polynomial function in the following way. If you can find a value \(x = a\) at which a polynomial function is positive, and another value \(x = b\) at which it is negative, you can conclude that the function has at least one real zero between these two values. For example, the function given by \(f(x) = x^3 + x^2 + 1\) is negative when \(x = -2\) and positive when \(x = -1\). Therefore, it follows from the Intermediate Value Theorem that \(f\) must have a real zero somewhere between \(-2\) and \(-1\), as shown in Figure 2.26.

![Figure 2.26](image)

By continuing this line of reasoning, you can approximate any real zeros of a polynomial function to any desired accuracy. This concept is further demonstrated in Example 6.
Approximating a Zero of a Polynomial Function

Use the Intermediate Value Theorem to approximate the real zero of

\[ f(x) = x^3 - x^2 + 1. \]

**Solution**

Begin by computing a few function values, as follows.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( f(x) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>-11</td>
</tr>
<tr>
<td>-1</td>
<td>-1</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Because \( f(-1) \) is negative and \( f(0) \) is positive, you can apply the Intermediate Value Theorem to conclude that the function has a zero between -1 and 0. To pinpoint this zero more closely, divide the interval \([-1, 0]\) into tenths and evaluate the function at each point. When you do this, you will find that

\[ f(-0.8) = -0.152 \quad \text{and} \quad f(-0.7) = 0.167. \]

So, \( f \) must have a zero between -0.8 and -0.7, as shown in Figure 2.27. For a more accurate approximation, compute function values between \( f(-0.8) \) and \( f(-0.7) \) and apply the Intermediate Value Theorem again. By continuing this process, you can approximate this zero to any desired accuracy.

**CHECKPOINT** Now try Exercise 93.

**TECHNOLOGY**

You can use the table feature of a graphing utility to approximate the zeros of a polynomial function. For instance, for the function given by

\[ f(x) = -2x^3 - 3x^2 + 3 \]

create a table that shows the function values for \(-20 \leq x \leq 20\), as shown in the first table at the right. Scroll through the table looking for consecutive function values that differ in sign. From the table, you can see that \( f(0) \) and \( f(1) \) differ in sign. So, you can conclude from the Intermediate Value Theorem that the function has a zero between 0 and 1. You can adjust your table to show function values for \( 0 \leq x \leq 1 \) using increments of 0.1, as shown in the second table at the right. By scrolling through the table you can see that \( f(0.8) \) and \( f(0.9) \) differ in sign. So, the function has a zero between 0.8 and 0.9. If you repeat this process several times, you should obtain \( x = 0.806 \) as the zero of the function. Use the zero or root feature of a graphing utility to confirm this result.
2.2 EXERCISES

VOCABULARY: Fill in the blanks.
1. The graphs of all polynomial functions are ________, which means that the graphs have no breaks, holes, or gaps.
2. The ________ ________ ________ is used to determine the left-hand and right-hand behavior of the graph of a polynomial function.
3. Polynomial functions of the form \( f(x) = ________ \) are often referred to as power functions.
4. A polynomial function of degree \( n \) has at most ________ real zeros and at most ________ turning points.
5. If \( x = a \) is a zero of a polynomial function \( f \), then the following three statements are true.
   (a) \( x = a \) is a ________ of the polynomial equation \( f(x) = 0 \).
   (b) ________ is a factor of the polynomial \( f(x) \).
   (c) \((a, 0)\) is an ________ of the graph of \( f \).
6. If a real zero of a polynomial function is of even multiplicity, then the graph of \( f ________ \) the \( x \)-axis at \( x = a \), and if it is of odd multiplicity, then the graph of \( f ________ \) the \( x \)-axis at \( x = a \).
7. A polynomial function is written in ________ form if its terms are written in descending order of exponents from left to right.
8. The ________ ________ Theorem states that if \( f \) is a polynomial function such that \( f(a) \neq f(b) \), then, in the interval \([a, b]\), \( f \) takes on every value between \( f(a) \) and \( f(b) \).

SKILLS AND APPLICATIONS

In Exercises 9–16, match the polynomial function with its graph. [The graphs are labeled (a), (b), (c), (d), (e), (f), (g), and (h).]

(a) \( f(x) = -2x + 3 \)  (b) \( f(x) = x^2 - 4x \)
(c) \( f(x) = -2x^2 - 5x \)  (d) \( f(x) = x^3 - 3x + 1 \)
(e) \( f(x) = -\frac{1}{2}x^4 + 3x^2 \) (f) \( f(x) = \frac{1}{2}x^3 - 2x^3 + \frac{9}{2}x \)

In Exercises 17–20, sketch the graph of \( y = x^n \) and each transformation.

17. \( y = x^3 \)
   (a) \( f(x) = (x - 4)^3 \)  (b) \( f(x) = x^3 - 4 \)
   (c) \( f(x) = -\frac{1}{2}x^3 \)  (d) \( f(x) = (x - 4)^3 - 4 \)
18. \( y = x^5 \)
   (a) \( f(x) = (x + 1)^5 \)  (b) \( f(x) = x^5 + 1 \)
   (c) \( f(x) = 1 - \frac{1}{2}x^5 \)  (d) \( f(x) = -\frac{1}{2}(x + 1)^5 \)
19. \( y = x^4 \)
   (a) \( f(x) = (x + 3)^4 \)  (b) \( f(x) = x^4 - 3 \)
   (c) \( f(x) = 4 - x^4 \)  (d) \( f(x) = \frac{1}{2}(x - 1)^4 \)
   (e) \( f(x) = (2x)^4 + 1 \)  (f) \( f(x) = (\frac{1}{2}x)^4 - 2 \)
20. \( y = x^6 \)
   (a) \( f(x) = -\frac{1}{4}x^6 \)
   (b) \( f(x) = (x + 2)^6 - 4 \)
   (c) \( f(x) = x^6 - 5 \)
   (d) \( f(x) = -\frac{1}{4}x^6 + 1 \)
   (e) \( f(x) = \frac{1}{2}x^6 - 2 \)
   (f) \( f(x) = (2x)^6 - 1 \)

In Exercises 21–30, describe the right-hand and left-hand behavior of the graph of the polynomial function.

21. \( f(x) = \frac{1}{2}x^3 + 4x \)
22. \( f(x) = 2x^2 - 3x + 1 \)
23. \( g(x) = 5 \cdot \frac{7}{2}x - 3x^2 \)
24. \( h(x) = 1 - x^6 \)
25. \( f(x) = -2.1x^5 + 4x^3 - 2 \)
26. \( f(x) = 4x^3 - 7x + 6.5 \)
27. \( f(x) = 6 - 2x + 4x^2 - 5x^3 \)
28. \( f(x) = (3x^2 - 2x + 5)/4 \)
29. \( h(t) = -\frac{5}{2}(t^2 - 3t + 6) \)
30. \( f(s) = -\frac{7}{2}(s^3 + 5s^2 - 7s + 1) \)

**GRAPHICAL ANALYSIS** In Exercises 31–34, use a graphing utility to graph the functions \( f \) and \( g \) in the same viewing window. Zoom out sufficiently far to show that the right-hand and left-hand behaviors of \( f \) and \( g \) appear identical.

31. \( f(x) = 3x^3 - 9x + 1 \), \( g(x) = 3x^3 \)
32. \( f(x) = -\frac{1}{2}(x^3 - 3x + 2) \), \( g(x) = -\frac{1}{2}x^3 \)
33. \( f(x) = -(x^4 - 4x^3 + 16x) \), \( g(x) = -x^4 \)
34. \( f(x) = 3x^4 - 6x^2 \), \( g(x) = 3x^4 \)

In Exercises 35–50, (a) find all the real zeros of the polynomial function, (b) determine the multiplicity of each zero and the number of turning points of the graph of the function, and (c) use a graphing utility to graph the function and verify your answers.

35. \( f(x) = x^2 - 36 \)
36. \( f(x) = 81 - x^2 \)
37. \( h(t) = t^2 - 6t + 9 \)
38. \( f(x) = x^2 + 10x + 25 \)
39. \( f(x) = \frac{1}{2}x^2 + \frac{1}{2}x - \frac{5}{2} \)
40. \( f(x) = \frac{1}{2}x^2 + \frac{1}{2}x - \frac{5}{2} \)
41. \( f(x) = 3x^3 - 12x^2 + 3x \)
42. \( g(x) = 5x(x^2 - 2x - 1) \)
43. \( f(t) = t^3 - 8t^2 + 16t \)
44. \( f(x) = x^4 - x^3 - 30x^2 \)
45. \( g(t) = t^5 - 6t^3 + 9t \)
46. \( f(x) = x^5 + x^3 - 6x \)
47. \( f(x) = 3x^4 + 9x^2 + 3x \)
48. \( f(x) = 2x^4 - 2x^2 - 40 \)
49. \( g(x) = x^3 + 3x^2 - 4x - 12 \)
50. \( f(x) = x^3 - 4x^2 - 25x + 100 \)

**GRAPHICAL ANALYSIS** In Exercises 51–54, (a) use a graphing utility to graph the function, (b) use the graph to approximate any \( x \)-intercepts of the graph, (c) set \( y = 0 \) and solve the resulting equation, and (d) compare the results of part (c) with any \( x \)-intercepts of the graph.

51. \( y = 4x^3 - 20x^2 + 25x \)
52. \( y = 4x^3 + 4x^2 - 8x - 8 \)
53. \( y = x^5 - 5x^3 + 4x \)
54. \( y = \frac{1}{3}x^3(x^2 - 9) \)

In Exercises 55–64, find a polynomial function that has the given zeros. (There are many correct answers.)

55. 0, 8
56. 0, −7
57. 2, −6
58. −4, 5
59. 0, −4, −5
60. 0, 1, 10
61. 4, −3, 3, 0
62. −2, −1, 0, 1, 2
63. 1 + √3, 1 − √3
64. 2, 4 + √3, 4 − √3

In Exercises 65–74, find a polynomial of degree \( n \) that has the given zeros. (There are many correct answers.)

<table>
<thead>
<tr>
<th>Zero(s)</th>
<th>Degree</th>
</tr>
</thead>
<tbody>
<tr>
<td>65. ( x = -3 )</td>
<td>( n = 2 )</td>
</tr>
<tr>

</tr>
<tr>
<td>74. ( x = -1, 4, 7, 8 )</td>
<td>( n = 5 )</td>
</tr>
</tbody>
</table>

In Exercises 75–88, sketch the graph of the function by (a) applying the Leading Coefficient Test, (b) finding the zeros of the polynomial, (c) plotting sufficient solution points, and (d) drawing a continuous curve through the points.

75. \( f(x) = x^3 - 25x \)
76. \( g(x) = x^4 - 9x^2 \)
77. \( f(t) = \frac{1}{2}(t^2 - 2t + 15) \)
78. \( g(x) = -x^2 + 10x - 16 \)
79. \( f(x) = x^3 + 2x^2 \)
80. \( f(x) = 8 - x^3 \)
81. \( f(x) = 3x^3 - 15x^2 + 18x \)
82. \( f(x) = -4x^3 + 4x^2 + 15x \)
83. \( f(x) = -5x^2 - x^3 \)
84. \( f(x) = -48x^2 + 3x^4 \)
85. \( f(x) = x^3(x - 4) \)
86. \( h(x) = \frac{1}{3}x^3(x - 4)^2 \)
87. \( g(t) = -\frac{1}{2}(t - 2)(t + 2)^2 \)
88. \( g(x) = \frac{1}{10}(x + 1)^2(x - 3)^3 \)

In Exercises 89–92, use a graphing utility to graph the function. Use the zero or root feature to approximate the real zeros of the function. Then determine the multiplicity of each zero.

89. \( f(x) = x^3 - 16x \)
90. \( f(x) = \frac{1}{2}x^4 - 2x^2 \)
91. \( g(x) = \frac{1}{2}(x + 1)^2(x - 3)(2x - 9) \)
92. \( h(x) = \frac{1}{2}(x + 2)^2(3x - 5)^2 \)
In Exercises 93–96, use the Intermediate Value Theorem and the table feature of a graphing utility to find intervals one unit in length in which the polynomial function is guaranteed to have a zero. Adjust the table to approximate the zeros of the function. Use the zero or root feature of the graphing utility to verify your results.

93. \( f(x) = x^3 - 3x^2 + 3 \)
94. \( f(x) = 0.11x^3 - 2.07x^2 + 9.81x - 6.88 \)
95. \( g(x) = 3x^4 + 4x^3 - 3 \)
96. \( h(x) = x^4 - 10x^2 + 3 \)

97. **NUMERICAL AND GRAPHICAL ANALYSIS** An open box is to be made from a square piece of material, 36 inches on a side, by cutting equal squares with sides of length \( x \) from the corners and turning up the sides (see figure).

![Diagram of an open box](image)

(a) Write a function \( V(x) \) that represents the volume of the box.

(b) Determine the domain of the function.

(c) Use a graphing utility to create a table that shows box heights \( x \) and the corresponding volumes \( V \). Use the table to estimate the dimensions that will produce a maximum volume.

(d) Use a graphing utility to graph \( V \) and use the graph to estimate the value of \( x \) for which \( V(x) \) is maximum. Compare your result with that of part (c).

98. **MAXIMUM VOLUME** An open box with locking tabs is to be made from a square piece of material 24 inches on a side. This is to be done by cutting equal squares from the corners and folding along the dashed lines shown in the figure.

![Diagram of an open box with locking tabs](image)

(a) Write a function \( V(x) \) that represents the volume of the box.

(b) Determine the domain of the function \( V \).

(c) Sketch a graph of the function and estimate the value of \( x \) for which \( V(x) \) is maximum.

99. **CONSTRUCTION** A roofing contractor is fabricating gutters from 12-inch aluminum sheeting. The contractor plans to use an aluminum siding folding press to create the gutter by creasing equal lengths for the sidewalls (see figure).

![Diagram of a gutter](image)

(a) Let \( x \) represent the height of the sidewall of the gutter. Write a function \( A \) that represents the cross-sectional area of the gutter.

(b) The length of the aluminum sheeting is 16 feet. Write a function \( V \) that represents the volume of one run of gutter in terms of \( x \).

(c) Determine the domain of the function in part (b).

(d) Use a graphing utility to create a table that shows sidewall heights \( x \) and the corresponding volumes \( V \). Use the table to estimate the dimensions that will produce a maximum volume.

(e) Use a graphing utility to graph \( V \). Use the graph to estimate the value of \( x \) for which \( V(x) \) is a maximum. Compare your result with that of part (d).

(f) Would the value of \( x \) change if the aluminum sheeting were of different lengths? Explain.

100. **CONSTRUCTION** An industrial propane tank is formed by adjoining two hemispheres to the ends of a right circular cylinder. The length of the cylindrical portion of the tank is four times the radius of the hemispherical components (see figure).

![Diagram of a propane tank](image)

(a) Write a function that represents the total volume \( V \) of the tank in terms of \( r \).

(b) Find the domain of the function.

(c) Use a graphing utility to graph the function.

(d) The total volume of the tank is to be 120 cubic feet. Use the graph from part (c) to estimate the radius and length of the cylindrical portion of the tank.
101. **REVENUE** The total revenues $R$ (in millions of dollars) for Krispy Kreme from 2000 through 2007 are shown in the table.

<table>
<thead>
<tr>
<th>Year</th>
<th>Revenue, $R$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>300.7</td>
</tr>
<tr>
<td>2001</td>
<td>394.4</td>
</tr>
<tr>
<td>2002</td>
<td>491.5</td>
</tr>
<tr>
<td>2003</td>
<td>665.6</td>

<tr>
<td>2004</td>
<td>707.8</td>
</tr>
<tr>
<td>2005</td>
<td>543.4</td>
</tr>
<tr>
<td>2006</td>
<td>461.2</td>
</tr>
<tr>
<td>2007</td>
<td>429.3</td>
</tr>
</tbody>
</table>

A model that represents these data is given by $R = 3.0711t^2 - 42.803t + 160.59t^2 - 62.6t + 307$, $0 \leq t \leq 7$, where $t$ represents the year, with $t = 0$ corresponding to 2000. (Source: Krispy Kreme)

(a) Use a graphing utility to create a scatter plot of the data. Then graph the model in the same viewing window.

(b) How well does the model fit the data?

(c) Use a graphing utility to approximate any relative extrema of the model over its domain.

(d) Use a graphing utility to approximate the intervals over which the revenue for Krispy Kreme was increasing and decreasing over its domain.

(e) Use the results of parts (c) and (d) to write a short paragraph about Krispy Kreme’s revenue during this time period.

102. **REVENUE** The total revenues (in millions of dollars) for Papa John’s International from 2000 through 2007 are shown in the table.

<table>
<thead>
<tr>
<th>Year</th>
<th>Revenue, $R$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>944.7</td>
</tr>
<tr>
<td>2001</td>
<td>971.2</td>
</tr>
<tr>
<td>2002</td>
<td>946.2</td>

<td>942.4</td>
</tr>
<tr>
<td>2005</td>
<td>968.8</td>
</tr>
<tr>
<td>2006</td>
<td>1001.6</td>
</tr>
<tr>
<td>2007</td>
<td>1063.6</td>
</tr>
</tbody>
</table>

A model that represents these data is given by $R = -0.5635t^2 + 9.019t^3 - 40.20t^2 + 49.0t + 947$, $0 \leq t \leq 7$, where $t$ represents the year, with $t = 0$ corresponding to 2000. (Source: Papa John’s International)

(a) Use a graphing utility to create a scatter plot of the data. Then graph the model in the same viewing window.

(b) How well does the model fit the data?

(c) Use a graphing utility to approximate any relative extrema of the model over its domain.

(d) Use a graphing utility to approximate the intervals over which the revenue for Papa John’s International was increasing and decreasing over its domain.

(e) Use the results of parts (c) and (d) to write a short paragraph about the revenue for Papa John’s International during this time period.

103. **TREE GROWTH** The growth of a red oak tree is approximated by the function $G = -0.003t^3 + 0.137t^2 + 0.458t - 0.839$ where $G$ is the height of the tree (in feet) and $t$ ($2 \leq t \leq 34$) is its age (in years).

(a) Use a graphing utility to graph the function. (Hint: Use a viewing window in which $0 \leq t \leq 7$ and $0 \leq y \leq 60$.)

(b) Estimate the age of the tree when it is growing most rapidly. This point is called the point of diminishing returns because the increase in size will be less with each additional year.

(c) Using calculus, the point of diminishing returns can also be found by finding the vertex of the parabola given by $y = -0.009t^2 + 0.274t + 0.458$.

Find the vertex of this parabola.

(d) Compare your results from parts (b) and (c).

104. **REVENUE** The total revenue $R$ (in millions of dollars) for a company is related to its advertising expense by the function

$$R = \frac{1}{100,000}(-x^3 + 600x^2), \quad 0 \leq x \leq 400$$

where $x$ is the amount spent on advertising (in tens of thousands of dollars). Use the graph of this function, shown in the figure on the next page, to estimate the point on the graph at which the function is increasing most rapidly. This point is called the point of diminishing returns because any expense above this amount will yield less return per dollar invested in advertising.
105. A fifth-degree polynomial can have five turning points in its graph.

106. It is possible for a sixth-degree polynomial to have only one solution.

107. The graph of the function given by

\[ f(x) = 2 + x - x^2 + x^3 - x^4 + x^5 - x^7 \]

rises to the left and falls to the right.

108. CAPSTONE For each graph, describe a polynomial function that could represent the graph. (Indicate the degree of the function and the sign of its leading coefficient.)

(a) (b) (c) (d)

109. GRAPHICAL REASONING Sketch a graph of the function given by \( f(x) = x^4 \). Explain how the graph of each function \( g \) differs (if it does) from the graph of each function \( f \). Determine whether \( g \) is odd, even, or neither.

(a) \( g(x) = f(x) + 2 \)  
(b) \( g(x) = f(x + 2) \)  
(c) \( g(x) = f(-x) \)  
(d) \( g(x) = -f(x) \)  
(e) \( g(x) = f(\frac{1}{2}x) \)  
(f) \( g(x) = \frac{1}{2}f(x) \)  
(g) \( g(x) = f(x^{3/4}) \)  
(h) \( g(x) = (f \cdot g)(x) \)

110. THINK ABOUT IT For each function, identify the degree of the function and whether the degree of the function is even or odd. Identify the leading coefficient and whether the leading coefficient is positive or negative. Use a graphing utility to graph each function. Describe the relationship between the degree of the function and the sign of the leading coefficient of the function and the right-hand and left-hand behavior of the graph of the function.

(a) \( f(x) = x^3 - 2x^2 - x + 1 \)  
(b) \( f(x) = 2x^5 + 2x^2 - 5x + 1 \)  
(c) \( f(x) = -2x^5 - x^2 + 5x + 3 \)  
(d) \( f(x) = -x^3 + 5x - 2 \)  
(e) \( f(x) = 2x^2 + 3x - 4 \)  
(f) \( f(x) = x^4 - 3x^2 + 2x - 1 \)  
(g) \( f(x) = x^2 + 3x + 2 \)

111. THINK ABOUT IT Sketch the graph of each polynomial function. Then count the number of zeros of the function and the numbers of relative minima and relative maxima. Compare these numbers with the degree of the polynomial. What do you observe?

(a) \( f(x) = -x^3 + 9x \)  
(b) \( f(x) = x^4 - 10x^2 + 9 \)  
(c) \( f(x) = x^3 - 16x \)

112. Explore the transformations of the form \( g(x) = a(x - h)^5 + k \).

(a) Use a graphing utility to graph the functions \( y_1 = -\frac{1}{4}(x - 2)^5 + 1 \) and \( y_2 = \frac{1}{2}(x + 2)^5 - 3 \). Determine whether the graphs are increasing or decreasing. Explain.

(b) Will the graph of \( g \) always be increasing or decreasing? If so, is this behavior determined by \( a, h, \) or \( k \)? Explain.

(c) Use a graphing utility to graph the function given by \( H(x) = x^5 - 3x^3 + 2x + 1 \). Use the graph and the result of part (b) to determine whether \( H \) can be written in the form \( H(x) = a(x - h)^5 + k \). Explain.
Chapter 2 Polynomial and Rational Functions

2.3 POLYNOMIAL AND SYNTHETIC DIVISION

What you should learn

• Use long division to divide polynomials by other polynomials.
• Use synthetic division to divide polynomials by binomials of the form \( (x - k) \).
• Use the Remainder Theorem and the Factor Theorem.

Why you should learn it

Synthetic division can help you evaluate polynomial functions. For instance, in Exercise 85 on page 157, you will use synthetic division to determine the amount donated to support higher education in the United States in 2010.

Long Division of Polynomials

In this section, you will study two procedures for dividing polynomials. These procedures are especially valuable in factoring and finding the zeros of polynomial functions. To begin, suppose you are given the graph of

\[ f(x) = 6x^3 - 19x^2 + 16x - 4. \]

Notice that a zero of \( f \) occurs at \( x = 2 \), as shown in Figure 2.28. Because \( x = 2 \) is a zero of \( f \), you know that \( (x - 2) \) is a factor of \( f(x) \). This means that there exists a second-degree polynomial \( q(x) \) such that

\[ f(x) = (x - 2) \cdot q(x). \]

To find \( q(x) \), you can use **long division**, as illustrated in Example 1.

**Example 1** Long Division of Polynomials

Divide \( 6x^3 - 19x^2 + 16x - 4 \) by \( x - 2 \), and use the result to factor the polynomial completely.

**Solution**

\[
\begin{array}{c|ccccc}
& 6x^2 & -7x & 2 \\
\hline
x - 2 & 6x^3 & -19x^2 & +16x & -4 \\
\hline
\end{array}
\]

Multiply: \( 6x^2(x - 2) \).

Subtract.

Multiply: \(-7x(x - 2)\).

Subtract.

Multiply: \(2(x - 2)\).

Subtract.

From this division, you can conclude that

\[ 6x^3 - 19x^2 + 16x - 4 = (x - 2)(6x^2 - 7x + 2) \]

and by factoring the quadratic \( 6x^2 - 7x + 2 \), you have

\[ 6x^3 - 19x^2 + 16x - 4 = (x - 2)(2x - 1)(3x - 2). \]

Note that this factorization agrees with the graph shown in Figure 2.28 in that the three \( x \)-intercepts occur at \( x = 2 \), \( x = \frac{1}{2} \), and \( x = \frac{2}{3} \).

**Check Point** Now try Exercise 11.
In Example 1, $x - 2$ is a factor of the polynomial $6x^3 - 19x^2 + 16x - 4$, and the long division process produces a remainder of zero. Often, long division will produce a nonzero remainder. For instance, if you divide $x^2 + 3x + 5$ by $x + 1$, you obtain the following.

\[
\begin{array}{r|rrr}
\text{Divisor} & x^2 + x & 2x + 5 & 3 \\
\hline
x + 1 & \underline{x^2 + 3x + 5} & \underline{2x + 2} & \underline{3} \\
\end{array}
\]

This implies that

\[
x^2 + 3x + 5 = (x + 1)(x + 2) + 3
\]

which illustrates the following theorem, called the **Division Algorithm**.

### The Division Algorithm

If $f(x)$ and $d(x)$ are polynomials such that $d(x) \neq 0$, and the degree of $d(x)$ is less than or equal to the degree of $f(x)$, there exist unique polynomials $q(x)$ and $r(x)$ such that

\[
f(x) = d(x)q(x) + r(x)
\]

where $r(x) = 0$ or the degree of $r(x)$ is less than the degree of $d(x)$. If the remainder $r(x)$ is zero, $d(x)$ divides evenly into $f(x)$.

The Division Algorithm can also be written as

\[
\frac{f(x)}{d(x)} = q(x) + \frac{r(x)}{d(x)}
\]

In the Division Algorithm, the rational expression $f(x)/d(x)$ is **improper** because the degree of $f(x)$ is greater than or equal to the degree of $d(x)$. On the other hand, the rational expression $r(x)/d(x)$ is **proper** because the degree of $r(x)$ is less than the degree of $d(x)$.
Before you apply the Division Algorithm, follow these steps.

1. Write the dividend and divisor in descending powers of the variable.
2. Insert placeholders with zero coefficients for missing powers of the variable.

### Example 2 Long Division of Polynomials

Divide $x^3 - 1$ by $x - 1$.

**Solution**

Because there is no $x^2$-term or $x$-term in the dividend, you need to line up the subtraction by using zero coefficients (or leaving spaces) for the missing terms.

\[
\begin{array}{ccc}
\text{ } & x^2 & + 1 \\
\hline
x - 1 | x^3 & + 0x^2 & + 0x - 1 \\
\text{ } & x^3 & - x^2 \\
\hline
& x^2 & + 0x \\
& x^2 & - x \\
\hline
& x - 1 \\
& x - 1 & \\
\hline
& 0
\end{array}
\]

So, $x - 1$ divides evenly into $x^3 - 1$, and you can write

\[
\frac{x^3 - 1}{x - 1} = x^2 + x + 1, \quad x \neq 1.
\]

**CHECK Point** Now try Exercise 17.

You can check the result of Example 2 by multiplying.

\[(x - 1)(x^2 + x + 1) = x^3 + x^2 + x - x^2 - x - 1 = x^3 - 1\]

### Example 3 Long Division of Polynomials

Divide $-5x^2 - 2 + 3x + 2x^4 + 4x^3$ by $2x - 3 + x^2$.

**Solution**

Begin by writing the dividend and divisor in descending powers of $x$.

\[
\begin{array}{ccc}
2x^2 & + 1 \\
\hline
x^2 & + 2x & - 3 | 2x^4 & + 4x^3 & - 5x^2 & + 3x & - 2 \\
\text{ } & 2x^4 & + 4x^3 & - 6x^2 \\
\hline
& x^2 & + 3x & - 2 \\
& x^2 & + 2x & - 3 \\
\hline
& x & + 1
\end{array}
\]

Note that the first subtraction eliminated two terms from the dividend. When this happens, the quotient skips a term. You can write the result as

\[
\frac{2x^4 + 4x^3 - 5x^2 + 3x - 2}{x^2 + 2x - 3} = 2x^2 + 1 + \frac{x + 1}{x^2 + 2x - 3}.
\]

**CHECK Point** Now try Exercise 23.
Synthetic Division

There is a nice shortcut for long division of polynomials by divisors of the form \( x - k \). This shortcut is called synthetic division. The pattern for synthetic division of a cubic polynomial is summarized as follows. (The pattern for higher-degree polynomials is similar.)

<table>
<thead>
<tr>
<th>Synthetic Division (for a Cubic Polynomial)</th>
</tr>
</thead>
<tbody>
<tr>
<td>To divide ( ax^3 + bx^2 + cx + d ) by ( x - k ), use the following pattern.</td>
</tr>
<tr>
<td>( k )</td>
</tr>
<tr>
<td>( ka )</td>
</tr>
<tr>
<td>( a )</td>
</tr>
<tr>
<td>( \text{Remainder} )</td>
</tr>
<tr>
<td>( \text{Vertical pattern: Add terms.} )</td>
</tr>
<tr>
<td>( \text{Diagonal pattern: Multiply by } k. )</td>
</tr>
</tbody>
</table>

This algorithm for synthetic division works only for divisors of the form \( x - k \). Remember that \( x + k = x - (-k) \).

**Example 4** Using Synthetic Division

Use synthetic division to divide \( x^4 - 10x^2 - 2x + 4 \) by \( x + 3 \).

**Solution**

You should set up the array as follows. Note that a zero is included for the missing \( x^3 \)-term in the dividend.

\[
\begin{array}{cccccc}
-3 & 1 & 0 & -10 & -2 & 4 \\
1 & -3 & 9 & 3 & -3 & \\
\end{array}
\]

Then, use the synthetic division pattern by adding terms in columns and multiplying the results by \(-3\).

\[
\begin{array}{cccccc}
-3 & 1 & 0 & -10 & -2 & 4 \\
& -3 & 9 & 3 & -3 & \\
& 1 & -3 & -1 & 1 & 1 & \text{Remainder: 1} \\
\end{array}
\]

So, you have

\[
\frac{x^4 - 10x^2 - 2x + 4}{x + 3} = x^3 - 3x^2 - x + 1 + \frac{1}{x + 3}
\]

**CHECKPOINT** Now try Exercise 27.
The Remainder and Factor Theorems

The remainder obtained in the synthetic division process has an important interpretation, as described in the **Remainder Theorem**.

**The Remainder Theorem**

If a polynomial $f(x)$ is divided by $x - k$, the remainder is

$$r = f(k).$$

For a proof of the Remainder Theorem, see Proofs in Mathematics on page 211.

The Remainder Theorem tells you that synthetic division can be used to evaluate a polynomial function. That is, to evaluate a polynomial function when divide $f(x)$ by $x - k$. The remainder will be $f(k)$, as illustrated in Example 5.

**Example 5** Using the Remainder Theorem

Use the Remainder Theorem to evaluate the following function at $x = -2$.

$$f(x) = 3x^3 + 8x^2 + 5x - 7$$

**Solution**

Using synthetic division, you obtain the following.

$$
\begin{array}{c|cccc}
  -2 & 3 & 8 & 5 & -7 \\
  & & -6 & -4 & -2 \\
\hline
  & 3 & 2 & 1 & -9 \\
\end{array}
$$

Because the remainder is $r = -9$, you can conclude that

$$f(-2) = -9, \quad r = f(k)$$

This means that $(-2, -9)$ is a point on the graph of $f$. You can check this by substituting $x = -2$ in the original function.

**Check**

$$f(-2) = 3(-2)^3 + 8(-2)^2 + 5(-2) - 7$$

$$= 3(-8) + 8(4) - 10 - 7 = -9$$

**CHECK POINT** Now try Exercise 55.

Another important theorem is the **Factor Theorem**, stated below. This theorem states that you can test to see whether a polynomial has $(x - k)$ as a factor by evaluating the polynomial at $x = k$. If the result is 0, $(x - k)$ is a factor.

**The Factor Theorem**

A polynomial $f(x)$ has a factor $(x - k)$ if and only if $f(k) = 0$.

For a proof of the Factor Theorem, see Proofs in Mathematics on page 211.
**Example 6**  **Factoring a Polynomial: Repeated Division**

Show that \((x - 2)\) and \((x + 3)\) are factors of \(f(x) = 2x^4 + 7x^3 - 4x^2 - 27x - 18\). Then find the remaining factors of \(f(x)\).

**Algebraic Solution**

Using synthetic division with the factor \(x - 2\), you obtain the following.

<table>
<thead>
<tr>
<th></th>
<th>2</th>
<th>7</th>
<th>-4</th>
<th>-27</th>
<th>-18</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4</td>
<td>22</td>
<td>36</td>
<td>18</td>
<td></td>
</tr>
</tbody>
</table>

0 remainder, so \(f(2) = 0\) and \((x - 2)\) is a factor.

Take the result of this division and perform synthetic division again using the factor \((x + 3)\).

<table>
<thead>
<tr>
<th></th>
<th>-3</th>
<th>2</th>
<th>11</th>
<th>18</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td>5</td>
<td>3</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2\(x^2 + 5x + 3\)

Because the resulting quadratic expression factors as

\[2x^2 + 5x + 3 = (2x + 3)(x + 1)\]

the complete factorization of \(f(x)\) is

\[f(x) = (x - 2)(x + 3)(2x + 3)(x + 1).\]

**Graphical Solution**

From the graph of \(f(x) = 2x^4 + 7x^3 - 4x^2 - 27x - 18\), you can see that there are four \(x\)-intercepts (see Figure 2.29). These occur at \(x = -3, x = -\frac{3}{2}, x = -1,\) and \(x = 2\). (Check this algebraically.) This implies that \((x + 3), (x + \frac{3}{2}), (x + 1),\) and \((x - 2)\) are factors of \(f(x)\). [Note that \((x + \frac{3}{2})\) and \((2x + 3)\) are equivalent factors because they both yield the same zero, \(x = -\frac{3}{2}\)]

**Figure 2.29**

**Study Tip**

Note in Example 6 that the complete factorization of \(f(x)\) implies that \(f\) has four real zeros: \(x = 2, x = -3, x = -\frac{3}{2},\) and \(x = -1\). This is confirmed by the graph of \(f\), which is shown in the Figure 2.29.

**Uses of the Remainder in Synthetic Division**

The remainder \(r\), obtained in the synthetic division of \(f(x)\) by \(x - k\), provides the following information.

1. The remainder \(r\) gives the value of \(f\) at \(x = k\). That is, \(r = f(k)\).
2. If \(r = 0, (x - k)\) is a factor of \(f(x)\).
3. If \(r = 0, (k, 0)\) is an \(x\)-intercept of the graph of \(f\).

Throughout this text, the importance of developing several problem-solving strategies is emphasized. In the exercises for this section, try using more than one strategy to solve several of the exercises. For instance, if you find that \(x - k\) divides evenly into \(f(x)\) (with no remainder), try sketching the graph of \(f\). You should find that \((k, 0)\) is an \(x\)-intercept of the graph.
Section 2.3 EXERCISES

**VOCABULARY**

1. Two forms of the Division Algorithm are shown below. Identify and label each term or function.

\[ f(x) = d(x)q(x) + r(x) \quad \frac{f(x)}{d(x)} = q(x) + r(x) \]

2. In Exercises 2–6, fill in the blanks.

   a. The rational expression \( p(x)/q(x) \) is called _______ if the degree of the numerator is greater than or equal to that of the denominator, and is called _______ if the degree of the numerator is less than that of the denominator.

   b. In the Division Algorithm, the rational expression \( f(x)/d(x) \) is _______ because the degree of \( f(x) \) is greater than or equal to the degree of \( d(x) \).

   c. An alternative method to long division of polynomials is called _______ _______, in which the divisor must be of the form \( x - k \).

   d. The _______ Theorem states that a polynomial \( f(x) \) has a factor \( (x - k) \) if and only if \( f(k) = 0 \).

   e. The _______ Theorem states that if a polynomial \( f(x) \) is divided by \( x - k \), the remainder is \( r = f(k) \).

**SKILLS AND APPLICATIONS**

**ANALYTICAL ANALYSIS** In Exercises 7 and 8, use long division to verify that \( y_1 = y_2 \).

7. \( y_1 = \frac{x^2}{x + 2} \), \( y_2 = x + 2 \) + \( \frac{4}{x + 2} \)

8. \( y_1 = \frac{x^4 - 3x^2 + 1}{x^2 + 5} \), \( y_2 = x^2 + 8 + \frac{39}{x^2 + 5} \)

**GRAPHICAL ANALYSIS** In Exercises 9 and 10, (a) use a graphing utility to graph the two equations in the same viewing window, (b) use the graphs to verify that the expressions are equivalent, and (c) use long division to verify the results algebraically.

9. \( y_1 = \frac{x^3 + 2x - 1}{x + 3} \), \( y_2 = x - 1 + \frac{2}{x + 3} \)

10. \( y_1 = \frac{x^4 + x^2 - 1}{x^2 + 1} \), \( y_2 = x^2 - \frac{1}{x^2 + 1} \)

In Exercises 11–26, use long division to divide.

11. \( (2x^2 + 10x + 12) \div (x + 3) \)

12. \( (5x^2 - 17x - 12) \div (x - 4) \)

13. \( (4x^3 - 7x^2 - 11x + 5) \div (x + 5) \)

14. \( (6x^3 - 16x^2 + 17x - 6) \div (3x - 2) \)

15. \( (x^4 + 5x^3 + 6x^2 - x - 2) \div (x + 2) \)

16. \( (x^3 + 4x^2 - 3x - 12) \div (x - 3) \)

17. \( (x^3 - 27) \div (x - 3) \)

18. \( (x^3 + 125) \div (x + 5) \)

19. \( (7x + 3) \div (x + 2) \)

20. \( (8x - 5) \div (2x + 1) \)

21. \( (x^3 - 9) \div (x^2 + 2) \)

22. \( (x^3 + 7) \div (x^2 - 1) \)

23. \( (3x + 2x^3 - 9 - 8x^2) \div (x^2 + 1) \)

24. \( \frac{5x^3 - 16 - 20x + x^4}{x^2 - x - 3} \)

25. \( \frac{x^4}{(x - 1)^3} \)

26. \( \frac{2x^3 - 4x^2 - 15x + 5}{(x - 1)^2} \)

In Exercises 27–46, use synthetic division to divide.

27. \( \frac{3x^3 - 17x^2 + 15x - 25}{x - 5} \)

28. \( \frac{5x^3 + 18x^2 + 7x - 6}{x + 3} \)

29. \( \frac{6x^3 + 7x^2 - x + 26}{x - 3} \)

30. \( \frac{2x^3 + 14x^2 - 20x + 7}{x + 6} \)

31. \( \frac{4x^3 - 9x + 8x^2 - 18}{x + 2} \)

32. \( \frac{9x^3 - 16x - 18x^2 + 32}{x - 2} \)

33. \( \frac{-x^3 + 75x - 250}{x + 10} \)

34. \( \frac{3x^3 - 16x^2 - 72}{x - 6} \)

35. \( \frac{5x^3 - 6x^2 + 8}{x - 4} \)

36. \( \frac{5x^3 + 6x + 8}{x + 2} \)

37. \( \frac{10x^4 - 50x^3 - 800}{x - 6} \)

38. \( \frac{x^5 - 13x^4 - 120x + 80}{x + 3} \)

39. \( \frac{x^3 + 512}{x + 8} \)

40. \( \frac{x^3 - 729}{x - 9} \)

41. \( \frac{-3x^4}{x - 2} \)

42. \( \frac{-3x^4}{x + 2} \)

43. \( \frac{180x - x^4}{x - 6} \)

44. \( \frac{5 - 3x + 2x^3 - x^3}{x + 1} \)

45. \( \frac{4x^3 + 16x^2 - 23x - 15}{x + \frac{3}{2}} \)

46. \( \frac{3x^3 - 4x^2 + 5}{x - \frac{3}{2}} \)
In Exercises 47–54, write the function in the form \( f(x) = (x - k)q(x) + r \) for the given value of \( k \), and demonstrate that \( f(k) = r \).  
47. \( f(x) = x^3 - x^2 - 14x + 11 \), \( k = 4 \)  
48. \( f(x) = x^3 - 5x^2 - 11x + 8 \), \( k = -2 \)  
49. \( f(x) = 15x^4 + 10x^3 - 6x^2 + 14 \), \( k = -\frac{2}{3} \)  
50. \( f(x) = 10x^3 - 22x^2 - 3x + 4 \), \( k = \frac{1}{2} \)  
51. \( f(x) = x^3 + 3x^2 - 2x - 14 \), \( k = \sqrt{2} \)  
52. \( f(x) = x^3 + 2x^2 - 5x - 4 \), \( k = -\sqrt{3} \)  
53. \( f(x) = -4x^3 + 6x^2 + 12x + 4 \), \( k = 1 - \sqrt{3} \)  
54. \( f(x) = -3x^3 + 8x^2 + 10x - 8 \), \( k = 2 + \sqrt{2} \)  

In Exercises 55–58, use the Remainder Theorem and synthetic division to find each function value. Verify your answers using another method.  
55. \( f(x) = 2x^3 - 7x + 3 \)  
(a) \( f(1) \)  
(b) \( f(-2) \)  
(c) \( f(\frac{1}{2}) \)  
(d) \( f(2) \)  
56. \( g(x) = 2x^6 + 3x^4 - x^2 + 3 \)  
(a) \( g(2) \)  
(b) \( g(1) \)  
(c) \( g(3) \)  
(d) \( g(-1) \)  
57. \( h(x) = x^3 - 5x^2 - 7x + 4 \)  
(a) \( h(3) \)  
(b) \( h(2) \)  
(c) \( h(-2) \)  
(d) \( h(-5) \)  
58. \( f(x) = 4x^4 - 16x^3 + 7x^2 + 20 \)  
(a) \( f(1) \)  
(b) \( f(-2) \)  
(c) \( f(5) \)  
(d) \( f(-10) \)  

In Exercises 59–66, use synthetic division to show that \( x \) is a solution of the third-degree polynomial equation, and use the result to factor the polynomial completely. List all real solutions of the equation.  
59. \( x^3 - 7x + 6 = 0 \), \( x = 2 \)  
60. \( x^3 - 28x - 48 = 0 \), \( x = -4 \)  
61. \( 2x^3 - 15x^2 + 27x - 10 = 0 \), \( x = \frac{1}{2} \)  
62. \( 48x^3 - 80x^2 + 41x - 6 = 0 \), \( x = \frac{2}{3} \)  
63. \( x^3 + 2x^2 - 3x - 6 = 0 \), \( x = \sqrt{3} \)  
64. \( x^3 + 2x^2 - 2x - 4 = 0 \), \( x = \sqrt{2} \)  
65. \( x^3 - 3x^2 + 2 = 0 \), \( x = 1 + \sqrt{3} \)  
66. \( x^3 - x^2 - 13x - 3 = 0 \), \( x = 2 - \sqrt{5} \)  

In Exercises 67–74, (a) verify the given factors of the function \( f \), (b) find the remaining factor(s) of \( f \), (c) use your results to write the complete factorization of \( f \), (d) list all real zeros of \( f \), and (e) confirm your results by using a graphing utility to graph the function.  

### Function | Factors  
--- | ---  
67. \( f(x) = 2x^3 + x^2 - 5x + 2 \) | \((x + 2), (x - 1)\)  
68. \( f(x) = 3x^3 + 2x^2 - 19x + 6 \) | \((x + 3), (x - 2)\)  
69. \( f(x) = x^4 - 4x^3 - 15x^2 + 58x - 40 \) | \((x - 5), (x + 4)\)  

---  

**GRAPHICAL ANALYSIS** In Exercises 75–80, (a) use the zero or root feature of a graphing utility to approximate the zeros of the function accurate to three decimal places, (b) determine one of the exact zeros, and (c) use synthetic division to verify your result from part (b), and then factor the polynomial completely.  
75. \( f(x) = x^3 - 2x^2 - 5x + 10 \)  
76. \( g(x) = x^3 - 4x^2 - 2x + 8 \)  
77. \( h(t) = t^3 - 2t^2 - 7t + 2 \)  
78. \( f(s) = s^3 - 12s^2 + 40s - 24 \)  
79. \( h(x) = x^3 - 7x^2 + 10x^3 + 14x^2 - 24x \)  
80. \( g(x) = 6x^4 - 11x^3 - 51x^2 + 99x - 27 \)  

In Exercises 81–84, simplify the rational expression by using long division or synthetic division.  
81. \( \frac{4x^3 - 8x^2 + x + 3}{2x - 3} \)  
82. \( \frac{x^3 + x^2 - 64x - 64}{x + 8} \)  
83. \( \frac{x^4 + 6x^3 + 11x^2 + 6x}{x^2 + 3x + 2} \)  
84. \( \frac{x^4 + 9x^3 - 5x^2 - 36x + 4}{x^2 - 4} \)  

**85. DATA ANALYSIS: HIGHER EDUCATION** The amounts \( A \) (in billions of dollars) donated to support higher education in the United States from 2000 through 2007 are shown in the table, where \( t \) represents the year, with \( t = 0 \) corresponding to 2000.  

<table>

(b) Use the regression feature of the graphing utility to find a cubic model for the data. Graph the model in the same viewing window as the scatter plot.
(c) Use the model to create a table of estimated values of \( A \). Compare the model with the original data.
(d) Use synthetic division to evaluate the model for the year 2010.

EXPLORATION

89. The rational expression
\[
\frac{x^3 + 2x^2 - 13x + 10}{x^2 - 4x - 12}
\]
is improper.

90. Use the form \( f(x) = (x - k)g(x) + r \) to create a cubic function that (a) passes through the point \( (2, 5) \) and rises to the right, and (b) passes through the point \( (-3, 1) \) and falls to the right. (There are many correct answers.)

THINK ABOUT IT In Exercises 91 and 92, perform the division by assuming that \( n \) is a positive integer.

91. \[
\frac{x^{3n} + 9x^{2n} + 27x^n + 27}{x^n + 3}
\]
92. \[
\frac{x^{3n} - 3x^{2n} + 5x^n - 6}{x^n - 2}
\]

93. WRITING Briefly explain what it means for a divisor to divide evenly into a dividend.

94. WRITING Briefly explain how to check polynomial division, and justify your reasoning. Give an example.

EXPLORATION In Exercises 95 and 96, find the constant \( c \) such that the denominator will divide evenly into the numerator.

95. \[
\frac{x^3 + 4x^2 - 3x + c}{x - 5}
\]
96. \[
\frac{x^3 - 2x^2 + x + c}{x + 2}
\]

97. THINK ABOUT IT Find the value of \( k \) such that \( x - 4 \) is a factor of \( x^3 - kx^2 + 2kx - 8 \).

98. THINK ABOUT IT Find the value of \( k \) such that \( x - 3 \) is a factor of \( x^3 - kx^2 + 2kx - 12 \).

99. WRITING Complete each polynomial division. Write a brief description of the pattern that you obtain, and use your result to find a formula for the polynomial division \( (x^n - 1)/(x - 1) \). Create a numerical example to test your formula.

(a) \[
\frac{x^2 - 1}{x - 1}
\]
(b) \[
\frac{x^3 - 1}{x - 1}
\]
(c) \[
\frac{x^4 - 1}{x - 1}
\]

100. CAPSTONE Consider the division \( f(x) \div (x - k) \) where \( f(x) = (x + 3)^2(x - 3)(x + 1)^3 \).
(a) What is the remainder when \( k = -3 \)? Explain.
(b) If it is necessary to find \( f(2) \), it is easier to evaluate the function directly or to use synthetic division? Explain.
The Imaginary Unit $i$

You have learned that some quadratic equations have no real solutions. For instance, the quadratic equation $x^2 + 1 = 0$ has no real solution because there is no real number $x$ that can be squared to produce $-1$. To overcome this deficiency, mathematicians created an expanded system of numbers using the **imaginary unit** $i$, defined as

$$i = \sqrt{-1}$$

where $i^2 = -1$. By adding real numbers to real multiples of this imaginary unit, the set of **complex numbers** is obtained. Each complex number can be written in the **standard form** $a + bi$. For instance, the standard form of the complex number $-5 + \sqrt{-9}$ is $-5 + 3i$ because

$$-5 + \sqrt{-9} = -5 + \sqrt{3^2(-1)} = -5 + 3\sqrt{-1} = -5 + 3i.$$

In the standard form $a + bi$, the real number $a$ is called the **real part** of the complex number $a + bi$, and the number $bi$ (where $b$ is a real number) is called the **imaginary part** of the complex number.

**Definition of a Complex Number**

If $a$ and $b$ are real numbers, the number $a + bi$ is a complex number, and it is said to be written in **standard form**. If $b = 0$, the number $a + bi = a$ is a real number. If $b \neq 0$, the number $a + bi$ is called an imaginary number. A number of the form $bi$, where $b \neq 0$, is called a pure imaginary number.

The set of real numbers is a subset of the set of complex numbers, as shown in Figure 2.30. This is true because every real number $a$ can be written as a complex number using $b = 0$. That is, for every real number $a$, you can write $a = a + 0i$.

**Equality of Complex Numbers**

Two complex numbers $a + bi$ and $c + di$, written in standard form, are equal to each other

$$a + bi = c + di$$

if and only if $a = c$ and $b = d$. 
Operations with Complex Numbers

To add (or subtract) two complex numbers, you add (or subtract) the real and imaginary parts of the numbers separately.

Addition and Subtraction of Complex Numbers

If \( a + bi \) and \( c + di \) are two complex numbers written in standard form, their sum and difference are defined as follows.

**Sum:** \((a + bi) + (c + di) = (a + c) + (b + d)i\)

**Difference:** \((a + bi) - (c + di) = (a - c) + (b - d)i\)

The **additive identity** in the complex number system is zero (the same as in the real number system). Furthermore, the **additive inverse** of the complex number \( a + bi \) is

\[-(a + bi) = -a - bi.\]  

So, you have

\[(a + bi) + (-a - bi) = 0 + 0i = 0.\]

**Example 1** Adding and Subtracting Complex Numbers

**a.** \((4 + 7i) + (1 - 6i) = 4 + 7i + 1 - 6i\) Remove parentheses.

\[= (4 + 1) + (7i - 6i)\] Group like terms.

\[= 5 + i\] Write in standard form.

**b.** \((1 + 2i) - (4 + 2i) = 1 + 2i - 4 - 2i\) Remove parentheses.

\[= (1 - 4) + (2i - 2i)\] Group like terms.

\[= -3 + 0\] Simplify.

\[= -3\] Write in standard form.

**c.** \(3i - (-2 + 3i) - (2 + 5i) = 3i + 2 - 3i - 2 - 5i\)

\[= (2 - 2) + (3i - 3i - 5i)\]

\[= 0 - 5i\]

\[= -5i\]

**d.** \((3 + 2i) + (4 - i) - (7 + i) = 3 + 2i + 4 - i - 7 - i\)

\[= (3 + 4 - 7) + (2i - i - i)\]

\[= 0 + 0i\]

\[= 0\]

**CHECKPOINT** Now try Exercise 21.

Note in Examples 1(b) and 1(d) that the sum of two complex numbers can be a real number.
Many of the properties of real numbers are valid for complex numbers as well. Here are some examples.

**Associated Properties of Addition and Multiplication**

**Commutative Properties of Addition and Multiplication**

Distributive Property of Multiplication Over Addition

Notice below how these properties are used when two complex numbers are multiplied.

\[(a + bi)(c + di) = a(c + di) + bi(c + di)\]

\[= ac + (ad)i + (bc)i + (bd)i^2\]

\[= ac + (ad)i + (bc)i + (bd)(-1)\]

\[= ac - bd + (ad)i + (bc)i\]

\[= (ac - bd) + (ad + bc)i\]

Rather than trying to memorize this multiplication rule, you should simply remember how the Distributive Property is used to multiply two complex numbers.

### Example 2
**Multiplying Complex Numbers**

**a.** \(4(-2 + 3i) = 4(-2) + 4(3i)\)

\[= -8 + 12i\]

**b.** \((2 - i)(4 + 3i) = 2(4 + 3i) - i(4 + 3i)\)

\[= 8 + 6i - 4i - 3i^2\]

\[= 8 + 6i - 4i - 3(-1)\]

\[= (8 + 3) + (6i - 4i)\]

\[= 11 + 2i\]

**c.** \((3 + 2i)(3 - 2i) = 3(3 - 2i) + 2i(3 - 2i)\)

\[= 9 - 6i + 6i - 4i^2\]

\[= 9 - 6i + 6i - 4(-1)\]

\[= 9 + 4\]

\[= 13\]

**d.** \((3 + 2i)^2 = (3 + 2i)(3 + 2i)\)

\[= 3(3 + 2i) + 2i(3 + 2i)\]

\[= 9 + 6i + 6i + 4i^2\]

\[= 9 + 6i + 6i + 4(-1)\]

\[= 9 + 12i - 4\]

\[= 5 + 12i\]

Now try Exercise 31.
Complex Conjugates

Notice in Example 2(c) that the product of two complex numbers can be a real number. This occurs with pairs of complex numbers of the form \(a + bi\) and \(a - bi\), called complex conjugates.

\[
(a + bi)(a - bi) = a^2 - abi + abi - b^2i^2 = a^2 - b^2(-1) = a^2 + b^2
\]

**Example 3** Multiplying Conjugates

Multiply each complex number by its complex conjugate.

a. \(1 + i\)  
   b. \(4 - 3i\)

**Solution**

a. The complex conjugate of \(1 + i\) is \(1 - i\).
   \[
   (1 + i)(1 - i) = 1^2 - i^2 = 1 - (-1) = 2
   \]

b. The complex conjugate of \(4 - 3i\) is \(4 + 3i\).
   \[
   (4 - 3i)(4 + 3i) = 4^2 - (3i)^2 = 16 - 9(-1) = 16 + 9 = 25
   \]

**Example 4** Writing a Quotient of Complex Numbers in Standard Form

To write the quotient of \(a + bi\) and \(c + di\) in standard form, where \(c\) and \(d\) are not both zero, multiply the numerator and denominator by the complex conjugate of the denominator to obtain

\[
\frac{a + bi}{c + di} = \frac{a + bi(c - di)}{c + di(c - di)} = \frac{(ac + bd) + (bc - ad)i}{c^2 + d^2}. \text{ Standard form}
\]

\[
\frac{2 + 3i}{4 - 2i} \quad \text{Multiply numerator and denominator by complex conjugate of denominator.}
\]

\[
= \frac{2 + 3i(4 + 2i)}{4 - 2i(4 + 2i)}
\]

\[
= \frac{8 + 4i + 12i + 6i^2}{16 - 4i^2}
\]

\[
= \frac{8 - 6 + 16i}{16 + 4}
\]

\[
= \frac{2 + 16i}{20}
\]

\[
= \frac{1}{10} + \frac{4}{5}i
\]

**CHECKPOINT** Now try Exercise 53.
Complex Solutions of Quadratic Equations

When using the Quadratic Formula to solve a quadratic equation, you often obtain a result such as $\sqrt{-3}$, which you know is not a real number. By factoring out $i = \sqrt{-1}$, you can write this number in standard form.

$$\sqrt{-3} = \sqrt{3(-1)} = \sqrt{3} \sqrt{-1} = \sqrt{3}i$$

The number $\sqrt{3}i$ is called the principal square root of $-3$.

**Principal Square Root of a Negative Number**

If $a$ is a positive number, the principal square root of the negative number $-a$ is defined as

$$\sqrt{-a} = \sqrt{a}i.$$

**Example 5** Writing Complex Numbers in Standard Form

a. $\sqrt{-3} \sqrt{-12} = \sqrt{3i \sqrt{12}} i = \sqrt{36i^2} = 6(-1) = -6$

b. $\sqrt{-48} - \sqrt{-27} = \sqrt{48i} - \sqrt{27i} = 4\sqrt{3i} - 3\sqrt{3i} = \sqrt{3}i$

c. $(−1 + \sqrt{-3})^2 = (−1 + \sqrt{3})^2$

$$= (-1)^2 + 2\sqrt{3}i + (\sqrt{3})^2(i^2)$$

$$= 1 - 2\sqrt{3}i + 3(-1)$$

$$= -2 - 2\sqrt{3}i$$

**Example 6** Complex Solutions of a Quadratic Equation

Solve (a) $x^2 + 4 = 0$ and (b) $3x^2 - 2x + 5 = 0$.

**Solution**

a. $x^2 + 4 = 0$

$\quad \quad x^2 = -4$

$\quad \quad x = \pm 2i$

b. $3x^2 - 2x + 5 = 0$

$\quad \quad x = \frac{-(-2) \pm \sqrt{(-2)^2 - 4(3)(5)}}{2(3)}$

$\quad \quad = \frac{2 \pm \sqrt{-56}}{6}$

$\quad \quad = \frac{2 \pm 2\sqrt{14}i}{6}$

$\quad \quad = \frac{1 \pm \sqrt{14}i}{3}$

Write original equation.

Subtract 4 from each side.

Extract square roots.

Write original equation.

Quadratic Formula

Simplify.

Write $\sqrt{-56}$ in standard form.

Write in standard form.

**CHECK POINT** Now try Exercise 69.
2.4  **EXERCISES**

**VOCABULARY**

1. Match the type of complex number with its definition.
   - (a) Real number
     - (i) $a + bi, \ a \neq 0, \ b \neq 0$
   - (b) Imaginary number
     - (ii) $a + bi, \ a = 0, \ b \neq 0$
   - (c) Pure imaginary number
     - (iii) $a + bi, \ b = 0$

In Exercises 2–4, fill in the blanks.

2. The imaginary unit is defined as $i = \_\_, \ where \ i^2 = \_\_\_\_\_\_\_\$. 

3. If $a$ is a positive number, the \_\_\_\_\_\_\_\_\_\_ root of the negative number $−a$ is defined as $\sqrt{−a} = a^i$.

4. The numbers $a + bi$ and $a − bi$ are called \_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_\_, and their product is a real number $a^2 + b^2$.

**SKILLS AND APPLICATIONS**

In Exercises 5–8, find real numbers $a$ and $b$ such that the equation is true.

- 5. $a + bi = −12 + 7i$
- 6. $a + bi = 13 + 4i$
- 7. $(a − 1) + (b + 3)i = 5 + 8i$
- 8. $(a + 6) + 2bi = 6 − 5i$

In Exercises 9–20, write the complex number in standard form.

- 9. $8 + \sqrt{−25}$
- 10. $5 + \sqrt{−36}$
- 11. $2 − \sqrt{−27}$
- 12. $1 + \sqrt{−8}$
- 13. $−\sqrt{−80}$
- 14. $\sqrt{−4}$
- 15. 14
- 16. 75
- 17. $−10i + i^2$
- 18. $−4i^2 + 2i$
- 19. $\sqrt{−0.09}$
- 20. $\sqrt{−0.0049}$

In Exercises 21–30, perform the addition or subtraction and write the result in standard form.

- 21. $(7 + i) + (3 − 4i)$
- 22. $(13 − 2i) + (−5 + 6i)$
- 23. $(9 − i) − (8 − i)$
- 24. $(3 + 2i) − (6 + 3i)$
- 25. $(−2 + \sqrt{−8}) + (5 − \sqrt{−50})$
- 26. $(8 + \sqrt{−18}) − (4 + 3\sqrt{2}i)$
- 27. $13i − (14 − 7i)$
- 28. $25 + (−10 + 11i) + 15i$
- 29. $−(\frac{3}{2} + \frac{5}{3}i) + (\frac{3}{5} + \frac{5}{4}i)$
- 30. $(1.6 + 3.2i) + (−5.8 + 4.3i)$

In Exercises 31–40, perform the operation and write the result in standard form.

- 31. $(1 + i)(3 − 2i)$
- 32. $(7 − 2i)(3 − 5i)$
- 33. $12i(1 − 9i)$
- 34. $−8i(9 + 4i)$
- 35. $(\sqrt{14} + \sqrt{10}i)(\sqrt{14} − \sqrt{10}i)$
- 36. $(\sqrt{3} + \sqrt{3}i)(\sqrt{3} − \sqrt{3}i)$
- 37. $(6 + 7i)^2$
- 38. $(5 − 4i)^2$
- 39. $(2 + 3i)^2 + (2 − 3i)^2$
- 40. $(1 − 2i)^2 − (1 + 2i)^2$

In Exercises 41–48, write the complex conjugate of the complex number. Then multiply the number by its complex conjugate.

- 41. $9 + 2i$
- 42. $8 − 10i$
- 43. $−1 − \sqrt{3}i$
- 44. $−3 + \sqrt{2}i$
- 45. $\sqrt{−20}$
- 46. $\sqrt{−15}$
- 47. $\sqrt{5}$
- 48. $1 + \sqrt{3}$

In Exercises 49–58, write the quotient in standard form.

- 49. $\frac{3}{i}$
- 50. $\frac{−14}{2i}$
- 51. $\frac{2}{4 − 5i}$
- 52. $\frac{13}{1 − i}$
- 53. $\frac{5 + i}{5 − i}$
- 54. $\frac{6 − 7i}{1 − 2i}$
- 55. $\frac{9 − 4i}{i}$
- 56. $\frac{8 + 16i}{2i}$
- 57. $\frac{3i}{(4 − 5i)^2}$
- 58. $\frac{5i}{(2 + 3i)^2}$

In Exercises 59–62, perform the operation and write the result in standard form.

- 59. $\frac{2}{1 + i} − \frac{3}{1 − i}$
- 60. $\frac{2i}{2 + i} + \frac{5}{2 − i}$
- 61. $\frac{i}{3 − 2i} + \frac{2i}{3 + 8i}$
- 62. $\frac{1 + i}{i} − \frac{3}{4 − i}$
In Exercises 63–68, write the complex number in standard form.

63. \( \sqrt{-6} \cdot \sqrt{-2} \)  
64. \( \sqrt{-5} \cdot \sqrt{-10} \)  
65. \( (\sqrt{-15})^2 \)  
66. \( (\sqrt{-75})^2 \)  
67. \( (3 + \sqrt{-5})(7 - \sqrt{-10}) \)  
68. \( (2 - \sqrt{-6})^2 \)  

In Exercises 69–78, use the Quadratic Formula to solve the quadratic equation.

69. \( x^2 - 2x + 2 = 0 \)  
70. \( x^2 + 6x + 10 = 0 \)  
71. \( 4x^2 + 16x + 17 = 0 \)  
72. \( 9x^2 - 6x + 37 = 0 \)  
73. \( 4x^2 + 16x + 15 = 0 \)  
74. \( 16t^2 - 4t + 3 = 0 \)  
75. \( \frac{3}{2}x^2 - 6x + 9 = 0 \)  
76. \( 2 \frac{3}{8}x^2 - \frac{3}{2}x + \frac{5}{16} = 0 \)  
77. \( 1.4x^2 - 2x - 10 = 0 \)  
78. \( 4.5x^2 - 3x + 12 = 0 \)  

In Exercises 79–88, simplify the complex number and write it in standard form.

79. \( -6i^3 + i^2 \)  
80. \( 4i^2 - 2i^3 \)  
81. \( -14i^5 \)  
82. \( -(i)^3 \)  
83. \( (\sqrt{-72})^3 \)  
84. \( (\sqrt{-2})^6 \)  
85. \( \frac{1}{i^3} \)  
86. \( \frac{1}{(2i)^3} \)  
87. \( (3i)^4 \)  
88. \( -(i)^6 \)  

89. IMPEDANCE  The opposition to current in an electrical circuit is called its impedance. The impedance \( z \) in a parallel circuit with two pathways satisfies the equation

\[
\frac{1}{z} = \frac{1}{z_1} + \frac{1}{z_2}
\]

where \( z_1 \) is the impedance (in ohms) of pathway 1 and \( z_2 \) is the impedance of pathway 2.

(a) The impedance of each pathway in a parallel circuit is found by adding the impedances of all components in the pathway. Use the table to find \( z_1 \) and \( z_2 \).

(b) Find the impedance \( z \).

<table>
<thead>
<tr>
<th>Impedance</th>
<th>Resistor</th>
<th>Inductor</th>
<th>Capacitor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symbol</td>
<td>-( \frac{1}{a\Omega} )</td>
<td>-( \frac{1}{b\Omega} )</td>
<td>-( \frac{1}{c\Omega} )</td>
</tr>
<tr>
<td>16\Omega</td>
<td>20\Omega</td>
<td>9\Omega</td>
<td>10\Omega</td>
</tr>
</tbody>
</table>

90. Cube each complex number.

(a) \( 2 \)  
(b) \(-1 + \sqrt{3}i \)  
(c) \(-1 - \sqrt{3}i \)

91. Raise each complex number to the fourth power.

(a) \( 2 \)  
(b) \(-2 \)  
(c) \(2i \)  
(d) \(-2i \)

92. Write each of the powers of \( i \) as \( i, -i, 1, \) or \(-1 \).

(a) \( i^{40} \)  
(b) \( i^{25} \)  
(c) \( i^{50} \)  
(d) \( i^{67} \)

EXPLORATION

TRUE OR FALSE?  In Exercises 93–96, determine whether the statement is true or false. Justify your answer.

93. There is no complex number that is equal to its complex conjugate.

94. \(-i\sqrt{6} \) is a solution of \( x^4 - x^2 + 14 = 56 \).

95. \( i^{44} + i^{150} - i^{74} - i^{109} + i^{64} = -1 \)

96. The sum of two complex numbers is always a real number.

97. PATTERN RECOGNITION  Complete the following.

\[
i^1 = i \quad i^2 = -1 \quad i^3 = -i \quad i^4 = 1
\]

\[
i^5 = \text{no solution} \quad i^6 = \text{no solution} \quad i^7 = i \quad i^8 = \text{no solution}
\]

What pattern do you see? Write a brief description of how you would find \( i \) raised to any positive integer power.

98. CAPSTONE  Consider the functions

\[f(x) = 2(x - 3)^2 - 4\] and \([g(x) = -2(x - 3)^2 - 4].

(a) Without graphing either function, determine whether the graph of \( f \) and the graph of \( g \) have \( x \)-intercepts. Explain your reasoning.

(b) Solve \( f(x) = 0 \) and \( g(x) = 0 \).

(c) Explain how the zeros of \( f \) and \( g \) are related to whether their graphs have \( x \)-intercepts.

(d) For the function \( f(x) = a(x - h)^2 + k \), make a general statement about how \( a, h, \) and \( k \) affect whether the graph of \( f \) has \( x \)-intercepts, and whether the zeros of \( f \) are real or complex.

99. ERROR ANALYSIS  Describe the error.

\[\sqrt{-6} \cdot \sqrt{-6} = \sqrt{(-6)(-6)} = \sqrt{36} = 6\]

100. PROOF  Prove that the complex conjugate of the product of two complex numbers \( a_1 + b_1i \) and \( a_2 + b_2i \) is the product of their complex conjugates.

101. PROOF  Prove that the complex conjugate of the sum of two complex numbers \( a_1 + b_1i \) and \( a_2 + b_2i \) is the sum of their complex conjugates.
Zeros of Polynomial Functions

The Fundamental Theorem of Algebra

You know that an nth-degree polynomial can have at most n real zeros. In the complex number system, this statement can be improved. That is, in the complex number system, every nth-degree polynomial function has precisely n zeros. This important result is derived from the Fundamental Theorem of Algebra, first proved by the German mathematician Carl Friedrich Gauss (1777–1855).

The Fundamental Theorem of Algebra

If \( f(x) \) is a polynomial of degree \( n \), where \( n > 0 \), then \( f \) has at least one zero in the complex number system.

Using the Fundamental Theorem of Algebra and the equivalence of zeros and factors, you obtain the Linear Factorization Theorem.

Linear Factorization Theorem

If \( f(x) \) is a polynomial of degree \( n \), where \( n > 0 \), then \( f \) has precisely \( n \) linear factors

\[
f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n)
\]

where \( c_1, c_2, \ldots, c_n \) are complex numbers.

For a proof of the Linear Factorization Theorem, see Proofs in Mathematics on page 212.

Note that the Fundamental Theorem of Algebra and the Linear Factorization Theorem tell you only that the zeros or factors of a polynomial exist, not how to find them. Such theorems are called existence theorems. Remember that the \( n \) zeros of a polynomial function can be real or complex, and they may be repeated.

Example 1 Zeros of Polynomial Functions

a. The first-degree polynomial \( f(x) = x - 2 \) has exactly one zero: \( x = 2 \).

b. Counting multiplicity, the second-degree polynomial function

\[
f(x) = x^2 - 6x + 9 = (x - 3)(x - 3)
\]

has exactly two zeros: \( x = 3 \) and \( x = 3 \). (This is called a repeated zero.)

c. The third-degree polynomial function

\[
f(x) = x^3 + 4x = x(x^2 + 4) = x(x - 2i)(x + 2i)
\]

has exactly three zeros: \( x = 0 \), \( x = 2i \), and \( x = -2i \).

d. The fourth-degree polynomial function

\[
f(x) = x^4 - 1 = (x - 1)(x + 1)(x - i)(x + i)
\]

has exactly four zeros: \( x = 1 \), \( x = -1 \), \( x = i \), and \( x = -i \).

CHECKPOINT Now try Exercise 9.
The Rational Zero Test

The Rational Zero Test relates the possible rational zeros of a polynomial (having integer coefficients) to the leading coefficient and to the constant term of the polynomial.

The Rational Zero Test

If the polynomial \( f(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_2x^2 + a_1x + a_0 \) has integer coefficients, every rational zero of \( f \) has the form

\[
\text{Rational zero} = \frac{p}{q}
\]

where \( p \) and \( q \) have no common factors other than 1, and

\[
p = \text{a factor of the constant term } a_0
\]

\[
q = \text{a factor of the leading coefficient } a_n.
\]

To use the Rational Zero Test, you should first list all rational numbers whose numerators are factors of the constant term and whose denominators are factors of the leading coefficient.

Possible rational zeros = \( \frac{\text{factors of constant term}}{\text{factors of leading coefficient}} \)

Having formed this list of possible rational zeros, use a trial-and-error method to determine which, if any, are actual zeros of the polynomial. Note that when the leading coefficient is 1, the possible rational zeros are simply the factors of the constant term.

Example 2  Rational Zero Test with Leading Coefficient of 1

Find the rational zeros of

\[
f(x) = x^3 + x + 1.
\]

Solution

Because the leading coefficient is 1, the possible rational zeros are \( \pm 1 \), the factors of the constant term. By testing these possible zeros, you can see that neither works.

\[
f(1) = (1)^3 + 1 + 1 = 3
\]

\[
f(-1) = (-1)^3 + (-1) + 1 = -1
\]

So, you can conclude that the given polynomial has no rational zeros. Note from the graph of \( f \) in Figure 2.31 that \( f \) does have one real zero between \(-1 \) and 0. However, by the Rational Zero Test, you know that this real zero is not a rational number.

Check Point  Now try Exercise 15.
Rational Zero Test with Leading Coefficient of 1

Find the rational zeros of \( f(x) = x^4 - x^3 + x^2 - 3x - 6 \).

**Solution**

Because the leading coefficient is 1, the possible rational zeros are the factors of the constant term.

Possible rational zeros: \( \pm 1, \pm 2, \pm 3, \pm 6 \)

By applying synthetic division successively, you can determine that \( x = -1 \) and \( x = 2 \) are the only two rational zeros.

\[
\begin{array}{c|cccc}
-1 & 1 & -1 & 1 & -3 & -6 \\
& & -1 & 2 & -3 & 6 \\
\hline
& 1 & -2 & 3 & -6 & 0 \\
\end{array}
\]

0 remainder, so \( x = -1 \) is a zero.

\[
\begin{array}{c|cccc}
2 & 1 & -2 & 3 & -6 \\
& & 2 & 0 & 6 \\
\hline
& 1 & 0 & 3 & 0 \\
\end{array}
\]

0 remainder, so \( x = 2 \) is a zero.

So, \( f(x) \) factors as

\[ f(x) = (x + 1)(x - 2)(x^2 + 3). \]

Because the factor \( x^2 + 3 \) produces no real zeros, you can conclude that \( x = -1 \) and \( x = 2 \) are the only real zeros of \( f \), which is verified in Figure 2.32.

![Figure 2.32](image)

**Check Point** Now try Exercise 19.
Using the Rational Zero Test

Find the rational zeros of \( f(x) = 2x^3 + 3x^2 - 8x + 3 \).

Solution

The leading coefficient is 2 and the constant term is 3.

Possible rational zeros: Factors of 3 Factors of 2
\[
\frac{\pm 1, \pm 3}{\pm 1, \pm 2} = \pm 1, \pm 3, \pm \frac{1}{2}, \pm \frac{3}{2}
\]

By synthetic division, you can determine that \( x = 1 \) is a rational zero.

\[
\begin{array}{c|cccc}
1 & 2 & 3 & -8 & 3 \\
 & & 2 & 5 & -3 \\
\hline
 & 1 & 2 & 3 & 0
\end{array}
\]

So, \( f(x) \) factors as

\[
f(x) = (x - 1)(2x^2 + 5x - 3) = (x - 1)(2x - 1)(x + 3)
\]

and you can conclude that the rational zeros of \( f \) are \( x = 1, x = \frac{1}{2}, \) and \( x = -3 \).

Example 5 Solving a Polynomial Equation

Find all the real solutions of \(-10x^3 + 15x^2 + 16x - 12 = 0\).

Solution

The leading coefficient is \(-10\) and the constant term is \(-12\).

Possible rational solutions: Factors of \(-12\) Factors of \(-10\)
\[
\frac{\pm 1, \pm 2, \pm 3, \pm 4, \pm 6, \pm 12}{\pm 1, \pm 2, \pm 5, \pm 10}
\]

With so many possibilities (32, in fact), it is worth your time to stop and sketch a graph. From Figure 2.33, it looks like three reasonable solutions would be \( x = -\frac{3}{2}, x = \frac{1}{2}, \) and \( x = 2 \). Testing these by synthetic division shows that \( x = 2 \) is the only rational solution. So, you have

\[
(x - 2)(-10x^2 - 5x + 6) = 0.
\]

Using the Quadratic Formula for the second factor, you find that the two additional solutions are irrational numbers.

\[
x = \frac{-5 - \sqrt{265}}{20} \approx -1.0639
\]

and

\[
x = \frac{-5 + \sqrt{265}}{20} \approx 0.5639
\]

Example 4 Using the Rational Zero Test

Find the rational zeros of \( f(x) = 2x^3 + 3x^2 - 8x + 3 \).

Solution

The leading coefficient is 2 and the constant term is 3.

Possible rational zeros: Factors of 3 Factors of 2
\[
\frac{\pm 1, \pm 3}{\pm 1, \pm 2} = \pm 1, \pm 3, \pm \frac{1}{2}, \pm \frac{3}{2}
\]

By synthetic division, you can determine that \( x = 1 \) is a rational zero.

\[
\begin{array}{c|cccc}
1 & 2 & 3 & -8 & 3 \\
 & & 2 & 5 & -3 \\
\hline
 & 1 & 2 & 3 & 0
\end{array}
\]

So, \( f(x) \) factors as

\[
f(x) = (x - 1)(2x^2 + 5x - 3) = (x - 1)(2x - 1)(x + 3)
\]

and you can conclude that the rational zeros of \( f \) are \( x = 1, x = \frac{1}{2}, \) and \( x = -3 \).

Recall from Section 2.2 that if \( x = a \) is a zero of the polynomial function \( f \), then \( x = a \) is a solution of the polynomial equation \( f(x) = 0 \).

Example 5 Solving a Polynomial Equation

Find all the real solutions of \(-10x^3 + 15x^2 + 16x - 12 = 0\).

Solution

The leading coefficient is \(-10\) and the constant term is \(-12\).

Possible rational solutions: Factors of \(-12\) Factors of \(-10\)
\[
\frac{\pm 1, \pm 2, \pm 3, \pm 4, \pm 6, \pm 12}{\pm 1, \pm 2, \pm 5, \pm 10}
\]

With so many possibilities (32, in fact), it is worth your time to stop and sketch a graph. From Figure 2.33, it looks like three reasonable solutions would be \( x = -\frac{3}{2}, x = \frac{1}{2}, \) and \( x = 2 \). Testing these by synthetic division shows that \( x = 2 \) is the only rational solution. So, you have

\[
(x - 2)(-10x^2 - 5x + 6) = 0.
\]

Using the Quadratic Formula for the second factor, you find that the two additional solutions are irrational numbers.

\[
x = \frac{-5 - \sqrt{265}}{20} \approx -1.0639
\]

and

\[
x = \frac{-5 + \sqrt{265}}{20} \approx 0.5639
\]
Conjugate Pairs

In Examples 1(c) and 1(d), note that the pairs of complex zeros are conjugates. That is, they are of the form \(a + bi\) and \(a - bi\).

**Complex Zeros Occur in Conjugate Pairs**

Let \(f(x)\) be a polynomial function that has real coefficients. If \(a + bi\), where \(b \neq 0\), is a zero of the function, the conjugate \(a - bi\) is also a zero of the function.

Be sure you see that this result is true only if the polynomial function has real coefficients. For instance, the result applies to the function given by \(f(x) = x^2 + 1\) but not to the function given by \(g(x) = x - i\).

**Example 6** Finding a Polynomial with Given Zeros

Find a fourth-degree polynomial function with real coefficients that has \(-1, -1, 3i\) as zeros.

**Solution**

Because \(3i\) is a zero and the polynomial is stated to have real coefficients, you know that the conjugate \(-3i\) must also be a zero. So, from the Linear Factorization Theorem, \(f(x)\) can be written as

\[
f(x) = a(x + 1)(x + 1)(x - 3i)(x + 3i).
\]

For simplicity, let \(a = 1\) to obtain

\[
f(x) = (x^2 + 2x + 1)(x^2 + 9)
\]

\[
= x^4 + 2x^3 + 10x^2 + 18x + 9.
\]

**CHECKPOINT** Now try Exercise 45.

**Factoring a Polynomial**

The Linear Factorization Theorem shows that you can write any \(n\)th-degree polynomial as the product of \(n\) linear factors.

\[
f(x) = a_n(x - c_1)(x - c_2)(x - c_3) \cdots (x - c_n)
\]

However, this result includes the possibility that some of the values of \(c_i\) are complex. The following theorem says that even if you do not want to get involved with “complex factors,” you can still write \(f(x)\) as the product of linear and/or quadratic factors. For a proof of this theorem, see Proofs in Mathematics on page 212.

**Factors of a Polynomial**

Every polynomial of degree \(n > 0\) with real coefficients can be written as the product of linear and quadratic factors with real coefficients, where the quadratic factors have no real zeros.
A quadratic factor with no real zeros is said to be \textit{prime} or \textit{irreducible over the reals}. Be sure you see that this is not the same as being \textit{irreducible over the rationals}. For example, the quadratic \(x^2 + 1 = (x - i)(x + i)\) is irreducible over the reals (and therefore over the rationals). On the other hand, the quadratic \(x^2 - 2 = (x - \sqrt{2})(x + \sqrt{2})\) is irreducible over the rationals but \textit{reducible over the reals}.

\section*{Example 7 \ Finding the Zeros of a Polynomial Function}

Find all the zeros of \(f(x) = x^4 - 3x^3 + 6x^2 + 2x - 60\) given that \(1 + 3i\) is a zero of \(f\).

\textbf{Algebraic Solution}

Because complex zeros occur in conjugate pairs, you know that \(1 - 3i\) is also a zero of \(f\). This means that both

\[ [x - (1 + 3i)] \quad \text{and} \quad [x - (1 - 3i)] \]

are factors of \(f\). Multiplying these two factors produces

\[ [x - (1 + 3i)][x - (1 - 3i)] = [(x - 1) - 3i][(x - 1) + 3i] \]

\[ = (x - 1)^2 - 9i^2 \]

\[ = x^2 - 2x + 10. \]

Using long division, you can divide \(x^2 - 2x + 10\) into \(f\) to obtain the following.

\[
\begin{array}{c|ccccc}
& x^2 & - & 2x & + & 10 \\
\hline
x^2 - 2x + 10 & x^4 & - & 3x^3 & + & 6x^2 & + & 2x & - & 60 \\
\hline
& x^4 & - & 2x^3 & + & 10x^2 \\
& -x^3 & - & 4x^2 & + & 2x \\
& -x^3 & + & 2x^2 & - & 10x \\
& -6x^2 & + & 12x & - & 60 \\
& -6x^2 & + & 12x & - & 60 \\
& & & & & 0 \\
\end{array}
\]

So, you have

\[ f(x) = (x^2 - 2x + 10)(x^2 - x - 6) \]

\[ = (x^2 - 2x + 10)(x - 3)(x + 2) \]

and you can conclude that the zeros of \(f\) are \(x = 1 + 3i, x = 1 - 3i,\)

\(x = 3,\) and \(x = -2.\)

\textbf{Graphical Solution}

Because complex zeros always occur in conjugate pairs, you know that \(1 - 3i\) is also a zero of \(f\). Because the polynomial is a fourth-degree polynomial, you know that there are at most two other zeros of the function. Use a graphing utility to graph

\[ y = x^4 - 3x^3 + 6x^2 + 2x - 60 \]

as shown in Figure 2.34.

\[
\begin{array}{c}
\text{Figure 2.34} \\
y = x^4 - 3x^3 + 6x^2 + 2x - 60 \\
-80 \quad 80 \\
-4 \quad 5 \\
\end{array}
\]

You can see that \(-2\) and \(3\) appear to be zeros of the graph of the function. Use the zero or root feature or the zoom and trace features of the graphing utility to confirm that \(x = -2\) and \(x = 3\) are zeros of the graph.

So, you can conclude that the zeros of \(f\) are \(x = 1 + 3i, x = 1 - 3i, x = 3,\) and \(x = -2.\)

\textbf{Check Point}

Now try Exercise 55.

\textbf{Example 7 \ Finding the Zeros of a Polynomial Function}

You can review the techniques for polynomial long division in Section 2.3.
Example 8 shows how to find all the zeros of a polynomial function, including complex zeros.

### Example 8 Finding the Zeros of a Polynomial Function

Write \( f(x) = x^5 + x^3 + 2x^2 - 12x + 8 \) as the product of linear factors, and list all of its zeros.

**Solution**

The possible rational zeros are \( \pm 1, \pm 2, \pm 4 \), and \( \pm 8 \). Synthetic division produces the following.

\[
\begin{array}{c|ccccc}
1 & 1 & 0 & 1 & 2 & -12 & 8 \\
& 1 & 1 & 2 & 4 & -8 & 0 \\
\hline
1 & 1 & 2 & 4 & -8 & 0 \\
-2 & 1 & 1 & 2 & 4 & -8 \\
& -2 & -2 & -8 & 8 \\
\hline
& 1 & -1 & 4 & -4 & 0 \\
\end{array}
\]

So, you have

\[
f(x) = (x - 1)(x + 2)(x^3 - x^2 + 4x - 4)
\]

You can factor \( x^3 - x^2 + 4x - 4 \) as \( (x - 1)(x^2 + 4) \), and by factoring \( x^2 + 4 \) as

\[
x^2 - (-4) = (x - \sqrt{-4})(x + \sqrt{-4})
\]

you obtain

\[
f(x) = (x - 1)(x + 1)(x + 2i)(x - 2i)
\]

which gives the following five zeros of \( f \).

\[
x = 1, x = 1, x = -2, x = 2i, \quad \text{and} \quad x = -2i
\]

From the graph of \( f \) shown in Figure 2.35, you can see that the real zeros are the only ones that appear as \( x \)-intercepts. Note that \( x = 1 \) is a repeated zero.

**CHECKPOINT** Now try Exercise 77.
Other Tests for Zeros of Polynomials

You know that an \( n \)-th degree polynomial function can have at most \( n \) real zeros. Of course, many \( n \)-th degree polynomials do not have that many real zeros. For instance, \( f(x) = x^2 + 1 \) has no real zeros, and \( f(x) = x^3 + 1 \) has only one real zero. The following theorem, called Descartes’s Rule of Signs, sheds more light on the number of real zeros of a polynomial.

### Descartes’s Rule of Signs

A variation in sign means that two consecutive coefficients have opposite signs. When using Descartes’s Rule of Signs, a zero of multiplicity should be counted as zeros. For instance, the polynomial \( f(x) = x^3 - 3x + 2 \) has two variations in sign, and so has either two positive or no positive real zeros. Because

\[
x^3 - 3x + 2 = (x - 1)(x - 1)(x + 2)
\]

you can see that the two positive real zeros are \( x = 1 \) of multiplicity 2.

#### Example 9  Using Descartes’s Rule of Signs

Describe the possible real zeros of

\[
f(x) = 3x^3 - 5x^2 + 6x - 4.
\]

**Solution**

The original polynomial has three variations in sign.

\[
\begin{array}{c}
\uparrow & \downarrow & \downarrow & \downarrow & + & \downarrow & \downarrow & \downarrow & - & + \\
\end{array}
\]

\[
f(x) = 3x^3 - 5x^2 + 6x - 4
\]

The polynomial

\[
f(-x) = 3(-x)^3 - 5(-x)^2 + 6(-x) - 4 = -3x^3 - 5x^2 - 6x - 4
\]

has no variations in sign. So, from Descartes’s Rule of Signs, the polynomial \( f(x) = 3x^3 - 5x^2 + 6x - 4 \) has either three positive real zeros or one positive real zero, and has no negative real zeros. From the graph in Figure 2.36, you can see that the function has only one real zero, at \( x = 1 \).

**CHECK Point** Now try Exercise 87.
Another test for zeros of a polynomial function is related to the sign pattern in the last row of the synthetic division array. This test can give you an upper or lower bound of the real zeros of \( f \). A real number \( b \) is an upper bound for the real zeros of \( f \) if no zeros are greater than \( b \). Similarly, \( b \) is a lower bound if no real zeros of \( f \) are less than \( b \).

### Upper and Lower Bound Rules

Let \( f(x) \) be a polynomial with real coefficients and a positive leading coefficient. Suppose \( f(x) \) is divided by \( x - c \), using synthetic division.

1. If \( c > 0 \) and each number in the last row is either positive or zero, \( c \) is an upper bound for the real zeros of \( f \).
2. If \( c < 0 \) and the numbers in the last row are alternately positive and negative (zero entries count as positive or negative), \( c \) is a lower bound for the real zeros of \( f \).

### Example 10 Finding the Zeros of a Polynomial Function

Find the real zeros of \( f(x) = 6x^3 - 4x^2 + 3x - 2 \).

**Solution**

The possible real zeros are as follows.

\[
\begin{align*}
\text{Factors of 2} & = \frac{\pm 1, \pm 2}{\pm 1, \pm 2, \pm 3, \pm 6} = \pm 1, \pm \frac{1}{2}, \pm \frac{1}{3}, \pm \frac{1}{6}, \pm \frac{2}{3}, \pm 2
\end{align*}
\]

The original polynomial \( f(x) \) has three variations in sign. The polynomial

\[
\begin{align*}
f(-x) &= 6(-x)^3 - 4(-x)^2 + 3(-x) - 2 \\
&= -6x^3 - 4x^2 - 3x - 2
\end{align*}
\]

has no variations in sign. As a result of these two findings, you can apply Descartes’s Rule of Signs to conclude that there are three positive real zeros or one positive real zero, and no negative zeros. Trying \( x = 1 \) produces the following.

\[
\begin{array}{c|cccc}
1 & 6 & -4 & 3 & -2 \\
& & 6 & 2 & 5 \\
6 & 2 & 5 & 3
\end{array}
\]

So, \( x = 1 \) is not a zero, but because the last row has all positive entries, you know that \( x = 1 \) is an upper bound for the real zeros. So, you can restrict the search to zeros between 0 and 1. By trial and error, you can determine that \( x = \frac{2}{3} \) is a zero. So,

\[
f(x) = \left(x - \frac{2}{3}\right)(6x^2 + 3).
\]

Because \( 6x^2 + 3 \) has no real zeros, it follows that \( x = \frac{2}{3} \) is the only real zero.

**CHECKPOINT** Now try Exercise 95.
Before concluding this section, here are two additional hints that can help you find the real zeros of a polynomial.

1. If the terms of \( f(x) \) have a common monomial factor, it should be factored out before applying the tests in this section. For instance, by writing
   \[
   f(x) = x^4 - 5x^3 + 3x^2 + x
   \]
   you can see that \( x = 0 \) is a zero of \( f \) and that the remaining zeros can be obtained by analyzing the cubic factor.

2. If you are able to find all but two zeros of \( f(x) \), you can always use the Quadratic Formula on the remaining quadratic factor. For instance, if you succeeded in writing
   \[
   f(x) = x^4 - 5x^3 + 3x^2 + x
   \]
   you can apply the Quadratic Formula to \( x^2 - 4x - 1 \) to conclude that the two remaining zeros are \( x = 2 + \sqrt{5} \) and \( x = 2 - \sqrt{5} \).

**Example 11 Using a Polynomial Model**

You are designing candle-making kits. Each kit contains 25 cubic inches of candle wax and a mold for making a pyramid-shaped candle. You want the height of the candle to be 2 inches less than the length of each side of the candle’s square base. What should the dimensions of your candle mold be?

**Solution**

The volume of a pyramid is \( V = \frac{1}{3}Bh \), where \( B \) is the area of the base and \( h \) is the height. The area of the base is \( x^2 \) and the height is \( x - 2 \). So, the volume of the pyramid is \( V = \frac{1}{3}x^2(x - 2) \). Substituting 25 for the volume yields the following.

\[
25 = \frac{1}{3}x^2(x - 2) \quad \text{Substitute 25 for } V.
\]
\[
75 = x^3 - 2x^2 \quad \text{Multiply each side by 3.}
\]
\[
0 = x^3 - 2x^2 - 75 \quad \text{Write in general form.}
\]

The possible rational solutions are \( x = \pm 1, \pm 3, \pm 5, \pm 15, \pm 25, \pm 75 \). Use synthetic division to test some of the possible solutions. Note that in this case, it makes sense to test only positive \( x \)-values. Using synthetic division, you can determine that \( x = 5 \) is a solution.

\[
\begin{array}{rrrr}
5 & 1 & -2 & 0 & -75 \\
\hline
1 & 3 & 15 & 75 \\
\end{array}
\]

The other two solutions, which satisfy \( x^2 + 3x + 15 = 0 \), are imaginary and can be discarded. You can conclude that the base of the candle mold should be 5 inches by 5 inches and the height of the mold should be \( 5 - 2 = 3 \) inches.

**Check Point** Now try Exercise 115.
Chapter 2 Polynomial and Rational Functions

2.5 EXERCISES

VOCABULARY: Fill in the blanks.

1. The ________ ________ of ________ states that if \( f(x) \) is a polynomial of degree \( n \) \((n > 0)\), then \( f \) has at least one zero in the complex number system.

2. The ________ ________ ________ states that if \( f(x) \) is a polynomial of degree \( n \) \((n > 0)\), then \( f \) has precisely \( n \) linear factors, \( f(x) = a_n(x - c_1)(x - c_2) \cdots (x - c_n) \), where \( c_1, c_2, \ldots, c_n \) are complex numbers.

3. The test that gives a list of the possible rational zeros of a polynomial function is called the ________ ________ Test.

4. If \( a + bi \) is a complex zero of a polynomial with real coefficients, then so is its ________, \( a - bi \).

5. Every polynomial of degree \( n > 0 \) with real coefficients can be written as the product of ________ and ________ factors with real coefficients, where the ________ factors have no real zeros.

6. A quadratic factor that cannot be factored further as a product of linear factors containing real numbers is said to be ________ over the ________.

7. The theorem that can be used to determine the possible numbers of positive real zeros and negative real zeros of a function is called ________ ________ ________ of ________.

8. A real number \( b \) is a(n) ________ bound for the real zeros of \( f \) if no real zeros are less than \( b \), and is a(n) ________ bound if no real zeros are greater than \( b \).

SKILLS AND APPLICATIONS

In Exercises 9–14, find all the zeros of the function.

9. \( f(x) = x(x - 6)^2 \)
10. \( f(x) = x^2(x + 3)(x^2 - 1) \)
11. \( g(x) = (x - 2)(x + 4)^3 \)
12. \( f(x) = (x + 5)(x - 8)^2 \)
13. \( f(x) = (x + 6)(x + i)(x - i) \)
14. \( h(t) = (t - 3)(t - 2)(t - 3i)(t + 3i) \)

In Exercises 15–18, use the Rational Zero Test to list all possible rational zeros of \( f \). Verify that the zeros of \( f \) shown on the graph are contained in the list.

15. \( f(x) = x^3 + 2x^2 - x - 2 \)
16. \( f(x) = x^3 - 4x^2 - 4x + 16 \)
17. \( f(x) = 2x^4 - 17x^3 + 35x^2 + 9x - 45 \)
18. \( f(x) = 4x^5 - 8x^4 - 5x^3 + 10x^2 + x - 2 \)

In Exercises 19–28, find all the rational zeros of the function.

19. \( f(x) = x^3 - 6x^2 + 11x - 6 \)
20. \( f(x) = x^3 - 7x - 6 \)
21. \( g(x) = x^3 - 4x^2 - x + 4 \)
22. \( h(x) = x^3 - 9x^2 + 20x - 12 \)
23. \( h(t) = t^3 + 8t^2 + 13t + 6 \)
24. \( p(x) = x^3 - 9x^2 + 27x - 27 \)
25. \( C(x) = 2x^3 + 3x^2 - 1 \)
26. \( f(x) = 3x^3 - 19x^2 + 33x - 9 \)
27. \( f(x) = 9x^4 - 9x^3 - 58x^2 + 4x + 24 \)
28. \( f(x) = 2x^4 - 15x^3 + 23x^2 + 15x - 25 \)
In Exercises 29–32, find all real solutions of the polynomial equation.
29. \( z^4 + z^3 + z^2 + 3z - 6 = 0 \)
30. \( x^4 - 13x^2 - 12x = 0 \)
31. \( 2y^4 + 3y^3 - 16y^2 + 15y - 4 = 0 \)
32. \( x^5 - x^4 - 3x^3 + 5x^2 - 2x = 0 \)

In Exercises 33–36, (a) list the possible rational zeros of \( f \), (b) sketch the graph of \( f \) so that some of the possible zeros in part (a) can be disregarded, and then (c) determine all real zeros of \( f \).
33. \( f(x) = x^3 + x^2 - 4x - 4 \)
34. \( f(x) = -3x^3 + 20x^2 - 36x + 16 \)
35. \( f(x) = -4x^3 + 15x^2 - 8x - 3 \)
36. \( f(x) = 4x^3 - 12x^2 - x + 15 \)

In Exercises 37–40, (a) list the possible rational zeros of \( f \), (b) use a graphing utility to graph \( f \) so that some of the possible zeros in part (a) can be disregarded, and then (c) determine all real zeros of \( f \).
37. \( f(x) = -2x^4 + 13x^3 - 21x^2 + 2x + 8 \)
38. \( f(x) = 4x^4 - 17x^2 + 4 \)
39. \( f(x) = 32x^3 - 52x^2 + 17x + 3 \)
40. \( f(x) = 4x^3 + 7x^2 - 11x - 18 \)

**GRAPHICAL ANALYSIS** In Exercises 41–44, (a) use the zero or root feature of a graphing utility to approximate the zeros of the function accurate to three decimal places, (b) determine one of the exact zeros (use synthetic division to verify your result), and (c) factor the polynomial completely.
41. \( f(x) = x^4 - 3x^2 + 2 \)
42. \( P(t) = t^4 - 7t^2 + 12 \)
43. \( h(x) = x^5 - 7x^4 + 10x^3 + 14x^2 - 24x \)
44. \( g(x) = 6x^4 - 11x^3 - 51x^2 + 99x - 27 \)

In Exercises 45–50, find a polynomial function with real coefficients that has the given zeros. (There are many correct answers.)
45. \( 1, 5i \)
46. \( 4, -3i \)
47. \( 2, 5 + i \)
48. \( 5, 3 - 2i \)
49. \( \frac{1}{2}, -1, 3 + \sqrt{2}i \)
50. \( -5, -5, 1 + \sqrt{3}i \)

In Exercises 51–54, write the polynomial (a) as the product of factors that are irreducible over the rationals, (b) as the product of linear and quadratic factors that are irreducible over the reals, and (c) in completely factored form.
51. \( f(x) = x^4 + 6x^2 - 27 \)
52. \( f(x) = x^4 - 2x^3 - 3x^2 + 12x - 18 \)

\( \text{Hint: One factor is } x^2 - 6. \)
53. \( f(x) = x^4 - 4x^3 + 5x^2 - 2x - 6 \)
\( \text{Hint: One factor is } x^2 - 2x - 2. \)
54. \( f(x) = x^4 - 3x^3 - x^2 - 12x - 20 \)
\( \text{Hint: One factor is } x^2 + 4. \)

In Exercises 55–62, use the given zero to find all the zeros of the function.
55. \( f(x) = x^3 - x^2 + 4x - 4 \)
56. \( f(x) = 2x^3 + 3x^2 + 18x + 27 \)
57. \( f(x) = 2x^4 - x^3 + 39x^2 - 25x - 25 \)
58. \( g(x) = x^3 - 7x^2 - x + 87 \)
59. \( g(x) = 4x^3 + 2x^2 + 34x - 10 \)
60. \( h(x) = 3x^4 - 4x^2 + 8x + 8 \)
61. \( f(x) = x^4 + 3x^3 - 5x^2 - 21x + 22 \)
62. \( f(x) = x^3 + 4x^2 + 14x + 20 \)

In Exercises 63–80, find all the zeros of the function and write the polynomial as a product of linear factors.
63. \( f(x) = x^2 + 36 \)
64. \( f(x) = x^2 - x + 56 \)
65. \( h(x) = x^2 - 2x + 17 \)
66. \( g(x) = x^2 + 10x + 17 \)
67. \( f(x) = x^4 - 16 \)
68. \( f(y) = y^4 - 256 \)
69. \( f(z) = z^2 - 2z + 2 \)
70. \( h(x) = x^3 - 3x^2 + 4x - 2 \)
71. \( g(x) = x^3 - 3x^2 + x + 5 \)
72. \( f(x) = x^3 - x^2 + x + 39 \)
73. \( h(x) = x^3 - x + 6 \)
74. \( h(x) = x^3 + 9x^2 + 27x + 35 \)
75. \( f(x) = 5x^3 - 9x^2 + 28x + 6 \)
76. \( g(x) = 2x^3 - x^2 + 8x + 21 \)
77. \( g(x) = x^4 - 4x^3 + 8x^2 - 16x + 16 \)
78. \( h(x) = x^4 + 6x^3 + 10x^2 + 6x + 9 \)
79. \( f(x) = x^4 + 10x^2 + 9 \)
80. \( f(x) = x^4 + 29x^2 + 100 \)

In Exercises 81–86, find all the zeros of the function. When there is an extended list of possible rational zeros, use a graphing utility to graph the function in order to discard any rational zeros that are obviously not zeros of the function.
81. \( f(x) = x^3 + 24x^2 + 214x + 740 \)
82. \( f(s) = 2s^3 - 5s^2 + 12s - 5 \)
83. \( f(x) = 16x^3 - 20x^2 - 4x + 15 \)
84. \( f(x) = 9x^3 - 15x^2 + 11x - 5 \)
85. \( f(x) = 2x^4 + 5x^3 + 4x^2 + 5x + 2 \)
86. \( g(x) = x^5 - 8x^4 + 28x^3 - 56x^2 + 64x - 32 \)
In Exercises 87–94, use Descartes’s Rule of Signs to determine the possible numbers of positive and negative zeros of the function.

87. \( g(x) = 2x^3 - 3x^2 - 3 \)  
88. \( h(x) = 4x^2 - 8x + 3 \)  
89. \( h(x) = 2x^3 + 3x^2 + 1 \)  
90. \( h(x) = 2x^4 - 3x + 2 \)  
91. \( g(x) = 5x^5 - 10x \)  
92. \( f(x) = 4x^3 - 3x^2 + 2x - 1 \)  
93. \( f(x) = -5x^3 + x^2 - x + 5 \)  
94. \( f(x) = 3x^3 + 2x^2 + x + 3 \)

In Exercises 95–98, use synthetic division to verify the upper and lower bounds of the real zeros of \( f \).

95. \( f(x) = x^3 + 3x^2 - 2x + 1 \)
   (a) Upper: \( x = 1 \)  
   (b) Lower: \( x = -4 \)
96. \( f(x) = x^3 - 4x^2 + 1 \)
   (a) Upper: \( x = 4 \)  
   (b) Lower: \( x = -1 \)
97. \( f(x) = x^4 - 4x^3 + 16x - 16 \)
   (a) Upper: \( x = 5 \)  
   (b) Lower: \( x = -3 \)
98. \( f(x) = 2x^4 - 8x + 3 \)
   (a) Upper: \( x = 3 \)  
   (b) Lower: \( x = -4 \)

In Exercises 99–102, find all the real zeros of the function.

99. \( f(x) = 4x^3 - 3x - 1 \)
100. \( f(z) = 12z^3 - 4z^2 - 27z + 9 \)
101. \( f(y) = 4y^3 + 3y^2 + 8y + 6 \)
102. \( g(x) = 3x^3 - 2x^2 + 15x - 10 \)

In Exercises 103–106, find all the rational zeros of the polynomial function.

103. \( P(x) = x^4 - \frac{25}{2}x^2 + 9 = \frac{1}{4}(4x^4 - 25x^2 + 36) \)
104. \( f(x) = x^3 - \frac{3}{2}x^2 + 6 = \frac{1}{2}(2x^3 - 3x^2 - 23x + 12) \)
105. \( f(x) = x^3 - \frac{3}{2}x^2 - x + \frac{1}{2} = \frac{1}{2}(4x^3 - x^2 - 4x + 1) \)
106. \( f(z) = z^3 + \frac{14}{5}z^2 - \frac{1}{5}z - \frac{1}{3} = \frac{1}{5}(6z^3 + 11z^2 - 3z - 2) \)

In Exercises 107–110, match the cubic function with the numbers of rational and irrational zeros.

(a) Rational zeros: 0; irrational zeros: 1  
(b) Rational zeros: 3; irrational zeros: 0  
(c) Rational zeros: 1; irrational zeros: 2  
(d) Rational zeros: 1; irrational zeros: 0

107. \( f(x) = x^3 - 1 \)  
108. \( f(x) = x^3 - 2 \)  
109. \( f(x) = x^3 - x \)  
110. \( f(x) = x^3 - 2x \)

111. GEOMETRY An open box is to be made from a rectangular piece of material, 15 centimeters by 9 centimeters by cutting equal squares from the corners and turning up the sides.

(a) Let \( x \) represent the length of the sides of the squares removed. Draw a diagram showing the squares removed from the original piece of material and the resulting dimensions of the open box.

(b) Use the diagram to write the volume \( V \) of the box as a function of \( x \). Determine the domain of the function.

(c) Sketch the graph of the function and approximate the dimensions of the box that will yield a maximum volume.

(d) Find values of \( x \) such that \( V = 56 \). Which of these values is a physical impossibility in the construction of the box? Explain.

112. GEOMETRY A rectangular package to be sent by a delivery service (see figure) can have a maximum combined length and girth (perimeter of a cross section) of 120 inches.

(a) Write a function \( V(x) \) that represents the volume of the package.

(b) Use a graphing utility to graph the function and approximate the dimensions of the package that will yield a maximum volume.

(c) Find values of \( x \) such that \( V = 13,500 \). Which of these values is a physical impossibility in the construction of the package? Explain.

113. ADVERTISING COST A company that produces MP3 players estimates that the profit \( P \) (in dollars) for selling a particular model is given by

\[ P = -76x^2 + 4830x - 320,000, \quad 0 \leq x \leq 60 \]

where \( x \) is the advertising expense (in tens of thousands of dollars). Using this model, find the smaller of two advertising amounts that will yield a profit of $2,500,000.

114. ADVERTISING COST A company that manufactures bicycles estimates that the profit \( P \) (in dollars) for selling a particular model is given by

\[ P = -45x^3 + 2500x^2 - 275,000, \quad 0 \leq x \leq 50 \]

where \( x \) is the advertising expense (in tens of thousands of dollars). Using this model, find the smaller of two advertising amounts that will yield a profit of $800,000.
115. GEOMETRY A bulk food storage bin with dimensions 2 feet by 3 feet by 4 feet needs to be increased in size to hold five times as much food as the current bin. (Assume each dimension is increased by the same amount.)
   (a) Write a function that represents the volume \( V \) of the new bin.
   (b) Find the dimensions of the new bin.
116. GEOMETRY A manufacturer wants to enlarge an existing manufacturing facility such that the total floor area is 1.5 times that of the current facility. The floor area of the current facility is rectangular and measures 250 feet by 160 feet. The manufacturer wants to increase each dimension by the same amount.
   (a) Write a function that represents the new floor area \( A \).
   (b) Find the dimensions of the new floor.
   (c) Another alternative is to increase the current floor's length by an amount that is twice an increase in the floor's width. The total floor area is 1.5 times that of the current facility. Repeat parts (a) and (b) using these criteria.

117. COST The ordering and transportation cost \( C \) (in thousands of dollars) for the components used in manufacturing a product is given by
   \[
   C = 100 \left( \frac{200}{x^2} + \frac{x}{x + 30} \right), \quad x \geq 1
   \]
   where \( x \) is the order size (in hundreds). In calculus, it can be shown that the cost is a minimum when
   \[
   3x^3 - 40x^2 - 2400x - 36,000 = 0.
   
   Use a calculator to approximate the optimal order size to the nearest hundred units.

118. HEIGHT OF A BASEBALL A baseball is thrown upward from a height of 6 feet with an initial velocity of 48 feet per second, and its height \( h \) (in feet) is
   \[
   h(t) = -16t^2 + 48t + 6, \quad 0 \leq t \leq 3
   \]
   where \( t \) is the time (in seconds). You are told the ball reaches a height of 64 feet. Is this possible?

119. PROFIT The demand equation for a certain product is \( p = 140 - 0.0001x \), where \( p \) is the unit price (in dollars) of the product and \( x \) is the number of units produced and sold. The cost equation for the product is \( C = 80x + 150,000 \), where \( C \) is the total cost (in dollars) and \( x \) is the number of units produced. The total profit obtained by producing and selling \( x \) units is
   \[
   P = R - C = xp - C.
   
   You are working in the marketing department of the company that produces this product, and you are asked to determine a price \( p \) that will yield a profit of 9 million dollars. Is this possible? Explain.

120. ATHLETICS The attendance \( A \) (in millions) at NCAA women’s college basketball games for the years 2000 through 2007 is shown in the table.
   
<table>
<thead>
<tr>
<th>Year</th>

   (Source: National Collegiate Athletic Association, Indianapolis, IN)

   (a) Use a graphing utility to create a scatter plot of the data. Let \( t \) represent the year, with \( t = 0 \) corresponding to 2000.
   (b) Use the regression feature of the graphing utility to find a quartic model for the data.
   (c) Graph the model and the scatter plot in the same viewing window. How well does the model fit the data?
   (d) According to the model in part (b), in what year(s) was the attendance at least 10 million?
   (e) According to the model, will the attendance continue to increase? Explain.

EXPLORATION

TRUE OR FALSE? In Exercises 121 and 122, decide whether the statement is true or false. Justify your answer.

121. It is possible for a third-degree polynomial function with integer coefficients to have no real zeros.

122. If \( x = -i \) is a zero of the function given by
   \[
   f(x) = x^3 + ix^2 + ix - 1
   \]
   then \( x = i \) must also be a zero of \( f \).

THINK ABOUT IT In Exercises 123–128, determine (if possible) the zeros of the function \( g \) if the function \( f \) has zeros at \( x = r_1, x = r_2, \) and \( x = r_3 \).

123. \( g(x) = -f(x) \)
124. \( g(x) = 3f(x) \)
125. \( g(x) = f(x - 5) \)
126. \( g(x) = f(2x) \)
127. \( g(x) = 3 + f(x) \)
128. \( g(x) = f(-x) \)
129. **THINK ABOUT IT** A third-degree polynomial function \( f \) has real zeros \(-2, \frac{1}{2}, \) and 3, and its leading coefficient is negative. Write an equation for \( f \). Sketch the graph of \( f \). How many different polynomial functions are possible for \( f \)?

130. **CAPSTONE** Use a graphing utility to graph the function given by \( f(x) = x^4 - 4x^2 + k \) for different values of \( k \). Find values of \( k \) such that the zeros of \( f \) satisfy the specified characteristics. (Some parts do not have unique answers.)

(a) Four real zeros
(b) Two real zeros, each of multiplicity 2
(c) Two real zeros and two complex zeros
(d) Four complex zeros
(e) Will the answers to parts (a) through (d) change for the function \( g(x) = f(x - 2) \)?
(f) Will the answers to parts (a) through (d) change for the function \( g(x) = f(2x) \)?

131. **THINK ABOUT IT** Sketch the graph of a fifth-degree polynomial function whose leading coefficient is positive and that has a zero at \( x = 3 \) of multiplicity 2.

132. **WRITING** Compile a list of all the various techniques for factoring a polynomial that have been covered so far in the text. Give an example illustrating each technique, and write a paragraph discussing when the use of each technique is appropriate.

133. **THINK ABOUT IT** Let \( y = f(x) \) be a quartic polynomial with leading coefficient \( a = 1 \) and \( f(i) = f(2i) = 0 \). Write an equation for \( f \).

134. **THINK ABOUT IT** Let \( y = f(x) \) be a cubic polynomial with leading coefficient \( a = -1 \) and \( f(2) = f(i) = 0 \). Write an equation for \( f \).

In Exercises 135 and 136, the graph of a cubic polynomial function \( y = f(x) \) is shown. It is known that one of the zeros is \( 1 + i \). Write an equation for \( f \).

135.

136.

137. Use the information in the table to answer each question.

<table>
<thead>
<tr>
<th>Interval</th>
<th>Value of ( f(x) )</th>

</tbody>
</table>

(a) What are the three real zeros of the polynomial function \( f \)?
(b) What can be said about the behavior of the graph of \( f \) at \( x = 1 \)?
(c) What is the least possible degree of \( f \)? Explain. Can the degree of \( f \) ever be odd? Explain.
(d) Is the leading coefficient of \( f \) positive or negative? Explain.
(e) Write an equation for \( f \). (There are many correct answers.)
(f) Sketch a graph of the equation you wrote in part (e).

138. (a) Find a quadratic function \( f \) (with integer coefficients) that has \( \pm \sqrt{b}i \) as zeros. Assume that \( b \) is a positive integer.
(b) Find a quadratic function \( f \) (with integer coefficients) that has \( a \pm bi \) as zeros. Assume that \( b \) is a positive integer.

139. **GRAPHICAL REASONING** The graph of one of the following functions is shown below. Identify the function shown in the graph. Explain why each of the others is not the correct function. Use a graphing utility to verify your result.

(a) \( f(x) = x^2(x + 2)(x - 3.5) \)
(b) \( g(x) = (x + 2)(x - 3.5) \)
(c) \( h(x) = (x + 2)(x - 3.5)(x^2 + 1) \)
(d) \( k(x) = (x + 1)(x + 2)(x - 3.5) \)
Introduction

A rational function is a quotient of polynomial functions. It can be written in the form

\[ f(x) = \frac{N(x)}{D(x)} \]

where \( N(x) \) and \( D(x) \) are polynomials and \( D(x) \) is not the zero polynomial.

In general, the domain of a rational function of \( x \) includes all real numbers except \( x \)-values that make the denominator zero. Much of the discussion of rational functions will focus on their graphical behavior near the \( x \)-values excluded from the domain.

Example 1  Finding the Domain of a Rational Function

Find the domain of the reciprocal function \( f(x) = \frac{1}{x} \) and discuss the behavior of \( f \) near any excluded \( x \)-values.

Solution

Because the denominator is zero when \( x = 0 \), the domain of \( f \) is all real numbers except \( x = 0 \). To determine the behavior of \( f \) near this excluded value, evaluate \( f(x) \) to the left and right of \( x = 0 \), as indicated in the following tables.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-1</th>
<th>-0.5</th>
<th>-0.1</th>
<th>-0.01</th>
<th>-0.001</th>
<th>( \rightarrow 0 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>-1</td>
<td>-2</td>
<td>-10</td>
<td>-100</td>
<td>-1000</td>
<td>( \rightarrow -\infty )</td>

<td>( f(x) )</td>
<td>( \infty )</td>
<td>1000</td>
<td>100</td>
<td>10</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

Note that as \( x \) approaches 0 from the left, \( f(x) \) decreases without bound. In contrast, as \( x \) approaches 0 from the right, \( f(x) \) increases without bound. The graph of \( f \) is shown in Figure 2.37.

![Figure 2.37](image)

CHECK POINT  Now try Exercise 5.
Chapter 2 Polynomial and Rational Functions

Vertical and Horizontal Asymptotes

In Example 1, the behavior of $f$ near $x = 0$ is denoted as follows.

$$f(x) \rightarrow -\infty \text{ as } x \rightarrow 0^- \quad f(x) \rightarrow \infty \text{ as } x \rightarrow 0^+$$

$f(x)$ decreases without bound as $x$ approaches 0 from the left. $f(x)$ increases without bound as $x$ approaches 0 from the right.

The line $x = 0$ is a **vertical asymptote** of the graph of $f$, as shown in Figure 2.38. From this figure, you can see that the graph of $f$ also has a **horizontal asymptote**—the line $y = 0$. This means that the values of $f(x) = \frac{1}{x}$ approach zero as $x$ increases or decreases without bound.

$$f(x) \rightarrow 0 \text{ as } x \rightarrow -\infty \quad f(x) \rightarrow 0 \text{ as } x \rightarrow \infty$$

$f(x)$ approaches 0 as $x$ decreases without bound. $f(x)$ approaches 0 as $x$ increases without bound.

**Definitions of Vertical and Horizontal Asymptotes**

1. The line $x = a$ is a **vertical asymptote** of the graph of $f$ if
   
   $$f(x) \rightarrow \infty \quad \text{or} \quad f(x) \rightarrow -\infty$$

   as $x \rightarrow a$, either from the right or from the left.

2. The line $y = b$ is a **horizontal asymptote** of the graph of $f$ if

   $$f(x) \rightarrow b$$

   as $x \rightarrow \infty$ or $x \rightarrow -\infty$.

Eventually (as $x \rightarrow \infty$ or $x \rightarrow -\infty$), the distance between the horizontal asymptote and the points on the graph must approach zero. Figure 2.39 shows the vertical and horizontal asymptotes of the graphs of three rational functions.

The graphs of $f(x) = \frac{1}{x}$ in Figure 2.38 and $f(x) = \frac{2x + 1}{x + 1}$ in Figure 2.39(a) are **hyperbolas**. You will study hyperbolas in Section 10.4.
Vertical and Horizontal Asymptotes of a Rational Function

Let \( f(x) \) be the rational function given by
\[
f(x) = \frac{N(x)}{D(x)} = \frac{a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0}{b_m x^m + b_{m-1} x^{m-1} + \cdots + b_1 x + b_0}
\]
where \( N(x) \) and \( D(x) \) have no common factors.

1. The graph of \( f \) has vertical asymptotes at the zeros of \( D(x) \).
2. The graph of \( f \) has one or no horizontal asymptote determined by comparing the degrees of \( N(x) \) and \( D(x) \).
   a. If \( n < m \), the graph of \( f \) has the line \( y = 0 \) (the \( x \)-axis) as a horizontal asymptote.
   b. If \( n = m \), the graph of \( f \) has the line \( y = \frac{a_n}{b_m} \) (ratio of the leading coefficients) as a horizontal asymptote.
   c. If \( n > m \), the graph of \( f \) has no horizontal asymptote.

Example 2  Finding Vertical and Horizontal Asymptotes

Find all vertical and horizontal asymptotes of the graph of each rational function.

a. \( f(x) = \frac{2x^2}{x^2 - 1} \)

Solution

For this rational function, the degree of the numerator is equal to the degree of the denominator. The leading coefficient of the numerator is 2 and the leading coefficient of the denominator is 1, so the graph has the line \( y = 2 \) as a horizontal asymptote. To find any vertical asymptotes, set the denominator equal to zero and solve the resulting equation for \( x \).

\[
x^2 - 1 = 0 \quad \text{Set denominator equal to zero.}
\]

\[
(x + 1)(x - 1) = 0 \quad \text{Factor.}
\]

\[
x + 1 = 0 \quad \Rightarrow \quad x = -1 \quad \text{Set 1st factor equal to 0.}
\]

\[
x - 1 = 0 \quad \Rightarrow \quad x = 1 \quad \text{Set 2nd factor equal to 0.}
\]

This equation has two real solutions, \( x = -1 \) and \( x = 1 \), so the graph has the lines \( x = -1 \) and \( x = 1 \) as vertical asymptotes. The graph of the function is shown in Figure 2.40.

b. \( f(x) = \frac{x^2 + x - 2}{x^2 - x - 6} \)

For this rational function, the degree of the numerator is equal to the degree of the denominator. The leading coefficient of both the numerator and denominator is 1, so the graph has the line \( y = 1 \) as a horizontal asymptote. To find any vertical asymptotes, first factor the numerator and denominator as follows.

\[
f(x) = \frac{x^2 + x - 2}{x^2 - x - 6} = \frac{(x - 1)(x + 2)}{(x + 2)(x - 3)} = \frac{x - 1}{x - 3}, \quad x \neq -2
\]

By setting the denominator \( x - 3 \) (of the simplified function) equal to zero, you can determine that the graph has the line \( x = 3 \) as a vertical asymptote.
Analyzing Graphs of Rational Functions

To sketch the graph of a rational function, use the following guidelines.

**Guidelines for Analyzing Graphs of Rational Functions**

Let \( f(x) = \frac{N(x)}{D(x)} \) where \( N(x) \) and \( D(x) \) are polynomials.

1. Simplify \( f(x) \), if possible.
2. Find and plot the \( y \)-intercept (if any) by evaluating \( f(0) \).
3. Find the zeros of the numerator (if any) by solving the equation \( N(x) = 0 \).
   Then plot the corresponding \( x \)-intercepts.
4. Find the zeros of the denominator (if any) by solving the equation \( D(x) = 0 \).
   Then sketch the corresponding vertical asymptotes.
5. Find and sketch the horizontal asymptote (if any) by using the rule for finding the horizontal asymptote of a rational function.
6. Plot at least one point between and one point beyond each \( x \)-intercept and vertical asymptote.
7. Use smooth curves to complete the graph between and beyond the vertical asymptotes.

**TECHNOLOGY**

Some graphing utilities have difficulty graphing rational functions that have vertical asymptotes. Often, the utility will connect parts of the graph that are not supposed to be connected. For instance, the top screen on the right shows the graph of

\[ f(x) = \frac{1}{x - 2} \]

Notice that the graph should consist of two unconnected portions—one to the left of \( x = 2 \) and the other to the right of \( x = 2 \). To eliminate this problem, you can try changing the mode of the graphing utility to *dot mode*. The problem with this is that the graph is then represented as a collection of dots (as shown in the bottom screen on the right) rather than as a smooth curve.

The concept of *test intervals* from Section 2.2 can be extended to graphing of rational functions. To do this, use the fact that a rational function can change signs only at its zeros and its undefined values (the \( x \)-values for which its denominator is zero). Between two consecutive zeros of the numerator and the denominator, a rational function must be entirely positive or entirely negative. This means that when the zeros of the numerator and the denominator of a rational function are put in order, they divide the real number line into test intervals in which the function has no sign changes. A representative \( x \)-value is chosen to determine if the value of the rational function is positive (the graph lies above the \( x \)-axis) or negative (the graph lies below the \( x \)-axis).
Section 2.6  Rational Functions

Sketching the Graph of a Rational Function

Example 3  Sketching the Graph of a Rational Function

Sketch the graph of \( g(x) = \frac{3}{x - 2} \) and state its domain.

Solution

y-intercept: \((0, -\frac{3}{2})\), because \( g(0) = -\frac{3}{2} \)

x-intercept: None, because \( 3 \neq 0 \)

Vertical asymptote: \( x = 2 \), zero of denominator

Horizontal asymptote: \( y = 0 \), because degree of \( N(x) \) < degree of \( D(x) \)

Additional points:

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative x-value</th>
<th>Value of g</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, 2))</td>
<td>-4</td>
<td>( g(-4) = -0.5 )</td>
<td>Negative</td>
<td>((-4, -0.5))</td>
</tr>
<tr>
<td>((2, \infty))</td>
<td>3</td>
<td>( g(3) = 3 )</td>
<td>Positive</td>
<td>((3, 3))</td>
</tr>
</tbody>
</table>

By plotting the intercepts, asymptotes, and a few additional points, you can obtain the graph shown in Figure 2.41. The domain of \( g \) is all real numbers \( x \) except \( x = 2 \).

Check Point  Now try Exercise 31.

Example 4  Sketching the Graph of a Rational Function

Sketch the graph of

\[ f(x) = \frac{2x - 1}{x} \]

and state its domain.

Solution

y-intercept: None, because \( x = 0 \) is not in the domain

x-intercept: \((\frac{1}{2}, 0)\), because \( 2x - 1 = 0 \)

Vertical asymptote: \( x = 0 \), zero of denominator

Horizontal asymptote: \( y = 2 \), because degree of \( N(x) \) = degree of \( D(x) \)

Additional points:

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative x-value</th>
<th>Value of f</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, 0))</td>
<td>-1</td>
<td>( f(-1) = 3 )</td>
<td>Positive</td>
<td>((-1, 3))</td>
</tr>
<tr>
<td>((0, \frac{1}{2}))</td>
<td>( \frac{1}{2} )</td>
<td>( f\left(\frac{1}{2}\right) = -2 )</td>
<td>Negative</td>
<td>( \left(\frac{1}{2}, -2\right) )</td>
</tr>
<tr>
<td>(\frac{1}{2}, \infty)</td>
<td>4</td>
<td>( f(4) = 1.75 )</td>
<td>Positive</td>
<td>((4, 1.75))</td>
</tr>
</tbody>
</table>

By plotting the intercepts, asymptotes, and a few additional points, you can obtain the graph shown in Figure 2.42. The domain of \( f \) is all real numbers \( x \) except \( x = 0 \).

Check Point  Now try Exercise 35.
### Example 5 Sketching the Graph of a Rational Function

Sketch the graph of \( f(x) = \frac{x}{x^2 - x - 2} \).

**Solution**

Factoring the denominator, you have \( f(x) = \frac{x}{(x + 1)(x - 2)} \).

- **y-intercept:** \((0, 0)\), because \( f(0) = 0 \)
- **x-intercept:** \((0, 0)\)
- **Vertical asymptotes:** \( x = -1, x = 2 \), zeros of denominator
- **Horizontal asymptote:** \( y = 0 \), because degree of \( N(x) < \) degree of \( D(x) \)

**Additional points:**

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative x-value</th>
<th>Value of ( f )</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, -1))</td>
<td>-3</td>
<td>( f(-3) = -0.3 )</td>
<td>Negative</td>
<td>((-3, -0.3))</td>
</tr>
<tr>
<td>((-1, 0))</td>
<td>-0.5</td>
<td>( f(-0.5) = 0.4 )</td>
<td>Positive</td>
<td>((-0.5, 0.4))</td>
</tr>
<tr>
<td>((0, 2))</td>
<td>1</td>
<td>( f(1) = -0.5 )</td>
<td>Negative</td>
<td>((1, -0.5))</td>
</tr>
<tr>
<td>((2, \infty))</td>
<td>3</td>
<td>( f(3) = 0.75 )</td>
<td>Positive</td>
<td>((3, 0.75))</td>
</tr>
</tbody>
</table>

The graph is shown in Figure 2.43.

**WARNING / CAUTION**

If you are unsure of the shape of a portion of the graph of a rational function, plot some additional points. Also note that when the numerator and the denominator of a rational function have a common factor, the graph of the function has a hole at the zero of the common factor (see Example 6).

### Example 6 A Rational Function with Common Factors

Sketch the graph of \( f(x) = \frac{x^2 - 9}{x^2 - 2x - 3} \).

**Solution**

By factoring the numerator and denominator, you have

\[
f(x) = \frac{x^2 - 9}{x^2 - 2x - 3} = \frac{(x - 3)(x + 3)}{(x - 3)(x + 1)} = \frac{x + 3}{x + 1}, \quad x \neq 3,\]

- **y-intercept:** \((0, 3)\), because \( f(0) = 3 \)
- **x-intercept:** \((-3, 0)\), because \( f(-3) = 0 \)
- **Vertical asymptote:** \( x = -1 \), zero of (simplified) denominator
- **Horizontal asymptote:** \( y = 1 \), because degree of \( N(x) < \) degree of \( D(x) \)

**Additional points:**

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative x-value</th>
<th>Value of ( f )</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, -3))</td>
<td>-4</td>
<td>( f(-4) = 0.33 )</td>
<td>Positive</td>
<td>((-4, 0.33))</td>
</tr>
<tr>
<td>((-3, -1))</td>
<td>-2</td>
<td>( f(-2) = -1 )</td>
<td>Negative</td>
<td>((-2, -1))</td>
</tr>
<tr>
<td>((-1, \infty))</td>
<td>2</td>
<td>( f(2) = 1.67 )</td>
<td>Positive</td>
<td>((2, 1.67))</td>
</tr>
</tbody>
</table>

The graph is shown in Figure 2.44. Notice that there is a hole in the graph at \( x = 3 \), because the function is not defined when \( x = 3 \).
Slant Asymptotes

Consider a rational function whose denominator is of degree 1 or greater. If the degree of the numerator is exactly one more than the degree of the denominator, the graph of the function has a slant (or oblique) asymptote. For example, the graph of

\[ f(x) = \frac{x^2 - x}{x + 1} \]

has a slant asymptote, as shown in Figure 2.45. To find the equation of a slant asymptote, use long division. For instance, by dividing \( x + 1 \) into \( x^2 - x \), you obtain

\[ f(x) = \frac{x^2 - x}{x + 1} = x - 2 + \frac{2}{x + 1}. \]

Slant asymptote
\( y = x - 2 \)

As \( x \) increases or decreases without bound, the remainder term \( 2/(x + 1) \) approaches 0, so the graph of \( f \) approaches the line \( y = x - 2 \), as shown in Figure 2.45.

**Example 7**  
A Rational Function with a Slant Asymptote

Sketch the graph of \( f(x) = \frac{x^2 - x - 2}{x - 1} \).

**Solution**

Factoring the numerator as \((x - 2)(x + 1)\) allows you to recognize the \( x \)-intercepts. Using long division

\[ f(x) = \frac{x^2 - x - 2}{x - 1} = x - 2 + \frac{2}{x - 1} \]

allows you to recognize that the line \( y = x \) is a slant asymptote of the graph.

- **\( y \)-intercept:** \((0, 2)\), because \( f(0) = 2 \)
- **\( x \)-intercepts:** \((-1, 0)\) and \((2, 0)\)
- **Vertical asymptote:** \( x = 1 \), zero of denominator
- **Slant asymptote:** \( y = x \)

**Additional points:**

<table>
<thead>
<tr>
<th>Test interval</th>
<th>Representative ( x )-value</th>
<th>Value of ( f )</th>
<th>Sign</th>
<th>Point on graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, -1))</td>
<td>-2</td>
<td>( f(-2) = -1.33 )</td>
<td>Negative</td>
<td>((-2, -1.33))</td>
</tr>
<tr>
<td>((-1, 1))</td>
<td>0.5</td>
<td>( f(0.5) = 4.5 )</td>
<td>Positive</td>
<td>((0.5, 4.5))</td>
</tr>
<tr>
<td>((1, 2))</td>
<td>1.5</td>
<td>( f(1.5) = -2.5 )</td>
<td>Negative</td>
<td>((1.5, -2.5))</td>
</tr>
<tr>
<td>((2, \infty))</td>
<td>3</td>
<td>( f(3) = 2 )</td>
<td>Positive</td>
<td>((3, 2))</td>
</tr>
</tbody>
</table>

The graph is shown in Figure 2.46.

Now try Exercise 65.
Applications

There are many examples of asymptotic behavior in real life. For instance, Example 8 shows how a vertical asymptote can be used to analyze the cost of removing pollutants from smokestack emissions.

Example 8  Cost-Benefit Model

A utility company burns coal to generate electricity. The cost $C$ (in dollars) of removing $p\%$ of the smokestack pollutants is given by

$$C = \frac{80,000p}{100 - p}$$

for $0 \leq p < 100$. You are a member of a state legislature considering a law that would require utility companies to remove 90% of the pollutants from their smokestack emissions. The current law requires 85% removal. How much additional cost would the utility company incur as a result of the new law?

Algebraic Solution

Because the current law requires 85% removal, the current cost to the utility company is

$$C = \frac{80,000(85)}{100 - 85} \approx 453,333.$$  Evaluate $C$ when $p = 85$.

If the new law increases the percent removal to 90%, the cost will be

$$C = \frac{80,000(90)}{100 - 90} = 720,000.$$  Evaluate $C$ when $p = 90$.

So, the new law would require the utility company to spend an additional

$$720,000 - 453,333 = 266,667.$$  Subtract 85% removal cost from 90% removal cost.

Graphical Solution

Use a graphing utility to graph the function

$$y_1 = \frac{80,000}{100 - x}$$

using a viewing window similar to that shown in Figure 2.47. Note that the graph has a vertical asymptote at $x = 100$. Then use the trace or value feature to approximate the values of $y_1$ when $x = 85$ and $x = 90$. You should obtain the following values.

When $x = 85$, $y_1 \approx 453,333$.

When $x = 90$, $y_1 = 720,000$.

So, the new law would require the utility company to spend an additional

$$720,000 - 453,333 = 266,667.$$  

CHECKPoint  Now try Exercise 77.
A rectangular page is designed to contain 48 square inches of print. The margins at the top and bottom of the page are each 1 inch deep. The margins on each side are \( \frac{1}{2} \) inches wide. What should the dimensions of the page be so that the least amount of paper is used?

**Example 9** Finding a Minimum Area

Let \( A \) be the area to be minimized. From Figure 2.48, you can write

\[
A = (x + 3)(y + 2).
\]

The printed area inside the margins is modeled by \( A = xy \) or \( y = \frac{48}{x} \). To find the minimum area, rewrite the equation for \( A \) in terms of just one variable by substituting \( \frac{48}{x} \) for \( y \).

\[
A = (x + 3)\left(\frac{48}{x} + 2\right) = \frac{(x + 3)(48 + 2x)}{x}, \quad x > 0
\]

The graph of this rational function is shown in Figure 2.49. Because \( x \) represents the width of the printed area, you need consider only the portion of the graph for which \( x \) is positive. Using a graphing utility, you can approximate the minimum value of \( A \) to occur when \( x \approx 8.5 \) inches. The corresponding value of \( y \) is \( 48/8.5 \approx 5.6 \) inches. So, the dimensions should be

\[ x + 3 \approx 11.5 \text{ inches by } y + 2 \approx 7.6 \text{ inches}. \]

**Graphical Solution**

**Numerical Solution**

Let \( A \) be the area to be minimized. From Figure 2.48, you can write

\[
A = (x + 3)(y + 2).
\]

The printed area inside the margins is modeled by \( A = xy \) or \( y = \frac{48}{x} \). To find the minimum area, rewrite the equation for \( A \) in terms of just one variable by substituting \( \frac{48}{x} \) for \( y \).

\[
A = (x + 3)\left(\frac{48}{x} + 2\right) = \frac{(x + 3)(48 + 2x)}{x}, \quad x > 0
\]

Use the `table` feature of a graphing utility to create a table of values for the function

\[
y_1 = \frac{(x + 3)(48 + 2x)}{x}
\]

beginning at \( x = 1 \). From the table, you can see that the minimum value of \( y_1 \) occurs when \( x \) is somewhere between 8 and 9, as shown in Figure 2.50. To approximate the minimum value of \( y_1 \) to one decimal place, change the table so that it starts at \( x = 8 \) and increases by 0.1. The minimum value of \( y_1 \) occurs when \( x \approx 8.5 \), as shown in Figure 2.51. The corresponding value of \( y \) is \( 48/8.5 \approx 5.6 \) inches. So, the dimensions should be \( x + 3 \approx 11.5 \) inches by \( y + 2 \approx 7.6 \) inches.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( y_1 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>90.571</td>
</tr>
<tr>
<td>8.1</td>
<td>87.858</td>
</tr>
<tr>
<td>8.2</td>
<td>87.767</td>
</tr>
<tr>
<td>8.3</td>
<td>87.648</td>
</tr>
<tr>
<td>8.4</td>
<td>87.501</td>
</tr>
<tr>
<td>8.5</td>
<td>87.339</td>
</tr>
<tr>
<td>8.6</td>
<td>87.150</td>

<tr>
<td>8.8</td>
<td>86.707</td>
</tr>
<tr>
<td>8.9</td>
<td>86.446</td>
</tr>
</tbody>
</table>

If you go on to take a course in calculus, you will learn an analytic technique for finding the exact value of \( x \) that produces a minimum area. In this case, that value is \( x = 6\sqrt{2} \approx 8.485 \).
2.6 EXERCISES

**VOCABULARY:** Fill in the blanks.

1. Functions of the form \( f(x) = \frac{N(x)}{D(x)} \), where \( N(x) \) and \( D(x) \) are polynomials and \( D(x) \) is not the zero polynomial, are called _______ _______.

2. If \( f(x) \to \pm \infty \) as \( x \to a \) from the left or the right, then \( x = a \) is a _______ _______ of the graph of \( f \).

3. If \( f(x) \to b \) as \( x \to \pm \infty \), then \( y = b \) is a _______ _______ of the graph of \( f \).

4. For the rational function given by \( f(x) = \frac{N(x)}{D(x)} \), if the degree of \( N(x) \) is exactly one more than the degree of \( D(x) \), then the graph of \( f \) has a _______ (or oblique) _______.

**SKILLS AND APPLICATIONS**

In Exercises 5–8, (a) complete each table for the function, (b) determine the vertical and horizontal asymptotes of the graph of the function, and (c) find the domain of the function.

<table>

5. \( f(x) = \frac{1}{x - 1} \)

6. \( f(x) = \frac{5x}{x - 1} \)

7. \( f(x) = \frac{3x^2}{x^2 - 1} \)

8. \( f(x) = \frac{4x}{x^2 - 1} \)

In Exercises 5–8, (a) complete each table for the function, (b) determine the vertical and horizontal asymptotes of the graph of the function, and (c) find the domain of the function.

11. \( f(x) = \frac{5 + x}{5 - x} \)

12. \( f(x) = \frac{3 - 7x}{3 + 2x} \)

13. \( f(x) = \frac{x^3}{x^2 - 1} \)

14. \( f(x) = \frac{4x^2}{x + 2} \)

15. \( f(x) = \frac{3x^2 + 1}{x^2 + x + 9} \)

16. \( f(x) = \frac{3x^2 + x - 5}{x^2 + 1} \)

In Exercises 17–20, match the rational function with its graph. [The graphs are labeled (a), (b), (c), and (d).]

17. \( f(x) = \frac{4}{x + 5} \)

18. \( f(x) = \frac{5}{x - 2} \)

19. \( f(x) = \frac{x - 1}{x - 4} \)

20. \( f(x) = \frac{x + 2}{x + 4} \)

In Exercises 21–24, find the zeros (if any) of the rational function.

<table>

In Exercises 25–30, find the domain of the function and identify any vertical and horizontal asymptotes.

25. \( f(x) = \frac{x - 4}{x^2 - 16} \)
26. \( f(x) = \frac{x + 1}{x^2 - 1} \)
27. \( f(x) = \frac{x^2 - 25}{x^2 - 4x - 5} \)
28. \( f(x) = \frac{x^2 - 4}{x^2 - 3x + 2} \)
29. \( f(x) = \frac{x^2 - 3x - 4}{2x^2 + x - 1} \)
30. \( f(x) = \frac{6x^2 - 11x + 3}{6x^2 - 7x - 3} \)

In Exercises 31–50, (a) state the domain of the function, (b) identify all intercepts, (c) find any vertical and horizontal asymptotes, and (d) plot additional solution points as needed to sketch the graph of the rational function.

31. \( f(x) = \frac{1}{x + 2} \)
32. \( f(x) = \frac{1}{x - 3} \)
33. \( h(x) = \frac{-1}{x + 4} \)
34. \( g(x) = \frac{1}{6 - x} \)
35. \( C(x) = \frac{7 + 2x}{2 + x} \)
36. \( P(x) = \frac{x - 3}{1 - x} \)
37. \( f(t) = \frac{x^2}{x^2 + 9} \)
38. \( f(t) = \frac{1 - 2t}{t} \)
39. \( g(s) = \frac{4s}{s^2 + 4} \)
40. \( f(x) = -\frac{1}{(x - 2)^2} \)
41. \( h(x) = \frac{x^2 - 5x + 4}{x^2 - 4} \)
42. \( g(x) = \frac{x^2 - 2x - 8}{x^2 - 9} \)
43. \( f(x) = \frac{2x^2 - 5x - 3}{x^2 - 2x^2 - x + 2} \)
44. \( f(x) = \frac{x^2 - x - 2}{x^2 - 2x^2 - 5x + 6} \)
45. \( f(x) = \frac{x^2 + 3x}{x^2 + x - 6} \)
46. \( f(x) = \frac{5(x + 4)}{x^2 + x - 12} \)
47. \( f(x) = \frac{2x^2 - 5x + 2}{2x^2 - x - 6} \)
48. \( f(x) = \frac{3x^2 - 8x + 4}{2x^2 - 3x - 2} \)
49. \( f(t) = \frac{t^2 - 1}{t - 1} \)
50. \( f(x) = \frac{x^2 - 36}{x + 6} \)

In Exercises 55–68, (a) state the domain of the function, (b) identify all intercepts, (c) identify any vertical and slant asymptotes, and (d) plot additional solution points as needed to sketch the graph of the rational function.

51. \( f(x) = \frac{x^2 - 1}{x + 1} \), \( g(x) = x - 1 \)

**ANALYTICAL, NUMERICAL, AND GRAPHICAL ANALYSIS**

In Exercises 51–54, do the following.

(a) Determine the domains of \( f \) and \( g \).

(b) Simplify \( f \) and find any vertical asymptotes of the graph of \( f \).

(c) Compare the functions by completing the table.

(d) Use a graphing utility to graph \( f \) and \( g \) in the same viewing window.

(e) Explain why the graphing utility may not show the difference in the domains of \( f \) and \( g \).
67. \( f(x) = \frac{2x^3 - x^2 - 2x + 1}{x^2 + 3x + 2} \)

68. \( f(x) = \frac{2x^3 + x^2 - 8x - 4}{x^2 - 3x + 2} \)

In Exercises 69–72, use a graphing utility to graph the rational function. Give the domain of the function and identify any asymptotes. Then zoom out sufficiently far so that the graph appears as a line. Identify the line.

69. \( f(x) = \frac{x^2 + 5x + 8}{x + 3} \)

70. \( f(x) = \frac{2x^2 + x}{x + 1} \)

71. \( g(x) = \frac{1 + 3x^2 - x^3}{x^2} \)

72. \( h(x) = \frac{12 - 2x - x^2}{2(4 + x)} \)

GRAPHICAL REASONING In Exercises 73–76, (a) use the graph to determine any x-intercepts of the graph of the rational function and (b) set \( y = 0 \) and solve the resulting equation to confirm your result in part (a).

73. \( y = \frac{x + 1}{x - 3} \)

74. \( y = \frac{2x}{x - 3} \)

75. \( y = \frac{1}{x} - x \)

76. \( y = x - 3 + \frac{2}{x} \)

77. POLLUTION The cost \( C \) (in millions of dollars) of removing \( p\% \) of the industrial and municipal pollutants discharged into a river is given by

\[
C = \frac{255p}{100 - p}, \quad 0 \leq p < 100.
\]

(a) Use a graphing utility to graph the cost function.

(b) Find the costs of removing 10\%, 40\%, and 75\% of the pollutants.

(c) According to this model, would it be possible to remove 100\% of the pollutants? Explain.

78. RECYCLING In a pilot project, a rural township is given recycling bins for separating and storing recyclable products. The cost \( C \) (in dollars) of supplying bins to \( p\% \) of the population is given by

\[
C = \frac{25,000p}{100 - p}, \quad 0 \leq p < 100.
\]

(a) Use a graphing utility to graph the cost function.

(b) Find the costs of supplying bins to 15\%, 50\%, and 90\% of the population.

(c) According to this model, would it be possible to supply bins to 100\% of the residents? Explain.

79. POPULATION GROWTH The game commission introduces 100 deer into newly acquired state game lands. The population \( N \) of the herd is modeled by

\[
N = \frac{20(5 + 3t)}{1 + 0.04t}, \quad t \geq 0
\]

where \( t \) is the time in years (see figure).

(a) Find the populations when \( t = 5, \ t = 10, \) and \( t = 25. \)

(b) What is the limiting size of the herd as time increases?

80. CONCENTRATION OF A MIXTURE A 1000-liter tank contains 50 liters of a 25\% brine solution. You add \( x \) liters of a 75\% brine solution to the tank.

(a) Show that the concentration \( C \), the proportion of brine to total solution, in the final mixture is

\[
C = \frac{3x + 50}{4(x + 50)}
\]

(b) Determine the domain of the function based on the physical constraints of the problem.

(c) Sketch a graph of the concentration function.

(d) As the tank is filled, what happens to the rate at which the concentration of brine is increasing? What percent does the concentration of brine appear to approach?
81. PAGE DESIGN A page that is \( x \) inches wide and \( y \) inches high contains 30 square inches of print. The top and bottom margins are 1 inch deep, and the margins on each side are 2 inches wide (see figure).

![Page Design Diagram]

(a) Write a function for the total area \( A \) of the page in terms of \( x \).
(b) Determine the domain of the function based on the physical constraints of the problem.
(c) Use a graphing utility to graph the area function and approximate the page size for which the least amount of paper will be used. Verify your answer numerically using the table feature of the graphing utility.

82. PAGE DESIGN A rectangular page is designed to contain 64 square inches of print. The margins at the top and bottom of the page are each 1 inch deep. The margins on each side are \( \frac{1}{2} \) inches wide. What should the dimensions of the page be so that the least amount of paper is used?

83. AVERAGE SPEED A driver averaged 50 miles per hour on the round trip between Akron, Ohio, and Columbus, Ohio, 100 miles away. The average speeds for going and returning were \( x \) and \( y \) miles per hour, respectively.

(a) Show that \( y = \frac{25x}{x - 25} \).
(b) Determine the vertical and horizontal asymptotes of the graph of the function.
(c) Use a graphing utility to graph the function.
(d) Complete the table.

<table>
<thead>
<tr>
<th>( x )</th>
<th>30</th>
<th>35</th>
<th>40</th>
<th>45</th>
<th>50</th>
<th>55</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(e) Are the results in the table what you expected? Explain.
(f) Is it possible to average 20 miles per hour in one direction and still average 50 miles per hour on the round trip? Explain.

84. WRITING Is every rational function a polynomial function? Is every polynomial function a rational function? Explain.

85. TRUE OR FALSE? In Exercises 85–87, determine whether the statement is true or false. Justify your answer.

(a) A polynomial can have infinitely many vertical asymptotes.
(b) The graph of a rational function can never cross one of its asymptotes.
(c) The graph of a function can have a vertical asymptote, a horizontal asymptote, and a slant asymptote.

88. LIBRARY OF PARENT FUNCTIONS In Exercises 88 and 89, identify the rational function represented by the graph.

(a) \( f(x) = \frac{x^2 - 9}{x^2 - 4} \)
(b) \( f(x) = \frac{x^2 - 4}{x^2 - 9} \)
(c) \( f(x) = \frac{x - 4}{x^2 - 9} \)
(d) \( f(x) = \frac{x - 9}{x^2 - 4} \)

89. (a) \( f(x) = \frac{x^2 - 1}{x^2 + 1} \)
(b) \( f(x) = \frac{x^2 + 1}{x^2 - 1} \)
(c) \( f(x) = \frac{x}{x^2 - 1} \)
(d) \( f(x) = \frac{x}{x^2 + 1} \)

90. CAPSTONE Write a rational function \( f \) that has the specified characteristics. (There are many correct answers.)

(a) Vertical asymptote: \( x = 2 \)
   Horizontal asymptote: \( y = 0 \)
   Zero: \( x = 1 \)
(b) Vertical asymptote: \( x = -1 \)
   Horizontal asymptote: \( y = 0 \)
   Zero: \( x = 2 \)
(c) Vertical asymptotes: \( x = -2, x = 1 \)
   Horizontal asymptote: \( y = 2 \)
   Zeros: \( x = 3, x = -3, \)
(d) Vertical asymptotes: \( x = -1, x = 2 \)
   Horizontal asymptote: \( y = -2 \)
   Zeros: \( x = -2, x = 3 \)

PROJECT: DEPARTMENT OF DEFENSE To work an extended application analyzing the total numbers of the Department of Defense personnel from 1980 through 2007, visit this text's website at academic.cengage.com. (Data Source: U.S. Department of Defense)
Polynomial Inequalities

To solve a polynomial inequality such as \( x^2 - 2x - 3 < 0 \), you can use the fact that a polynomial can change signs only at its zeros (the \( x \)-values that make the polynomial equal to zero). Between two consecutive zeros, a polynomial must be entirely positive or entirely negative. This means that when the real zeros of a polynomial are put in order, they divide the real number line into intervals in which the polynomial has no sign changes. These zeros are the key numbers of the inequality, and the resulting intervals are the test intervals for the inequality. For instance, the polynomial above factors as

\[ x^2 - 2x - 3 = (x + 1)(x - 3) \]

and has two zeros, \( x = -1 \) and \( x = 3 \). These zeros divide the real number line into three test intervals:

\[ (-\infty, -1), \quad (-1, 3), \quad \text{and} \quad (3, \infty). \]  (See Figure 2.52.)

So, to solve the inequality \( x^2 - 2x - 3 < 0 \), you need only test one value from each of these test intervals to determine whether the value satisfies the original inequality. If so, you can conclude that the interval is a solution of the inequality.

You can use the same basic approach to determine the test intervals for any polynomial.

Finding Test Intervals for a Polynomial

To determine the intervals on which the values of a polynomial are entirely negative or entirely positive, use the following steps.

1. Find all real zeros of the polynomial, and arrange the zeros in increasing order (from smallest to largest). These zeros are the key numbers of the polynomial.

2. Use the key numbers of the polynomial to determine its test intervals.

3. Choose one representative \( x \)-value in each test interval and evaluate the polynomial at that value. If the value of the polynomial is negative, the polynomial will have negative values for every \( x \)-value in the interval. If the value of the polynomial is positive, the polynomial will have positive values for every \( x \)-value in the interval.
Section 2.7 Nonlinear Inequalities

Solving a Polynomial Inequality

Solve $x^2 - x - 6 < 0$.

**Solution**

By factoring the polynomial as

$$x^2 - x - 6 = (x + 2)(x - 3)$$

you can see that the key numbers are $x = -2$ and $x = 3$. So, the polynomial’s test intervals are

$$(-\infty, -2), \ (-2, 3), \ \text{and} \ (3, \infty).$$

In each test interval, choose a representative $x$-value and evaluate the polynomial.

<table>
<thead>
<tr>
<th>Test Interval</th>
<th>x-Value</th>
<th>Polynomial Value</th>
<th>Conclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(-\infty, -2)$</td>
<td>$x = -3$</td>
<td>$(-3)^2 - (-3) - 6 = 6$</td>
<td>Positive</td>
</tr>
<tr>
<td>$(-2, 3)$</td>
<td>$x = 0$</td>
<td>$(0)^2 - (0) - 6 = -6$</td>
<td>Negative</td>
</tr>
<tr>
<td>$(3, \infty)$</td>
<td>$x = 4$</td>
<td>$(4)^2 - (4) - 6 = 6$</td>
<td>Positive</td>
</tr>
</tbody>
</table>

From this you can conclude that the inequality is satisfied for all $x$-values in $(-2, 3)$. This implies that the solution of the inequality $x^2 - x - 6 < 0$ is the interval $(-2, 3)$, as shown in Figure 2.53. Note that the original inequality contains a “less than” symbol. This means that the solution set does not contain the endpoints of the test interval $(-2, 3)$.

As with linear inequalities, you can check the reasonableness of a solution by substituting $x$-values into the original inequality. For instance, to check the solution found in Example 1, try substituting several $x$-values from the interval $(-2, 3)$ into the inequality

$$x^2 - x - 6 < 0.$$ 

Regardless of which $x$-values you choose, the inequality should be satisfied.

You can also use a graph to check the result of Example 1. Sketch the graph of $y = x^2 - x - 6$, as shown in Figure 2.54. Notice that the graph is below the $x$-axis on the interval $(-2, 3)$.

In Example 1, the polynomial inequality was given in general form (with the polynomial on one side and zero on the other). Whenever this is not the case, you should begin the solution process by writing the inequality in general form.
Example 2  Solving a Polynomial Inequality

Solve \(2x^3 - 3x^2 - 32x > -48\).

Solution

\[
2x^3 - 3x^2 - 32x + 48 > 0 \quad \text{Write in general form.}
\]

\[
(x - 4)(x + 4)(2x - 3) > 0 \quad \text{Factor.}
\]

The key numbers are \(x = -4, x = \frac{3}{2}\), and \(x = 4\), and the test intervals are \((-\infty, -4), \left(-4, \frac{3}{2}\right), \left(\frac{3}{2}, 4\right),\) and \((4, \infty)\).

<table>
<thead>
<tr>
<th>Test Interval</th>
<th>x-Value</th>
<th>Polynomial Value</th>
<th>Conclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-\infty, -4))</td>
<td>(x = -5)</td>
<td>(2(-5)^3 - 3(-5)^2 - 32(-5) + 48)</td>
<td>Negative</td>
</tr>
<tr>
<td>(\left(-4, \frac{3}{2}\right))</td>
<td>(x = 0)</td>
<td>(2(0)^3 - 3(0)^2 - 32(0) + 48)</td>
<td>Positive</td>
</tr>
<tr>
<td>(\left(\frac{3}{2}, 4\right))</td>
<td>(x = 2)</td>
<td>(2(2)^3 - 3(2)^2 - 32(2) + 48)</td>
<td>Negative</td>
</tr>
<tr>
<td>((4, \infty))</td>
<td>(x = 5)</td>
<td>(2(5)^3 - 3(5)^2 - 32(5) + 48)</td>
<td>Positive</td>
</tr>
</tbody>
</table>

From this you can conclude that the inequality is satisfied on the open intervals \(\left(-4, \frac{3}{2}\right)\) and \((4, \infty)\). So, the solution set is \(\left(-4, \frac{3}{2}\right) \cup (4, \infty)\), as shown in Figure 2.55.

![Figure 2.55](image)

Example 3  Solving a Polynomial Inequality

Solve \(4x^2 - 5x > 6\).

Algebraic Solution

\[
4x^2 - 5x - 6 > 0 \quad \text{Write in general form.}
\]

\[
(x - 2)(4x + 3) > 0 \quad \text{Factor.}
\]

Key Numbers: \(x = -\frac{3}{4}, x = 2\)

Test Intervals: \((-\infty, -\frac{3}{4}), \left(-\frac{3}{4}, 2\right), (2, \infty)\)

Test: Is \((x - 2)(4x + 3) > 0\)?)

After testing these intervals, you can see that the polynomial \(4x^2 - 5x - 6\) is positive on the open intervals \((-\infty, -\frac{3}{4})\) and \((2, \infty)\). So, the solution set of the inequality is \((-\infty, -\frac{3}{4}) \cup (2, \infty)\).

Graphical Solution

First write the polynomial inequality \(4x^2 - 5x > 6\) as \(4x^2 - 5x - 6 > 0\). Then use a graphing utility to graph \(y = 4x^2 - 5x - 6\). In Figure 2.56, you can see that the graph is above the x-axis when \(x\) is less than \(-\frac{3}{4}\) or when \(x\) is greater than 2. So, you can graphically approximate the solution set to be \((-\infty, -\frac{3}{4}) \cup (2, \infty)\).

![Figure 2.56](image)

Now try Exercise 27.
When solving a polynomial inequality, be sure you have accounted for the particular type of inequality symbol given in the inequality. For instance, in Example 3, note that the original inequality contained a “greater than” symbol and the solution consisted of two open intervals. If the original inequality had been

\[ 4x^2 - 5x \geq 6 \]

the solution would have consisted of the intervals \((-\infty, -\frac{1}{2}] \) and \([2, \infty)\).

Each of the polynomial inequalities in Examples 1, 2, and 3 has a solution set that consists of a single interval or the union of two intervals. When solving the exercises for this section, watch for unusual solution sets, as illustrated in Example 4.

### Example 4 Unusual Solution Sets

a. The solution set of the following inequality consists of the entire set of real numbers, \((-\infty, \infty)\). In other words, the value of the quadratic \(x^2 + 2x + 4\) is positive for every real value of \(x\).

\[ x^2 + 2x + 4 > 0 \]

b. The solution set of the following inequality consists of the single real number \(-1\), because the quadratic \(x^2 + 2x + 1\) has only one key number, \(x = -1\), and it is the only value that satisfies the inequality.

\[ x^2 + 2x + 1 \leq 0 \]

c. The solution set of the following inequality is empty. In other words, the quadratic \(x^2 + 3x + 5\) is not less than zero for any value of \(x\).

\[ x^2 + 3x + 5 < 0 \]

d. The solution set of the following inequality consists of all real numbers except \(x = 2\). In interval notation, this solution set can be written as \((-\infty, 2) \cup (2, \infty)\).

\[ x^2 - 4x + 4 > 0 \]
Rational Inequalities

The concepts of key numbers and test intervals can be extended to rational inequalities. To do this, use the fact that the value of a rational expression can change sign only at its zeros (the x-values for which its numerator is zero) and its undefined values (the x-values for which its denominator is zero). These two types of numbers make up the key numbers of a rational inequality. When solving a rational inequality, begin by writing the inequality in general form with the rational expression on the left and zero on the right.

Example 5  Solving a Rational Inequality

Solve \( \frac{2x - 7}{x - 5} \leq 3 \).

Solution

\[ \frac{2x - 7}{x - 5} \leq 3 \quad \text{Write original inequality.} \]

\[ \frac{2x - 7}{x - 5} - 3 \leq 0 \quad \text{Write in general form.} \]

\[ \frac{2x - 7 - 3x + 15}{x - 5} \leq 0 \quad \text{Find the LCD and subtract fractions.} \]

\[ \frac{-x + 8}{x - 5} \leq 0 \quad \text{Simplify.} \]

Key numbers: \( x = 5, x = 8 \)  Zeros and undefined values of rational expression

Test intervals: \( (-\infty, 5), (5, 8), (8, \infty) \)

Test: Is \( \frac{-x + 8}{x - 5} \leq 0 ? \)

After testing these intervals, as shown in Figure 2.57, you can see that the inequality is satisfied on the open intervals \( (-\infty, 5) \) and \( (8, \infty) \). Moreover, because \( \frac{-x + 8}{x - 5} = 0 \) when \( x = 8 \), you can conclude that the solution set consists of all real numbers in the intervals \( (-\infty, 5) \cup [8, \infty) \). (Be sure to use a closed interval to indicate that \( x \) can equal 8.)

Choose \( x = 6 \), \( \frac{-x + 8}{x - 5} > 0 \)

Choose \( x = 4 \), \( \frac{-x + 8}{x - 5} < 0 \)

Choose \( x = 9 \), \( \frac{-x + 8}{x - 5} < 0 \)

FIGURE 2.57

Now try Exercise 45.
Applications

One common application of inequalities comes from business and involves profit, revenue, and cost. The formula that relates these three quantities is

\[
\text{Profit} = \text{Revenue} - \text{Cost}
\]

\[
P = R - C.
\]

**Example 6** Increasing the Profit for a Product

The marketing department of a calculator manufacturer has determined that the demand for a new model of calculator is

\[
p = 100 - 0.00001x, \quad 0 \leq x \leq 10,000,000
\]

Demand equation

where \(p\) is the price per calculator (in dollars) and \(x\) represents the number of calculators sold. (If this model is accurate, no one would be willing to pay $100 for the calculator. At the other extreme, the company couldn't sell more than 10 million calculators.) The revenue for selling \(x\) calculators is

\[
R = xp = x(100 - 0.00001x)
\]

Revenue equation

as shown in Figure 2.58. The total cost of producing \(x\) calculators is $10 per calculator plus a development cost of $2,500,000. So, the total cost is

\[
C = 10x + 2,500,000.
\]

Cost equation

What price should the company charge per calculator to obtain a profit of at least $190,000,000?

**Solution**

**Verbal Model:**

\[
\text{Profit} = \text{Revenue} - \text{Cost}
\]

**Equation:**

\[
P = 100x - 0.00001x^2 - (10x + 2,500,000)
\]

\[
P = -0.00001x^2 + 90x - 2,500,000
\]

To answer the question, solve the inequality

\[
P \geq 190,000,000
\]

\[
-0.00001x^2 + 90x - 2,500,000 \geq 190,000,000.
\]

When you write the inequality in general form, find the key numbers and the test intervals, and then test a value in each test interval, you can find the solution to be

\[
3,500,000 \leq x \leq 5,500,000
\]

as shown in Figure 2.59. Substituting the \(x\)-values in the original price equation shows that prices of

\[
$45.00 \leq p \leq $65.00
\]

will yield a profit of at least $190,000,000.

**Check Point** Now try Exercise 75.
Another common application of inequalities is finding the domain of an expression that involves a square root, as shown in Example 7.

**Example 7  Finding the Domain of an Expression**

Find the domain of \( \sqrt{64 - 4x^2} \).

**Algebraic Solution**

Remember that the domain of an expression is the set of all \( x \)-values for which the expression is defined. Because \( \sqrt{64 - 4x^2} \) is defined (has real values) only if \( 64 - 4x^2 \) is nonnegative, the domain is given by \( 64 - 4x^2 \geq 0 \).

\[
\begin{align*}
64 - 4x^2 & \geq 0 & \text{Write in general form.} \\
16 - x^2 & \geq 0 & \text{Divide each side by 4.} \\
(4 - x)(4 + x) & \geq 0 & \text{Write in factored form.}
\end{align*}
\]

So, the inequality has two key numbers: \( x = -4 \) and \( x = 4 \). You can use these two numbers to test the inequality as follows.

**Key numbers:** \( x = -4, x = 4 \)

**Test intervals:** \( (-\infty, -4), (-4, 4), (4, \infty) \)

**Test:** For what values of \( x \) is \( \sqrt{64 - 4x^2} \) is the interval \( [-4, 4] \).

A test shows that the inequality is satisfied in the closed interval \( [-4, 4] \). So, the domain of the expression \( \sqrt{64 - 4x^2} \) is the interval \( [-4, 4] \).

**CHECKPoint** Now try Exercise 59.

**Graphical Solution**

Begin by sketching the graph of the equation \( y = \sqrt{64 - 4x^2} \), as shown in Figure 2.60. From the graph, you can determine that the \( x \)-values extend from \(-4\) to \(4\) (including \(-4\) and \(4\)). So, the domain of the expression \( \sqrt{64 - 4x^2} \) is the interval \([ -4, 4 \]\

To analyze a test interval, choose a representative \( x \)-value in the interval and evaluate the expression at that value. For instance, in Example 7, if you substitute any number from the interval \([ -4, 4 \] into the expression \( \sqrt{64 - 4x^2} \), you will obtain a nonnegative number under the radical symbol that simplifies to a real number. If you substitute any number from the intervals \( (-\infty, -4) \) and \( (4, \infty) \), you will obtain a complex number. It might be helpful to draw a visual representation of the intervals, as shown in Figure 2.61.

**CLASSROOM DISCUSSION**

**Profit Analysis** Consider the relationship

\[
P = R - C
\]

described on page 199. Write a paragraph discussing why it might be beneficial to solve \( P < 0 \) if you owned a business. Use the situation described in Example 6 to illustrate your reasoning.
2.7 EXERCISES

**VOCABULARY:** Fill in the blanks.
1. Between two consecutive zeros, a polynomial must be entirely ________ or entirely ________.
2. To solve a polynomial inequality, find the ________ numbers of the polynomial, and use these numbers to create ________ ________ for the inequality.
3. The key numbers of a rational expression are its ________ and its ________ ________.
4. The formula that relates cost, revenue, and profit is ________.

**SKILLS AND APPLICATIONS**

In Exercises 5–8, determine whether each value of $x$ is a solution of the inequality.

<table>
<thead>

In Exercises 9–12, find the key numbers of the expression.

9. $3x^2 - x - 2$  
10. $9x^3 - 25x^2$  
11. $\frac{1}{x - 5} + 1$  
12. $x + 2 - \frac{2}{x - 1}$

In Exercises 13–30, solve the inequality and graph the solution on the real number line.

13. $x^2 < 9$  
14. $x^2 \leq 16$  
15. $(x + 2)^2 \leq 25$  
16. $(x - 3)^2 \geq 1$  
17. $x^2 + 4x + 4 \geq 9$  
18. $x^2 - 6x + 9 < 16$  
19. $x^2 + x < 6$  
20. $x^2 + 2x > 3$  
21. $x^2 + 2x - 3 < 0$  
22. $x^2 > 2x + 8$  
23. $3x^2 - 11x > 20$  
24. $-2x^2 + 6x + 15 \leq 0$  
25. $x^2 - 3x > 18 > 0$  
26. $x^3 + 2x^2 - 4x - 8 \leq 0$  
27. $x^3 - 3x^2 - x > -3$  
28. $2x^3 + 13x^2 - 8x - 46 \geq 6$  
29. $4x^2 - 4x + 1 \leq 0$  
30. $x^2 + 3x + 8 > 0$

In Exercises 31–36, solve the inequality and write the solution set in interval notation.

31. $4x^3 - 6x^2 < 0$  
32. $4x^3 - 12x^2 > 0$  
33. $x^3 - 4x \geq 0$  
34. $2x^3 - x^4 \leq 0$  
35. $(x - 1)^2(x + 2)^3 \geq 0$  
36. $x^4(x - 3) \leq 0$

**GRAPHICAL ANALYSIS** In Exercises 37–40, use a graphing utility to graph the equation. Use the graph to approximate the values of $x$ that satisfy each inequality.

<table>
<thead>
<tr>

<td>(a) $y \leq 0$ (b) $y \geq 36$</td>
</tr>
</tbody>
</table>

In Exercises 41–54, solve the inequality and graph the solution on the real number line.

41. $\frac{4x - 1}{x} > 0$  
42. $\frac{x^2 - 1}{x} < 0$  
43. $\frac{3x - 5}{x - 5} \geq 0$  
44. $\frac{5 + 7x}{1 + 2x} \leq 4$  
45. $\frac{x + 6}{x + 1} - 2 < 0$  
46. $\frac{x + 12}{x + 2} - 3 \geq 0$  
47. $\frac{2}{x + 5} > \frac{1}{x - 3}$  
48. $\frac{5}{x - 6} > \frac{3}{x + 2}$  
49. $\frac{1}{x - 3} \leq \frac{9}{4x + 3}$  
50. $\frac{1}{x} \geq \frac{1}{x + 3}$  
51. $\frac{x^2 + 2x}{x^2 - 9} \leq 0$  
52. $\frac{x^2 + x - 6}{x} \geq 0$  
53. $\frac{3}{x - 1} + \frac{2x}{x + 1} > -1$  
54. $\frac{3x}{x - 1} \leq \frac{x}{x + 4} + 3$
GRAPHICAL ANALYSIS In Exercises 55–58, use a graphing utility to graph the equation. Use the graph to approximate the values of \( x \) that satisfy each inequality.

\[
\begin{align*}
55. \quad y &= \frac{3x}{x - 2} \\
56. \quad y &= \frac{2(x - 2)}{x + 1} \\
57. \quad y &= \frac{2x^2}{x^2 + 4} \\
58. \quad y &= \frac{5x}{x^2 + 4}
\end{align*}
\]

(a) \( y \leq 0 \)  (b) \( y \geq 6 \)
(a) \( y \leq 0 \)  (b) \( y \geq 8 \)
(a) \( y \geq 1 \)  (b) \( y \leq 2 \)
(a) \( y \geq 1 \)  (b) \( y \leq 0 \)

In Exercises 59–64, find the domain of \( x \) in the expression. Use a graphing utility to verify your result.

\[
\begin{align*}
59. \quad \sqrt{4 - x^2} & \quad 60. \quad \sqrt{x^2 - 4} \\
61. \quad \sqrt{x^2 - 9x + 20} & \quad 62. \quad \sqrt{81 - 4x^2} \\
63. \quad \sqrt{x} & \quad 64. \quad x
\end{align*}
\]

In Exercises 65–70, solve the inequality. (Round your answers to two decimal places.)

\[
\begin{align*}
65. \quad 0.4x^2 + 5.26 & < 10.2 \\
66. \quad -1.3x^2 + 3.78 & > 2.12 \\
67. \quad -0.5x^2 + 12.5x + 1.6 & > 0 \\
68. \quad 1.2x^2 + 4.8x + 3.1 & < 5.3 \\
69. \quad \frac{1}{2.3x - 5.2} & > 3.4 \\
70. \quad \frac{2}{3.1x - 3.7} & > 5.8
\end{align*}
\]

HEIGHT OF A PROJECTILE In Exercises 71 and 72, use the position equation \( s = -16t^2 + v_0t + s_0 \), where \( s \) represents the height of an object (in feet), \( v_0 \) represents the initial velocity of the object (in feet per second), \( s_0 \) represents the initial height of the object (in feet), and \( t \) represents the time (in seconds).

71. A projectile is fired straight upward from ground level \( (s_0 = 0) \) with an initial velocity of 160 feet per second.
   (a) At what instant will it be back at ground level?
   (b) When will the height exceed 384 feet?

72. A projectile is fired straight upward from ground level \( (s_0 = 0) \) with an initial velocity of 128 feet per second.
   (a) At what instant will it be back at ground level?
   (b) When will the height be less than 128 feet?

73. GEOMETRY A rectangular playing field with a perimeter of 100 meters is to have an area of at least 500 square meters. Within what bounds must the length of the rectangle lie?

74. GEOMETRY A rectangular parking lot with a perimeter of 440 feet is to have an area of at least 8000 square feet. Within what bounds must the length of the rectangle lie?

75. COST, REVENUE, AND PROFIT The revenue and cost equations for a product are \( R = x(75 - 0.0005x) \) and \( C = 30x + 250,000 \), where \( R \) and \( C \) are measured in dollars and \( x \) represents the number of units sold. How many units must be sold to obtain a profit of at least $750,000? What is the price per unit?

76. COST, REVENUE, AND PROFIT The revenue and cost equations for a product are

\[
R = x(50 - 0.0002x) \quad \text{and} \quad C = 12x + 150,000
\]

where \( R \) and \( C \) are measured in dollars and \( x \) represents the number of units sold. How many units must be sold to obtain a profit of at least $1,650,000? What is the price per unit?

77. SCHOOL ENROLLMENT The numbers \( N \) (in millions) of students enrolled in schools in the United States from 1995 through 2006 are shown in the table. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>

(a) Use a graphing utility to create a scatter plot of the data. Let \( t \) represent the year, with \( t = 5 \) corresponding to 1995.
(b) Use the regression feature of a graphing utility to find a quartic model for the data.
(c) Graph the model and the scatter plot in the same viewing window. How well does the model fit the data?
(d) According to the model, during what range of years will the number of students enrolled in schools exceed 74 million?
(e) Is the model valid for long-term predictions of student enrollment in schools? Explain.
78. **SAFE LOAD** The maximum safe load uniformly distributed over a one-foot section of a two-inch-wide wooden beam is approximated by the model  
\[ \text{Load} = 168.5d^2 - 472.1, \]  
where \( d \) is the depth of the beam. 

(a) Evaluate the model for \( d = 4, d = 6, d = 8, \)  
\( d = 10, \) and \( d = 12. \) Use the results to create a bar graph. 

(b) Determine the minimum depth of the beam that will safely support a load of 2000 pounds. 

79. **RESISTORS** When two resistors of resistances \( R_1 \) and \( R_2 \) are connected in parallel (see figure), the total resistance \( R \) satisfies the equation 
\[ \frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}. \]  
Find \( R_1 \) for a parallel circuit in which \( R_2 = 2 \) ohms and \( R \) must be at least 1 ohm.

![Resistors Diagram]

80. **TEACHER SALARIES** The mean salaries \( S \) (in thousands of dollars) of classroom teachers in the United States from 2000 through 2007 are shown in the table. 

<table>
<thead>
<tr>
<th>Year</th>
<th>Salary, ( S )</th>

</tr>
</tbody>
</table>

A model that approximates these data is given by 
\[ S = \frac{42.6 - 1.95t}{1 - 0.06t}, \]  
where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. ([Source: Educational Research Service, Arlington, VA]) 

(a) Use a graphing utility to create a scatter plot of the data. Then graph the model in the same viewing window. 

(b) How well does the model fit the data? Explain. 

(c) According to the model, in what year will the salary for classroom teachers exceed $60,000? 

(d) Is the model valid for long-term predictions of classroom teacher salaries? Explain. 

81. **TRUE OR FALSE?** In Exercises 81 and 82, determine whether the statement is true or false. Justify your answer. 

81. The zeros of the polynomial \( x^3 - 2x^2 - 11x + 12 \geq 0 \) divide the real number line into four test intervals. 

82. The solution set of the inequality \( \frac{3}{4}x^2 + 3x + 6 \geq 0 \) is the entire set of real numbers. 

83. \( x^2 + bx + 4 = 0 \)  
84. \( x^2 + bx - 4 = 0 \)  
85. \( 3x^2 + bx + 10 = 0 \)  
86. \( 2x^2 + bx + 5 = 0 \)

87. **GRAPHICAL ANALYSIS** You can use a graphing utility to verify the results in Example 4. For instance, the graph of \( y = x^2 + 2x + 4 \) is shown below. Notice that the \( y \)-values are greater than 0 for all values of \( x \), as stated in Example 4(a). Use the graphing utility to graph \( y = x^2 + 2x + 1, y = x^2 + 3x + 5, \) and \( y = x^2 - 4x + 4 \). Explain how you can use the graphs to verify the results of parts (b), (c), and (d) of Example 4. 

88. **CAPSTONE** Consider the polynomial 
\[ (x - a)(x - b) \]
and the real number line shown below. 

(a) Identify the points on the line at which the polynomial is zero. 

(b) In each of the three subintervals of the line, write the sign of each factor and the sign of the product. 

(c) At what \( x \)-values does the polynomial change signs?
## Chapter Summary

### What Did You Learn?  
### Explanation/Examples  
### Review Exercises

#### Section 2.1

<table>
<thead>
<tr>
<th>What Did You Learn?</th>
<th>Explanation/Examples</th>
<th>Review Exercises</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analyze graphs of quadratic functions (p. 126).</td>
<td>Let ( a, b, \text{and } c ) be real numbers with ( a \neq 0 ). The function given by ( f(x) = ax^2 + bx + c ) is called a quadratic function. Its graph is a “U-shaped” curve called a parabola.</td>
<td>1, 2</td>
</tr>
<tr>
<td>Write quadratic functions in standard form and use the results to sketch graphs of functions (p. 129).</td>
<td>The quadratic function ( f(x) = a(x - h)^2 + k, a \neq 0 ), is in standard form. The graph of ( f ) is a parabola whose axis is the vertical line ( x = h ) and whose vertex is ( (h, k) ). If ( a &gt; 0 ), the parabola opens upward. If ( a &lt; 0 ), the parabola opens downward.</td>
<td>3–20</td>
</tr>
<tr>
<td>Find minimum and maximum values of quadratic functions in real-life applications (p. 131).</td>
<td>Consider ( f(x) = ax^2 + bx + c ) with vertex ( \left(-\frac{b}{2a}, \frac{b^2}{4a} - c\right) ). If ( a &gt; 0 ), ( f ) has a minimum at ( x = -\frac{b}{2a} ). If ( a &lt; 0 ), ( f ) has a maximum at ( x = -\frac{b}{2a} ).</td>
<td>21–24</td>
</tr>
</tbody>
</table>

#### Section 2.2

<table>
<thead>
<tr>
<th>What Did You Learn?</th>
<th>Explanation/Examples</th>
<th>Review Exercises</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use transformations to sketch graphs of polynomial functions (p. 136).</td>
<td>The graph of a polynomial function is continuous (no breaks, holes, or gaps) and has only smooth, rounded turns.</td>
<td>25–30</td>
</tr>
</tbody>
</table>
| Use the Leading Coefficient Test to determine the end behavior of graphs of polynomial functions (p. 138). | Consider the graph of \( f(x) = a_n x^n + \cdots + a_1 x + a_0 \).  
**When \( n \) is odd:** If \( a_n > 0 \), the graph falls to the left and rises to the right. If \( a_n < 0 \), the graph rises to the left and falls to the right.  
**When \( n \) is even:** If \( a_n > 0 \), the graph rises to the left and right. If \( a_n < 0 \), the graph falls to the left and right. | 31–34 |
| Find and use zeros of polynomial functions as sketching aids (p. 139). | If \( f \) is a polynomial function and \( a \) is a real number, the following are equivalent: (1) \( x = a \) is a zero of \( f \), (2) \( x = a \) is a solution of the equation \( f(x) = 0 \), (3) \( x - a \) is a factor of \( f(x) \), and (4) \( (a, 0) \) is an \( x \)-intercept of the graph of \( f \). | 35–44 |
| Use the Intermediate Value Theorem to help locate zeros of polynomial functions (p. 143). | Let \( a \) and \( b \) be real numbers such that \( a < b \). If \( f \) is a polynomial function such that \( f(a) \neq f(b) \), then, in \( [a, b] \), \( f \) takes on every value between \( f(a) \) and \( f(b) \). | 45–48 |

#### Section 2.3

<table>
<thead>
<tr>
<th>What Did You Learn?</th>
<th>Explanation/Examples</th>
<th>Review Exercises</th>
</tr>
</thead>
</table>
| Use long division to divide polynomials by other polynomials (p. 150). | Dividend: \( x^2 + 3x + 5 \)  
Divisor: \( x + 1 \)  
Quotient: \( x + 2 + \frac{3}{x + 1} \)  
Remainder: \( \frac{3}{x + 1} \) | 49–54 |
| Use synthetic division to divide polynomials by binomials of the form \( (x - k) \) (p. 153). | Divisor: \( x + 3 \)  
Dividend: \( x^4 - 10x^2 - 2x + 4 \)  
\( -3 \) \( \begin{array}{c|cccc} \hline & 1 & 0 & -10 & -2 & 4 \\ \hline & -3 & -3 & 9 & -3 \end{array} \)  
Quotient: \( x^3 - 3x^2 - x + 1 \)  
Remainder: 1 | 55–60 |
| Use the Remainder Theorem and the Factor Theorem (p. 154). | **The Remainder Theorem:** If a polynomial \( f(x) \) is divided by \( x - k \), the remainder is \( r = f(k) \).  
**The Factor Theorem:** A polynomial \( f(x) \) has a factor \( (x - k) \) if and only if \( f(k) = 0 \). | 61–66 |

<td><strong>Section 2.6</strong></td>
<td><strong>Section 2.7</strong></td>
</tr>
<tr>
<td>Use the Fundamental Theorem of Algebra to find the number of zeros of polynomial functions (p. 166).</td>
<td><strong>The Fundamental Theorem of Algebra</strong> If (f(x)) is a polynomial of degree (n), where (n &gt; 0), then (f) has at least one zero in the complex number system.</td>
<td>87–92</td>
</tr>
<tr>
<td>Find rational zeros of polynomial functions (p. 167), and conjugate pairs of complex zeros (p. 170).</td>
<td>The Rational Zero Test relates the possible rational zeros of a polynomial to the leading coefficient and to the constant term of the polynomial. Let (f(x)) be a polynomial function that has real coefficients. If (a + bi) ((b \neq 0)) is a zero of the function, the conjugate (a - bi) is also a zero of the function.</td>
<td>93–102</td>
</tr>
<tr>
<td>Find zeros of polynomials by factoring (p. 170).</td>
<td>Every polynomial of degree (n &gt; 0) with real coefficients can be written as the product of linear and quadratic factors with real coefficients, where the quadratic factors have no real zeros.</td>
<td>103–110</td>
</tr>
<tr>
<td>Use Descartes’ Rule of Signs (p. 173) and the Upper and Lower Bound Rules (p. 174) to find zeros of polynomials.</td>
<td><strong>Descartes’ Rule of Signs</strong> Let (f(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_2x^2 + a_1x + a_0) be a polynomial with real coefficients and (a_0 \neq 0). 1. The number of positive real zeros of (f) is either equal to the number of variations in sign of (f(x)) or less than that number by an even integer. 2. The number of negative real zeros of (f) is either equal to the number of variations in sign of (f(−x)) or less than that number by an even integer.</td>
<td>111–114</td>
</tr>
<tr>
<td>Find the domains (p. 181), and vertical and horizontal asymptotes (p. 182) of rational functions.</td>
<td>The domain of a rational function of (x) includes all real numbers except (x)-values that make the denominator zero. The line (x = a) is a vertical asymptote of the graph of (f) if (f(x) \to \infty) or (f(x) \to -\infty) as (x \to a), either from the right or from the left. The line (y = b) is a horizontal asymptote of the graph of (f) if (f(x) \to b) as (x \to \infty). or (x \to -\infty).</td>
<td>115–122</td>
</tr>
<tr>
<td>Analyze and sketch graphs of rational functions (p. 184) including functions with slant asymptotes (p. 187).</td>
<td>Consider a rational function whose denominator is of degree 1 or greater. If the degree of the numerator is exactly one more than the degree of the denominator, the graph of the function has a slant asymptote.</td>
<td>123–138</td>
</tr>
<tr>
<td>Use rational functions to model and solve real-life problems (p. 188).</td>
<td>A rational function can be used to model the cost of removing a given percent of smokestack pollutants at a utility company that burns coal. (See Example 8.)</td>
<td>139–142</td>
</tr>
<tr>
<td>Solve polynomial (p. 194) and rational inequalities (p. 198).</td>
<td>Use the concepts of key numbers and test intervals to solve both polynomial and rational inequalities.</td>
<td>143–150</td>
</tr>
<tr>
<td>Use inequalities to model and solve real-life problems (p. 199).</td>
<td>A common application of inequalities involves profit (P), revenue (R), and cost (C). (See Example 6.)</td>
<td>151, 152</td>
</tr>
</tbody>
</table>
2.1 In Exercises 1 and 2, graph each function. Compare the graph of each function with the graph of \( y = x^2 \).

1. (a) \( f(x) = 2x^2 \)  
   (b) \( g(x) = -2x^2 \)  
   (c) \( h(x) = x^2 + 2 \)  
   (d) \( k(x) = (x + 2)^2 \)  
2. (a) \( f(x) = x^2 - 4 \)  
   (b) \( g(x) = 4 - x^2 \)  
   (c) \( h(x) = (x - 3)^2 \)  
   (d) \( k(x) = \frac{1}{2}x^2 - 1 \)

In Exercises 3–14, write the quadratic function in standard form and sketch its graph. Identify the vertex, axis of symmetry, and x-intercept(s).

3. \( g(x) = x^2 - 2x \)  
4. \( f(x) = 6x - x^2 \)  
5. \( f(x) = x^2 + 8x + 10 \)  
6. \( h(x) = 3 + 4x - x^2 \)  
7. \( f(t) = -2r^2 + 4r + 1 \)  
8. \( f(x) = x^2 - 8x + 12 \)  
9. \( h(x) = 4x^2 + 4x + 13 \)  
10. \( f(x) = x^2 - 6x + 1 \)  
11. \( h(x) = x^2 + 5x - 4 \)  
12. \( f(x) = 4x^2 + 4x + 5 \)  
13. \( f(x) = \frac{1}{2}(x^2 + 5x - 4) \)  
14. \( f(x) = \frac{1}{2}(6x^2 - 24x + 22) \)

In Exercises 15–20, write the standard form of the equation of the parabola that has the indicated vertex and whose graph passes through the given point.

15. \( \text{Vertex: } (1, -4); \text{ point: } (2, -3) \)  

16. \( \text{Vertex: } (2, 2); \text{ point: } (0, 3) \)  

17. \( \text{Vertex: } (1, -4); \text{ point: } (2, -3) \)  
18. \( \text{Vertex: } (2, 3); \text{ point: } (-1, 6) \)  
19. \( \text{Vertex: } (-\frac{3}{2}, 0); \text{ point: } \left(-\frac{9}{2}, -\frac{11}{4}\right) \)  
20. \( \text{Vertex: } (3, 3); \text{ point: } \left(\frac{1}{2}, \frac{7}{2}\right) \)

21. **GEOMETRY**  
   The perimeter of a rectangle is 1000 meters.
   (a) Draw a diagram that gives a visual representation of the problem. Label the length and width as \( x \) and \( y \), respectively.
   (b) Write \( y \) as a function of \( x \). Use the result to write the area as a function of \( x \).
   (c) Of all possible rectangles with perimeters of 1000 meters, find the dimensions of the one with the maximum area.

22. **MAXIMUM REVENUE**  
   The total revenue \( R \) earned (in dollars) from producing a gift box of candles is given by
   \[ R(p) = -10p^2 + 800p \]
   where \( p \) is the price per unit (in dollars).
   (a) Find the revenues when the prices per box are $20, $25, and $30.
   (b) Find the unit price that will yield a maximum revenue. What is the maximum revenue? Explain your results.

23. **MINIMUM COST**  
   A soft-drink manufacturer has daily production costs of
   \[ C = 70,000 - 120x + 0.055x^2 \]
   where \( C \) is the total cost (in dollars) and \( x \) is the number of units produced. How many units should be produced each day to yield a minimum cost?

24. **SOCIOLOGY**  
   The average age of the groom at a first marriage for a given age of the bride can be approximated by the model
   \[ y = -0.107x^2 + 5.68x - 48.5, \quad 20 \leq x \leq 25 \]
   where \( y \) is the age of the groom and \( x \) is the age of the bride. Sketch a graph of the model. For what age of the bride is the average age of the groom 26? (Source: U.S. Census Bureau)

2.2 In Exercises 25–30, sketch the graphs of \( y = x^n \) and the transformation.

25. \( y = x^3, \quad f(x) = -(x - 2)^3 \)  
26. \( y = x^3, \quad f(x) = -4x^3 \)  
27. \( y = x^4, \quad f(x) = 6 - x^4 \)  
28. \( y = x^4, \quad f(x) = 2(x - 8)^4 \)  
29. \( y = x^5, \quad f(x) = (x - 5)^5 \)  
30. \( y = x^5, \quad f(x) = \frac{1}{2}x^5 + 3 \)
In Exercises 31–34, describe the right-hand and left-hand behavior of the graph of the polynomial function.

31. \(f(x) = -2x^3 - 5x + 12\)
32. \(f(x) = \frac{1}{2}x^3 + 2x\)
33. \(g(x) = \frac{1}{2}(x^4 + 3x^2 + 2)\)
34. \(h(x) = -x^7 + 8x^2 - 8x\)

In Exercises 35–40, find all the real zeros of the polynomial function. Determine the multiplicity of each zero and the number of turning points of the graph of the function. Use a graphing utility to verify your answers.

35. \(f(x) = 3x^2 + 20x - 32\)
36. \(f(x) = x(x + 3)^2\)
37. \(f(t) = t^3 - 3t\)
38. \(f(x) = x^3 - 8x^2\)
39. \(f(x) = -18x^3 + 12x^2\)
40. \(g(x) = x^4 + x^3 - 12x^2\)

In Exercises 41–44, sketch the graph of the function by (a) applying the Leading Coefficient Test, (b) finding the zeros of the polynomial, (c) plotting sufficient solution points, and (d) drawing a continuous curve through the points.

41. \(f(x) = -x^3 + x^2 - 2\)
42. \(g(x) = 2x^3 + 4x^2\)
43. \(f(x) = x(x^3 + x^2 - 5x + 3)\)
44. \(h(x) = 3x^2 - x^4\)

In Exercises 45–48, (a) use the Intermediate Value Theorem and the table feature of a graphing utility to find intervals one unit in length in which the polynomial function is guaranteed to have a zero. (b) Adjust the table to approximate the zeros of the function. Use the zero or root feature of the graphing utility to verify your results.

45. \(f(x) = 3x^3 - x^2 + 3\)
46. \(f(x) = 0.25x^3 - 3.65x + 6.12\)
47. \(f(x) = x^4 - 5x - 1\)
48. \(f(x) = 7x^4 + 3x^3 - 8x^2 + 2\)

2.3 In Exercises 49–54, use long division to divide.

49. \(\frac{30x^2 - 3x + 8}{5x - 3}\)
50. \(\frac{4x + 7}{3x - 2}\)
51. \(\frac{5x^3 - 21x^2 - 25x - 4}{x^2 - 5x - 1}\)
52. \(\frac{3x^3}{x^2 - 1}\)
53. \(\frac{x^4 - 3x^3 + 4x^2 - 6x + 3}{x^2 + 2}\)
54. \(\frac{6x^4 + 10x^3 + 13x^2 - 5x + 2}{2x^2 - 1}\)

In Exercises 55–58, use synthetic division to divide.

55. \(6x^4 - 4x^3 - 27x^2 + 18x - 2\)
56. \(0.1x^3 + 0.3x^2 - 0.5\)
57. \(2x^5 - 25x^2 + 66x + 48\)
58. \(5x^3 + 33x^2 + 50x - 8\)

In Exercises 59 and 60, use synthetic division to determine whether the given values of \(x\) are zeros of the function.

59. \(f(x) = 20x^4 + 9x^3 - 14x^2 - 3x\)
   (a) \(x = -1\)  (b) \(x = \frac{3}{4}\)  (c) \(x = 0\)  (d) \(x = 1\)
60. \(f(x) = 3x^3 - 8x^2 - 20x + 16\)
   (a) \(x = 4\)  (b) \(x = -4\)  (c) \(x = \frac{2}{3}\)  (d) \(x = -1\)

In Exercises 61 and 62, use the Remainder Theorem and synthetic division to find each function value.

61. \(f(x) = x^4 + 10x^3 - 24x^2 + 20x + 44\)
   (a) \(f(-3)\)  (b) \(f(-1)\)
62. \(g(t) = 2t^3 - 5t^4 - 8t + 20\)
   (a) \(g(-4)\)  (b) \(g(\sqrt{2})\)

In Exercises 63–66, (a) verify the given factor(s) of the function \(f\), (b) find the remaining factors of \(f\), (c) use your results to write the complete factorization of \(f\), (d) list all real zeros of \(f\), and (e) confirm your results by using a graphing utility to graph the function.

Function  | Factor(s)
---------|---------
63. \(f(x) = x^3 + 4x^2 - 25x - 28\) | \((x - 4)\)
64. \(f(x) = 2x^3 + 11x^2 - 21x - 90\) | \((x + 6)\)
65. \(f(x) = x^4 - 4x^3 - 7x^2 + 22x + 24\) | \((x + 2)(x - 3)\)
66. \(f(x) = x^4 - 11x^3 + 41x^2 - 61x + 30\) | \((x - 2)(x - 5)\)

2.4 In Exercises 67–70, write the complex number in standard form.

67. \(8 + \sqrt{-100}\)
68. \(-i^2 + 3i\)
69. \(-5i + i^2\)
70. \(-5i + i^2\)

In Exercises 71–78, perform the operation and write the result in standard form.

71. \((7 + 5i) + (-4 + 2i)\)
72. \(\left(\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}i\right) - \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}i\right)\)
73. \(7i(11 - 9i)\)
74. \((1 + 6i)(5 - 2i)\)
75. \((10 - 8i)(2 - 3i)\)
76. \(i(6 + i)(3 - 2i)\)
77. \((8 - 5i)^2\)
78. \((4 + 7i)^2 + (4 - 7i)^2\)
In Exercises 79 and 80, write the quotient in standard form.

79. \( \frac{6 + i}{4 - i} \)  \hspace{1cm} 80. \( \frac{8 - 5i}{i} \)

In Exercises 81 and 82, perform the operation and write the result in standard form.

81. \( \frac{4}{2 - 3i} + \frac{2}{1 + i} \)  \hspace{1cm} 82. \( \frac{1}{2 + i} - \frac{5}{1 + 4i} \)

In Exercises 83–86, find all solutions of the equation.

83. \( 5x^2 + 2 = 0 \)  \hspace{1cm} 84. \( 2 + 8x^3 = 0 \)  \hspace{1cm} 85. \( x^2 - 2x + 10 = 0 \)  \hspace{1cm} 86. \( 6x^2 + 3x + 27 = 0 \)

2.5 In Exercises 87–92, find all the zeros of the function.

87. \( f(x) = 4x(x - 3)^2 \)  \hspace{1cm} 88. \( f(x) = (x - 4)(x + 9)^2 \)  \hspace{1cm} 89. \( f(x) = x^2 - 11x + 18 \)  \hspace{1cm} 90. \( f(x) = x^3 + 10x \)  \hspace{1cm} 91. \( f(x) = (x + 4)(x - 6)(x - 2i)(x + 2i) \)  \hspace{1cm} 92. \( f(x) = (x - 8)(5x - 3 + i)(x - 3 - i) \)

In Exercises 93 and 94, use the Rational Zero Test to list all possible rational zeros of \( f \).

93. \( f(x) = -4x^3 + 8x^2 - 3x + 15 \)  \hspace{1cm} 94. \( f(x) = 3x^4 + 4x^3 - 5x^2 - 8 \)

In Exercises 95–100, find all the rational zeros of the function.

95. \( f(x) = x^3 + 3x^2 - 28x - 60 \)  \hspace{1cm} 96. \( f(x) = 4x^3 - 27x^2 + 11x + 42 \)  \hspace{1cm} 97. \( f(x) = x^3 - 10x^2 + 17x - 8 \)  \hspace{1cm} 98. \( f(x) = x^3 + 9x^2 + 24x + 20 \)  \hspace{1cm} 99. \( f(x) = x^4 + x^3 - 11x^2 + x - 12 \)  \hspace{1cm} 100. \( f(x) = 25x^4 + 25x^3 - 154x^2 - 4x + 24 \)

In Exercises 101 and 102, find a polynomial function with real coefficients that has the given zeros. (There are many correct answers.)

101. \( \frac{2}{3}, 4, \sqrt{3}i \)  \hspace{1cm} 102. \( 2, -3, 1 - 2i \)

In Exercises 103–106, use the given zero to find all the zeros of the function.

<table>
<thead>
<tr>
<th>Function</th>
<th>Zero</th>
</tr>
</thead>
<tbody>
<tr>
<td>103. ( f(x) = x^3 - 4x^2 + x - 4 )</td>
<td>( i )</td>

<td>( 1 - i )</td>
</tr>
</tbody>
</table>

In Exercises 107–110, find all the zeros of the function and write the polynomial as a product of linear factors.

107. \( f(x) = x^3 + 4x^2 - 5x \)  \hspace{1cm} 108. \( g(x) = x^3 - 7x^2 + 36 \)  \hspace{1cm} 109. \( g(x) = x^4 + 4x^3 - 3x^2 + 40x + 208 \)  \hspace{1cm} 110. \( f(x) = x^4 + 8x^3 + 8x^2 - 72x - 153 \)

In Exercises 111 and 112, use Descartes’s Rule of Signs to determine the possible numbers of positive and negative zeros of the function.

111. \( g(x) = 5x^3 + 3x^2 - 6x + 9 \)  \hspace{1cm} 112. \( h(x) = -2x^5 + 4x^3 - 2x^2 + 5 \)

In Exercises 113 and 114, use synthetic division to verify the upper and lower bounds of the real zeros of \( f \).

113. \( f(x) = 4x^3 - 3x^2 + 4x - 3 \)  \hspace{1cm} (a) Upper: \( x = 1 \)  \hspace{1cm} (b) Lower: \( x = -\frac{1}{4} \)

114. \( f(x) = 2x^3 - 5x^2 - 14x + 8 \)  \hspace{1cm} (a) Upper: \( x = 8 \)  \hspace{1cm} (b) Lower: \( x = -4 \)

2.6 In Exercises 115–118, find the domain of the rational function.

115. \( f(x) = \frac{3x}{x + 10} \)  \hspace{1cm} 116. \( f(x) = \frac{4x^3}{2 + 5x} \)  \hspace{1cm} 117. \( f(x) = \frac{8}{x^2 - 10x + 24} \)  \hspace{1cm} 118. \( f(x) = \frac{x^2 + x - 2}{x^2 + 4} \)

In Exercises 119–122, identify any vertical or horizontal asymptotes.

119. \( f(x) = \frac{4}{x + 3} \)  \hspace{1cm} 120. \( f(x) = \frac{2x^2 + 5x - 3}{x^2 + 2} \)  \hspace{1cm} 121. \( h(x) = \frac{5x + 20}{x^2 - 2x - 24} \)  \hspace{1cm} 122. \( h(x) = \frac{x^3 - 4x^2}{x^2 + 3x + 2} \)

In Exercises 123–134, (a) state the domain of the function, (b) identify all intercepts, (c) find any vertical and horizontal asymptotes, and (d) plot additional solution points as needed to sketch the graph of the rational function.

123. \( f(x) = \frac{-3}{2x^2} \)  \hspace{1cm} 124. \( f(x) = \frac{4}{x} \)  \hspace{1cm} 125. \( g(x) = \frac{2 + x}{1 - x} \)  \hspace{1cm} 126. \( h(x) = \frac{x - 4}{x - 7} \)  \hspace{1cm} 127. \( p(x) = \frac{5x^2}{4x^2 + 1} \)  \hspace{1cm} 128. \( f(x) = \frac{2x}{x^2 + 4} \)  \hspace{1cm} 129. \( f(x) = \frac{x}{x^2 + 1} \)  \hspace{1cm} 130. \( h(x) = \frac{9}{(x - 3)^2} \)
In Exercises 135–138, (a) state the domain of the function, (b) identify all intercepts, (c) identify any vertical and slant asymptotes, and (d) plot additional solution points as needed to sketch the graph of the rational function.

135. \( f(x) = \frac{2x^3}{x^2 + 1} \)

136. \( f(x) = \frac{2x^2}{x^2 - 4} \)

137. \( f(x) = \frac{3x^3 - 2x^2 - 3x + 2}{3x^2 - x - 4} \)

138. \( f(x) = \frac{3x^3 - 4x^2 - 12x + 16}{3x^2 + 5x - 2} \)

139. **AVERAGE COST** A business has a production cost of \( C = 0.5x + 500 \) for producing \( x \) units of a product. The average cost per unit, \( \overline{C} \), is given by

\[
\overline{C} = \frac{C}{x} = \frac{0.5x + 500}{x}, \quad x > 0.
\]

Determine the average cost per unit as \( x \) increases without bound. (Find the horizontal asymptote.)

140. **SEIZURE OF ILLEGAL DRUGS** The cost \( C \) (in millions of dollars) for the federal government to seize \( p\% \) of an illegal drug as it enters the country is given by

\[
C = \frac{528p}{100 - p}, \quad 0 \leq p < 100.
\]

(a) Use a graphing utility to graph the cost function.

(b) Find the costs of seizing 25\%, 50\%, and 75\% of the drug.

(c) According to this model, would it be possible to seize 100\% of the drug?

141. **PAGE DESIGN** A page that is \( x \) inches wide and \( y \) inches high contains 30 square inches of print. The top and bottom margins are 2 inches deep and the margins on each side are 2 inches wide.

(a) Draw a diagram that gives a visual representation of the problem.

(b) Write a function for the total area \( A \) of the page in terms of \( x \).

(c) Determine the domain of the function based on the physical constraints of the problem.

(d) Use a graphing utility to graph the area function and approximate the page size for which the least amount of paper will be used. Verify your answer numerically using the table feature of the graphing utility.

142. **PHOTOSYNTHESIS** The amount \( y \) of CO\(_2\) uptake (in milligrams per square decimeter per hour) at optimal temperatures and with the natural supply of CO\(_2\) is approximated by the model

\[
y = \frac{18.47x - 2.96}{0.23x + 1}, \quad x > 0
\]

where \( x \) is the light intensity (in watts per square meter). Use a graphing utility to graph the function and determine the limiting amount of CO\(_2\) uptake.

2.7 In Exercises 143–150, solve the inequality.

143. \( 12x^2 + 5x < 2 \)

144. \( 3x^2 + x \geq 24 \)

145. \( x^3 - 16x \geq 0 \)

146. \( 12x^3 - 20x^2 < 0 \)

147. \( \frac{2}{x + 1} \leq \frac{3}{x - 1} \)

148. \( \frac{x - 5}{3 - x} < 0 \)

149. \( \frac{x^2 - 9x + 20}{x} \leq 0 \)

150. \( \frac{1}{x - 2} > \frac{1}{x} \)

151. **INVESTMENT** \( P \) dollars invested at interest rate \( r \) compounded annually increases to an amount \( A = P(1 + r)^2 \) in 2 years. An investment of $5000 is to increase to an amount greater than $5500 in 2 years. The interest rate must be greater than what percent?

152. **POPULATION OF A SPECIES** A biologist introduces 200 ladybugs into a crop field. The population \( P \) of the ladybugs is approximated by the model

\[
P = \frac{1000(1 + 3t)}{5 + t}
\]

where \( t \) is the time in days. Find the time required for the population to increase to at least 2000 ladybugs.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 153 and 154, determine whether the statement is true or false. Justify your answer.

153. A fourth-degree polynomial with real coefficients can have \( -5, -8i, 4i, \) and 5 as its zeros.

154. The domain of a rational function can never be the set of all real numbers.

155. **WRITING** Explain how to determine the maximum or minimum value of a quadratic function.

156. **WRITING** Explain the connections among factors of a polynomial, zeros of a polynomial function, and solutions of a polynomial equation.

157. **WRITING** Describe what is meant by an asymptote of a graph.
210  Chapter 2  Polynomial and Rational Functions

CHAPTER TEST

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Describe how the graph of \( g \) differs from the graph of \( f(x) = x^2 \).
   (a) \( g(x) = 2 - x^2 \)  
   (b) \( g(x) = \left(x - \frac{1}{2}\right)^2 \)

2. Find an equation of the parabola shown in the figure at the left.

3. The path of a ball is given by \( y = -\frac{1}{30}x^2 + 3x + 5 \), where \( y \) is the height (in feet) of the ball and \( x \) is the horizontal distance (in feet) from where the ball was thrown.
   (a) Find the maximum height of the ball.
   (b) Which number determines the height at which the ball was thrown? Does changing this value change the coordinates of the maximum height of the ball? Explain.

4. Determine the right-hand and left-hand behavior of the graph of the function \( f(x) \). Then sketch its graph.

5. Divide using long division.

6. Divide using synthetic division.

7. Use synthetic division to show that \( x = \frac{5}{2} \) is a zero of the function given by \( f(x) = 2x^3 - 5x^2 - 6x + 15 \).
   Use the result to factor the polynomial function completely and list all the real zeros of the function.

8. Perform each operation and write the result in standard form.
   (a) \( 10i - (3 + \sqrt{-25}) \)  
   (b) \( (2 + \sqrt{3}i)(2 - \sqrt{3}i) \)

9. Write the quotient in standard form: \( \frac{5}{2 + i} \)

In Exercises 10 and 11, find a polynomial function with real coefficients that has the given zeros. (There are many correct answers.)

10. 0, 3, 2 + i  
11. 1 - \sqrt{3}i, 2, 2

In Exercises 12 and 13, find all the zeros of the function.

12. \( f(x) = 3x^3 + 14x^2 - 7x - 10 \)  
13. \( f(x) = x^4 - 9x^2 - 22x - 24 \)

In Exercises 14–16, identify any intercepts and asymptotes of the graph of the function. Then sketch a graph of the function.

14. \( h(x) = \frac{4}{x^2 - 1} \)  
15. \( f(x) = \frac{2x^2 - 5x - 12}{x^2 - 16} \)  
16. \( g(x) = \frac{x^2 + 2}{x - 1} \)

In Exercises 17 and 18, solve the inequality. Sketch the solution set on the real number line.

17. \( 2x^2 + 5x > 12 \)  
18. \( \frac{2}{x} \leq \frac{1}{x + 6} \)
PROOFS IN MATHEMATICS

These two pages contain proofs of four important theorems about polynomial functions. The first two theorems are from Section 2.3, and the second two theorems are from Section 2.5.

The Remainder Theorem  (p. 154)
If a polynomial \( f(x) \) is divided by \( x - k \), the remainder is
\[
r = f(k).
\]

Proof
From the Division Algorithm, you have
\[
f(x) = (x - k)q(x) + r(x)
\]
and because either \( r(x) = 0 \) or the degree of \( r(x) \) is less than the degree of \( x - k \), you know that \( r(x) \) must be a constant. That is, \( r(x) = r \). Now, by evaluating \( f(x) \) at \( x = k \), you have
\[
f(k) = (k - k)q(k) + r
= 0q(k) + r = r.
\]

To be successful in algebra, it is important that you understand the connection among factors of a polynomial, zeros of a polynomial function, and solutions or roots of a polynomial equation. The Factor Theorem is the basis for this connection.

The Factor Theorem  (p. 154)
A polynomial \( f(x) \) has a factor \( (x - k) \) if and only if \( f(k) = 0 \).

Proof
Using the Division Algorithm with the factor \( (x - k) \), you have
\[
f(x) = (x - k)q(x) + r(x).
\]
By the Remainder Theorem, \( r(x) = r = f(k) \), and you have
\[
f(x) = (x - k)q(x) + f(k)
\]
where \( q(x) \) is a polynomial of lesser degree than \( f(x) \). If \( f(k) = 0 \), then
\[
f(x) = (x - k)q(x)
\]
and you see that \( (x - k) \) is a factor of \( f(x) \). Conversely, if \( (x - k) \) is a factor of \( f(x) \), division of \( f(x) \) by \( (x - k) \) yields a remainder of 0. So, by the Remainder Theorem, you have \( f(k) = 0 \).
The Fundamental Theorem of Algebra

The Linear Factorization Theorem is closely related to the Fundamental Theorem of Algebra. The Fundamental Theorem of Algebra has a long and interesting history. In the early work with polynomial equations, the Fundamental Theorem of Algebra was thought to have been not true, because imaginary solutions were not considered. In fact, in the very early work by mathematicians such as Abu al-Khwarizmi (c. 800 A.D.), negative solutions were also not considered.

Once imaginary numbers were accepted, several mathematicians attempted to give a general proof of the Fundamental Theorem of Algebra. These included Gottfried von Leibniz (1702), Jean d’Alembert (1746), Leonhard Euler (1749), Joseph-Louis Lagrange (1772), and Pierre Simon Laplace (1795). The mathematician usually credited with the first correct proof of the Fundamental Theorem of Algebra is Carl Friedrich Gauss, who published the proof in his doctoral thesis in 1799.

Proof

Using the Fundamental Theorem of Algebra, you know that \( f \) must have at least one zero, \( c_1 \). Consequently, \( (x - c_1) \) is a factor of \( f(x) \), and you have

\[
 f(x) = (x - c_1)f_1(x).
\]

If the degree of \( f_1(x) \) is greater than zero, you again apply the Fundamental Theorem to conclude that \( f_1 \) must have a zero \( c_2 \), which implies that

\[
 f(x) = (x - c_1)(x - c_2)f_2(x).
\]

It is clear that the degree of \( f_2(x) \) is \( n - 1 \), that the degree of \( f_3(x) \) is \( n - 2 \), and that you can repeatedly apply the Fundamental Theorem \( n \) times until you obtain

\[
 f(x) = a_n(x - c_1)(x - c_2)\cdots(x - c_n)
\]

where \( a_n \) is the leading coefficient of the polynomial \( f(x) \).

Factors of a Polynomial (p. 170)

Every polynomial of degree \( n > 0 \) with real coefficients can be written as the product of linear and quadratic factors with real coefficients, where the quadratic factors have no real zeros.

Proof

To begin, you use the Linear Factorization Theorem to conclude that \( f(x) \) can be completely factored in the form

\[
 f(x) = d(x - c_1)(x - c_2)\cdots(x - c_n).
\]

If each \( c_j \) is real, there is nothing more to prove. If any \( c_j \) is complex \( (c_j = a + bi, b \neq 0) \), then, because the coefficients of \( f(x) \) are real, you know that the conjugate \( c_j = a - bi \) is also a zero. By multiplying the corresponding factors, you obtain

\[
 (x - c_j)(x - c_j) = [x - (a + bi)][x - (a - bi)]
 = x^2 - 2ax + (a^2 + b^2)
\]

where each coefficient is real.
PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. Show that if \( f(x) = ax^3 + bx^2 + cx + d \), then \( f(k) = r \), where \( r = ak^3 + bk^2 + ck + d \), using long division. In other words, verify the Remainder Theorem for a third-degree polynomial function.

2. In 2000 B.C., the Babylonians solved polynomial equations by referring to tables of values. One such table gave the values of \( y^3 + y^2 \). To be able to use this table, the Babylonians sometimes had to manipulate the equation, as shown below.

\[
ax^3 + bx^2 = c \quad \text{Original equation}
\]

\[
\frac{a^3x^3}{b^3} + \frac{a^2x^2}{b^2} = \frac{a^2c}{b^2} \quad \text{Multiply each side by \( \frac{a^2}{b^3} \)}
\]

\[
\left(\frac{ax}{b}\right)^3 + \left(\frac{ax}{b}\right)^2 = \frac{a^2c}{b^3} \quad \text{Rewrite.}
\]

Then they would find \((ax^2c)/b^3\) in the \(y^3 + y^2\) column of the table. Because they knew that the corresponding \(y\)-value was equal to \((ax)/b\), they could conclude that \(x = (by)/a\).

(a) Calculate \(y^3 + y^2\) for \(y = 1, 2, 3, \ldots, 10\). Record the values in a table.

Use the table from part (a) and the method above to solve each equation.

(b) \(x^3 + x^2 = 252\)

(c) \(x^3 + 2x^2 = 288\)

(d) \(3x^3 + x^2 = 90\)

(e) \(2x^3 + 5x^2 = 2500\)

(f) \(7x^3 + 6x^2 = 1728\)

(g) \(10x^3 + 3x^2 = 297\)

Using the methods from this chapter, verify your solution to each equation.

3. At a glassware factory, molten cobalt glass is poured into molds to make paperweights. Each mold is a rectangular prism whose height is 3 inches greater than the length of each side of the square base. A machine pours 20 cubic inches of liquid glass into each mold. What are the dimensions of the mold?

4. Determine whether the statement is true or false. If false, provide one or more reasons why the statement is false and correct the statement. Let \( f(x) = ax^3 + bx^2 + cx + d, \ a \neq 0, \) and let \( f(2) = -1. \) Then

\[
\frac{f(x)}{x+1} = q(x) + \frac{2}{x+1}
\]

where \(q(x)\) is a second-degree polynomial.

5. The parabola shown in the figure has an equation of the form \(y = ax^2 + bx + c\). Find the equation of this parabola by the following methods. (a) Find the equation analytically. (b) Use the regression feature of a graphing utility to find the equation.

6. One of the fundamental themes of calculus is to find the slope of the tangent line to a curve at a point. To see how this can be done, consider the point \( (2, 4) \) on the graph of the quadratic function \( f(x) = x^2 \), which is shown in the figure.

(a) Find the slope \(m_1\) of the line joining \((2, 4)\) and \((3, 9)\). Is the slope of the tangent line at \((2, 4)\) greater than or less than the slope of the line through \((2, 4)\) and \((3, 9)\)?

(b) Find the slope \(m_2\) of the line joining \((2, 4)\) and \((1, 1)\). Is the slope of the tangent line at \((2, 4)\) greater than or less than the slope of the line through \((2, 4)\) and \((1, 1)\)?

(c) Find the slope \(m_3\) of the line joining \((2, 4)\) and \((2.1, 4.41)\). Is the slope of the tangent line at \((2, 4)\) greater than or less than the slope of the line through \((2, 4)\) and \((2.1, 4.41)\)?

(d) Find the slope \(m_4\) of the line joining \((2, 4)\) and \((2 + h, f(2 + h))\) in terms of the nonzero number \(h\).

(e) Evaluate the slope formula from part (d) for \(h = -1, 1,\) and 0.1. Compare these values with those in parts (a)–(c).

(f) What can you conclude the slope \(m_{tan}\) of the tangent line at \((2, 4)\) to be? Explain your answer.
7. Use the form \( f(x) = (x - k)q(x) + r \) to create a cubic function that (a) passes through the point \((2, 5)\) and rises to the right and (b) passes through the point \((-3, 1)\) and falls to the right. (There are many correct answers.)

8. The multiplicative inverse of \( z \) is a complex number \( z_m \) such that \( z \cdot z_m = 1 \). Find the multiplicative inverse of each complex number.
   (a) \( z = 1 + i \)  
   (b) \( z = 3 - i \)  
   (c) \( z = -2 + 8i \)

9. Prove that the product of a complex number \( a + bi \) and its complex conjugate is a real number.

10. Match the graph of the rational function given by
    
    \[ f(x) = \frac{ax + b}{cx + d} \]
    
    with the given conditions.
    (a) 
    (b) 

    
    
    
    

11. Consider the function given by
    
    \[ f(x) = \frac{ax}{(x - b)^2} \]

    (a) Determine the effect on the graph of \( f \) if \( b \neq 0 \) and \( a \) is varied. Consider cases in which \( a \) is positive and \( a \) is negative.
    (b) Determine the effect on the graph of \( f \) if \( a \neq 0 \) and \( b \) is varied.

12. The endpoints of the interval over which distinct vision is possible are called the near point and far point of the eye (see figure). With increasing age, these points normally change. The table shows the approximate near points \( y \) (in inches) for various ages \( x \) (in years).

<table>
<thead>
<tr>
<th>Age, ( x )</th>

</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a quadratic model \( y_1 \) for the data. Use a graphing utility to plot the data and graph the model in the same viewing window.

(b) Find a rational model \( y_2 \) for the data. Take the reciprocals of the near points to generate the points \((x, 1/y)\). Use the regression feature of a graphing utility to find a linear model for the data. The resulting line has the form

\[ \frac{1}{y} = ax + b. \]

Solve for \( y \). Use a graphing utility to plot the data and graph the model in the same viewing window.

(c) Use the table feature of a graphing utility to create a table showing the predicted near point based on each model for each of the ages in the original table. How well do the models fit the original data?

(d) Use both models to estimate the near point for a person who is 25 years old. Which model is a better fit?

(e) Do you think either model can be used to predict the near point for a person who is 70 years old? Explain.
In Mathematics
Exponential functions involve a constant base and a variable exponent. The inverse of an exponential function is a logarithmic function.

In Real Life
Exponential and logarithmic functions are widely used in describing economic and physical phenomena such as compound interest, population growth, memory retention, and decay of radioactive material. For instance, a logarithmic function can be used to relate an animal’s weight and its lowest galloping speed. (See Exercise 95, page 242.)

IN CAREERS
There are many careers that use exponential and logarithmic functions. Several are listed below.

- Astronomer
  Example 7, page 240
- Psychologist
  Exercise 136, page 253
- Archeologist
  Example 3, page 258
- Forensic Scientist
  Exercise 75, page 266
3.1 EXPONENTIAL FUNCTIONS AND THEIR GRAPHS

Exponential Functions

So far, this text has dealt mainly with algebraic functions, which include polynomial functions and rational functions. In this chapter, you will study two types of nonalgebraic functions—exponential functions and logarithmic functions. These functions are examples of transcendental functions.

Definition of Exponential Function

The exponential function with base \(a\) is denoted by

\[ f(x) = a^x \]

where \(a > 0, a \neq 1\), and \(x\) is any real number.

The base \(a = 1\) is excluded because it yields \(f(x) = 1^x = 1\). This is a constant function, not an exponential function.

You have evaluated \(a^x\) for integer and rational values of \(x\). For example, you know that \(4^3 = 64\) and \(4^{1/2} = 2\). However, to evaluate \(a^x\) for any real number \(x\), you need to interpret forms with irrational exponents. For the purposes of this text, it is sufficient to think of

\[ a^{\sqrt{2}} \quad \text{(where } \sqrt{2} \approx 1.41421356\text{)} \]

as the number that has the successively closer approximations

\[ a^{1.4}, a^{1.41}, a^{1.414}, a^{1.4142}, a^{1.41421}, \ldots \]

Example 1 Evaluating Exponential Functions

Use a calculator to evaluate each function at the indicated value of \(x\).

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>(f(x) = 2^x)</td>
<td>(x = -3.1)</td>
</tr>
<tr>
<td>(f(x) = 2^{-x})</td>
<td>(x = \pi)</td>
</tr>
<tr>
<td>(f(x) = 0.6^x)</td>
<td>(x = \frac{3}{2})</td>
</tr>
</tbody>
</table>

Solution

<table>
<thead>
<tr>
<th>Function Value</th>
<th>Graphing Calculator Keystrokes</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>(f(-3.1) = 2^{-3.1})</td>
<td>2 (\div) (3.1) ENTER</td>
<td>0.1166291</td>
</tr>
<tr>
<td>(f(\pi) = 2^{-\pi})</td>
<td>2 (\div) (\pi) ENTER</td>
<td>0.1133147</td>
</tr>
<tr>
<td>(f\left(\frac{3}{2}\right) = (0.6)^{3/2})</td>
<td>.6 (\times) (3) (\div) (2) ENTER</td>
<td>0.4647580</td>
</tr>
</tbody>
</table>

CHECKPOINT Now try Exercise 7.

When evaluating exponential functions with a calculator, remember to enclose fractional exponents in parentheses. Because the calculator follows the order of operations, parentheses are crucial in order to obtain the correct result.
Graphs of Exponential Functions

The graphs of all exponential functions have similar characteristics, as shown in Examples 2, 3, and 5.

**Example 2**  Graphs of \( y = a^x \)

In the same coordinate plane, sketch the graph of each function.

- a. \( f(x) = 2^x \)
- b. \( g(x) = 4^x \)

**Solution**

The table below lists some values for each function, and Figure 3.1 shows the graphs of the two functions. Note that both graphs are increasing. Moreover, the graph of \( g(x) = 4^x \) is increasing more rapidly than the graph of \( f(x) = 2^x \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 2^x )</td>
<td>( \frac{1}{8} )</td>
<td>( \frac{1}{4} )</td>
<td>( \frac{1}{2} )</td>
<td>1</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>( 4^x )</td>
<td>( \frac{1}{64} )</td>
<td>( \frac{1}{16} )</td>
<td>( \frac{1}{4} )</td>
<td>1</td>
<td>4</td>
<td>16</td>
</tr>
</tbody>
</table>

**CHECK Point** Now try Exercise 17.

The table in Example 2 was evaluated by hand. You could, of course, use a graphing utility to construct tables with even more values.

**Example 3**  Graphs of \( y = a^{-x} \)

In the same coordinate plane, sketch the graph of each function.

- a. \( F(x) = 2^{-x} \)
- b. \( G(x) = 4^{-x} \)

**Solution**

The table below lists some values for each function, and Figure 3.2 shows the graphs of the two functions. Note that both graphs are decreasing. Moreover, the graph of \( G(x) = 4^{-x} \) is decreasing more rapidly than the graph of \( F(x) = 2^{-x} \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 2^{-x} )</td>
<td>4</td>
<td>2</td>
<td>1</td>
<td>( \frac{1}{2} )</td>
<td>( \frac{1}{4} )</td>
<td>( \frac{1}{8} )</td>
</tr>
<tr>
<td>( 4^{-x} )</td>
<td>16</td>
<td>4</td>
<td>1</td>
<td>( \frac{1}{4} )</td>
<td>( \frac{1}{16} )</td>
<td>( \frac{1}{64} )</td>
</tr>
</tbody>
</table>

**CHECK Point** Now try Exercise 19.

In Example 3, note that by using one of the properties of exponents, the functions \( F(x) = 2^{-x} \) and \( G(x) = 4^{-x} \) can be rewritten with positive exponents.

\[
F(x) = 2^{-x} = \frac{1}{2^x} = \left( \frac{1}{2} \right)^x \quad \text{and} \quad G(x) = 4^{-x} = \frac{1}{4^x} = \left( \frac{1}{4} \right)^x
\]
Comparing the functions in Examples 2 and 3, observe that
\[ F(x) = 2^{-x} = f(-x) \quad \text{and} \quad G(x) = 4^{-x} = g(-x). \]
Consequently, the graph of \( F \) is a reflection (in the \( y \)-axis) of the graph of \( f \). The graphs of \( G \) and \( g \) have the same relationship. The graphs in Figures 3.1 and 3.2 are typical of the exponential functions \( y = a^x \) and \( y = a^{-x} \). They have one \( y \)-intercept and one horizontal asymptote (the \( x \)-axis), and they are continuous. The basic characteristics of these exponential functions are summarized in Figures 3.3 and 3.4.

**Graph of \( y = a^x, a > 1 \)**
- Domain: \(( -\infty, \infty )\)
- Range: \(( 0, \infty )\)
- \( y \)-intercept: \(( 0, 1 )\)
- Increasing
- \( x \)-axis is a horizontal asymptote \( (a^x \to 0 \text{ as } x \to -\infty). \)
- Continuous

**Graph of \( y = a^{-x}, a > 1 \)**
- Domain: \(( -\infty, \infty )\)
- Range: \(( 0, \infty )\)
- \( y \)-intercept: \(( 0, 1 )\)
- Decreasing
- \( x \)-axis is a horizontal asymptote \( (a^{-x} \to 0 \text{ as } x \to \infty). \)
- Continuous

From Figures 3.3 and 3.4, you can see that the graph of an exponential function is always increasing or always decreasing. As a result, the graphs pass the Horizontal Line Test, and therefore the functions are one-to-one functions. You can use the following One-to-One Property to solve simple exponential equations.

For \( a > 0 \) and \( a \neq 1 \), \( a^x = a^y \) if and only if \( x = y \). One-to-One Property

**Example 4 Using the One-to-One Property**

a. \( 9 = 3^{x+1} \)
\[ 3^2 = 3^{x+1} \]
\[ 2 = x + 1 \]
\[ 1 = x \]

b. \( \left( \frac{1}{2} \right)^x = 8 \Rightarrow 2^{-x} = 2^3 \Rightarrow x = -3 \)

Now try Exercise 51.
In the following example, notice how the graph of \( y = a^x \) can be used to sketch the graphs of functions of the form \( f(x) = b \pm a^{x+c} \).

### Example 5  
**Transformations of Graphs of Exponential Functions**

Each of the following graphs is a transformation of the graph of \( f(x) = 3^x \).

**a.** Because \( g(x) = 3^{x+1} = f(x+1) \), the graph of \( g \) can be obtained by shifting the graph of \( f \) one unit to the left, as shown in Figure 3.5.

**b.** Because \( h(x) = 3^x - 2 = f(x) - 2 \), the graph of \( h \) can be obtained by shifting the graph of \( f \) downward two units, as shown in Figure 3.6.

**c.** Because \( k(x) = -3^x = -f(x) \), the graph of \( k \) can be obtained by reflecting the graph of \( f \) in the \( x \)-axis, as shown in Figure 3.7.

**d.** Because \( j(x) = 3^{-x} = f(-x) \), the graph of \( j \) can be obtained by reflecting the graph of \( f \) in the \( y \)-axis, as shown in Figure 3.8.

Notice that the transformations in Figures 3.5, 3.7, and 3.8 keep the \( x \)-axis as a horizontal asymptote, but the transformation in Figure 3.6 yields a new horizontal asymptote of \( y = -2 \). Also, be sure to note how the \( y \)-intercept is affected by each transformation.
The Natural Base $e$

In many applications, the most convenient choice for a base is the irrational number
\[ e \approx 2.718281828 \ldots \]

This number is called the natural base. The function given by $f(x) = e^x$ is called the natural exponential function. Its graph is shown in Figure 3.9. Be sure you see that for the exponential function $f(x) = e^x$, $e$ is the constant 2.718281828 . . . , whereas $x$ is the variable.

Example 6 Evaluating the Natural Exponential Function

Use a calculator to evaluate the function given by $f(x) = e^x$ at each indicated value of $x$.

a. $x = -2$

b. $x = -1$

c. $x = 0.25$

d. $x = -0.3$

Solution

<table>
<thead>
<tr>
<th>Function Value</th>
<th>Graphing Calculator Keystrokes</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>$f(-2) = e^{-2}$</td>
<td>$\text{EXP} (-2) \text{ ENTER}$</td>
<td>0.1353353</td>
</tr>
<tr>
<td>$f(-1) = e^{-1}$</td>
<td>$\text{EXP} (-1) \text{ ENTER}$</td>
<td>0.3678794</td>
</tr>
<tr>
<td>$f(0.25) = e^{0.25}$</td>
<td>$\text{EXP} 0.25 \text{ ENTER}$</td>
<td>1.2840254</td>
</tr>
<tr>
<td>$f(-0.3) = e^{-0.3}$</td>
<td>$\text{EXP} (-0.3) \text{ ENTER}$</td>
<td>0.7408182</td>
</tr>
</tbody>
</table>

Now try Exercise 33.

Example 7 Graphing Natural Exponential Functions

Sketch the graph of each natural exponential function.

a. $f(x) = 2e^{0.24x}$

b. $g(x) = \frac{1}{2}e^{-0.58x}$

Solution

To sketch these two graphs, you can use a graphing utility to construct a table of values, as shown below. After constructing the table, plot the points and connect them with smooth curves, as shown in Figures 3.10 and 3.11. Note that the graph in Figure 3.10 is increasing, whereas the graph in Figure 3.11 is decreasing.

<table>
<thead>
<tr>
<th>$x$</th>
<th>-3</th>
<th>-2</th>
<th>-1</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>$f(x)$</td>
<td>0.974</td>
<td>1.238</td>
<td>1.573</td>
<td>2.000</td>
<td>2.542</td>
<td>3.232</td>
<td>4.109</td>
</tr>
<tr>
<td>$g(x)$</td>
<td>2.849</td>
<td>1.595</td>
<td>0.893</td>
<td>0.500</td>
<td>0.280</td>
<td>0.157</td>
<td>0.088</td>
</tr>
</tbody>
</table>

Now try Exercise 41.
Applications

One of the most familiar examples of exponential growth is an investment earning continuously compounded interest. Using exponential functions, you can develop a formula for interest compounded \( n \) times per year and show how it leads to continuous compounding.

Suppose a principal \( P \) is invested at an annual interest rate \( r \), compounded once per year. If the interest is added to the principal at the end of the year, the new balance \( P_1 \) is

\[
P_1 = P + Pr = P(1 + r).
\]

This pattern of multiplying the previous principal by \( 1 + r \) is then repeated each successive year, as shown below.

<table>
<thead>
<tr>
<th>Year</th>
<th>Balance After Each Compounding</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>( P )</td>
</tr>
<tr>
<td>1</td>
<td>( P_1 = P(1 + r) )</td>
</tr>
<tr>
<td>2</td>
<td>( P_2 = P_1(1 + r) = P(1 + r)^2 )</td>
</tr>
<tr>
<td>( n )</td>
<td>( P_n = P(1 + r)^n )</td>
</tr>
</tbody>
</table>

To accommodate more frequent (quarterly, monthly, or daily) compounding of interest, let \( n \) be the number of compoundings per year and let \( t \) be the number of years. Then the rate per compounding is \( r/n \) and the account balance after \( t \) years is

\[
A = P\left(1 + \frac{r}{n}\right)^{nt},
\]

Amount (balance) with \( n \) compoundings per year

If you let the number of compoundings \( n \) increase without bound, the process approaches what is called continuous compounding. In the formula for \( n \) compoundings per year, let \( m = n/r \). This produces

\[
A = P\left(1 + \frac{r}{m}\right)^{mr},
\]

Amount with \( m \) compoundings per year

\[
= P\left(1 + \frac{r}{mr}\right)^{mr}
\]

Substitute \( mr \) for \( n \).

\[
= P\left(1 + \frac{1}{m}\right)^{mr}
\]

Simplify.

\[
= P\left[\left(1 + \frac{1}{m}\right)^m\right]^r
\]

Property of exponents

As \( m \) increases without bound, the table at the left shows that \( \left[1 + (1/m)\right]^m \to e \) as \( m \to \infty \). From this, you can conclude that the formula for continuous compounding is

\[
A = Pe^{rt},
\]

Substitute \( e \) for \( (1 + 1/m)^m \).
Chapter 3 Exponential and Logarithmic Functions

Formulas for Compound Interest

After \( t \) years, the balance \( A \) in an account with principal \( P \) and annual interest rate \( r \) (in decimal form) is given by the following formulas.

1. For \( n \) compoundings per year:  
   \[ A = P \left(1 + \frac{r}{n}\right)^{nt} \]

2. For continuous compounding:  
   \[ A = Pe^{rt} \]

Example 8 Compound Interest

A total of $12,000 is invested at an annual interest rate of 9%. Find the balance after 5 years if it is compounded

a. quarterly.

b. monthly.

c. continuously.

Solution

a. For quarterly compounding, you have \( n = 4 \). So, in 5 years at 9%, the balance is

\[
A = P \left(1 + \frac{r}{n}\right)^{nt} \quad \text{Formula for compound interest}
\]

\[
= 12,000 \left(1 + \frac{0.09}{4}\right)^{4(5)} \quad \text{Substitute for } P, r, n, \text{ and } t.
\]

\[
= 12,000 \left(1 + \frac{0.09}{4}\right)^{4(5)} \quad \text{Substitute for } P, r, n, \text{ and } t.
\]

\[
\approx 18,726.11. \quad \text{Use a calculator.}
\]

b. For monthly compounding, you have \( n = 12 \). So, in 5 years at 9%, the balance is

\[
A = P \left(1 + \frac{r}{n}\right)^{nt} \quad \text{Formula for compound interest}
\]

\[
= 12,000 \left(1 + \frac{0.09}{12}\right)^{12(5)} \quad \text{Substitute for } P, r, n, \text{ and } t.
\]

\[
= 12,000 \left(1 + \frac{0.09}{12}\right)^{12(5)} \quad \text{Substitute for } P, r, n, \text{ and } t.
\]

\[
\approx 18,788.17. \quad \text{Use a calculator.}
\]

c. For continuous compounding, the balance is

\[
A = Pe^{rt} \quad \text{Formula for continuous compounding}
\]

\[
= 12,000e^{0.09(5)} \quad \text{Substitute for } P, r, \text{ and } t.
\]

\[
= 12,000e^{0.09(5)} \quad \text{Substitute for } P, r, \text{ and } t.
\]

\[
\approx 18,819.75. \quad \text{Use a calculator.}
\]

Now try Exercise 59.

In Example 8, note that continuous compounding yields more than quarterly or monthly compounding. This is typical of the two types of compounding. That is, for a given principal, interest rate, and time, continuous compounding will always yield a larger balance than compounding \( n \) times per year.
The half-life of radioactive radium ($^{226}\text{Ra}$) is about 1599 years. That is, for a given amount of radium, half of the original amount will remain after 1599 years. After another 1599 years, one-quarter of the original amount will remain, and so on. Let $y$ represent the mass, in grams, of a quantity of radium. The quantity present after $t$ years, then, is $y = 25\left(\frac{1}{2}\right)^{t/1599}$.

a. What is the initial mass (when $t = 0$)?

b. How much of the initial mass is present after 2500 years?

**Algebraic Solution**

a. $y = 25\left(\frac{1}{2}\right)^{t/1599}$  
   Write original equation.
   
   $= 25\left(\frac{1}{2}\right)^0$  
   Substitute 0 for $t$.
   
   $= 25$  
   Simplify.

So, the initial mass is 25 grams.

b. $y = 25\left(\frac{1}{2}\right)^{t/1599}$  
   Write original equation.
   
   $= 25\left(\frac{1}{2}\right)^{2500/1599}$  
   Substitute 2500 for $t$.
   
   $\approx 25\left(\frac{1}{2}\right)^{1.563}$  
   Simplify.
   
   $\approx 8.46$  
   Use a calculator.

So, about 8.46 grams is present after 2500 years.

**Graphical Solution**

Use a graphing utility to graph $y = 25\left(\frac{1}{2}\right)^{t/1599}$.

a. Use the value feature or the zoom and trace features of the graphing utility to determine that when the value of $x$ is 25, as shown in Figure 3.12. So, the initial mass is 25 grams.

b. Use the value feature or the zoom and trace features of the graphing utility to determine that when the value of $x$ is about 8.46, as shown in Figure 3.13. So, about 8.46 grams is present after 2500 years.

**Classroom Discussion**

**Identifying Exponential Functions**

Which of the following functions generated the two tables below? Discuss how you were able to decide. What do these functions have in common? Are any of them the same? If so, explain why.

<table>
<thead>
<tr>
<th>$f_1(x)$</th>
<th>$f_2(x)$</th>
<th>$f_3(x)$</th>
<th>$f_4(x)$</th>
<th>$f_5(x)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$2^{(x+3)}$</td>
<td>$8\left(\frac{1}{2}\right)^x$</td>
<td>$\left(\frac{1}{2}\right)^x + 7$</td>
<td>$7 + 2^x$</td>
<td>$8(2^x)$</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>$x$</th>
<th>$g(x)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$-1$</td>
<td>7.5</td>
</tr>
<tr>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>1</td>

</tbody>
</table>

Create two different exponential functions of the forms $y = a(b)^x$ and $y = c^x + d$ with $y$-intercepts of $(0, -3)$. Now try Exercise 73.
Chapter 3 Exponential and Logarithmic Functions

3.1 EXERCISES

VOCABULARY: Fill in the blanks.
1. Polynomial and rational functions are examples of ________ functions.
2. Exponential and logarithmic functions are examples of nonalgebraic functions, also called ________ functions.
3. You can use the ________ Property to solve simple exponential equations.
4. The exponential function given by \( f(x) = e^x \) is called the ________ ________ function, and the base \( e \) is called the ________ base.
5. To find the amount \( A \) in an account after \( t \) years with principal \( P \) and an annual interest rate \( r \) compounded \( n \) times per year, you can use the formula ________.
6. To find the amount \( A \) in an account after \( t \) years with principal \( P \) and an annual interest rate \( r \) compounded continuously, you can use the formula ________.

SKILLS AND APPLICATIONS

In Exercises 7–12, evaluate the function at the indicated value of \( x \). Round your result to three decimal places.

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>7. ( f(x) = 0.9^x )</td>
<td>( x = 1.4 )</td>
</tr>
<tr>
<td>8. ( f(x) = 2.3^x )</td>
<td></td>
</tr>
<tr>
<td>9. ( f(x) = 5^x )</td>
<td>( x = -\pi )</td>
</tr>
<tr>
<td>10. ( f(x) = (\frac{2}{3})^x )</td>
<td>( x = \frac{3}{10} )</td>
</tr>
<tr>
<td>11. ( g(x) = 5000(2^x) )</td>
<td>( x = -1.5 )</td>
</tr>
<tr>
<td>12. ( f(x) = 200(1.2)^{12x} )</td>
<td>( x = 24 )</td>
</tr>
</tbody>
</table>

In Exercises 13–16, match the exponential function with its graph. [The graphs are labeled (a), (b), (c), and (d).]

(a) \( y \) \( x \) \( (0, 1) \) \( 0 \) \( 1 \) \( 2 \) \( 3 \) \( 4 \)
(b) \( y \) \( x \) \( (0, 1) \) \( 0 \) \( 1 \) \( 2 \) \( 3 \) \( 4 \)
(c) \( y \) \( x \) \( (0, 2) \) \( 0 \) \( 1 \) \( 2 \) \( 3 \) \( 4 \)
(d) \( y \) \( x \) \( (0, 1) \) \( 0 \) \( 1 \) \( 2 \) \( 3 \) \( 4 \)

13. \( f(x) = 2^x \)  
14. \( f(x) = 2^x + 1 \)  
15. \( f(x) = 2^{-x} \)  
16. \( f(x) = 2^{x-2} \)  

In Exercises 17–22, use a graphing utility to construct a table of values for the function. Then sketch the graph of the function.

17. \( f(x) = \left(\frac{1}{2}\right)^x \)  
18. \( f(x) = \left(\frac{1}{3}\right)^{-x} \)  
19. \( f(x) = 6^{-x} \)  
20. \( f(x) = 6^x \)  
21. \( f(x) = 2^{x-1} \)  
22. \( f(x) = 4^{x-3} + 3 \)  

In Exercises 23–28, use the graph of \( f \) to describe the transformation that yields the graph of \( g \).

23. \( f(x) = 3^x \), \( g(x) = 3^x + 1 \)  
24. \( f(x) = 4^x \), \( g(x) = 4^{x-3} \)  
25. \( f(x) = 2^x \), \( g(x) = 3 - 2^x \)  
26. \( f(x) = 10^x \), \( g(x) = 10^{-x} + 3 \)  
27. \( f(x) = \left(\frac{1}{2}\right)^x \), \( g(x) = -\left(\frac{1}{2}\right)^x \)  
28. \( f(x) = 0.3^x \), \( g(x) = -0.3^x + 5 \)  

In Exercises 29–32, use a graphing utility to graph the exponential function.

29. \( y = 2^{-x} \)  
30. \( y = 3^{-|x|} \)  
31. \( y = 3^{x-2} + 1 \)  
32. \( y = 4^{x+1} - 2 \)  

In Exercises 33–38, evaluate the function at the indicated value of \( x \). Round your result to three decimal places.

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>33. ( h(x) = e^{-x} )</td>
<td>( x = \frac{3}{2} )</td>

<td>( x = 20 )</td>
</tr>
</tbody>
</table>
68. **TRUST FUND** A deposit of $5000 is made in a trust fund that pays 7.5% interest, compounded continuously. It is specified that the balance will be given to the college from which the donor graduated after the money has earned interest for 50 years. How much will the college receive?

69. **INFLATION** If the annual rate of inflation averages 4% over the next 10 years, the approximate costs $C$ of goods or services during any year in that decade will be modeled by $C(t) = P(1.04)^t$, where $t$ is the time in years and $P$ is the present cost. The price of an oil change for your car is presently $23.95. Estimate the price 10 years from now.

70. **COMPUTER VIRUS** The number $V$ of computers infected by a computer virus increases according to the model $V(t) = 100e^{0.6052t}$, where $t$ is the time in hours. Find the number of computers infected after (a) 1 hour, (b) 1.5 hours, and (c) 2 hours.

71. **POPULATION GROWTH** The projected populations $P$ of California for the years 2015 through 2030 can be modeled by $P = 34.696e^{0.0098t}$, where $t$ is the population (in millions) and is the time (in years), with $t = 15$ corresponding to 2015. (Source: U.S. Census Bureau)

   (a) Use a graphing utility to graph the function for the years 2015 through 2030.

   (b) Use the `table` feature of a graphing utility to create a table of values for the same time period as in part (a).

   (c) According to the model, when will the population of California exceed 50 million?

72. **POPULATION** The populations $P$ (in millions) of Italy from 1990 through 2008 can be approximated by the model $P = 56.8e^{0.015t}$, where $t$ represents the year, with $t = 0$ corresponding to 1990. (Source: U.S. Census Bureau, International Data Base)

   (a) According to the model, is the population of Italy increasing or decreasing? Explain.

   (b) Find the populations of Italy in 2000 and 2008.

   (c) Use the model to predict the populations of Italy in 2015 and 2020.

73. **RADIOACTIVE DECAY** Let $Q$ represent a mass of radioactive plutonium $^{239}$Pu (in grams), whose half-life is 24,100 years. The quantity of plutonium present after $t$ years is $Q = 16(\frac{1}{2})^{t/24100}$.

   (a) Determine the initial quantity (when $t = 0$).

   (b) Determine the quantity present after 75,000 years.

   (c) Use a graphing utility to graph the function over the interval $t = 0$ to $t = 150,000$. 

---

**Section 3.1 Exponential Functions and Their Graphs**

**COMPOUND INTEREST** In Exercises 39–62, complete the table to determine the balance $A$ for $P$ dollars invested at rate $r$ for $t$ years and compounded $n$ times per year.

<table>
<thead>
<tr>
<th>$n$</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>12</th>
<th>365</th>
<th>Continuous</th>
</tr>
</thead>
<tbody>
<tr>
<td>$A$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

59. $P = 1500, r = 2\%$, $t = 10$ years
60. $P = 2500, r = 3.5\%$, $t = 10$ years
61. $P = 2500, r = 4\%$, $t = 20$ years
62. $P = 1000, r = 6\%$, $t = 40$ years

**COMPOUND INTEREST** In Exercises 63–66, complete the table to determine the balance $A$ for $12,000$ invested at rate $r$ for $t$ years, compounded continuously.

<table>
<thead>
<tr>
<th>$t$</th>
<th>10</th>
<th>20</th>
<th>30</th>
<th>40</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>$A$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

63. $r = 4\%$
64. $r = 6\%$
65. $r = 6.5\%$
66. $r = 3.5\%$

67. **TRUST FUND** On the day of a child’s birth, a deposit of $30,000 is made in a trust fund that pays 5% interest, compounded continuously. Determine the balance in this account on the child’s 25th birthday.
74. **Radioactive Decay** Let \( Q \) represent a mass of carbon 14 \((^{14}\text{C})\) (in grams), whose half-life is 5715 years. The quantity of carbon 14 present after \( t \) years is 
\[ Q = 10(\frac{1}{2})^{t/5715}. \]
(a) Determine the initial quantity (when \( t = 0 \)).
(b) Determine the quantity present after 2000 years.
(c) Sketch the graph of this function over the interval \( t = 0 \) to \( t = 10,000 \).

75. **Depreciation** After \( t \) years, the value of a wheelchair conversion van that originally cost \$30,500 depreciates so that each year it is worth \( \frac{3}{4} \) of its value for the previous year.
(a) Find a model for \( V(t) \), the value of the van after \( t \) years.
(b) Determine the value of the van 4 years after it was purchased.

76. **Drug Concentration** Immediately following an injection, the concentration of a drug in the bloodstream is 300 milligrams per milliliter. After \( t \) hours, the concentration is 75\% of the level of the previous hour.
(a) Find a model for \( C(t) \), the concentration of the drug after \( t \) hours.
(b) Determine the concentration of the drug after 8 hours.

**Exploration**

**True or False?** In Exercises 77 and 78, determine whether the statement is true or false. Justify your answer.

77. The line \( y = -2 \) is an asymptote for the graph of \( f(x) = 10^x - 2 \).

78. \( e = \frac{271,801}{99,990} \)

**Think About It** In Exercises 79–82, use properties of exponents to determine which functions (if any) are the same.

79. \( f(x) = 3^{x-2} \) \hspace{1cm} 80. \( f(x) = 4^x + 12 \)
   
   \( g(x) = 3^x - 9 \) \hspace{1cm} \( g(x) = 2^{2x+6} \)
   
   \( h(x) = \frac{1}{2}(3^x) \) \hspace{1cm} \( h(x) = 64(4^x) \)

81. \( f(x) = 16(4^{-x}) \) \hspace{1cm} 82. \( f(x) = e^{-x} + 3 \)
   
   \( g(x) = \left(\frac{1}{4}\right)^{x-2} \) \hspace{1cm} \( g(x) = e^{3-x} \)
   
   \( h(x) = 16(2^{-2x}) \) \hspace{1cm} \( h(x) = -e^{x-3} \)

83. Graph the functions given by \( y = 3^x \) and \( y = 4^x \) and use the graphs to solve each inequality.
   (a) \( 4^x < 3^x \) \hspace{1cm} (b) \( 4^x > 3^x \)

84. Use a graphing utility to graph each function. Use the graph to find where the function is increasing and decreasing, and approximate any relative maximum or minimum values.
   (a) \( f(x) = x^2e^{-x} \) \hspace{1cm} (b) \( g(x) = x^{3-3} \)

85. **Graphical Analysis** Use a graphing utility to graph \( y_1 = (1 + 1/x)^x \) and \( y_2 = e \) in the same viewing window. Use the **trace** feature, explain what happens to the graph of \( y_1 \) as \( x \) increases.

86. **Graphical Analysis** Use a graphing utility to graph
\[ f(x) = \left(1 + \frac{0.5}{x}\right)^x \] and \( g(x) = e^{0.5} \)

in the same viewing window. What is the relationship between \( f \) and \( g \) as \( x \) increases and decreases without bound?

87. **Graphical Analysis** Use a graphing utility to graph each pair of functions in the same viewing window. Describe any similarities and differences in the graphs.
(a) \( y_1 = 2^x, \ y_2 = x^2 \) \hspace{1cm} (b) \( y_1 = 3^x, \ y_2 = x^3 \)

88. **Think About It** Which functions are exponential?
(a) \( 3x \) \hspace{1cm} (b) \( 3x^2 \) \hspace{1cm} (c) \( 3^x \) \hspace{1cm} (d) \( 2^{-x} \)

89. **Compound Interest** Use the formula
\[ A = P\left(1 + \frac{r}{n}\right)^{nt} \]
to calculate the balance of an account when \( P = \$3000 \), \( r = 6\% \), and \( t = 10 \) years, and compounding is done (a) by the day, (b) by the hour, (c) by the minute, and (d) by the second. Does increasing the number of compoundings per year result in unlimited growth of the balance of the account? Explain.

90. **Capstone** The figure shows the graphs of \( y = 2^x \), \( y = e^x \), \( y = 10^x \), \( y = 2^{-x} \), \( y = e^{-x} \), and \( y = 10^{-x} \). Match each function with its graph. [The graphs are labeled (a) through (f).] Explain your reasoning.

**Project: Population Per Square Mile** To work an extended application analyzing the population per square mile of the United States, visit this text’s website at academic.cengage.com. (Data Source: U.S. Census Bureau)
Logarithmic Functions

In Section 1.9, you studied the concept of an inverse function. There, you learned that if a function is one-to-one—that is, if the function has the property that no horizontal line intersects the graph of the function more than once—the function must have an inverse function. By looking back at the graphs of the exponential functions introduced in Section 3.1, you will see that every function of the form passes the Horizontal Line Test and therefore must have an inverse function. This inverse function is called the logarithmic function with base $a$.

The equations

$y = \log_a x$ if and only if $x = a^y$.

are equivalent. The first equation is in logarithmic form and the second is in exponential form. For example, the logarithmic equation $2 = \log_3 9$ can be rewritten in exponential form as $9 = 3^2$. The exponential equation $5^3 = 125$ can be rewritten in logarithmic form as $\log_5 125 = 3$.

When evaluating logarithms, remember that a logarithm is an exponent. This means that $\log_a x$ is the exponent to which $a$ must be raised to obtain $x$. For instance, $\log_2 8 = 3$ because $2$ must be raised to the third power to get $8$.

**Example 1** Evaluating Logarithms

Use the definition of logarithmic function to evaluate each logarithm at the indicated value of $x$.

- $a. \quad f(x) = \log_2 x, \quad x = 32$
- $b. \quad f(x) = \log_3 x, \quad x = 1$
- $c. \quad f(x) = \log_4 x, \quad x = 2$
- $d. \quad f(x) = \log_{10} x, \quad x = \frac{1}{100}$

**Solution**

- $a. \quad f(32) = \log_2 32 = 5$ because $2^5 = 32$.
- $b. \quad f(1) = \log_3 1 = 0$ because $3^0 = 1$.
- $c. \quad f(2) = \log_4 2 = \frac{1}{2}$ because $4^{1/2} = \sqrt{4} = 2$.
- $d. \quad f(\frac{1}{100}) = \log_{10} \frac{1}{100} = -2$ because $10^{-2} = \frac{1}{100}$.

Now try Exercise 23.
The logarithmic function with base 10 is called the **common logarithmic function**. It is denoted by \log_{10} or simply by \log. On most calculators, this function is denoted by \text{LOG}. Example 2 shows how to use a calculator to evaluate common logarithmic functions. You will learn how to use a calculator to calculate logarithms to any base in the next section.

**Example 2** Evaluating Common Logarithms on a Calculator

Use a calculator to evaluate the function given by \( f(x) = \log x \) at each value of \( x \).

<table>
<thead>
<tr>
<th>Function Value</th>
<th>Graphing Calculator Keystrokes</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. ( x = 10 )</td>
<td>\text{LOG} 10 \text{ ENTER}</td>
<td>1</td>
</tr>
<tr>
<td>b. ( x = \frac{1}{3} )</td>
<td>\text{LOG} \ 1 \ 3 \ \text{ ENTER}</td>
<td>-0.4771213</td>
</tr>
<tr>
<td>c. ( x = 2.5 )</td>
<td>\text{LOG} 2.5 \text{ ENTER}</td>
<td>0.3979400</td>
</tr>
<tr>
<td>d. ( x = -2 )</td>
<td>\text{LOG} -2 \text{ ENTER}</td>
<td>ERROR</td>
</tr>
</tbody>
</table>

Note that the calculator displays an error message (or a complex number) when you try to evaluate \( \log(-2) \). The reason for this is that there is no real number power to which 10 can be raised to obtain -2.

Now try Exercise 29.

The following properties follow directly from the definition of the logarithmic function with base \( a \).

**Properties of Logarithms**

1. \( \log_a 1 = 0 \) because \( a^0 = 1 \).
2. \( \log_a a = 1 \) because \( a^1 = a \).
3. \( \log_a a^x = x \) and \( a^{\log_a x} = x \)  
   **Inverse Properties**
4. If \( \log_a x = \log_a y \), then \( x = y \).  
   **One-to-One Property**

**Example 3** Using Properties of Logarithms

a. Simplify: \( \log_4 1 \)  
   b. Simplify: \( \log_{\sqrt{7}} \sqrt{7} \)  
   c. Simplify: \( 6^{\log_6 20} \)

**Solution**

a. Using Property 1, it follows that \( \log_4 1 = 0 \).

b. Using Property 2, you can conclude that \( \log_{\sqrt{7}} \sqrt{7} = 1 \).

c. Using the Inverse Property (Property 3), it follows that \( 6^{\log_6 20} = 20 \).

Now try Exercise 33.

You can use the One-to-One Property (Property 4) to solve simple logarithmic equations, as shown in Example 4.
Example 4  Using the One-to-One Property

a. \( \log_3 x = \log_3 12 \)  \begin{align*}
\text{Original equation} \\
x &= 12 \quad \text{One-to-One Property}
\end{align*}

b. \( \log(2x + 1) = \log 3x \Rightarrow 2x + 1 = 3x \Rightarrow x = 1 \)

c. \( \log_4(x^2 - 6) = \log_4 10 \Rightarrow x^2 - 6 = 10 \Rightarrow x^2 = 16 \Rightarrow x = \pm 4 \)

CHECK Point  Now try Exercise 85.

Graphs of Logarithmic Functions

To sketch the graph of \( y = \log_a x \), you can use the fact that the graphs of inverse functions are reflections of each other in the line \( y = x \).

Example 5  Graphs of Exponential and Logarithmic Functions

In the same coordinate plane, sketch the graph of each function.

a. \( f(x) = 2^x \)  \hspace{1cm} b. \( g(x) = \log_2 x \)

Solution

a. For \( f(x) = 2^x \), construct a table of values. By plotting these points and connecting them with a smooth curve, you obtain the graph shown in Figure 3.14.

\[
\begin{array}{c|cccc}
 x & -2 & -1 & 0 & 1 \\
 f(x) = 2^x & \frac{1}{4} & \frac{1}{2} & 1 & 2 \\
\end{array}
\]

b. Because \( g(x) = \log_2 x \) is the inverse function of \( f(x) = 2^x \), the graph of \( g \) is obtained by plotting the points \((f(x), x)\) and connecting them with a smooth curve. The graph of \( g \) is a reflection of the graph of \( f \) in the line \( y = x \), as shown in Figure 3.14.

CHECK Point  Now try Exercise 37.

Example 6  Sketching the Graph of a Logarithmic Function

Sketch the graph of the common logarithmic function \( f(x) = \log x \). Identify the vertical asymptote.

Solution

Begin by constructing a table of values. Note that some of the values can be obtained without a calculator by using the Inverse Property of Logarithms. Others require a calculator. Next, plot the points and connect them with a smooth curve, as shown in Figure 3.15. The vertical asymptote is \( x = 0 \) (y-axis).

\[
\begin{array}{c|cccc}
 x & \frac{1}{100} & \frac{1}{10} & 1 & 10 \\
 f(x) = \log x & -2 & -1 & 0 & 1 \\
\end{array}
\]

\[
\begin{array}{c|cccc}
 & 2 & 5 & 8 \\
 f(x) = \log x & 0.301 & 0.699 & 0.903 \\
\end{array}
\]

CHECK Point  Now try Exercise 43.
The nature of the graph in Figure 3.15 is typical of functions of the form \( f(x) = \log_a x, \ a > 1 \). They have one \( x \)-intercept and one vertical asymptote. Notice how slowly the graph rises for \( x > 1 \). The basic characteristics of logarithmic graphs are summarized in Figure 3.16.

![Figure 3.16](image)

**Graph of \( y = \log_a x, \ a > 1 \)**
- Domain: \((0, \infty)\)
- Range: \((-\infty, \infty)\)
- \( x \)-intercept: (1, 0)
- Increasing
- One-to-one, therefore has an inverse function
- \( y \)-axis is a vertical asymptote (\( \log_a x \to -\infty \) as \( x \to 0^+ \)).
- Continuous
- Reflection of graph of \( y = a^x \) about the line \( y = x \)

The basic characteristics of the graph of \( f(x) = a^x \) are shown below to illustrate the inverse relation between \( f(x) = a^x \) and \( g(x) = \log_a x \).

- Domain: \((-\infty, \infty)\)
- Range: \((0, \infty)\)
- \( y \)-intercept: (0,1)
- \( x \)-axis is a horizontal asymptote (\( a^x \to 0 \) as \( x \to -\infty \)).

In the next example, the graph of \( y = \log_a x \) is used to sketch the graphs of functions of the form \( f(x) = b \pm \log_a (x + c) \). Notice how a horizontal shift of the graph results in a horizontal shift of the vertical asymptote.

**Example 7**  **Shifting Graphs of Logarithmic Functions**

The graph of each of the functions is similar to the graph of \( f(x) = \log x \).

**a.** Because \( g(x) = \log(x - 1) = f(x - 1) \), the graph of \( g \) can be obtained by shifting the graph of \( f \) one unit to the right, as shown in Figure 3.17.

**b.** Because \( h(x) = 2 + \log x = 2 + f(x) \), the graph of \( h \) can be obtained by shifting the graph of \( f \) two units upward, as shown in Figure 3.18.

![Figure 3.17](image)

**Example 7 (cont.)**

**a.** Because \( g(x) = \log(x - 1) = f(x - 1) \), the graph of \( g \) can be obtained by shifting the graph of \( f \) one unit to the right, as shown in Figure 3.17.

**Example 7 (cont.)**

**b.** Because \( h(x) = 2 + \log x = 2 + f(x) \), the graph of \( h \) can be obtained by shifting the graph of \( f \) two units upward, as shown in Figure 3.18.

![Figure 3.18](image)
The Natural Logarithmic Function

By looking back at the graph of the natural exponential function introduced on page 220 in Section 3.1, you will see that is one-to-one and so has an inverse function. This inverse function is called the natural logarithmic function and is denoted by the special symbol \( \ln \) read as “the natural log of” or “el en of.” Note that the natural logarithm is written without a base. The base is understood to be \( e \).

The definition above implies that the natural logarithmic function and the natural exponential function are inverse functions of each other. So, every logarithmic equation can be written in an equivalent exponential form, and every exponential equation can be written in logarithmic form. That is, and are equivalent equations.

Because the functions given by and are inverse functions of each other, their graphs are reflections of each other in the line \( y = x \). This reflective property is illustrated in Figure 3.19.

On most calculators, the natural logarithm is denoted by \( \text{LN} \), as illustrated in Example 8.

### Example 8 Evaluating the Natural Logarithmic Function

Use a calculator to evaluate the function given by \( f(x) = \ln x \) for each value of \( x \).

- **a.** \( x = 2 \)
- **b.** \( x = 0.3 \)
- **c.** \( x = -1 \)
- **d.** \( x = 1 + \sqrt{2} \)

**Solution**

<table>
<thead>
<tr>
<th>Function Value</th>
<th>Graphing Calculator Keystrokes</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. ( f(2) = \ln 2 )</td>
<td>\text{LN} 2 \text{ ENTER}</td>
<td>0.6931472</td>
</tr>
<tr>
<td>b. ( f(0.3) = \ln 0.3 )</td>
<td>\text{LN} .3 \text{ ENTER}</td>
<td>−1.2039728</td>
</tr>
<tr>
<td>c. ( f(-1) = \ln(-1) )</td>
<td>\text{LN} \text{ (-1) ENTER}</td>
<td>ERROR</td>
</tr>
<tr>
<td>d. ( f(1 + \sqrt{2}) = \ln(1 + \sqrt{2}) )</td>
<td>\text{LN} 1 1 + \sqrt{2} \text{ ENTER}</td>
<td>0.8813736</td>
</tr>
</tbody>
</table>

**Warning/CAUTION**

Notice that as with every other logarithmic function, the domain of the natural logarithmic function is the set of **positive real numbers**—be sure you see that \( \ln x \) is not defined for zero or for negative numbers.

In Example 8, be sure you see that \( \ln(-1) \) gives an error message on most calculators. (Some calculators may display a complex number.) This occurs because the domain of \( \ln x \) is the set of positive real numbers (see Figure 3.19). So, \( \ln(-1) \) is undefined.

The four properties of logarithms listed on page 228 are also valid for natural logarithms.
Properties of Natural Logarithms

1. \( \ln 1 = 0 \) because \( e^0 = 1 \).
2. \( \ln e = 1 \) because \( e^1 = e \).
3. \( \ln e^x = x \) and \( e^{\ln x} = x \) \hspace{1cm} \text{Inverse Properties}
4. If \( \ln x = \ln y \), then \( x = y \). \hspace{1cm} \text{One-to-One Property}

Example 9 Using Properties of Natural Logarithms

Use the properties of natural logarithms to simplify each expression.

\( a. \ln \frac{1}{e} \quad b. \ e^{\ln 5} \quad c. \ \frac{\ln 1}{3} \quad d. \ 2 \ln e \)

Solution

\( a. \ln \frac{1}{e} = \ln e^{-1} = -1 \) \hspace{1cm} \text{Inverse Property} \hspace{1cm} b. \ e^{\ln 5} = 5 \hspace{1cm} \text{Inverse Property} \\
\( c. \ \frac{\ln 1}{3} = 0 = 0 \) \hspace{1cm} \text{Property 1} \hspace{1cm} d. \ 2 \ln e = 2(1) = 2 \hspace{1cm} \text{Property 2} \\

Now try Exercise 71.

Example 10 Finding the Domains of Logarithmic Functions

Find the domain of each function.

\( a. \ f(x) = \ln(x - 2) \quad b. \ g(x) = \ln(2 - x) \quad c. \ h(x) = \ln x^2 \)

Solution

\( a. \) Because \( \ln(x - 2) \) is defined only if \( x - 2 > 0 \), it follows that the domain of \( f \) is \( (2, \infty) \). The graph of \( f \) is shown in Figure 3.20.

\( b. \) Because \( \ln(2 - x) \) is defined only if \( 2 - x > 0 \), it follows that the domain of \( g \) is \( (-\infty, 2) \). The graph of \( g \) is shown in Figure 3.21.

\( c. \) Because \( \ln x^2 \) is defined only if \( x^2 > 0 \), it follows that the domain of \( h \) is all real numbers except \( x = 0 \). The graph of \( h \) is shown in Figure 3.22.

Now try Exercise 75.
## Application

### Example 11  Human Memory Model

Students participating in a psychology experiment attended several lectures on a subject and were given an exam. Every month for a year after the exam, the students were retested to see how much of the material they remembered. The average scores for the group are given by the human memory model \( f(t) = 75 - 6 \ln(t + 1), \) \( 0 \leq t \leq 12, \) where \( t \) is the time in months.

a. What was the average score on the original \((t = 0)\) exam?

b. What was the average score at the end of \( t = 2 \) months?

c. What was the average score at the end of \( t = 6 \) months?

### Algebraic Solution

a. The original average score was

\[
f(0) = 75 - 6 \ln(0 + 1)
\]

Substitute 0 for \( t \).

\[
= 75 - 6 \ln 1
\]

Simplify.

\[
= 75 - 6(0)
\]

Property of natural logarithms

\[
= 75.
\]

Solution

b. After 2 months, the average score was

\[
f(2) = 75 - 6 \ln(2 + 1)
\]

Substitute 2 for \( t \).

\[
= 75 - 6 \ln 3
\]

Simplify.

\[
\approx 75 - 6(1.0986)
\]

Use a calculator.

\[
\approx 68.4.
\]

Solution

c. After 6 months, the average score was

\[
f(6) = 75 - 6 \ln(6 + 1)
\]

Substitute 6 for \( t \).

\[
= 75 - 6 \ln 7
\]

Simplify.

\[
\approx 75 - 6(1.9459)
\]

Use a calculator.

\[
\approx 63.3.
\]

Solution

### Graphical Solution

Use a graphing utility to graph the model \( y = 75 - 6 \ln(x + 1) \). Then use the value or trace feature to approximate the following.

a. When \( x = 0, \) \( y = 75 \) (see Figure 3.23). So, the original average score was 75.

b. When \( x = 2, \) \( y \approx 68.4 \) (see Figure 3.24). So, the average score after 2 months was about 68.4.

c. When \( x = 6, \) \( y \approx 63.3 \) (see Figure 3.25). So, the average score after 6 months was about 63.3.

![Figure 3.24](image2)

![Figure 3.25](image3)

### Classroom Discussion

**Analyzing a Human Memory Model**  Use a graphing utility to determine the time in months when the average score in Example 11 was 60. Explain your method of solving the problem. Describe another way that you can use a graphing utility to determine the answer.
3.2 EXERCISES

VOCABULARY: Fill in the blanks.

1. The inverse function of the exponential function given by \( f(x) = a^x \) is called the ________ function with base \( a \).
2. The common logarithmic function has base ________ .
3. The logarithmic function given by \( f(x) = \ln x \) is called the ________ logarithmic function and has base ________.
4. The Inverse Properties of logarithms and exponentials state that \( \log_a a^x = x \) and ________.
5. The One-to-One Property of natural logarithms states that if \( \ln x = \ln y \), then ________.
6. The domain of the natural logarithmic function is the set of ________ ________ ________ .

SKILLS AND APPLICATIONS

In Exercises 7–14, write the logarithmic equation in exponential form. For example, the exponential form of \( \log_2 25 = 2 \) is \( 5^2 = 25 \).

7. \( \log_4 16 = 2 \) 8. \( \log_7 343 = 3 \)
9. \( \log_9 \frac{1}{81} = -2 \) 10. \( \log_{\frac{1}{10}} \frac{1}{100} = -3 \)
11. \( \log_{32} 4 = \frac{2}{5} \) 12. \( \log_{16} 8 = \frac{3}{4} \)
13. \( \log_{64} 8 = \frac{3}{2} \) 14. \( \log_4 4 = \frac{2}{3} \)

In Exercises 15–22, write the exponential equation in logarithmic form. For example, the logarithmic form of \( 2^3 = 8 \) is \( \log_2 8 = 3 \).

15. \( 5^3 = 125 \) 16. \( 13^2 = 169 \)
17. \( 81^{1/4} = 3 \) 18. \( 9^{3/2} = 27 \)
19. \( 6^{-2} = \frac{1}{36} \) 20. \( 4^{-3} = \frac{1}{64} \)
21. \( 24^0 = 1 \) 22. \( 10^{-3} = 0.001 \)

In Exercises 23–28, evaluate the function at the indicated value of \( x \) without using a calculator.

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>23. ( f(x) = \log_2 x )</td>
<td>( x = 64 )</td>
</tr>
<tr>
<td>24. ( f(x) = \log_{25} x )</td>
<td>( x = 5 )</td>
</tr>
<tr>
<td>25. ( f(x) = \log_9 x )</td>
<td>( x = 1 )</td>
</tr>
<tr>
<td>26. ( f(x) = \log x )</td>
<td>( x = 10 )</td>
</tr>
<tr>
<td>27. ( g(x) = \log_a x )</td>
<td>( x = a^2 )</td>
</tr>
<tr>
<td>28. ( g(x) = \log_b x )</td>
<td>( x = b^{-3} )</td>
</tr>
</tbody>
</table>

In Exercises 29–32, use a calculator to evaluate \( f(x) = \log x \) at the indicated value of \( x \). Round your result to three decimal places.

29. \( x = \frac{3}{4} \) 30. \( x = \frac{1}{500} \)
31. \( x = 12.5 \) 32. \( x = 96.75 \)

In Exercises 33–36, use the properties of logarithms to simplify the expression.

33. \( \log_{11} 11^7 \) 34. \( \log_{3.2} 1 \)
35. \( \log_\pi \pi \) 36. \( 9^{\log_{15} 9} \)

In Exercises 37–44, find the domain, \( x \)-intercept, and vertical asymptote of the logarithmic function and sketch its graph.

37. \( f(x) = \log_4 x \) 38. \( g(x) = \log_6 x \)
39. \( y = -\log_3 x + 2 \) 40. \( h(x) = \log_7(x - 3) \)
41. \( f(x) = -\log_6(x + 2) \) 42. \( y = \log_5(x - 1) + 4 \)
43. \( y = \log \left( \frac{x}{7} \right) \) 44. \( y = \log(-x) \)

In Exercises 45–50, use the graph of \( g(x) = \log_4 x \) to match the given function with its graph. Then describe the relationship between the graphs of \( f \) and \( g \). [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

(a)  
(b)  
(c)  
(d)  
(e)  
(f)  

45. \( f(x) = \log_3 x + 2 \)  
46. \( f(x) = -\log_3 x \) 
47. \( f(x) = -\log_5 (x + 2) \)  
48. \( f(x) = \log_5 (x + 1) \)  
49. \( f(x) = \log_4 (1 - x) \)  
50. \( f(x) = -\log_4 (-x) \)  

In Exercises 51–58, write the logarithmic equation in exponential form.

51. \( \log_2 \frac{1}{4} = -0.693 \ldots \)  
52. \( \log_2 \frac{3}{8} = -0.916 \ldots \)  
53. \( \ln 7 = 1.945 \ldots \)  
54. \( \ln 10 = 2.302 \ldots \)  
55. \( \ln 250 = 5.521 \ldots \)  
56. \( \ln 1084 = 6.988 \ldots \)  
57. \( \ln 1 = 0 \)  
58. \( \ln e = 1 \) 

In Exercises 59–66, write the exponential equation in logarithmic form.

59. \( e^4 = 54.598 \ldots \)  
60. \( e^2 = 7.3890 \ldots \)  
61. \( e^{1/2} = 1.6487 \ldots \)  
62. \( e^{1/3} = 1.3956 \ldots \)  
63. \( e^{-0.9} = 0.406 \ldots \)  
64. \( e^{-4.1} = 0.0165 \ldots \)  
65. \( e^4 = 4 \)  
66. \( e^{3x} = 3 \) 

In Exercises 67–70, use a calculator to evaluate the function at the indicated value of \( x \). Round your result to three decimal places.

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>67. ( f(x) = \ln x )</td>
<td>( x = 18.42 )</td>
</tr>
<tr>
<td>68. ( f(x) = 3 \ln x )</td>
<td>( x = 0.74 )</td>
</tr>
<tr>
<td>69. ( g(x) = 8 \ln x )</td>
<td>( x = 0.05 )</td>
</tr>
<tr>
<td>70. ( g(x) = -\ln x )</td>
<td>( x = \frac{1}{2} )</td>
</tr>
</tbody>
</table>

In Exercises 71–74, evaluate \( g(x) = \ln x \) at the indicated value of \( x \) without using a calculator.

71. \( x = e^3 \)  
72. \( x = e^{-4} \)  
73. \( x = e^{-5/6} \)  
74. \( x = e^{-5/2} \) 

In Exercises 75–78, find the domain, \( x \)-intercept, and vertical asymptote of the logarithmic function and sketch its graph.

75. \( f(x) = \ln(x - 4) \)  
76. \( h(x) = \ln(x + 5) \)  
77. \( g(x) = \ln(-x) \)  
78. \( f(x) = \ln(3 - x) \) 

In Exercises 79–84, use a graphing utility to graph the function. Be sure to use an appropriate viewing window.

79. \( f(x) = \log_5(x + 9) \)  
80. \( f(x) = \log_5(x - 6) \)  
81. \( f(x) = \ln(x + 1) \)  
82. \( f(x) = \ln(x + 2) \)  
83. \( f(x) = \ln x + 8 \)  
84. \( f(x) = 3 \ln x - 1 \)  

In Exercises 85–92, use the One-to-One Property to solve the equation for \( x \).

85. \( \log_5(x + 1) = \log_5 6 \)  
86. \( \log_2(x - 3) = \log_2 9 \)  
87. \( \log(2x + 1) = \log 15 \)  
88. \( \log(5x + 3) = \log 12 \)  
89. \( \ln(x + 4) = \ln 12 \)  
90. \( \ln(x - 7) = \ln 7 \)  
91. \( \ln(x^2 - 2) = \ln 23 \)  
92. \( \ln(x^2 - x) = \ln 6 \) 

93. **MONTHLY PAYMENT**  
   The model  
   \[ t = 16.625 \ln \left( \frac{x}{x - 750} \right) \]  
   \( x > 750 \) 
   approximates the length of a home mortgage of $150,000 at 6% in terms of the monthly payment. In the model, \( t \) is the length of the mortgage in years and \( x \) is the monthly payment in dollars.

   (a) Use the model to approximate the lengths of a $150,000 mortgage at 6% when the monthly payment is $897.72 and when the monthly payment is $1659.24.

   (b) Approximate the total amounts paid over the term of the mortgage with a monthly payment of $897.72 and with a monthly payment of $1659.24.

   (c) Approximate the total interest charges for a monthly payment of $897.72 and for a monthly payment of $1659.24.

   (d) What is the vertical asymptote for the model? Interpret its meaning in the context of the problem.

94. **COMPOUND INTEREST**  
   A principal \( P \), invested at 5\% and compounded continuously, increases to an amount \( K \) times the original principal after \( t \) years, where \( t \) is given by \( t = (\ln K)/0.055 \).

   (a) Complete the table and interpret your results.

<table>
<thead>
<tr>
<th>( K )</th>
<th>1</th>

</tbody>
</table>

   (b) Sketch a graph of the function.

95. **CABLE TELEVISION**  
   The numbers of cable television systems \( C \) (in thousands) in the United States from 2001 through 2006 can be approximated by the model  
   \[ C = 10.355 - 0.298t \ln t \]  
   \( 1 \leq t \leq 6 \) 

   where \( t \) represents the year, with \( t = 1 \) corresponding to 2001. (Source: Warren Communication News)

   (a) Complete the table.

<table>
<thead>
<tr>
<th>( t )</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>

(b) Use a graphing utility to graph the function.

97. **HUMAN MEMORY MODEL** Students in a mathematics class were given an exam and then retested monthly with an equivalent exam. The average scores for the class are given by the human memory model \( f(t) = 80 - 17 \log(t + 1), 0 \leq t \leq 12, \) where \( t \) is the time in months.

(a) Use a graphing utility to graph the model over the specified domain.
(b) What was the average score on the original exam \( (t = 0)?\)
(c) What was the average score after 4 months?
(d) What was the average score after 10 months?

98. **SOUND INTENSITY** The relationship between the number of decibels \( \beta \) and the intensity of a sound \( I \) in watts per square meter is

\[
\beta = 10 \log \left( \frac{I}{10^{-12}} \right).
\]

(a) Determine the number of decibels of a sound with an intensity of 1 watt per square meter.
(b) Determine the number of decibels of a sound with an intensity of \( 10^{-2} \) watt per square meter.
(c) The intensity of the sound in part (a) is 100 times as great as that in part (b). Is the number of decibels 100 times as great? Explain.

99. You can determine the graph of \( f(x) = \log_a x \) by graphing \( g(x) = 6^x \) and reflecting it about the x-axis.

100. The graph of \( f(x) = \log_a x \) contains the point \((27, 3)\).

In Exercises 101–104, sketch the graphs of \( f \) and \( g \) and describe the relationship between the graphs of \( f \) and \( g \). What is the relationship between the functions \( f \) and \( g \)?

101. \( f(x) = 3^x \), \( g(x) = \log_3 x \)
102. \( f(x) = 5^x \), \( g(x) = \log_5 x \)
103. \( f(x) = e^x \), \( g(x) = \ln x \)
104. \( f(x) = 8^x \), \( g(x) = \log_8 x \)

105. **THINK ABOUT IT** Complete the table for \( f(x) = 10^x \).

<table>
<thead>
<tr>
<th>( x )</th>

106. **GRAPHICAL ANALYSIS** Use a graphing utility to graph \( f \) and \( g \) in the same viewing window and determine which is increasing at the greater rate as \( x \) approaches \( +\infty \). What can you conclude about the rate of growth of the natural logarithmic function?

(a) \( f(x) = \ln x \), \( g(x) = \sqrt{x} \)
(b) \( f(x) = \ln x \), \( g(x) = \frac{1}{\sqrt{x}} \)

107. (a) Complete the table for the function given by \( f(x) = (\ln x)/x \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>(1)</th>
<th>(5)</th>
<th>(10)</th>
<th>(10^2)</th>
<th>(10^4)</th>
<th>(10^6)</th>

(a) \( y \) is an exponential function of \( x \).
(b) \( y \) is a logarithmic function of \( x \).
(c) \( x \) is an exponential function of \( y \).
(d) \( y \) is a linear function of \( x \).

109. **WRITING** Explain why \( \log_a x \) is defined only for \( 0 < a < 1 \) and \( a > 1 \).

In Exercises 110 and 111, (a) use a graphing utility to graph the function, (b) use the graph to determine the intervals in which the function is increasing and decreasing, and (c) approximate any relative maximum or minimum values of the function.

110. \( f(x) = |\ln x| \)
111. \( h(x) = \ln(x^2 + 1) \)
### Section 3.3 Properties of Logarithms

#### What you should learn

- Use the change-of-base formula to rewrite and evaluate logarithmic expressions.
- Use properties of logarithms to evaluate or rewrite logarithmic expressions.
- Use properties of logarithms to expand or condense logarithmic expressions.
- Use logarithmic functions to model and solve real-life problems.

#### Why you should learn it

Logarithmic functions can be used to model and solve real-life problems. For instance, in Exercises 87–90 on page 242, a logarithmic function is used to model the relationship between the number of decibels and the intensity of a sound.

### 3.3 Properties of Logarithms

#### Change of Base

Most calculators have only two types of log keys, one for common logarithms (base 10) and one for natural logarithms (base $e$). Although common logarithms and natural logarithms are the most frequently used, you may occasionally need to evaluate logarithms with other bases. To do this, you can use the following change-of-base formula.

$\log_a x = \frac{\log_b x}{\log_b a}$

One way to look at the change-of-base formula is that logarithms with base $a$ are simply constant multiples of logarithms with base $b$. The constant multiplier is $1/(\log_b a)$.

#### Example 1 Changing Bases Using Common Logarithms

a. $\log_4 25 = \frac{\log 25}{\log 4} \approx 1.39794$ Use a calculator.

b. $\log_2 12 = \frac{\log 12}{\log 2} \approx \frac{1.07918}{0.30103} \approx 3.5850$

**Check Point** Now try Exercise 7(a).

#### Example 2 Changing Bases Using Natural Logarithms

a. $\log_4 25 = \frac{\ln 25}{\ln 4} \approx \frac{3.21888}{1.38629} \approx 2.3219$ Simplify.

b. $\log_2 12 = \frac{\ln 12}{\ln 2} \approx \frac{2.48491}{0.69315} \approx 3.5850$

**Check Point** Now try Exercise 7(b).
Properties of Logarithms

You know from the preceding section that the logarithmic function with base is the inverse function of the exponential function with base. So, it makes sense that the properties of exponents should have corresponding properties involving logarithms. For instance, the exponential property has the corresponding logarithmic property

For proofs of the properties listed above, see Proofs in Mathematics on page 276.

Using Properties of Logarithms

Write each logarithm in terms of \( \ln 2 \) and \( \ln 3 \).

a. \( \ln 6 \)  

b. \( \ln \frac{2}{27} \)

Solution

a. \( \ln 6 = \ln(2 \cdot 3) \)  

\[ = \ln 2 + \ln 3 \]  

Product Property

b. \( \ln \frac{2}{27} = \ln 2 - \ln 27 \)  

\[ = \ln 2 - \ln 3^3 \]  

Rewrite 27 as \( 3^3 \).

\[ = \ln 2 - 3 \ln 3 \]  

Power Property

CHECK Point Now try Exercise 27.

Using Properties of Logarithms

Find the exact value of each expression without using a calculator.

a. \( \log_5 \sqrt[3]{5} \)  

b. \( \ln e^6 - \ln e^2 \)

Solution

a. \( \log_5 \sqrt[3]{5} = \log_5 5^{1/3} = \frac{1}{3} \log_5 5 = \frac{1}{3} \cdot 1 = \frac{1}{3} \)

b. \( \ln e^6 - \ln e^2 = \ln \frac{e^6}{e^2} = \ln e^4 = 4 \ln e = 4(1) = 4 \)

CHECK Point Now try Exercise 29.
**Rewriting Logarithmic Expressions**

The properties of logarithms are useful for rewriting logarithmic expressions in forms that simplify the operations of algebra. This is true because these properties convert complicated products, quotients, and exponential forms into simpler sums, differences, and products, respectively.

### Example 5 Expanding Logarithmic Expressions

Expand each logarithmic expression.

a. \( \log_4 5x^3y \)  

Solution

\[ \log_4 5x^3y = \log_4 5 + \log_4 x^3 + \log_4 y \]  

Product Property

\[ = \log_4 5 + 3 \log_4 x + \log_4 y \]  

Power Property

b. \( \ln \frac{\sqrt{3x - 5}}{7} \)  

Solution

\[ \ln \frac{\sqrt{3x - 5}}{7} = \ln \frac{(3x - 5)^{1/2}}{7} \]  

Rewrite using rational exponent.

\[ = \ln(3x - 5)^{1/2} - \ln 7 \]  

Quotient Property

\[ = \frac{1}{2} \ln(3x - 5) - \ln 7 \]  

Power Property

CHECK Point Now try Exercise 53.

In Example 5, the properties of logarithms were used to expand logarithmic expressions. In Example 6, this procedure is reversed and the properties of logarithms are used to condense logarithmic expressions.

### Example 6 Condensing Logarithmic Expressions

Condense each logarithmic expression.

a. \( \frac{1}{2} \log x + 3 \log(x + 1) \)  

Solution

\[ \frac{1}{2} \log x + 3 \log(x + 1) = \log x^{1/2} + \log(x + 1)^3 \]  

Power Property

\[ = \log \left( \sqrt{x} (x + 1)^3 \right) \]  

Product Property

b. \( 2 \ln(x + 2) - \ln x \)  

Solution

\[ 2 \ln(x + 2) - \ln x = \ln(x + 2)^2 - \ln x \]  

Power Property

\[ = \ln \left( \frac{(x + 2)^2}{x} \right) \]  

Quotient Property

c. \( \frac{1}{3} \left[ \log_2 x + \log_2(x + 1) \right] \)  

Solution

\[ \frac{1}{3} \left[ \log_2 x + \log_2(x + 1) \right] = \frac{1}{3} \log_2 [x(x + 1)] \]  

Product Property

\[ = \log_2 [x(x + 1)]^{1/3} \]  

Power Property

\[ = \log_2 \sqrt[3]{x(x + 1)} \]  

Rewrite with a radical.

CHECK Point Now try Exercise 75.
Application

One method of determining how the \(x\)- and \(y\)-values for a set of nonlinear data are related is to take the natural logarithm of each of the \(x\)- and \(y\)-values. If the points are graphed and fall on a line, then you can determine that the \(x\)- and \(y\)-values are related by the equation

\[
\ln y = m \ln x
\]

where \(m\) is the slope of the line.

Example 7 Finding a Mathematical Model

The table shows the mean distance from the sun \(x\) and the period \(y\) (the time it takes a planet to orbit the sun) for each of the six planets that are closest to the sun. In the table, the mean distance is given in terms of astronomical units (where Earth’s mean distance is defined as 1.0), and the period is given in years. Find an equation that relates \(y\) and \(x\).

<table>
<thead>
<tr>
<th>Planet</th>
<th>Mean distance, (x)</th>
<th>Period, (y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mercury</td>
<td>0.387</td>
<td>0.241</td>
</tr>
<tr>
<td>Venus</td>
<td>0.723</td>
<td>0.615</td>
</tr>
<tr>
<td>Earth</td>
<td>1.000</td>
<td>1.000</td>
</tr>
<tr>
<td>Mars</td>
<td>1.524</td>
<td>1.881</td>
</tr>
<tr>
<td>Jupiter</td>
<td>5.203</td>
<td>11.860</td>
</tr>
<tr>
<td>Saturn</td>
<td>9.537</td>
<td>29.460</td>
</tr>
</tbody>
</table>

Solution

The points in the table above are plotted in Figure 3.26. From this figure it is not clear how to find an equation that relates \(y\) and \(x\). To solve this problem, take the natural logarithm of each of the \(x\) - and \(y\)-values in the table. This produces the following results.

\[
\begin{align*}
\ln x &= -0.949 - 0.324 - 0.000 - 0.421 + 1.649 + 2.255 \\
\ln y &= -1.423 - 0.486 + 0.000 + 0.632 + 2.473 + 3.383
\end{align*}
\]

Now, by plotting the points in the second table, you can see that all six of the points appear to lie in a line (see Figure 3.27). Choose any two points to determine the slope of the line. Using the two points \((0.421, 0.632)\) and \((0, 0)\), you can determine that the slope of the line is

\[
m = \frac{0.632 - 0}{0.421 - 0} = \frac{1.5}{3} = \frac{3}{2}
\]

By the point-slope form, the equation of the line is \(Y = \frac{3}{2}X\), where \(Y = \ln y\) and \(X = \ln x\). You can therefore conclude that \(\ln y = \frac{3}{2} \ln x\).

Checkpoint Now try Exercise 91.
3.3 EXERCISES

VOCABULARY

In Exercises 1–3, fill in the blanks.

1. To evaluate a logarithm to any base, you can use the ________ formula.
2. The change-of-base formula for base $e$ is given by $\log_e x = \ldots$.
3. You can consider $\log_e x$ to be a constant multiple of $\log_6 x$; the constant multiplier is ________.

In Exercises 4–6, match the property of logarithms with its name.

4. $\log_a (uv) = \log_a u + \log_a v$ (a) Power Property
5. $\ln u^n = n \ln u$ (b) Quotient Property
6. $\log_a \frac{u}{v} = \log_a u - \log_a v$ (c) Product Property

SKILLS AND APPLICATIONS

In Exercises 7–14, rewrite the logarithm as a ratio of (a) common logarithms and (b) natural logarithms.

7. $\log_3 16$ 8. $\log_3 47$
9. $\log_{1/3} x$ 10. $\log_{1/3} x$
11. $\log_{\frac{3}{10}} x$ 12. $\log_{\frac{3}{10}} x$
13. $\log_{2.6} x$ 14. $\log_{2.6} x$

In Exercises 15–22, evaluate the logarithm using the change-of-base formula. Round your result to three decimal places.

15. $\log_3 7$ 16. $\log_3 4$
17. $\log_{1/2} 4$ 18. $\log_{1/2} 5$
19. $\log_{0.1} 0.1$ 20. $\log_{0.20} 0.25$
21. $\log_{0.5} 1250$ 22. $\log_{0.015} 0.015$

In Exercises 23–28, use the properties of logarithms to rewrite and simplify the logarithmic expression.

23. $\log_4 8$ 24. $\log_4 (4^2 \cdot 4^4)$
25. $\log_5 \frac{1}{50}$ 26. $\log_3 \frac{9}{200}$
27. $\ln (5e^6)$ 28. $\ln \frac{6}{e^3}$

In Exercises 29–44, find the exact value of the logarithmic expression without using a calculator. (If this is not possible, state the reason.)

29. $\log_3 9$ 30. $\log_5 \frac{1}{123}$
31. $\log_2 \sqrt[3]{8}$ 32. $\log_6 \sqrt[5]{6}$
33. $\log_4 16^2$ 34. $\log_3 81^{-3}$
35. $\log_2 (-2)$ 36. $\log_5 (-27)$

37. $\ln e^{5.3}$ 38. $\ln e^{3.1}$
39. $\ln \sqrt[3]{e}$ 40. $\ln \sqrt[4]{e}$
41. $\ln e^2 + \ln e^3$ 42. $2 \ln e^5 - \ln e^4$
43. $\log_5 75 - \log_3 3$ 44. $\log_4 2 + \log_4 32$

In Exercises 45–66, use the properties of logarithms to expand the expression as a sum, difference, and/or constant multiple of logarithms. (Assume all variables are positive.)

45. $\ln 4x$ 46. $\log_5 10z$
47. $\log_6 x^4$ 48. $\log_{10} \frac{y}{2}$
49. $\log_5 \frac{5}{x}$ 50. $\log_6 \frac{1}{x}$
51. $\ln \sqrt{2}$ 52. $\ln \sqrt{7}$
53. $\ln \sqrt{xz}$ 54. $\log_4 x^2 y$
55. $\ln (x + 1)^2$, $z > 1$ 56. $\ln \left(\frac{x^2 - 1}{x^3}\right)$, $x > 1$
57. $\log_2 \sqrt{a - 1}$, $a > 1$ 58. $\ln \sqrt{x^2 + 1}$
59. $\ln \sqrt{\frac{a}{y}}$ 60. $\ln \sqrt{\frac{x^2}{y^3}}$
61. $\ln x^2 \sqrt{\frac{y}{z}}$ 62. $\log_2 x^4 \sqrt{\frac{y}{z^3}}$
63. $\log_4 \frac{x^2}{y^2 z^3}$ 64. $\log_{10} x y^4 \sqrt{z}$
65. $\ln \sqrt{x^2(x^2 + 3)}$ 66. $\ln \sqrt{x^2(x + 2)}$
In Exercises 67–84, condense the expression to the logarithm of a single quantity.

67. \( \ln 2 + \ln x \)
68. \( \ln y + \ln t \)
69. \( \log_4 z - \log_4 y \)
70. \( \log_x 8 - \log_x t \)
71. \( 2 \log_3 x + 4 \log_2 y \)
72. \( \frac{1}{2} \log_5 (z - 2) \)
73. \( \frac{1}{3} \log_5 5x \)
74. \(- 4 \log_6 2y \)
75. \( \log x - 2 \log(x + 1) \)
76. \( 2 \ln 8 + 5 \ln(z - 4) \)
77. \( \log x - 2 \log y + 3 \log z \)
78. \( 3 \log_3 x + 4 \log_4 y - 4 \log_3 z \)
79. \( \ln x - [\ln(x + 1) + \ln(x - 1)] \)
80. \( 4[\ln z + \ln(z + 5)] - 2 \ln(z - 5) \)
81. \( \frac{1}{2} [2 \ln(x + 3) + \ln x - \ln(x^2 - 1)] \)
82. \( [3 \ln x - \ln(x + 1) - \ln(x - 1)] \)
83. \( \frac{1}{2} [\log_4 y + 2 \log_4 (y + 4)] - \log_8 (y - 1) \)
84. \( \frac{1}{2} [\log_5 (x + 1) + 2 \log_5 (x - 1)] + 6 \log_4 x \)

In Exercises 85 and 86, compare the logarithmic quantities. If two are equal, explain why.

85. \( \log_2 32 = \log_4 4 \)
86. \( \log_7 \sqrt{70}, \quad \log_5 35, \quad \frac{1}{2} + \log_3 \sqrt{10} \)

**SOUND INTENSITY** In Exercises 87–90, use the following information. The relationship between the number of decibels \( \beta \) and the intensity of a sound \( I \) in watts per square meter is given by

\[
\beta = 10 \log \left( \frac{I}{10^{-12}} \right).
\]

87. Use the properties of logarithms to write the formula in simpler form, and determine the number of decibels of a sound with an intensity of \( 10^{-6} \) watt per square meter.

88. Find the difference in loudness between an average office with an intensity of \( 1.26 \times 10^{-7} \) watt per square meter and a broadcast studio with an intensity of \( 3.16 \times 10^{-10} \) watt per square meter.

89. Find the difference in loudness between a vacuum cleaner with an intensity of \( 10^{-4} \) watt per square meter and rustling leaves with an intensity of \( 10^{-11} \) watt per square meter.

90. You and your roommate are playing your stereos at the same time and at the same intensity. How much louder is the music when both stereos are playing compared with just one stereo playing?

**CURVE FITTING** In Exercises 91–94, find a logarithmic equation that relates \( y \) and \( x \). Explain the steps used to find the equation.

91.

**GALLOPING SPEEDS OF ANIMALS** Four-legged animals run with two different types of motion: trotting and galloping. An animal that is trotting has at least one foot on the ground at all times, whereas an animal that is galloping has all four feet off the ground at some point in its stride. The number of strides per minute at which an animal breaks from a trot to a gallop depends on the weight of the animal. Use the table to find a logarithmic equation that relates an animal’s weight \( x \) (in pounds) and its lowest galloping speed \( y \) (in strides per minute).

97. **COMPARING MODELS** A cup of water at an initial temperature of 78°C is placed in a room at a constant temperature of 21°C. The temperature of the water is measured every 5 minutes during a half-hour period. The results are recorded as ordered pairs of the form \((t, T)\), where \(t\) is the time (in minutes) and \(T\) is the temperature (in degrees Celsius).

\[(0, 78.0\degree), (5, 66.0\degree), (10, 57.5\degree), (15, 51.2\degree), (20, 46.3\degree), (25, 42.4\degree), (30, 39.6\degree)\]

(a) The graph of the model for the data should be asymptotic with the graph of the temperature of the room. Subtract the room temperature from each of the temperatures in the ordered pairs. Use a graphing utility to plot the data points and verify that the result is equivalent to the model in part (b).

(b) An exponential model for the data \((t, T - 21)\) is given by \(T - 21 = 54.4(0.964)^t\). Solve for \(T\) and graph the model. Compare the result with the plot of the original data.

(c) Take the natural logarithms of the revised temperatures. Use a graphing utility to plot the points \((t, \ln(T - 21))\) and observe that the points appear to be linear. Use the regression feature of the graphing utility to fit a line to these data. This resulting line has the form \(\ln(T - 21) = at + b\). Solve for \(T\), and verify that the result is equivalent to the model in part (b).

(d) Fit a rational model to the data. Take the reciprocals of the \(y\)-coordinates of the revised data points to generate the points \((t, \frac{1}{T - 21})\). Use a graphing utility to graph these points and observe that they appear to be linear. Use the regression feature of a graphing utility to fit a line to these data. The resulting line has the form \(\frac{1}{T - 21} = at + b\).

Solve for \(T\), and use a graphing utility to graph the rational function and the original data points.

(e) Why did taking the logarithms of the temperatures lead to a linear scatter plot? Why did taking the reciprocals of the temperatures lead to a linear scatter plot?

**EXPLORATION**

98. **PROOF** Prove that \(\log_b \frac{u}{v} = \log_b u - \log_b v\).

99. **PROOF** Prove that \(\log_b u^n = n \log_b u\).

100. **CAPSTONE** A classmate claims that the following are true.

(a) \(\ln(u + v) = \ln u + \ln v = \ln(uv)\)

(b) \(\ln(u - v) = \ln u - \ln v = \ln \frac{u}{v}\)

(c) \((\ln u)^n = n(\ln u) = \ln u^n\)

Discuss how you would demonstrate that these claims are not true.

**TRUE OR FALSE?** In Exercises 101–106, determine whether the statement is true or false given that \(f(x) = \ln x\). Justify your answer.

101. \(f(0) = 0\)

102. \(f(ax) = f(a) + f(x), \quad a > 0, x > 0\)

103. \(f(x - 2) = f(x) - f(2), \quad x > 2\)

104. \(\sqrt{f(x)} = \frac{1}{2}f(x)\)

105. If \(f(u) = 2f(v)\), then \(v = u^2\).

106. If \(f(x) < 0\), then \(0 < x < 1\).

In Exercises 107–112, use the change-of-base formula to rewrite the logarithm as a ratio of logarithms. Then use a graphing utility to graph the ratio.

107. \(f(x) = \log_2 x\)

108. \(f(x) = \log_4 x\)

109. \(f(x) = \log_{1/2} x\)

110. \(f(x) = \log_{1/4} x\)

111. \(f(x) = \log_{11/3} x\)

112. \(f(x) = \log_{12/3} x\)

113. **THINK ABOUT IT** Consider the functions below.

\[f(x) = \frac{x}{2}, \quad g(x) = \frac{\ln x}{\ln 2}, \quad h(x) = \ln x - \ln 2\]

Which two functions should have identical graphs? Verify your answer by sketching the graphs of all three functions on the same set of coordinate axes.

114. **GRAPHICAL ANALYSIS** Use a graphing utility to graph the functions given by \(y_1 = \ln x - \ln(x - 3)\) and \(y_2 = \ln \frac{x}{x - 3}\) in the same viewing window. Does the graphing utility show the functions with the same domain? If so, should it? Explain your reasoning.

115. **THINK ABOUT IT** For how many integers between 1 and 20 can the natural logarithms be approximated given the values \(\ln 2 = 0.6931, \ln 3 \approx 1.0986\), and \(\ln 5 \approx 1.6094\)? Approximate these logarithms (do not use a calculator).
What you should learn
- Solve simple exponential and logarithmic equations.
- Solve more complicated exponential equations.
- Solve more complicated logarithmic equations.
- Use exponential and logarithmic equations to model and solve real-life problems.

Why you should learn it
Exponential and logarithmic equations are used to model and solve life science applications. For instance, in Exercise 132 on page 253, an exponential function is used to model the number of trees per acre given the average diameter of the trees.

Introduction
So far in this chapter, you have studied the definitions, graphs, and properties of exponential and logarithmic functions. In this section, you will study procedures for solving equations involving these exponential and logarithmic functions.

There are two basic strategies for solving exponential or logarithmic equations. The first is based on the One-to-One Properties and was used to solve simple exponential and logarithmic equations in Sections 3.1 and 3.2. The second is based on the Inverse Properties. For and the following properties are true for all and for which and are defined.

One-to-One Properties
\[ a^x = a^y \text{ if and only if } x = y. \]
\[ \log_a x = \log_a y \text{ if and only if } x = y. \]

Inverse Properties
\[ a^{\log_a x} = x \]
\[ \log_a a^x = x \]

Example 1 Solving Simple Equations

Strategies for Solving Exponential and Logarithmic Equations
1. Rewrite the original equation in a form that allows the use of the One-to-One Properties of exponential or logarithmic functions.
2. Rewrite an exponential equation in logarithmic form and apply the Inverse Property of logarithmic functions.
3. Rewrite a logarithmic equation in exponential form and apply the Inverse Property of exponential functions.

The strategies used in Example 1 are summarized as follows.
Solving Exponential Equations

Example 2

Solving Exponential Equations

Solve each equation and approximate the result to three decimal places, if necessary.

a. \(e^{-x^2} = e^{-3x - 4}\)

b. \(3(2^x) = 42\)

Solution

a. 
\[
e^{-x^2} = e^{-3x - 4}
\]

Write original equation.

\[-x^2 = -3x - 4\]

One-to-One Property

Write in general form.

\[x^2 + 3x + 4 = 0\]

Factor.

\[(x + 1)(x - 4) = 0\]

Set 1st factor equal to 0.

\[x + 1 = 0 \implies x = -1\]

Set 2nd factor equal to 0.

The solutions are \(x = -1\) and \(x = 4\). Check these in the original equation.

b. 
\[
3(2^x) = 42
\]

Write original equation.

\[
2^x = 14
\]

Divide each side by 3.

\[
\log_2 2^x = \log_2 14
\]

Take log (base 2) of each side.

\[
x = \log_2 14
\]

Inverse Property

\[
x = \frac{\ln 14}{\ln 2} \approx 3.807
\]

Change-of-base formula

The solution is \(x = \log_2 14 \approx 3.807\). Check this in the original equation.

Example 3

Solving an Exponential Equation

Solve \(e^x + 5 = 60\) and approximate the result to three decimal places.

Solution

\[
e^x + 5 = 60
\]

Write original equation.

\[
e^x = 55
\]

Subtract 5 from each side.

\[
\ln e^x = \ln 55
\]

Take natural log of each side.

\[
x = \ln 55 \approx 4.007
\]

Inverse Property

The solution is \(x = \ln 55 \approx 4.007\). Check this in the original equation.

CHECK POINT

Now try Exercise 55.
Example 4 Solving an Exponential Equation

Solve \(2(3^{2t-5}) - 4 = 11\) and approximate the result to three decimal places.

\[
\begin{align*}
2(3^{2t-5}) - 4 &= 11 & \text{Write original equation.} \\
2(3^{2t-5}) &= 15 & \text{Add 4 to each side.} \\
3^{2t-5} &= \frac{15}{2} & \text{Divide each side by 2.} \\
\log_3 3^{2t-5} &= \log_3 \frac{15}{2} & \text{Take log (base 3) of each side.} \\
2t - 5 &= \log_3 \frac{15}{2} & \text{Inverse Property} \\
2t &= 5 + \log_3 7.5 & \text{Add 5 to each side.} \\
t &= \frac{5}{2} + \frac{1}{2} \log_3 7.5 & \text{Divide each side by 2.} \\
t &\approx 3.417 & \text{Use a calculator.}
\end{align*}
\]

The solution is \(t = \frac{5}{2} + \frac{1}{2} \log_3 7.5 \approx 3.417\). Check this in the original equation.

Now try Exercise 57.

**Study Tip**

Remember that to evaluate a logarithm such as \(\log_3 7.5\), you need to use the change-of-base formula.

\[
\log_3 7.5 = \frac{\ln 7.5}{\ln 3} \approx 1.834
\]

Example 5 Solving an Exponential Equation of Quadratic Type

Solve \(e^{2x} - 3e^x + 2 = 0\).

**Algebraic Solution**

\[
\begin{align*}
e^{2x} - 3e^x + 2 &= 0 & \text{Write original equation.} \\
(e^x)^2 - 3e^x + 2 &= 0 & \text{Write in quadratic form.} \\
(e^x - 2)(e^x - 1) &= 0 & \text{Factor.} \\
e^x - 2 &= 0 & \text{Set 1st factor equal to 0.} \\
x &= \ln 2 & \text{Solution} \\
e^x - 1 &= 0 & \text{Set 2nd factor equal to 0.} \\
x &= 0 & \text{Solution}
\end{align*}
\]

The solutions are \(x = \ln 2 \approx 0.693\) and \(x = 0\). Check these in the original equation.

**Graphical Solution**

Use a graphing utility to graph \(y = e^{2x} - 3e^x + 2\). Use the zero or root feature or the zoom and trace features of the graphing utility to approximate the values of \(x\) for which \(y = 0\). In Figure 3.28, you can see that the zeros occur at \(x = 0\) and at \(x = 0.693\). So, the solutions are \(x = 0\) and \(x \approx 0.693\).

![Figure 3.28](image)
Solving Logarithmic Equations

To solve a logarithmic equation, you can write it in exponential form.

\[ \ln x = 3 \]

\[ e^{\ln x} = e^3 \]

\[ x = e^3 \]

This procedure is called exponentiating each side of an equation.

**Example 6** Solving Logarithmic Equations

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example 7** Solving a Logarithmic Equation

Solve \( 5 + 2 \ln x = 4 \) and approximate the result to three decimal places.

**Algebraic Solution**

\[ 5 + 2 \ln x = 4 \]

Write original equation.

\[ 2 \ln x = -1 \]

Subtract 5 from each side.

\[ \ln x = -\frac{1}{2} \]

Divide each side by 2.

\[ e^{\ln x} = e^{-1/2} \]

Exponentiate each side.

\[ x = e^{-1/2} \]

Inverse Property

\[ x \approx 0.607 \]

Use a calculator.

**Graphical Solution**

Use a graphing utility to graph \( y_1 = 5 + 2 \ln x \) and \( y_2 = 4 \) in the same viewing window. Use the **intersect** feature or the **zoom** and **trace** features to approximate the intersection point, as shown in Figure 3.29. So, the solution is \( x \approx 0.607 \).

![Figure 3.29](image)
Example 8  Solving a Logarithmic Equation

Solve $2 \log_5 3x = 4$.

Solution

\[
2 \log_5 3x = 4 \\
\log_5 3x = 2 \\
5 \log_5 3x = 5^2 \\
3x = 25 \\
x = \frac{25}{3}
\]

The solution is $x = \frac{25}{3}$. Check this in the original equation.

Example 9  Checking for Extraneous Solutions

Solve $\log 5x + \log(x - 1) = 2$.

Algebraic Solution

\[
\log 5x + \log(x - 1) = 2 \\
\log[5x(x - 1)] = 2 \\
10^{\log 5x(x - 1)} = 10^2 \\
5x(x - 1) = 100 \\
x^2 - x - 20 = 0 \\
(x - 5)(x + 4) = 0 \\
x - 5 = 0 \\
x = 5 \quad \text{Solution} \\
x + 4 = 0 \\
x = -4 \quad \text{Solution}
\]

The solutions appear to be $x = 5$ and $x = -4$. However, when you check these in the original equation, you can see that $x = 5$ is the only solution.

Graphical Solution

Use a graphing utility to graph $y_1 = \log 5x + \log(x - 1)$ and $y_2 = 2$ in the same viewing window. From the graph shown in Figure 3.30, it appears that the graphs intersect at one point. Use the intersect feature or the zoom and trace features to determine that the graphs intersect at approximately $(5, 2)$. So, the solution is $x = 5$. Verify that 5 is an exact solution algebraically.

In Example 9, the domain of $\log 5x$ is $x > 0$ and the domain of $\log(x - 1)$ is $x > 1$, so the domain of the original equation is $x > 1$. Because the domain is all real numbers greater than 1, the solution $x = -4$ is extraneous. The graph in Figure 3.30 verifies this conclusion.
Applications

Example 10  Doubling an Investment

You have deposited $500 in an account that pays 6.75% interest, compounded continuously. How long will it take your money to double?

Solution

Using the formula for continuous compounding, you can find that the balance in the account is

\[ A = P e^{rt} \]

\[ A = 500e^{0.0675t}. \]

To find the time required for the balance to double, let \( A = 1000 \) and solve the resulting equation for \( t \).

\[
\begin{align*}
500e^{0.0675t} &= 1000 & \text{Let } A = 1000. \\
e^{0.0675t} &= 2 & \text{Divide each side by } 500. \\
\ln e^{0.0675t} &= \ln 2 & \text{Take natural log of each side.} \\
0.0675t &= \ln 2 & \text{Inverse Property} \\
t &= \frac{\ln 2}{0.0675} & \text{Divide each side by } 0.0675. \\
t &= 10.27 & \text{Use a calculator.}
\end{align*}
\]

The balance in the account will double after approximately 10.27 years. This result is demonstrated graphically in Figure 3.31.

![Figure 3.31](image)

In Example 10, an approximate answer of 10.27 years is given. Within the context of the problem, the exact solution, \((\ln 2)/0.0675\) years, does not make sense as an answer.
Example 11 Retail Sales

The retail sales $y$ (in billions) of e-commerce companies in the United States from 2002 through 2007 can be modeled by

$$y = -549 + 236.7 \ln t, \quad 12 \leq t \leq 17$$

where $t$ represents the year, with $t = 12$ corresponding to 2002 (see Figure 3.32). During which year did the sales reach $108$ billion? 

(Source: U.S. Census Bureau)

Solution

Write original equation.

$$-549 + 236.7 \ln t = y$$

Substitute $108$ for $y$.

$$-549 + 236.7 \ln t = 108$$

Add 549 to each side.

$$236.7 \ln t = 657$$

Divide each side by 236.7.

$$\ln t = \frac{657}{236.7}$$

Exponentiate each side.

$$e^{\ln t} = e^{657/236.7}$$

Inverse Property

$$t = 657/236.7$$

Use a calculator.

$$t = 16$$

The solution is $t = 16$. Because $t = 12$ represents 2002, it follows that the sales reached $108$ billion in 2006.

CHECK POINT Now try Exercise 133.

Classroom Discussion

Analyzing Relationships Numerically Use a calculator to fill in the table row-by-row. Discuss the resulting pattern. What can you conclude? Find two equations that summarize the relationships you discovered.
3.4 **EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. To ________ an equation in \( x \) means to find all values of \( x \) for which the equation is true.
2. To solve exponential and logarithmic equations, you can use the following One-to-One and Inverse Properties.
   (a) \( a^x = a^y \) if and only if ________.
   (b) \( \log_a x = \log_a y \) if and only if ________.
   (c) \( a^{\log_a x} = \) ________
   (d) \( \log_a a^x = \) ________
3. To solve exponential and logarithmic equations, you can use the following strategies.
   (a) Rewrite the original equation in a form that allows the use of the ________ Properties of exponential or logarithmic functions.
   (b) Rewrite an exponential equation in ________ form and apply the Inverse Property of ________ functions.
   (c) Rewrite a logarithmic equation in ________ form and apply the Inverse Property of ________ functions.
4. An ________ solution does not satisfy the original equation.

**SKILLS AND APPLICATIONS**

In Exercises 5–12, determine whether each \( x \)-value is a solution (or an approximate solution) of the equation.

5. \( 4^{2x-7} = 64 \) 
   (a) \( x = 5 \) 
   (b) \( x = 2 \) 
5. \( 2^{3x+1} = 32 \) 
   (a) \( x = -1 \) 
   (b) \( x = 2 \) 
7. \( 3e^{x+2} = 75 \) 
   (a) \( x = -2 + e^{25} \) 
   (b) \( x = -2 + \ln 25 \) 
   (c) \( x \approx 1.219 \) 
8. \( 4^{x-1} = 60 \) 
   (a) \( x = 1 + \ln 15 \) 
   (b) \( x \approx 3.7081 \) 
   (c) \( x = \ln 16 \) 

9. \( \log_4(3x) = 3 \) 
   (a) \( x \approx 21.333 \) 
   (b) \( x = -4 \) 
   (c) \( x = \frac{64}{3} \) 
10. \( \log_2(x + 3) = 10 \) 
    (a) \( x = 1021 \) 
    (b) \( x = 17 \) 
    (c) \( x = 10^2 - 3 \) 

11. \( \ln(2x + 3) = 5.8 \) 
    (a) \( x = \frac{1}{2}(-3 + \ln 5.8) \) 
    (b) \( x = \frac{1}{2}(-3 + e^{5.8}) \) 
    (c) \( x \approx 163.650 \) 
12. \( \ln(x - 1) = 3.8 \) 
    (a) \( x = 1 + e^{3.8} \) 
    (b) \( x = 45.701 \) 
    (c) \( x = 1 + \ln 3.8 \) 

In Exercises 13–24, solve for \( x \).

13. \( 4^x = 16 \) 
14. \( 3^x = 243 \) 
15. \( \left(\frac{1}{2}\right)^x = 32 \) 
16. \( \left(\frac{1}{3}\right)^x = 64 \) 
17. \( \ln x - \ln 2 = 0 \) 
18. \( \ln x - \ln 5 = 0 \) 
19. \( e^x = 2 \) 
20. \( e^x = e \) 
21. \( \ln x = -1 \) 
22. \( \log_2 x = -2 \) 
23. \( \log_4 x = 3 \) 
24. \( \log_2 x = \frac{1}{2} \) 

In Exercises 25–28, approximate the point of intersection of the graphs of \( f \) and \( g \). Then solve the equation \( f(x) = g(x) \) algebraically to verify your approximation.

25. \( f(x) = 2^x \) 
   \( g(x) = 8 \) 
26. \( f(x) = 27^x \) 
   \( g(x) = 9 \) 
27. \( f(x) = \log_3 x \) 
   \( g(x) = 2 \) 
28. \( f(x) = \ln(x - 4) \) 
   \( g(x) = 0 \) 

In Exercises 29–70, solve the exponential equation algebraically. Approximate the result to three decimal places.

29. \( e^x = e^{x^2} - 2 \) 
30. \( e^x = e^{x^2} - 8 \) 
31. \( e^{x^2} - 3 = e^x - 2 \) 
32. \( e^{-x} = e^{x^2} - 2x \) 
33. \( 4(3^x) = 20 \) 
34. \( 2(5^x) = 32 \) 
35. \( 2e^x = 10 \) 
36. \( 4e^x = 91 \) 
37. \( e^x - 9 = 19 \) 
38. \( 6^x + 10 = 47 \) 
39. \( 3^{2x} = 80 \) 
40. \( 6^{2x} = 3000 \) 
41. \( 5^{-x/2} = 0.20 \) 
42. \( 4^{-3x} = 0.10 \) 
43. \( 3^{x-1} = 27 \) 
44. \( 2^{x-3} = 32 \) 
45. \( 2^{3-x} = 565 \) 
46. \( 8^{2-x} = 431 \)
102. \(5(10^{x-6}) = 7\)

47. \(8(10^{\frac{x}{2}}) = 12\)  
49. \(3(5^{x-1}) = 21\)  
51. \(e^{3x} = 12\)  
53. \(500e^{-x} = 300\)  
55. \(7 - 2e^x = 5\)  
57. \(6(2^{x-7}) - 7 = 9\)  
59. \(e^{2x} - 4e^x - 5 = 0\)  
61. \(e^{2x} - 3e^x - 4 = 0\)

63. \(\frac{500}{100 - e^{x/2}} = 20\)

65. \(\frac{3000}{x + e^{2x}} = 2\)

67. \(1 + \frac{0.065x}{365t} = 4\)

69. \(1 + \frac{0.10x}{12t} = 2\)

71. \(7 = 2^x\)

73. \(6e^{-x} = 25\)

75. \(3e^{3x/2} = 962\)

77. \(e^{0.09t} = 3\)

79. \(e^{0.125t} - 8 = 0\)

104. \(\ln(x + 1) - \ln(x - 2) = \ln x\)

105. \(\log_2(2x - 3) = \log_2(x + 4)\)

106. \(\log(3x + 4) = \log(x - 10)\)

107. \(\log(x + 4) - \log x = \log(x + 2)\)

108. \(\log x + \log_x(x + 2) = \log_2(x + 6)\)

109. \(\log_4 x - \log_4(x - 1) = \frac{1}{2}\)

110. \(\log_3 x + \log_3(x - 8) = 2\)

111. \(\log 8x - \log(1 + \sqrt{x}) = 2\)

112. \(\log 4x - \log(12 + \sqrt{x}) = 2\)

In Exercises 71–80, use a graphing utility to graph and solve the equation. Approximate the result to three decimal places. Verify your result algebraically.

71. \(7 = 2^x\)

73. \(6e^{-x} = 25\)

75. \(3e^{3x/2} = 962\)

77. \(e^{0.09t} = 3\)

79. \(e^{0.125t} - 8 = 0\)

In Exercises 81–112, solve the logarithmic equation algebraically. Approximate the result to three decimal places.

81. \(\ln x = -3\)

83. \(\ln x - 7 = 0\)

85. \(\ln 2x = 2.4\)

87. \(\log x = 6\)

89. \(3 \ln 5x = 10\)

91. \(\ln \sqrt{x + 2} = 1\)

93. \(7 + 3 \ln x = 5\)

94. \(2 - 6 \ln x = 10\)

95. \(-2 + 2 \ln 3x = 17\)

96. \(2 + 3 \ln x = 12\)

97. \(6 \log_2(0.5x) = 11\)

98. \(4 \log(x - 6) = 11\)

99. \(\ln x - \ln(x + 1) = 2\)

100. \(\ln x + \ln(x + 1) = 1\)

101. \(\ln x + \ln(x - 2) = 1\)

102. \(\ln x + \ln(x + 3) = 1\)

103. \(\ln(x + 5) = \ln(x - 1) - \ln(x + 1)\)

In Exercises 113–116, use a graphing utility to graph and solve the equation. Approximate the result to three decimal places. Verify your result algebraically.

113. \(3 - \ln x = 0\)

115. \(2 \ln(x + 3) = 3\)

117. \(r = 0.05\)

119. \(r = 0.025\)

121. \(2x^2e^{2x} + 2xe^{2x} = 0\)

123. \(-xe^{-x} + e^{-x} = 0\)

125. \(2x \ln x + x = 0\)

127. \(\frac{1 + \ln x}{2} = 0\)

128. \(2x \ln \left(\frac{1}{x}\right) - x = 0\)

129. **Demand** The demand equation for a limited edition coin set is

\[ p = 1000\left(1 - \frac{5}{5 - x}\right) \]

Find the demand \(x\) for a price of (a) \(p = 139.50\) and (b) \(p = 99.99\).

130. **Demand** The demand equation for a hand-held electronic organizer is

\[ p = 5000\left(1 - \frac{4}{4 + e^{-0.002x}}\right) \]

Find the demand \(x\) for a price of (a) \(p = 600\) and (b) \(p = 400\).
131. **FOREST YIELD**  The yield $V$ (in millions of cubic feet per acre) for a forest at age $t$ years is given by  

$$V = 6.7e^{-48.1t}.$$  

(a) Use a graphing utility to graph the function.  

(b) Determine the horizontal asymptote of the function. Interpret its meaning in the context of the problem.  

(c) Find the time necessary to obtain a yield of 1.3 million cubic feet.

132. **TREES PER ACRE**  The number $N$ of trees of a given species per acre is approximated by the model  

$$N = 68(10^{-0.03x}), \ 5 \leq x \leq 40,$$  

where $x$ is the average diameter of the trees (in inches) 3 feet above the ground. Use the model to approximate the average diameter of the trees in a test plot when $N = 21$.

133. **U.S. CURRENCY**  The values (in billions of dollars) of U.S. currency in circulation in the years 2000 through 2007 can be modeled by  

$$y = -451 + 444 \ln t, \ 10 \leq t \leq 17,$$  

where $t$ represents the year, with $t = 10$ corresponding to 2000. During which year did the value of U.S. currency in circulation exceed $690 billion? (Source: Board of Governors of the Federal Reserve System)

134. **MEDICINE**  The numbers $y$ of freestanding ambulatory care surgery centers in the United States from 2000 through 2007 can be modeled by  

$$y = 2875 + \frac{2635.11}{1 + 14.215e^{-0.8038t}}, \ 0 \leq t \leq 7,$$  

where $t$ represents the year, with $t = 0$ corresponding to 2000. (Source: Verispan)  

(a) Use a graphing utility to graph the model.  

(b) Use the trace feature of the graphing utility to estimate the year in which the number of surgery centers exceeded 3600.

135. **AVERAGE HEIGHTS**  The percent $m$ of American males between the ages of 18 and 24 who are no more than $x$ inches tall is modeled by  

$$m(x) = \frac{100}{1 + e^{-0.6114(x-69.71)}}$$  

and the percent $f$ of American females between the ages of 18 and 24 who are no more than $x$ inches tall is modeled by  

$$f(x) = \frac{100}{1 + e^{-0.66607(x-64.51)}}$$  

(Source: U.S. National Center for Health Statistics)  

(a) Use the graph to determine any horizontal asymptotes of the graphs of the functions. Interpret the meaning in the context of the problem.

(b) What is the average height of each sex?

136. **LEARNING CURVE**  In a group project in learning theory, a mathematical model for the proportion $P$ of correct responses after $n$ trials was found to be  

$$P = \frac{0.83}{1 + e^{-0.2n}}.$$  

(a) Use a graphing utility to graph the function.  

(b) Use the graph to determine any horizontal asymptotes of the graph of the function. Interpret the meaning of the upper asymptote in the context of this problem.  

(c) After how many trials will 60% of the responses be correct?

137. **AUTOMOBILES**  Automobiles are designed with crumple zones that help protect their occupants in crashes. The crumple zones allow the occupants to move short distances when the automobiles come to abrupt stops. The greater the distance moved, the fewer g’s the crash victims experience. (One g is equal to the acceleration due to gravity. For very short periods of time, humans have withstood as much as 40 g’s.) In crash tests with vehicles moving at 90 kilometers per hour, analysts measured the numbers of g’s experienced during deceleration by crash dummies that were permitted to move $x$ meters during impact. The data are shown in the table. A model for the data is given by  

$$y = -3.00 + 11.88 \ln x + (36.94/x),$$  

where $y$ is the number of g’s.

<table>
<thead>
<tr>
<th>$x$</th>

<td>32</td>
</tr>
</tbody>
</table>

(a) Complete the table using the model.
(b) Use a graphing utility to graph the data points and
the model in the same viewing window. How do
they compare?
(c) Use the model to estimate the distance traveled
during impact if the passenger deceleration must
not exceed 30 g’s.
(d) Do you think it is practical to lower the number of
g’s experienced during impact to fewer than 23?
Explain your reasoning.

138. DATA ANALYSIS An object at a temperature of
160°C was removed from a furnace and placed in a
room at 20°C. The temperature $T$ of the object was
measured each hour $h$ and recorded in the table. A
model for the data is given by
$$T = 20[1 + 7(2^{-h})].$$
The graph of this model is shown in the figure.

<table>
<thead>
<tr>
<th>Hour, $h$</th>
<th>Temperature, $T$</th>

</tbody>
</table>

(a) Use the graph to identify the horizontal asymptote
of the model and interpret the asymptote in
the context of the problem.
(b) Use the model to approximate the time when the
temperature of the object was 100°C.

EXPLORATION

TRUE OR FALSE? In Exercises 139–142, rewrite each
verbal statement as an equation. Then decide whether the
statement is true or false. Justify your answer.

139. The logarithm of the product of two numbers is equal
to the sum of the logarithms of the numbers.

140. The logarithm of the sum of two numbers is equal
to the product of the logarithms of the numbers.

141. The logarithm of the difference of two numbers is
equal to the difference of the logarithms of the numbers.

142. The logarithm of the quotient of two numbers is equal
to the difference of the logarithms of the numbers.

143. THINK ABOUT IT Is it possible for a logarithmic
equation to have more than one extraneous solution?
Explain.

144. FINANCE You are investing $P$ dollars at an annual
interest rate of $r$, compounded continuously, for $t$ years. Which of the following would result in the highest
value of the investment? Explain your reasoning.
(a) Double the amount you invest.
(b) Double your interest rate.
(c) Double the number of years.

145. THINK ABOUT IT Are the times required for the
investments in Exercises 117–120 to quadruple twice
as long as the times for them to double? Give a reason
for your answer and verify your answer algebraically.

146. The effective yield of a savings plan is the percent
increase in the balance after 1 year. Find the effective
yield for each savings plan when $1000 is deposited in
a savings account. Which savings plan will have the
highest balance after 5 years?
(a) 7% annual interest rate, compounded annually
(b) 7% annual interest rate, compounded continuously
(c) 7% annual interest rate, compounded quarterly
(d) 7.25% annual interest rate, compounded quarterly

147. GRAPHICAL ANALYSIS Let $f(x) = \log_a x$ and
g($x$) = $a^x$, where $a > 1$.
(a) Let $a = 1.2$ and use a graphing utility to graph the
two functions in the same viewing window. What
do you observe? Approximate any points of
intersection of the two graphs.
(b) Determine the value(s) of $a$ for which the two
degraps have one point of intersection.
(c) Determine the value(s) of $a$ for which the two
degraps have two points of intersection.

148. CAPSTONE Write two or three sentences stating
the general guidelines that you follow when solving
(a) exponential equations and (b) logarithmic
equations.
**What you should learn**

- Recognize the five most common types of models involving exponential and logarithmic functions.
- Use exponential growth and decay functions to model and solve real-life problems.
- Use Gaussian functions to model and solve real-life problems.
- Use logistic growth functions to model and solve real-life problems.
- Use logarithmic functions to model and solve real-life problems.

**Why you should learn it**

Exponential growth and decay models are often used to model the populations of countries. For instance, in Exercise 44 on page 263, you will use exponential growth and decay models to compare the populations of several countries.

---

**Introduction**

The five most common types of mathematical models involving exponential functions and logarithmic functions are as follows.

1. **Exponential growth model:** \( y = a e^{bx}, \ b > 0 \)
2. **Exponential decay model:** \( y = a e^{-bx}, \ b > 0 \)
3. **Gaussian model:** \( y = ae^{-(x-b)^2/c} \)
4. **Logistic growth model:** \( y = \frac{a}{1 + be^{-rx}} \)
5. **Logarithmic models:** \( y = a + b \ln x, \ y = a + b \log x \)

The basic shapes of the graphs of these functions are shown in Figure 3.33.

---

You can often gain quite a bit of insight into a situation modeled by an exponential or logarithmic function by identifying and interpreting the function’s asymptotes. Use the graphs in Figure 3.33 to identify the asymptotes of the graph of each function.
Exponential Growth and Decay

Example 1  Online Advertising

Estimates of the amounts (in billions of dollars) of U.S. online advertising spending from 2007 through 2011 are shown in the table. A scatter plot of the data is shown in Figure 3.34. (Source: eMarketer)

<table>
<thead>
<tr>
<th>Year</th>
<th>Advertising spending</th>
</tr>
</thead>
<tbody>
<tr>
<td>2007</td>
<td>21.1</td>
</tr>
<tr>
<td>2008</td>
<td>23.6</td>
</tr>
<tr>
<td>2009</td>
<td>25.7</td>
</tr>
<tr>
<td>2010</td>
<td>28.5</td>
</tr>
<tr>
<td>2011</td>
<td>32.0</td>
</tr>
</tbody>
</table>

An exponential growth model that approximates these data is given by $S = 10.33e^{0.1022t}$, $7 \leq t \leq 11$, where $S$ is the amount of spending (in billions) and $t = 7$ represents 2007. Compare the values given by the model with the estimates shown in the table. According to this model, when will the amount of U.S. online advertising spending reach $40$ billion?

Algebraic Solution

The following table compares the two sets of advertising spending figures.

<table>
<thead>
<tr>
<th>Year</th>
<th>2007</th>
<th>2008</th>
<th>2009</th>
<th>2010</th>
<th>2011</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>21.1</td>
<td>23.4</td>
<td>25.9</td>
<td>28.7</td>
<td>31.8</td>
</tr>
</tbody>
</table>

To find when the amount of U.S. online advertising spending will reach $40$ billion, let $S = 40$ in the model and solve for $t$.

1. $10.33e^{0.1022t} = S$
2. $10.33e^{0.1022t} = 40$
3. $e^{0.1022t} \approx 3.8722$
4. $\ln e^{0.1022t} = \ln 3.8722$
5. $0.1022t \approx 1.3538$
6. $t \approx 13.2$

According to the model, the amount of U.S. online advertising spending will reach $40$ billion in 2013.

Graphical Solution

Use a graphing utility to graph the model $y = 10.33e^{0.1022x}$ and the data in the same viewing window. You can see in Figure 3.35 that the model appears to fit the data closely.

According to the model, the amount of U.S. online advertising spending will reach $40$ billion in 2013.

Now try Exercise 43.

TECHNOLOGY

Some graphing utilities have an exponential regression feature that can be used to find exponential models that represent data. If you have such a graphing utility, try using it to find an exponential model for the data given in Example 1. How does your model compare with the model given in Example 1?
In Example 1, you were given the exponential growth model. But suppose this model were not given; how could you find such a model? One technique for doing this is demonstrated in Example 2.

**Example 2** Modeling Population Growth

In a research experiment, a population of fruit flies is increasing according to the law of exponential growth. After 2 days there are 100 flies, and after 4 days there are 300 flies. How many flies will there be after 5 days?

**Solution**

Let $y$ be the number of flies at time $t$. From the given information, you know that $y = 100$ when $t = 2$ and $y = 300$ when $t = 4$. Substituting this information into the model $y = ae^{bt}$ produces

$$
100 = ae^{2b} \quad \text{and} \quad 300 = ae^{4b}.
$$

To solve for $b$, solve for $a$ in the first equation.

$$
100 = ae^{2b} \quad \Rightarrow \quad a = \frac{100}{e^{2b}} \quad \text{Solve for } a \text{ in the first equation.}
$$

Then substitute the result into the second equation.

$$
300 = \left( \frac{100}{e^{2b}} \right) e^{4b} \quad \Rightarrow \quad \frac{300}{100} = e^{2b} \quad \text{Write second equation.}
$$

$$
\frac{300}{100} = e^{2b} \quad \Rightarrow \quad \frac{300}{100} = e^{2b} \quad \text{Substitute } \frac{100}{e^{2b}} \text{ for } a.
$$

$$
\ln 3 = 2b \quad \Rightarrow \quad \frac{1}{2} \ln 3 = b \quad \text{Divide each side by } 100.
$$

Using $b = \frac{1}{2} \ln 3$ and the equation you found for $a$, you can determine that

$$
a = \frac{100}{e^{2\left(\frac{1}{2} \ln 3\right)}} \quad \Rightarrow \quad a = \frac{100}{e^{\ln 3}} \quad \text{Substitute } \frac{1}{2} \ln 3 \text{ for } b.
$$

$$
\approx 33.33. \quad \text{Simplify.}
$$

$$
\Rightarrow \quad \frac{100}{3} \quad \text{Inverse Property}
$$

So, with $a \approx 33.33$ and $b = \frac{1}{2} \ln 3 = 0.5493$, the exponential growth model is

$$
y = 33.33e^{0.5493t}
$$

as shown in Figure 3.36. This implies that, after 5 days, the population will be

$$
y = 33.33e^{0.5493(5)} \approx 520 \text{ flies.}
$$

Now try Exercise 49.
In living organic material, the ratio of the number of radioactive carbon isotopes (carbon 14) to the number of nonradioactive carbon isotopes (carbon 12) is about 1 to 10^{12}. When organic material dies, its carbon 12 content remains fixed, whereas its radioactive carbon 14 begins to decay with a half-life of about 5700 years. To estimate the age of dead organic material, scientists use the following formula, which denotes the ratio of carbon 14 to carbon 12 present at any time $t$ (in years).

$$
R = \frac{1}{10^{12}} e^{-t/8223}
$$

The graph of $R$ is shown in Figure 3.37. Note that $R$ decreases as $t$ increases.

**Example 3**  
Carbon Dating

Estimate the age of a newly discovered fossil in which the ratio of carbon 14 to carbon 12 is

$$
R = \frac{1}{10^{13}}.
$$

**Algebraic Solution**

In the carbon dating model, substitute the given value of $R$ to obtain the following.

$$
\frac{1}{10^{12}} e^{-t/8223} = R
$$

Write original model.

$$
\frac{e^{-t/8223}}{10^{12}} = \frac{1}{10^{13}}
$$

Let $R = \frac{1}{10^{13}}$.

$$
e^{-t/8223} = \frac{1}{10}
$$

Multiply each side by $10^{12}$.

$$
\ln e^{-t/8223} = \ln \frac{1}{10}
$$

Take natural log of each side.

$$
\frac{-t}{8223} \approx -2.3026
$$

Inverse Property

$$
t \approx 18,934
$$

Multiply each side by $-8223$.

So, to the nearest thousand years, the age of the fossil is about 19,000 years.

**Graphical Solution**

Use a graphing utility to graph the formula for the ratio of carbon 14 to carbon 12 at any time $t$ as

$$
R = \frac{1}{10^{12}} e^{-t/8223}
$$

In the same viewing window, graph $y_2 = 1/(10^{13})$. Use the intersect feature or the zoom and trace features of the graphing utility to estimate that $x \approx 18,934$ when $y = 1/(10^{13})$, as shown in Figure 3.38.

So, to the nearest thousand years, the age of the fossil is about 19,000 years.

**CHECKPOINT**

Now try Exercise 51.

The value of $b$ in the exponential decay model $y = ae^{-br}$ determines the decay of radioactive isotopes. For instance, to find how much of an initial 10 grams of $^{226}$Ra isotope with a half-life of 1599 years is left after 500 years, substitute this information into the model $y = ae^{-br}$:

$$
\frac{1}{2}(10) = 10e^{-b(1599)} \quad \Rightarrow \quad \ln \frac{1}{2} = -1599b \quad \Rightarrow \quad b = -\frac{\ln \frac{1}{2}}{1599}
$$

Using the value of $b$ found above and $a = 10$, the amount left is

$$
y = 10e^{-(-\ln(1/2)/1599)(500)} \approx 8.05 \text{ grams}.
$$
Gaussian Models

As mentioned at the beginning of this section, Gaussian models are of the form

\[ y = ae^{-(x-b)^2/c}. \]

This type of model is commonly used in probability and statistics to represent populations that are **normally distributed**. The graph of a Gaussian model is called a **bell-shaped curve**. Try graphing the normal distribution with a graphing utility. Can you see why it is called a bell-shaped curve?

For **standard** normal distributions, the model takes the form

\[ y = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}. \]

The **average value** of a population can be found from the bell-shaped curve by observing where the maximum y-value of the function occurs. The x-value corresponding to the maximum y-value of the function represents the average value of the independent variable—in this case, \( x \).

**Example 4  SAT Scores**

In 2008, the Scholastic Aptitude Test (SAT) math scores for college-bound seniors roughly followed the normal distribution given by

\[ y = 0.0034e^{-(x-515)^2/26.912}, \quad 200 \leq x \leq 800 \]

where \( x \) is the SAT score for mathematics. Sketch the graph of this function. From the graph, estimate the average SAT score.  
(Source: College Board)

**Solution**

The graph of the function is shown in Figure 3.39. On this bell-shaped curve, the maximum value of the curve represents the average score. From the graph, you can estimate that the average mathematics score for college-bound seniors in 2008 was 515.

![Figure 3.39](image)

**CHECK Point** Now try Exercise 57.
Logistic Growth Models

Some populations initially have rapid growth, followed by a declining rate of growth, as indicated by the graph in Figure 3.40. One model for describing this type of growth pattern is the logistic curve given by the function

\[ y = \frac{a}{1 + be^{-rx}} \]

where \( y \) is the population size and \( x \) is the time. An example is a bacteria culture that is initially allowed to grow under ideal conditions, and then under less favorable conditions that inhibit growth. A logistic growth curve is also called a sigmoidal curve.

Example 5  
Spread of a Virus

On a college campus of 5000 students, one student returns from vacation with a contagious and long-lasting flu virus. The spread of the virus is modeled by

\[ y = \frac{5000}{1 + 4999e^{-0.8t}}, \quad t \geq 0 \]

where \( y \) is the total number of students infected after \( t \) days. The college will cancel classes when 40% or more of the students are infected.

a. How many students are infected after 5 days?

Graphical Solution

a. Use a graphing utility to graph \( y = \frac{5000}{1 + 4999e^{-0.8t}} \). Use the \textit{value} feature or the \textit{zoom} and \textit{trace} features of the graphing utility to estimate that \( y \approx 54 \) when \( x = 5 \). So, after 5 days, about 54 students will be infected.

b. Classes are canceled when the number of infected students is \( (0.40)(5000) = 2000 \). Use a graphing utility to graph

\[ y_1 = \frac{5000}{1 + 4999e^{-0.8t}} \text{ and } y_2 = 2000 \]

in the same viewing window. Use the \textit{intersect} feature or the \textit{zoom} and \textit{trace} features of the graphing utility to find the point of intersection of the graphs. In Figure 3.41, you can see that the point of intersection occurs near \( x \approx 10.1 \). So, after about 10 days, at least 40% of the students will be infected, and the college will cancel classes.

**CHECKPOINT**  
Now try Exercise 59.
Logarithmic Models

Example 6  Magnitudes of Earthquakes

On the Richter scale, the magnitude $R$ of an earthquake of intensity $I$ is given by

$$R = \log \frac{I}{I_0}$$

where $I_0 = 1$ is the minimum intensity used for comparison. Find the intensity of each earthquake. (Intensity is a measure of the wave energy of an earthquake.)

a. Nevada in 2008: $R = 6.0$

b. Eastern Sichuan, China in 2008: $R = 7.9$

Solution

a. Because $I_0 = 1$ and $R = 6.0$, you have

$$6.0 = \log \frac{I}{1}$$

Substitute 1 for $I_0$ and 6.0 for $R$. Exponentiate each side.

$$10^{6.0} = 10^{\log I}$$

Inverse Property

$$I = 10^{6.0} = 1,000,000.$$  

b. For $R = 7.9$, you have

$$7.9 = \log \frac{I}{1}$$

Substitute 1 for $I_0$ and 7.9 for $R$. Exponentiate each side.

$$10^{7.9} = 10^{\log I}$$

Inverse Property

$$I = 10^{7.9} = 79,400,000.$$  

Note that an increase of 1.9 units on the Richter scale (from 6.0 to 7.9) represents an increase in intensity by a factor of

$$\frac{79,400,000}{1,000,000} = 79.4.$$  

In other words, the intensity of the earthquake in Eastern Sichuan was about 79 times as great as that of the earthquake in Nevada.

Check Point  Now try Exercise 63.

Classroom Discussion

Comparing Population Models  The populations $P$ (in millions) of the United States for the census years from 1910 to 2000 are shown in the table at the left. Least squares regression analysis gives the best quadratic model for these data as $P = 1.0328t^2 + 9.607t + 81.82$, and the best exponential model for these data as $P = 82.677e^{0.124t}$. Which model better fits the data? Describe how you reached your conclusion.  
(Source: U.S. Census Bureau)
3.5 EXERCISES

VOCABULARY: Fill in the blanks.

1. An exponential growth model has the form ________ and an exponential decay model has the form ________.
2. A logarithmic model has the form ________ or ________.
3. Gaussian models are commonly used in probability and statistics to represent populations that are ________ ________.
4. The graph of a Gaussian model is ________ shaped, where the ________ ________ is the maximum y-value of the graph.
5. A logistic growth model has the form ________.
6. A logistic curve is also called a ________ curve.

SKILLS AND APPLICATIONS

In Exercises 7–12, match the function with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

7. \( y = 2e^{x/4} \)  
8. \( y = 6e^{-x/4} \)
9. \( y = 6 + \log(x + 2) \)  
10. \( y = 3e^{-(x-2)^2/5} \)
11. \( y = \ln(x + 1) \)  
12. \( y = \frac{4}{1 + e^{-2x}} \)

In Exercises 13 and 14, (a) solve for \( P \) and (b) solve for \( t \).

13. \( A = Pe^{rt} \)
14. \( A = P\left(1 + \frac{r}{n}\right)^{nt} \)

COMPOUND INTEREST In Exercises 15–22, complete the table for a savings account in which interest is compounded continuously.

39. In Exercises 39–42, find the exponential model \( y = ae^{bt} \) that fits the points shown in the graph or table.

40. (a) In the graph, model the data with the equation \( y = ae^{bt} \), where \( a = \frac{y_1}{e^{bt_1}} \). Use the model to complete the table.

### Table

41. (b) According to the model, when will the population of Horry County reach 300,000?

42. (c) Do you think the model is valid for long-term predictions of the population? Explain.

43. **POPULATION** The populations \( P \) (in thousands) of Horry County, South Carolina from 1970 through 2007 can be modeled by

\[
P = -18.5 + 92.2e^{0.0282t}
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 1970. (Source: U.S. Census Bureau)

(a) Use the model to complete the table.

(a) Find the exponential growth or decay model \( y = ae^{bt} \) or \( y = ae^{-bt} \) for the population of each country by letting \( t = 0 \) correspond to 2000. Use the model to predict the population of each country in 2030.

(b) You can see that the populations of the United States and the United Kingdom are growing at different rates. What constant in the equation \( y = ae^{bt} \) is determined by these different growth rates? Discuss the relationship between the different growth rates and the magnitude of the constant.

(c) You can see that the population of China is increasing while the population of Bulgaria is decreasing. What constant in the equation \( y = ae^{bt} \) reflects this difference? Explain.
45. **WEBSITE GROWTH** The number of hits a new search-engine website receives each month can be modeled by \( y = 4080e^{kt} \), where \( t \) represents the number of months the website has been operating. In the website’s third month, there were 10,000 hits. Find the value of \( k \), and use this value to predict the number of hits the website will receive after 24 months.

46. **VALUE OF A PAINTING** The value \( V \) (in millions of dollars) of a famous painting can be modeled by \( V = 10e^{kt} \), where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. In 2008, the same painting was sold for $65 million. Find the value of \( k \), and use this value to predict the value of the painting in 2014.

47. **POPULATION** The populations \( P \) (in thousands) of Reno, Nevada from 2000 through 2007 can be modeled by \( P = 346.8e^{kt} \), where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. In 2005, the population of Reno was about 395,000. (Source: U.S. Census Bureau)

(a) Find the value of \( k \). Is the population increasing or decreasing? Explain.
(b) Use the model to find the populations of Reno in 2010 and 2015. Are the results reasonable? Explain.
(c) According to the model, during what year will the population reach 500,000?

48. **POPULATION** The populations \( P \) (in thousands) of Orlando, Florida from 2000 through 2007 can be modeled by \( P = 1656.2e^{kt} \), where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. In 2005, the population of Orlando was about 1,940,000. (Source: U.S. Census Bureau)

(a) Find the value of \( k \). Is the population increasing or decreasing? Explain.
(b) Use the model to find the populations of Orlando in 2010 and 2015. Are the results reasonable? Explain.
(c) According to the model, during what year will the population reach 2.2 million?

49. **BACTERIA GROWTH** The number of bacteria in a culture is increasing according to the law of exponential growth. After 3 hours, there are 100 bacteria, and after 5 hours, there are 400 bacteria. How many bacteria will there be after 6 hours?

50. **BACTERIA GROWTH** The number of bacteria in a culture is increasing according to the law of exponential growth. The initial population is 250 bacteria, and the population after 10 hours is double the population after 1 hour. How many bacteria will there be after 6 hours?

51. **CARBON DATING**

(a) The ratio of carbon 14 to carbon 12 in a piece of wood discovered in a cave is \( R = 1/8^{14} \). Estimate the age of the piece of wood.

(b) The ratio of carbon 14 to carbon 12 in a piece of paper buried in a tomb is \( R = 1/13^{14} \). Estimate the age of the piece of paper.

52. **RADIOACTIVE DECAY** Carbon 14 dating assumes that the carbon dioxide on Earth today has the same radioactive content as it did centuries ago. If this is true, the amount of \(^{14}C\) absorbed by a tree that grew several centuries ago should be the same as the amount of \(^{14}C\) absorbed by a tree growing today. A piece of ancient charcoal contains only 15% as much radioactive carbon as a piece of modern charcoal. How long ago was the tree burned to make the ancient charcoal if the half-life of \(^{14}C\) is 5715 years?

53. **DEPRECIATION** A sport utility vehicle that costs $23,300 new has a book value of $12,500 after 2 years.

(a) Find the linear model \( V = mt + b \).

(b) Find the exponential model \( V = ae^{kt} \).

(c) Use a graphing utility to graph the two models in the same viewing window. Which model depreciates faster in the first 2 years?

(d) Find the book values of the vehicle after 1 year and after 3 years using each model.

(e) Explain the advantages and disadvantages of using each model to a buyer and a seller.

54. **DEPRECIATION** A laptop computer that costs $1150 new has a book value of $550 after 2 years.

(a) Find the linear model \( V = mt + b \).

(b) Find the exponential model \( V = ae^{kt} \).

(c) Use a graphing utility to graph the two models in the same viewing window. Which model depreciates faster in the first 2 years?

(d) Find the book values of the computer after 1 year and after 3 years using each model.

(e) Explain the advantages and disadvantages of using each model to a buyer and a seller.

55. **SALES** The sales \( S \) (in thousands of units) of a new CD burner after it has been on the market for \( t \) years are modeled by \( S(t) = 100(1 - e^{kt}) \). Fifteen thousand units of the new product were sold the first year.

(a) Complete the model by solving for \( k \).

(b) Sketch the graph of the model.

(c) Use the model to estimate the number of units sold after 5 years.
56. **LEARNING CURVE** The management at a plastics factory has found that the maximum number of units a worker can produce in a day is 30. The learning curve for the number of units produced per day after a new employee has worked days is modeled by \( N = 30(1 - e^{kt}) \). After 20 days on the job, a new employee produces 19 units.

(a) Find the learning curve for this employee (first, find the value of \( k \)).

(b) How many days should pass before this employee is producing 25 units per day?

57. **IQ SCORES** The IQ scores for a sample of a class of returning adult students at a small northeastern college roughly follow the normal distribution \( y = 0.0266e^{-\frac{(x - 100)^2}{450}} \), 70 ≤ \( x \) ≤ 115, where \( x \) is the IQ score.

(a) Use a graphing utility to graph the function.

(b) From the graph in part (a), estimate the average IQ score of an adult student.

58. **EDUCATION** The amount of time (in hours per week) a student utilizes a math-tutoring center roughly follows the normal distribution \( y = 0.7979e^{-\frac{(x - 5.0)^2}{0.5}} \), 4 ≤ \( x \) ≤ 7, where \( x \) is the number of hours.

(a) Use a graphing utility to graph the function.

(b) From the graph in part (a), estimate the average number of hours per week a student uses the tutoring center.

59. **CELL SITES** A cell site is a site where electronic communications equipment is placed in a cellular network for the use of mobile phones. The numbers \( y \) of cell sites from 1985 through 2008 can be modeled by

\[
y = \frac{237,101}{1 + 1950e^{-0.355t}}
\]

where \( t \) represents the year, with \( t = 5 \) corresponding to 1985. (Source: CTIA-The Wireless Association)

(a) Use the model to find the numbers of cell sites in the years 1985, 2000, and 2006.

(b) Use a graphing utility to graph the function.

(c) Use the graph to determine the year in which the number of cell sites will reach 235,000.

(d) Confirm your answer to part (c) algebraically.

60. **POPULATION** The populations \( P \) (in thousands) of Pittsburgh, Pennsylvania from 2000 through 2007 can be modeled by

\[
P = \frac{2632}{1 + 0.083e^{0.0500t}}
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 2000. (Source: U.S. Census Bureau)

(a) Complete the model by solving for \( k \).

(b) Estimate sales in 2012.

61. **POPULATION GROWTH** A conservation organization releases 100 animals of an endangered species into a game preserve. The organization believes that the preserve has a carrying capacity of 1000 animals and that the growth of the pack will be modeled by the logistic curve

\[
p(t) = \frac{1000}{1 + 9e^{-0.1656t}}
\]

where \( t \) is measured in months (see figure).

(a) Estimate the population after 5 months.

(b) After how many months will the population be 500?

(c) Use a graphing utility to graph the function. Use the graph to determine the horizontal asymptotes, and interpret the meaning of the asymptotes in the context of the problem.

62. **SALES** After discontinuing all advertising for a tool kit in 2004, the manufacturer noted that sales began to drop according to the model

\[
S = \frac{500,000}{1 + 0.4e^{kt}}
\]

where \( S \) represents the number of units sold and \( t = 4 \) represents 2004. In 2008, the company sold 300,000 units.

(a) Complete the model by solving for \( k \).

(b) Estimate sales in 2012.
GEOLOGY In Exercises 63 and 64, use the Richter scale

\[ R = \log \frac{I}{I_0} \]

for measuring the magnitudes of earthquakes.

63. Find the intensity \( I \) of an earthquake measuring \( R \) on the Richter scale (let \( I_0 = 1 \)).
   (a) Southern Sumatra, Indonesia in 2007, \( R = 8.5 \)
   (b) Illinois in 2008, \( R = 5.4 \)
   (c) Costa Rica in 2009, \( R = 6.1 \)

64. Find the magnitude \( R \) of each earthquake of intensity \( I \) (let \( I_0 = 1 \)).
   (a) \( I = 199,500,000 \)
   (b) \( I = 48,275,000 \)
   (c) \( I = 17,000 \)

INTENSITY OF SOUND In Exercises 65–68, use the following information for determining sound intensity. The level of sound \( \beta \), in decibels, with an intensity of \( I \), is given by

\[ \beta = 10 \log \left( \frac{I}{I_0} \right) \]

where \( I_0 \) is an intensity of \( 10^{-12} \) watt per square meter, corresponding roughly to the faintest sound that can be heard by the human ear. In Exercises 65 and 66, find the level of sound \( \beta \).

65. (a) \( I = 10^{-10} \) watt per m² (quiet room)
   (b) \( I = 10^{-5} \) watt per m² (busy street corner)
   (c) \( I = 10^{-8} \) watt per m² (quiet radio)
   (d) \( I = 10^{-10} \) watt per m² (threshold of pain)

66. (a) \( I = 10^{-11} \) watt per m² (rustle of leaves)
   (b) \( I = 10^2 \) watt per m² (jet at 30 meters)
   (c) \( I = 10^{-4} \) watt per m² (door slamming)
   (d) \( I = 10^{-2} \) watt per m² (siren at 30 meters)

67. Due to the installation of noise suppression materials, the noise level in an auditorium was reduced from 93 to 80 decibels. Find the percent decrease in the intensity level of the noise as a result of the installation of these materials.

68. Due to the installation of a muffler, the noise level of an engine was reduced from 88 to 72 decibels. Find the percent decrease in the intensity level of the noise as a result of the installation of the muffler.

pH LEVELS In Exercises 69–74, use the acidity model given by \( \text{pH} = -\log([\text{H}^+]) \), where acidity (pH) is a measure of the hydrogen ion concentration \([\text{H}^+]\) (measured in moles of hydrogen per liter) of a solution.

69. Find the pH if \([\text{H}^+] = 2.3 \times 10^{-5} \).

70. Find the pH if \([\text{H}^+] = 1.13 \times 10^{-5} \).

71. Compute \([\text{H}^+]\) for a solution in which pH = 5.8.

72. Compute \([\text{H}^+]\) for a solution in which pH = 3.2.

73. Apple juice has a pH of 2.9 and drinking water has a pH of 8.0. The hydrogen ion concentration of the apple juice is how many times the concentration of drinking water?

74. The pH of a solution is decreased by one unit. The hydrogen ion concentration is increased by what factor?

75. FORENSICS At 8:30 A.M., a coroner was called to the home of a person who had died during the night. In order to estimate the time of death, the coroner took the person’s temperature twice. At 9:00 A.M. the temperature was 85.7°F, and at 11:00 A.M. the temperature was 82.8°F. From these two temperatures, the coroner was able to determine that the time elapsed since death and the body temperature were related by the formula

\[ t = -\frac{10 \ln (T - 70)}{98.6 - 70} \]

where \( t \) is the time in hours elapsed since the person died and \( T \) is the temperature (in degrees Fahrenheit) of the person’s body. (This formula is derived from a general cooling principle called Newton’s Law of Cooling. It uses the assumptions that the person had a normal body temperature of 98.6°F at death, and that the room temperature was a constant 70°F.) Use the formula to estimate the time of death of the person.

76. HOME MORTGAGE A $120,000 home mortgage for 30 years at 7.2% has a monthly payment of $839.06. Part of the monthly payment is paid toward the interest charge on the unpaid balance, and the remainder of the payment is used to reduce the principal. The amount that is paid toward the interest is

\[ u = M - \left( M - \frac{Pr}{12} \right) \left( 1 + \frac{r}{12} \right)^{12t} \]

and the amount that is paid toward the reduction of the principal is

\[ v = \left( M - \frac{Pr}{12} \right) \left( 1 + \frac{r}{12} \right)^{12t}. \]

In these formulas, \( P \) is the size of the mortgage, \( r \) is the interest rate, \( M \) is the monthly payment, and \( t \) is the time (in years).

(a) Use a graphing utility to graph each function in the same viewing window. (The viewing window should show all 30 years of mortgage payments.)

(b) In the early years of the mortgage, is the larger part of the monthly payment paid toward the interest or the principal? Approximate the time when the monthly payment is evenly divided between interest and principal reduction.

(c) Repeat parts (a) and (b) for a repayment period of 20 years \( (M = 966.71) \). What can you conclude?
77. **HOME MORTGAGE** The total interest \( u \) paid on a home mortgage of \( P \) dollars at interest rate \( r \) for \( t \) years is

\[
u = P \left[ \frac{rt}{1 - \left( \frac{1}{1 + r/12} \right)^{12t}} - 1 \right].\]

Consider a $120,000 home mortgage at 7.2\%.

(a) Use a graphing utility to graph the total interest function.

(b) Approximate the length of the mortgage for which the total interest paid is the same as the size of the mortgage. Is it possible that some people are paying twice as much in interest charges as the size of the mortgage?

78. **DATA ANALYSIS** The table shows the time \( t \) (in seconds) required for a car to attain a speed of \( s \) miles per hour from a standing start.

<table>
<thead>
<tr>
<th>Speed, ( s )</th>
<th>Time, ( t )</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>3.4</td>
</tr>
<tr>
<td>40</td>
<td>5.0</td>
</tr>
<tr>
<td>50</td>
<td>7.0</td>
</tr>
<tr>
<td>60</td>
<td>9.3</td>
</tr>
<tr>
<td>70</td>
<td>12.0</td>
</tr>
<tr>
<td>80</td>
<td>15.8</td>
</tr>
<tr>
<td>90</td>
<td>20.0</td>
</tr>
</tbody>
</table>

Two models for these data are as follows.

\[
t_1 = 40.757 + 0.556s - 15.817 \ln s \]

\[
t_2 = 1.2259 + 0.0023s^2\]

(a) Use the regression feature of a graphing utility to find a linear model \( t_3 \) and an exponential model \( t_4 \) for the data.

(b) Use a graphing utility to graph the data and each model in the same viewing window.

(c) Create a table comparing the data with estimates obtained from each model.

(d) Use the results of part (c) to find the sum of the absolute values of the differences between the data and the estimated values given by each model. Based on the four sums, which model do you think best fits the data? Explain.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 79–82, determine whether the statement is true or false. Justify your answer.

79. The domain of a logistic growth function cannot be the set of real numbers.

80. A logistic growth function will always have an \( x \)-intercept.

81. The graph of \( f(x) = \frac{4}{1 + 6e^{-2x}} + 5 \) is the graph of \( g(x) = \frac{4}{1 + 6e^{-2x}} \) shifted to the right five units.

82. The graph of a Gaussian model will never have an \( x \)-intercept.

83. **WRITING** Use your school’s library, the Internet, or some other reference source to write a paper describing John Napier’s work with logarithms.

**PROJECT: SALES PER SHARE** To work an extended application analyzing the sales per share for Kohl’s Corporation from 1992 through 2007, visit this text’s website at academic.cengage.com. (Data Source: Kohl’s Corporation)
# Chapter Summary

## What Did You Learn?

### Explanation/Examples Review Exercises

| Section 3.1 | Recognize and evaluate exponential functions with base $a$ (p. 216). | The exponential function $f$ with base $a$ is denoted by $f(x) = a^x$ where $a > 0$, $a \neq 1$, and $x$ is any real number. | 1–6 |
| Section 3.1 | Graph exponential functions and use the One-to-One Property (p. 217). | **One-to-One Property:** For $a > 0$ and $a \neq 1$, $a^x = a^y$ if and only if $x = y$. | 7–24 |
| Section 3.1 | Recognize, evaluate, and graph exponential functions with base $e$ (p. 220). | The function $f(x) = e^x$ is called the natural exponential function. | 25–32 |
| Section 3.1 | Use exponential functions to model and solve real-life problems (p. 221). | Exponential functions are used in compound interest formulas (See Example 8.) and in radioactive decay models. (See Example 9.) | 33–36 |
| Section 3.2 | Recognize and evaluate logarithmic functions with base $a$ (p. 227). | For $x > 0$, $a > 0$, and $a \neq 1$, $y = \log_a x$ if and only if $x = a^y$. The function $f(x) = \log_a x$ is called the logarithmic function with base $a$. The logarithmic function with base 10 is the common logarithmic function. It is denoted by $\log_{10}$ or log. | 37–48 |
| Section 3.2 | Graph logarithmic functions (p. 229) and recognize, evaluate, and graph natural logarithmic functions (p. 231). | The graph of $y = \log_a x$ is a reflection of the graph of $y = a^x$ about the line $y = x$. The function defined by $f(x) = \ln x$, $x > 0$, is called the natural logarithmic function. Its graph is a reflection of the graph of $f(x) = e^x$ about the line $y = x$. | 49–52 |
| Section 3.2 | Use logarithmic functions to model and solve real-life problems (p. 233). | A logarithmic function is used in the human memory model. (See Example 11.) | 59, 60 |

### Section 3.3

Let $a$, $b$, and $x$ be positive real numbers such that $a 
eq 1$ and $b 
eq 1$. Then $\log_b x$ can be converted to a different base as follows.

- **Base $b$**: $\log_a x = \frac{\log_b x}{\log_b a}$
- **Base 10**: $\log_a x = \frac{\log x}{\log a}$
- **Base $e$**: $\log_a x = \frac{\ln x}{\ln a}$

Let $a$ be a positive number ($a \neq 1$), $n$ be a real number, and $u$ and $v$ be positive real numbers.

1. **Product Property**: $\log_a (uv) = \log_a u + \log_a v$
   
   $\ln(uv) = \ln u + \ln v$

2. **Quotient Property**: $\log_a \left(\frac{u}{v}\right) = \log_a u - \log_a v$
   
   $\ln\left(\frac{u}{v}\right) = \ln u - \ln v$

3. **Power Property**: $\log_a u^n = n \log_a u$, $\ln e^n = n \ln u$

### Section 3.4

Logarithmic functions can be used to find an equation that relates the periods of several planets and their distances from the sun. (See Example 7.)

One-to-One Properties and Inverse Properties of exponential or logarithmic functions can be used to help solve exponential or logarithmic equations.

To solve more complicated equations, rewrite the equations so that the One-to-One Properties and Inverse Properties of exponential or logarithmic functions can be used. (See Examples 2–8.)

Exponential and logarithmic equations can be used to find how long it will take to double an investment (see Example 10) and to find the year in which companies reached a given amount of sales. (See Example 11.)

An exponential growth function can be used to model a population of fruit flies (see Example 2) and an exponential decay function can be used to find the age of a fossil (see Example 3).

A Gaussian function can be used to model SAT math scores for college-bound seniors. (See Example 4.)

A logistic growth function can be used to model the spread of a flu virus. (See Example 5.)

A logarithmic function can be used to find the intensity of an earthquake using its magnitude. (See Example 6.)

### Section 3.5

1. **Exponential growth model**: $y = ae^{bx}$, $b > 0$

2. **Exponential decay model**: $y = ae^{-bx}$, $b > 0$

3. **Gaussian model**: $y = ae^{-(x-b)^2/c}$

4. **Logistic growth model**: $y = \frac{a}{1 + be^{-cx}}$

5. **Logarithmic models**: $y = a + b \ln x$, $y = a + b \log x$
In Exercises 1–6, evaluate the function at the indicated value of $x$. Round your result to three decimal places.

1. $f(x) = 0.3^x$, $x = 1.5$
2. $f(x) = 30^x$, $x = \sqrt{3}$
3. $f(x) = 2^{-0.5x}$, $x = \pi$
4. $f(x) = 1278^{0.5}$, $x = 1$
5. $f(x) = 7(0.2^x)$, $x = -\sqrt{11}$
6. $f(x) = -14(5^x)$, $x = -0.8$

In Exercises 7–14, use the graph of $f$ to describe the transformation that yields the graph of $g$.

7. $f(x) = 2^x$, $g(x) = 2^x - 2$
8. $f(x) = 3^x$, $g(x) = 3^x + 1$
9. $f(x) = 4^x$, $g(x) = 4^{x+2}$
10. $f(x) = 6^x$, $g(x) = 6^{x+1}$
11. $f(x) = 3^x$, $g(x) = 1 - 3^x$
12. $f(x) = 0.1^x$, $g(x) = -0.1^x$
13. $f(x) = \left(\frac{1}{2}\right)^x$, $g(x) = -\left(\frac{1}{2}\right)^{x+2}$
14. $f(x) = \left(\frac{2}{3}\right)^x$, $g(x) = 8 - \left(\frac{2}{3}\right)^x$

In Exercises 15–20, use a graphing utility to construct a table of values for the function. Then sketch the graph of the function.

15. $f(x) = 4^{-x} + 4$
16. $f(x) = 2.65^x - 1$
17. $f(x) = 5^{x-2} + 4$
18. $f(x) = 2^{x-6} - 5$
19. $f(x) = \left(\frac{1}{2}\right)^{x-3} + 3$
20. $f(x) = \left(\frac{1}{2}\right)^{x+2} - 5$

In Exercises 21–24, use the One-to-One Property to solve the equation for $x$.

21. $\frac{1}{3}^{x-3} = 9$
22. $3^{x+3} = \frac{1}{9}$
23. $e^{x-5} = e^7$
24. $e^{8-2x} = e^{-3}$

In Exercises 25–28, evaluate $f(x) = e^x$ at the indicated value of $x$. Round your result to three decimal places.

25. $x = 8$
26. $x = \frac{5}{8}$
27. $x = -1.7$
28. $x = 0.278$

In Exercises 29–32, use a graphing utility to construct a table of values for the function. Then sketch the graph of the function.

29. $h(x) = e^{-x/2}$
30. $h(x) = 2 - e^{-x/2}$
31. $f(x) = e^{x+2}$
32. $s(t) = 4e^{-2t}$, $t > 0$

**COMPOUND INTEREST** In Exercises 33 and 34, complete the table to determine the balance $A$ for $P$ dollars invested at rate $r$ for $t$ years and compounded $n$ times per year.

<table>
<thead>
<tr>
<th>$n$</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>12</th>
<th>365</th>
<th>Continuous</th>
</tr>
</thead>
<tbody>
<tr>
<td>$A$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

33. $P = $5000, $r = 3\%$, $t = 10$ years
34. $P = $4500, $r = 2.5\%$, $t = 30$ years

**35. WAITING TIMES** The average time between incoming calls at a switchboard is 3 minutes. The probability $P$ of waiting less than $t$ minutes until the next incoming call is approximated by the model $P(t) = 1 - e^{-t/3}$. A call has just come in. Find the probability that the next call will be within
(a) $\frac{1}{2}$ minute. (b) 2 minutes. (c) 5 minutes.

**36. DEPRECIATION** After $t$ years, the value $V$ of a car that originally cost $23,970 is given by $V(t) = 23,970(\frac{2}{3})^t$.

(a) Use a graphing utility to graph the function.
(b) Find the value of the car 2 years after it was purchased.
(c) According to the model, when does the car depreciate most rapidly? Is this realistic? Explain.
(d) According to the model, when will the car have no value?

**3.2** In Exercises 37–40, write the exponential equation in logarithmic form. For example, the logarithmic form of $2^3 = 8$ is $\log_2 8 = 3$.

37. $3^3 = 27$
38. $25^{3/2} = 125$
39. $e^{0.8} = 2.2555...$
40. $e^0 = 1$

In Exercises 41–44, evaluate the function at the indicated value of $x$ without using a calculator.

41. $f(x) = \log x$, $x = 1000$
42. $g(x) = \log_9 x$, $x = 3$
43. $g(x) = \log_2 x$, $x = \frac{1}{4}$
44. $f(x) = \log_3 x$, $x = \frac{1}{3}$

In Exercises 45–48, use the One-to-One Property to solve the equation for $x$.

45. $\log_4(x + 7) = \log_4 14$
46. $\log_8(3x - 10) = \log_8 5$
47. $\ln(x + 9) = \ln 4$
48. $\ln(2x - 1) = \ln 11$

In Exercises 49–52, find the domain, $x$-intercept, and vertical asymptote of the logarithmic function and sketch its graph.

49. $g(x) = \log_7 x$
50. $f(x) = \log \left(\frac{x}{3}\right)$
51. $f(x) = 4 - \log(x + 5)$
52. $f(x) = \log(x - 3) + 1$

53. Use a calculator to evaluate \( f(x) = \ln x \) at (a) \( x = 22.6 \) and (b) \( x = 0.98 \). Round your results to three decimal places if necessary.

54. Use a calculator to evaluate \( f(x) = 5 \ln x \) at (a) \( x = e^{-12} \) and (b) \( x = \sqrt{3} \). Round your results to three decimal places if necessary.

In Exercises 55–58, find the domain, x-intercept, and vertical asymptote of the logarithmic function and sketch its graph.

55. \( f(x) = \ln x + 3 \)
56. \( f(x) = \ln(x - 3) \)
57. \( h(x) = \ln(x^2) \)
58. \( f(x) = \frac{1}{2} \ln x \)

59. **ANTLER SPREAD** The antler spread \( a \) (in inches) and shoulder height \( h \) (in inches) of an adult male American elk are related by the model \( h = 116 \log(a + 40) - 176 \). Approximate the shoulder height of a male American elk with an antler spread of 55 inches.

60. **SNOW REMOVAL** The number of miles \( s \) of roads cleared of snow is approximated by the model

\[
s = 25 - \frac{13 \ln(h/12)}{\ln 3}, \quad 2 \leq h \leq 15
\]

where \( h \) is the depth of the snow in inches. Use this model to find \( s \) when \( h = 10 \) inches.

3.3 In Exercises 61–64, evaluate the logarithm using the change-of-base formula. Do each exercise twice, once with common logarithms and once with natural logarithms. Round the results to three decimal places.

61. \( \log_2 6 \)
62. \( \log_{10} 200 \)
63. \( \log_{10/2} 5 \)
64. \( \log_3 0.28 \)

In Exercises 65–68, use the properties of logarithms to rewrite and simplify the logarithmic expression.

65. \( \log 18 \)
66. \( \log_{\frac{1}{12}} (11) \)
67. \( \ln 20 \)
68. \( \ln(3e^{-3}) \)

In Exercises 69–74, use the properties of logarithms to expand the expression as a sum, difference, and/or constant multiple of logarithms. (Assume all variables are positive.)

69. \( \log_3 5x^2 \)
70. \( \log 7x^4 \)
71. \( \log_3 \frac{9}{\sqrt{x}} \)
72. \( \log_7 \frac{\sqrt{x}}{14} \)
73. \( \ln x^2 y^2 z \)
74. \( \ln \left(\frac{y - 1}{4}\right)^2, \quad y > 1 \)

In Exercises 75–80, condense the expression to the logarithm of a single quantity.

75. \( \log_2 5 + \log_2 x \)
76. \( \log_6 y - 2 \log_6 z \)

77. \( \ln x - \frac{1}{2} \ln y \)
78. \( 3 \ln x + 2 \ln(x + 1) \)
79. \( \frac{1}{2} \log_3 x - 2 \log_3(y + 8) \)
80. \( 5 \ln(x - 2) - \ln(x + 2) - 3 \ln x \)

81. **CLIMB RATE** The time \( t \) (in minutes) for a small plane to climb to an altitude of \( h \) feet is modeled by \( t = 50 \log\left[18,000/(18,000 - h)\right] \), where 18,000 feet is the plane’s absolute ceiling.

(a) Determine the domain of the function in the context of the problem.

(b) Use a graphing utility to graph the function and identify any asymptotes.

(c) As the plane approaches its absolute ceiling, what can be said about the time required to increase its altitude?

(d) Find the time for the plane to climb to an altitude of 4000 feet.

82. **HUMAN MEMORY MODEL** Students in a learning theory study were given an exam and then retested monthly for 6 months with an equivalent exam. The data obtained in the study are given as the ordered pairs

\[
(1, 84.2), (2, 78.4), (3, 72.1), (4, 68.5), (5, 67.1), (6, 65.3)
\]

3.4 In Exercises 83–88, solve for \( x \).

83. \( 5^x = 125 \)
84. \( 6^x = \frac{1}{216} \)
85. \( e^x = 3 \)
86. \( \log_3 x = -1 \)
87. \( \ln x = 4 \)
88. \( \ln x = -1.6 \)

In Exercises 89–92, solve the exponential equation algebraically. Approximate your result to three decimal places.

89. \( e^{3x} = e^{x^2 + 3} \)
90. \( e^{4x} = 25 \)
91. \( 2^x - 3 = 29 \)
92. \( e^{2x} - 6e^x + 8 = 0 \)

In Exercises 93 and 94, use a graphing utility to graph and solve the equation. Approximate the result to three decimal places.

93. \( 25e^{-0.3x} = 12 \)
94. \( 2^x = 3 + x - e^x \)

In Exercises 95–104, solve the logarithmic equation algebraically. Approximate the result to three decimal places.

95. \( \ln 3x = 8.2 \)
96. \( 4 \ln 3x = 15 \)
97. \( \ln x - \ln 3 = 2 \)
98. \( \ln x - \ln 5 = 4 \)
99. \( \ln \sqrt{x} = 4 \)
100. \( \ln \sqrt{x + 8} = 3 \)
101. \( \log_b(x - 1) = \log_b(x - 2) - \log_b(x + 2) \)  
102. \( \log_b(x + 2) - \log_b x = \log_b(x + 5) \)  
103. \( \log(1 - x) = -1 \)  
104. \( \log(-x - 4) = 2 \)

In Exercises 105–108, use a graphing utility to graph and solve the equation. Approximate the result to three decimal places.

105. \( 2 \ln(x + 3) - 3 = 0 \)  
106. \( x - 2 \log(x + 4) = 0 \)  
107. \( 6 \log(x^2 + 1) - x = 0 \)  
108. \( 3 \ln x + 2 \log x = e^x - 25 \)

109. **COMPOUND INTEREST** You deposit $8500 in an account that pays 3.5% interest, compounded continuously. How long will it take for the money to triple?

110. **METEOROLOGY** The speed of the wind \( S \) (in miles per hour) near the center of a tornado and the distance \( d \) (in miles) the tornado travels are related by the model \( S = 93 \log d + 65 \). On March 18, 1925, a large tornado struck portions of Missouri, Illinois, and Indiana with a wind speed at the center of about 283 miles per hour. Approximate the distance traveled by this tornado.

3.5 In Exercises 111–116, match the function with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

(a) \( y = 3e^{-2x/3} \)  
(b) \( y = 4e^{2x/3} \)  
(c) \( y = \ln(x + 3) \)  
(d) \( y = 7 - \log(x + 3) \)  
(e) \( y = 2e^{-(x+4)^2/3} \)  
(f) \( y = \frac{6}{1 + 2e^{-2x}} \)

In Exercises 117 and 118, find the exponential model \( y = ae^{kt} \) that passes through the points.

117. \((0, 2), (4, 3)\)  
118. \((0, \frac{5}{2}), (5, 5)\)

119. **POPULATION** In 2007, the population of Florida residents aged 65 and over was about 3.10 million. In 2015 and 2020, the populations of Florida residents aged 65 and over are projected to be about 4.13 million and 5.11 million, respectively. An exponential growth model that approximates these data is given by \( P = 2.36e^{0.0382t} \), \( 7 \leq t \leq 20 \), where \( P \) is the population (in millions) and \( t \) represents 2007. (Source: U.S. Census Bureau)

(a) Use a graphing utility to graph the model and the data in the same viewing window. Is the model a good fit for the data? Explain.
(b) According to the model, when will the population of Florida residents aged 65 and over reach 5.5 million? Does your answer seem reasonable? Explain.

120. **WILDLIFE POPULATION** A species of bat is in danger of becoming extinct. Five years ago, the total population of the species was 2000. Two years ago, the total population of the species was 1400. What was the total population of the species one year ago?

121. **TEST SCORES** The test scores for a biology test follow a normal distribution modeled by \( y = 0.0499e^{-(x-71)^2/128} \), \( 40 \leq x \leq 100 \), where \( x \) is the test score. Use a graphing utility to graph the equation and estimate the average test score.

122. **TYPING SPEED** In a typing class, the average number \( N \) of words per minute typed after \( t \) weeks of lessons was found to be \( N = \frac{157}{(1 + 5.4e^{-0.12t})} \). Find the time necessary to type (a) 50 words per minute and (b) 75 words per minute.

123. **SOUND INTENSITY** The relationship between the number of decibels \( \beta \) and the intensity of a sound \( I \) in watts per square meter is \( \beta = 10 \log(I/10^{-12}) \). Find \( I \) for each decibel level \( \beta \).

(a) \( \beta = 60 \)  
(b) \( \beta = 135 \)  
(c) \( \beta = 1 \)

**EXPLORATION**

124. Consider the graph of \( y = e^{kx} \). Describe the characteristics of the graph when \( k \) is positive and when \( k \) is negative.

**TRUE OR FALSE?** In Exercises 125 and 126, determine whether the equation is true or false. Justify your answer.

125. \( \log_b b^x = 2x \)  
126. \( \ln(x + y) = \ln x + \ln y \)
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1–4, evaluate the expression. Approximate your result to three decimal places.
1. $4^2.6$  
2. $4^{3n/2}$  
3. $e^{-7/10}$  
4. $e^{3.1}$

In Exercises 5–7, construct a table of values. Then sketch the graph of the function.
5. $f(x) = 10^{-x}$  
6. $f(x) = -6x - 2$  
7. $f(x) = 1 - e^{2x}$

8. Evaluate (a) $\log_7 7^{0.89}$ and (b) $4.6 \ln e^2$.

In Exercises 9–11, construct a table of values. Then sketch the graph of the function. Identify any asymptotes.
9. $f(x) = -\log x - 6$  
10. $f(x) = \ln(x - 4)$  
11. $f(x) = 1 + \ln(x + 6)$

In Exercises 12–14, evaluate the logarithm using the change-of-base formula. Round your result to three decimal places.
12. $\log_7 44$  
13. $\log_{10} 0.63$  
14. $\log_{3/4} 24$

In Exercises 15–17, use the properties of logarithms to expand the expression as a sum, difference, and/or constant multiple of logarithms.
15. $\log_2 3a^4$  
16. $\ln \frac{5\sqrt{x}}{6}$  
17. $\log \frac{(x - 1)^3}{y^2z}$

In Exercises 18–20, condense the expression to the logarithm of a single quantity.
18. $\log_3 13 + \log_3 y$  
19. $4 \ln x - 4 \ln y$  
20. $3 \ln x - \ln(x + 3) + 2 \ln y$

In Exercises 21–26, solve the equation algebraically. Approximate your result to three decimal places.
21. $5^x = \frac{1}{25}$  
22. $3e^{-5x} = 132$  
23. $\frac{1025}{8 + e^{4x}} = 5$  
24. $\ln x = \frac{1}{2}$  
25. $18 + 4 \ln x = 7$  
26. $\log x + \log(x - 15) = 2$

27. Find an exponential growth model for the graph shown in the figure.
28. The half-life of radioactive actinium ($^{237}$Ac) is 21.77 years. What percent of a present amount of radioactive actinium will remain after 19 years?
29. A model that can be used for predicting the height $H$ (in centimeters) of a child based on his or her age is $H = 70.228 + 5.104x + 9.222 \ln x$, $\frac{1}{2} \leq x \leq 6$, where $x$ is the age of the child in years. (Source: Snapshots of Applications in Mathematics)
   (a) Construct a table of values. Then sketch the graph of the model.
   (b) Use the graph from part (a) to estimate the height of a four-year-old child. Then calculate the actual height using the model.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Plot the points (−2, 5) and (3, −1). Find the coordinates of the midpoint of the line segment joining the points and the distance between the points.

In Exercises 2–4, graph the equation without using a graphing utility.

2. \( x - 3y + 12 = 0 \)
3. \( y = x^2 - 9 \)
4. \( y = \sqrt{4 - x} \)

5. Find an equation of the line passing through \((-\frac{1}{2}, 1)\) and \((3, 8)\).
6. Explain why the graph at the left does not represent \(y\) as a function of \(x\).

7. Evaluate (if possible) the function given by \(f(x) = \frac{x}{x - 2}\) for each value.
   \(a\) \(f(6)\) \(b\) \(f(2)\) \(c\) \(f(s + 2)\)

8. Compare the graph of each function with the graph of \(y = \sqrt[3]{x}\). (Note: It is not necessary to sketch the graphs.)
   \(a\) \(r(x) = \frac{1}{2}\sqrt[3]{x}\)
   \(b\) \(h(x) = \sqrt[3]{x} + 2\)
   \(c\) \(g(x) = \frac{1}{3}\sqrt[3]{x} + 2\)

In Exercises 9 and 10, find (a) \((f + g)(x)\), (b) \((f - g)(x)\), (c) \((fg)(x)\), and (d) \((f^g)(x)\). What is the domain of \(f^g\)?

9. \(f(x) = x - 3, \ g(x) = 4x + 1\)
10. \(f(x) = \sqrt{x - 1}, \ g(x) = x^2 + 1\)

In Exercises 11 and 12, find (a) \(f \circ g\) and (b) \(g \circ f\). Find the domain of each composite function.

11. \(f(x) = 2x^2, \ g(x) = \sqrt{x + 6}\)
12. \(f(x) = x - 2, \ g(x) = |x|\)

13. Determine whether \(h(x) = -5x + 3\) has an inverse function. If so, find the inverse function.

14. The power \(P\) produced by a wind turbine is proportional to the cube of the wind speed \(S\). A wind speed of 27 miles per hour produces a power output of 750 kilowatts. Find the output for a wind speed of 40 miles per hour.

15. Find the quadratic function whose graph has a vertex at \((-8, 5)\) and passes through the point \((-4, -7)\).

In Exercises 16–18, sketch the graph of the function without the aid of a graphing utility.

16. \(h(x) = -x^2 + 4x\)
17. \(f(t) = \frac{1}{2}(t - 2)^2\)
18. \(g(s) = s^2 + 4s + 10\)

In Exercises 19–21, find all the zeros of the function and write the function as a product of linear factors.

19. \(f(x) = x^3 + 2x^2 + 4x + 8\)
20. \(f(x) = x^4 + 4x^3 - 21x^2\)
21. \(f(x) = 2x^4 - 11x^3 + 30x^2 - 62x - 40\)
22. Use long division to divide \(6x^3 - 4x^2\) by \(2x + 1\).
23. Use synthetic division to divide \(3x^4 + 2x^2 - 5x + 3\) by \(x - 2\).
24. Use the Intermediate Value Theorem and a graphing utility to find intervals one unit in length in which the function \(g(x) = x^3 + 3x^2 - 6\) is guaranteed to have a zero. Approximate the real zeros of the function.

In Exercises 25–27, sketch the graph of the rational function by hand. Be sure to identify all intercepts and asymptotes.

25. \(f(x) = \frac{2x}{x^2 + 2x - 3}\)
26. \(f(x) = \frac{x^2 - 4}{x^2 + x - 2}\)
27. \(f(x) = \frac{x^3 - 2x^2 - 9x + 18}{x^2 + 4x + 3}\)

In Exercises 28 and 29, solve the inequality. Sketch the solution set on the real number line.

28. \(2x^3 - 18x \leq 0\)
29. \(\frac{1}{x + 1} \geq \frac{1}{x + 5}\)

In Exercises 30 and 31, use the graph of \(f\) to describe the transformation that yields the graph of \(g\).

30. \(f(x) = \left(\frac{2}{3}\right)^x, \quad g(x) = -\left(\frac{2}{3}\right)^{-x + 3}\)
31. \(f(x) = 2.2^x, \quad g(x) = -2.2^x + 4\)

In Exercises 32–35, use a calculator to evaluate the expression. Round your result to three decimal places.

32. \(\log 98\)
33. \(\log \left(\frac{9}{7}\right)\)
34. \(\ln \sqrt{37}\)
35. \(\ln \left(\sqrt{40} - 5\right)\)

36. Use the properties of logarithms to expand \(\ln \left(\frac{x^2 - 16}{x^4}\right)\), where \(x > 4\).

37. Write \(2 \ln x - \frac{1}{2} \ln(x + 5)\) as a logarithm of a single quantity.

In Exercises 38–40, solve the equation algebraically. Approximate the result to three decimal places.

38. \(6e^{2x} = 72\)
39. \(e^{2x} - 13e^x + 42 = 0\)
40. \(\ln \sqrt{x + 2} = 3\)

41. The sales \(S\) (in billions of dollars) of lottery tickets in the United States from 1997 through 2007 are shown in the table. (Source: TLF Publications, Inc.)

<table>

**TABLE FOR 41**

(a) Use a graphing utility to create a scatter plot of the data. Let \(t\) represent the year, with \(t = 7\) corresponding to 1997.
(b) Use the regression feature of the graphing utility to find a cubic model for the data.
(c) Use the graphing utility to graph the model in the same viewing window used for the scatter plot. How well does the model fit the data?
(d) Use the model to predict the sales of lottery tickets in 2015. Does your answer seem reasonable? Explain.

42. The number \(N\) of bacteria in a culture is given by the model \(N = 175e^{4t}\), where \(t\) is the time in hours. If \(N = 420\) when \(t = 8\), estimate the time required for the population to double in size.
PROOFS IN MATHEMATICS

Each of the following three properties of logarithms can be proved by using properties of exponential functions.

**Properties of Logarithms (p. 238)**

Let \( a \) be a positive number such that \( a \neq 1 \), and let \( n \) be a real number. If \( u \) and \( v \) are positive real numbers, the following properties are true.

<table>
<thead>
<tr>
<th>Property</th>
<th>Logarithm with Base ( a )</th>
<th>Natural Logarithm</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Product Property:</strong></td>
<td>( \log_a (uv) = \log_a u + \log_a v )</td>
<td>( \ln(uv) = \ln u + \ln v )</td>
</tr>
<tr>
<td><strong>2. Quotient Property:</strong></td>
<td>( \log_a \frac{u}{v} = \log_a u - \log_a v )</td>
<td>( \frac{u}{v} = \ln u - \ln v )</td>
</tr>
<tr>
<td><strong>3. Power Property:</strong></td>
<td>( \log_a u^n = n \log_a u )</td>
<td>( \ln u^n = n \ln u )</td>
</tr>
</tbody>
</table>

**Proof**

Let \( x = \log_a u \) and \( y = \log_a v \).

The corresponding exponential forms of these equations are

\[ a^x = u \quad \text{and} \quad a^y = v. \]

To prove the Product Property, multiply \( u \) and \( v \) to obtain

\[ uv = a^x a^y = a^{x+y}. \]

The corresponding logarithmic form of \( uv = a^{x+y} \) is \( \log_a(uv) = x + y \). So,

\[ \log_a(uv) = \log_a u + \log_a v. \]

To prove the Quotient Property, divide \( u \) by \( v \) to obtain

\[ \frac{u}{v} = \frac{a^x}{a^y} = a^{x-y}. \]

The corresponding logarithmic form of \( \frac{u}{v} = a^{x-y} \) is \( \log_a \frac{u}{v} = x - y \). So,

\[ \log_a \frac{u}{v} = \log_a u - \log_a v. \]

To prove the Power Property, substitute \( a^x \) for \( u \) in the expression \( \log_a u^n \), as follows.

\[
\begin{align*}
\log_a u^n &= \log_a (a^x)^n & \text{Substitute } a^x \text{ for } u. \\
&= \log_a a^{nx} & \text{Property of Exponents} \\
&= nx & \text{Inverse Property of Logarithms} \\
&= n \log_a u & \text{Substitute } \log_a u \text{ for } x.
\end{align*}
\]

So, \( \log_a u^n = n \log_a u \).
**PROBLEM SOLVING**

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. Graph the exponential function given by \( y = a^x \) for \( a = 0.5, 1.2, \) and \( 2.0. \) Which of these curves intersects the line \( y = x? \) Determine all positive numbers \( a \) for which the curve \( y = a^x \) intersects the line \( y = x. \)

2. Use a graphing utility to graph \( y_1 = e^x \) and each of the functions \( y_2 = x^2, \ y_3 = x^4, \ y_4 = \sqrt{x}, \) and \( y_5 = |x|. \) Which function increases at the greatest rate as \( x \) approaches \( +\infty? \)

3. Use the result of Exercise 2 to make a conjecture about the rate of growth of \( y_1 = e^x \) and \( y = x^n, \) where \( n \) is a natural number and \( x \) approaches \( +\infty. \)

4. Use the results of Exercises 2 and 3 to describe what is implied when it is stated that a quantity is growing exponentially.

5. Given the exponential function
   \[ f(x) = a^x \]
   show that
   (a) \( f(u + v) = f(u) \cdot f(v). \)
   (b) \( f(2x) = [f(x)]^2. \)

6. Given that
   \[ f(x) = \frac{e^x + e^{-x}}{2} \]
   and \( g(x) = \frac{e^x - e^{-x}}{2} \)
   show that
   \[ [f(x)]^2 = [g(x)]^2 = 1. \]

7. Use a graphing utility to compare the graph of the function given by \( y = e^x \) with the graph of each given function. \([n! \text{ (read "n factorial") is defined as } n! = 1 \cdot 2 \cdot 3 \cdots (n - 1) \cdot n.\]
   (a) \( y_1 = 1 + \frac{x}{1!} \)
   (b) \( y_2 = 1 + \frac{x}{1!} + \frac{x^2}{2!} \)
   (c) \( y_3 = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} \)

8. Identify the pattern of successive polynomials given in Exercise 7. Extend the pattern one more term and compare the graph of the resulting polynomial function with the graph of \( y = e^x. \) What do you think this pattern implies?

9. Graph the function given by
   \[ f(x) = e^x - e^{-x}. \]
   From the graph, the function appears to be one-to-one. Assuming that the function has an inverse function, find \( f^{-1}(x). \)

10. Find a pattern for \( f^{-1}(x) \) if
    \[ f(x) = \frac{a^x + 1}{a^x - 1} \]
    where \( a > 0, \ a \neq 1. \)

11. By observation, identify the equation that corresponds to the graph. Explain your reasoning.

12. You have two options for investing \$500. The first earns 7\% compounded annually and the second earns 7\% simple interest. The figure shows the growth of each investment over a 30-year period.
   (a) Identify which graph represents each type of investment. Explain your reasoning.
   (b) Verify your answer in part (a) by finding the equations that model the investment growth and graphing the models.
   (c) Which option would you choose? Explain your reasoning.

13. Two different samples of radioactive isotopes are decaying. The isotopes have initial amounts of \( c_1 \) and \( c_2, \) as well as half-lives of \( k_1 \) and \( k_2, \) respectively. Find the time \( t \) required for the samples to decay to equal amounts.

277
14. A lab culture initially contains 500 bacteria. Two hours later, the number of bacteria has decreased to 200. Find the exponential decay model of the form 
\[ B = B_0e^{kt} \]
that can be used to approximate the number of bacteria after \( t \) hours.

15. The table shows the colonial population estimates of the American colonies from 1700 to 1780. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>
<th>Population</th>

</tbody>
</table>

In each of the following, let \( y \) represent the population in the year \( t \), with \( t = 0 \) corresponding to 1700.

(a) Use the regression feature of a graphing utility to find an exponential model for the data.

(b) Use the regression feature of the graphing utility to find a quadratic model for the data.

(c) Use the graphing utility to plot the data and the models from parts (a) and (b) in the same viewing window.

(d) Which model is a better fit for the data? Would you use this model to predict the population of the United States in 2015? Explain your reasoning.

16. Show that \( \frac{\log_a x}{\log_a b} = 1 + \log_a \frac{1}{b} \).

17. Solve \( (\ln x)^2 = \ln x^2 \).

18. Use a graphing utility to compare the graph of the function \( y = \ln x \) with the graph of each given function.

(a) \( y_1 = x - 1 \)

(b) \( y_2 = (x - 1) - \frac{1}{2}(x - 1)^2 \)

(c) \( y_3 = (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{4}(x - 1)^3 \)

19. Identify the pattern of successive polynomials given in Exercise 18. Extend the pattern one more term and compare the graph of the resulting polynomial function with the graph of \( y = \ln x \). What do you think the pattern implies?

20. Using \( y = ab^x \) and \( y = ax^b \), take the natural logarithm of each side of each equation. What are the slope and \( y \)-intercept of the line relating \( x \) and \( \ln y \) for \( y = ab^x \)? What are the slope and \( y \)-intercept of the line relating \( \ln x \) and \( \ln y \) for \( y = ax^b \)?

In Exercises 21 and 22, use the model \( y = 80.4 - 11 \ln x, \quad 100 \leq x \leq 1500 \)

which approximates the minimum required ventilation rate in terms of the air space per child in a public school classroom. In the model, \( x \) is the air space per child in cubic feet and \( y \) is the ventilation rate per child in cubic feet per minute.

21. Use a graphing utility to graph the model and approximate the required ventilation rate if there is 300 cubic feet of air space per child.

22. A classroom is designed for 30 students. The air conditioning system in the room has the capacity of moving 450 cubic feet of air per minute.

(a) Determine the ventilation rate per child, assuming that the room is filled to capacity.

(b) Estimate the air space required per child.

(c) Determine the minimum number of square feet of floor space required for the room if the ceiling height is 30 feet.

In Exercises 23–26, (a) use a graphing utility to create a scatter plot of the data, (b) decide whether the data could best be modeled by a linear model, an exponential model, or a logarithmic model, (c) explain why you chose the model you did in part (b), (d) use the regression feature of a graphing utility to find the model you chose in part (b) for the data and graph the model with the scatter plot, and (e) determine how well the model you chose fits the data.

23. \( (1, 2.0), (1.5, 3.5), (2, 4.0), (4, 5.8), (6, 7.0), (8, 7.8) \)

4.1 Radian and Degree Measure
4.2 Trigonometric Functions: The Unit Circle
4.3 Right Triangle Trigonometry
4.4 Trigonometric Functions of Any Angle
4.5 Graphs of Sine and Cosine Functions
4.6 Graphs of Other Trigonometric Functions
4.7 Inverse Trigonometric Functions
4.8 Applications and Models

In Mathematics
Trigonometry is used to find relationships between the sides and angles of triangles, and to write trigonometric functions as models of real-life quantities.

In Real Life
Trigonometric functions are used to model quantities that are periodic. For instance, throughout the day, the depth of water at the end of a dock in Bar Harbor, Maine varies with the tides. The depth can be modeled by a trigonometric function. (See Example 7, page 325.)

IN CAREERS
There are many careers that use trigonometry. Several are listed below.

• Biologist
  Exercise 70, page 308
• Mechanical Engineer
  Exercise 95, page 339
• Meteorologist
  Exercise 99, page 318
• Surveyor
  Exercise 41, page 359
As derived from the Greek language, the word trigonometry means “measurement of triangles.” Initially, trigonometry dealt with relationships among the sides and angles of triangles and was used in the development of astronomy, navigation, and surveying. With the development of calculus and the physical sciences in the 17th century, a different perspective arose—one that viewed the classic trigonometric relationships as functions with the set of real numbers as their domains. Consequently, the applications of trigonometry expanded to include a vast number of physical phenomena involving rotations and vibrations. These phenomena include sound waves, light rays, planetary orbits, vibrating strings, pendulums, and orbits of atomic particles.

The approach in this text incorporates both perspectives, starting with angles and their measure.

An angle is determined by rotating a ray (half-line) about its endpoint. The starting position of the ray is the initial side of the angle, and the position after rotation is the terminal side, as shown in Figure 4.1. The endpoint of the ray is the vertex of the angle. This perception of an angle fits a coordinate system in which the origin is the vertex and the initial side coincides with the positive x-axis. Such an angle is in standard position, as shown in Figure 4.2. Positive angles are generated by counterclockwise rotation, and negative angles by clockwise rotation, as shown in Figure 4.3. Angles are labeled with Greek letters \( \alpha \) (alpha), \( \beta \) (beta), and \( \theta \) (theta), as well as uppercase letters \( A \), \( B \), and \( C \). In Figure 4.4, note that angles \( \alpha \) and \( \beta \) have the same initial and terminal sides. Such angles are coterminal.
Radian Measure

The measure of an angle is determined by the amount of rotation from the initial side to the terminal side. One way to measure angles is in radians. This type of measure is especially useful in calculus. To define a radian, you can use a central angle of a circle, one whose vertex is the center of the circle, as shown in Figure 4.5.

![Figure 4.5](image1)

**Definition of Radian**

One radian is the measure of a central angle \( \theta \) that intercepts an arc \( s \) equal in length to the radius \( r \) of the circle. See Figure 4.5. Algebraically, this means that

\[
\theta = \frac{s}{r}
\]

where \( \theta \) is measured in radians.

Because the circumference of a circle is \( 2\pi r \) units, it follows that a central angle of one full revolution (counterclockwise) corresponds to an arc length of

\[
s = 2\pi r.
\]

Moreover, because \( 2\pi \approx 6.28 \), there are just over six radius lengths in a full circle, as shown in Figure 4.6. Because the units of measure for \( s \) and \( r \) are the same, the ratio \( s/r \) has no units—it is simply a real number.

Because the radian measure of an angle of one full revolution is \( 2\pi \), you can obtain the following.

\[
\begin{align*}
\frac{1}{2} \text{ revolution} &= \frac{2\pi}{2} = \pi \text{ radians} \\
\frac{1}{4} \text{ revolution} &= \frac{2\pi}{4} = \frac{\pi}{2} \text{ radians} \\
\frac{1}{6} \text{ revolution} &= \frac{2\pi}{6} = \frac{\pi}{3} \text{ radians}
\end{align*}
\]

These and other common angles are shown in Figure 4.7.

![Figure 4.6](image2)

**Study Tip**

One revolution around a circle of radius \( r \) corresponds to an angle of \( 2\pi \) radians because

\[
\theta = \frac{s}{r} = \frac{2\pi r}{r} = 2\pi \text{ radians.}
\]

Recall that the four quadrants in a coordinate system are numbered I, II, III, and IV. Figure 4.8 on page 282 shows which angles between 0 and \( 2\pi \) lie in each of the four quadrants. Note that angles between 0 and \( \pi/2 \) are acute angles and angles between \( \pi/2 \) and \( \pi \) are obtuse angles.
Two angles are coterminal if they have the same initial and terminal sides. For instance, the angles 0 and are coterminal, as are the angles and You can find an angle that is coterminal to a given angle by adding or subtracting (one revolution), as demonstrated in Example 1. A given angle has infinitely many coterminal angles. For instance, is coterminal with where is an integer.

### Example 1 Sketching and Finding Coterminal Angles

**a.** For the positive angle 13π/6, subtract 2π to obtain a coterminal angle
\[
\frac{13\pi}{6} - 2\pi = \frac{\pi}{6}
\]
See Figure 4.9.

**b.** For the positive angle 3π/4, subtract 2π to obtain a coterminal angle
\[
\frac{3\pi}{4} - 2\pi = -\frac{5\pi}{4}
\]
See Figure 4.10.

**c.** For the negative angle −2π/3, add 2π to obtain a coterminal angle
\[
-\frac{2\pi}{3} + 2\pi = \frac{4\pi}{3}
\]
See Figure 4.11.

**CHECKPOINT** Now try Exercise 27.
Two positive angles \( \alpha \) and \( \beta \) are **complementary** (complements of each other) if their sum is \( \pi/2 \). Two positive angles are **supplementary** (supplements of each other) if their sum is \( \pi \). See Figure 4.12.

![Complementary and Supplementary Angles](image)

**Example 2**  
Complementary and Supplementary Angles

If possible, find the complement and the supplement of (a) \( 2\pi/5 \) and (b) \( 4\pi/5 \).

**Solution**

a. The complement of \( 2\pi/5 \) is

\[
\frac{\pi}{2} - \frac{2\pi}{5} = \frac{5\pi}{10} - \frac{4\pi}{10} = \frac{\pi}{10}
\]

The supplement of \( 2\pi/5 \) is

\[
\pi - \frac{2\pi}{5} = \frac{5\pi}{5} - \frac{2\pi}{5} = \frac{3\pi}{5}
\]

b. Because \( 4\pi/5 \) is greater than \( \pi/2 \), it has no complement. (Remember that complements are positive angles.) The supplement is

\[
\pi - \frac{4\pi}{5} = \frac{5\pi}{5} - \frac{4\pi}{5} = \frac{\pi}{5}
\]

**CHECK POINT**  
Now try Exercise 31.

**Degree Measure**

A second way to measure angles is in terms of **degrees**, denoted by the symbol \(^\circ\). A measure of one degree (1\(^\circ\)) is equivalent to a rotation of \( \frac{\pi}{180} \) of a complete revolution about the vertex. To measure angles, it is convenient to mark degrees on the circumference of a circle, as shown in Figure 4.13. So, a full revolution (counterclockwise) corresponds to 360\(^\circ\), a half revolution to 180\(^\circ\), a quarter revolution to 90\(^\circ\), and so on.

Because \( 2\pi \) radians corresponds to one complete revolution, degrees and radians are related by the equations

\[
360\(^\circ\) = 2\pi \text{ rad} \quad \text{and} \quad 180\(^\circ\) = \pi \text{ rad}.
\]

From the latter equation, you obtain

\[
1^\circ = \frac{\pi}{180} \text{ rad} \quad \text{and} \quad 1 \text{ rad} = \left(\frac{180^\circ}{\pi}\right)
\]

which lead to the conversion rules at the top of the next page.
Conversions Between Degrees and Radians

1. To convert degrees to radians, multiply degrees by \( \frac{\pi}{180} \).
2. To convert radians to degrees, multiply radians by \( \frac{180}{\pi} \).

To apply these two conversion rules, use the basic relationship \( \pi \text{ rad} = 180^\circ \). (See Figure 4.14.)

When no units of angle measure are specified, radian measure is implied. For instance, if you write \( \theta = 2 \), you imply that \( \theta = 2 \) radians.

Example 3  Converting from Degrees to Radians

a. \( 135^\circ = (135 \text{ deg}) \left( \frac{\pi \text{ rad}}{180 \text{ deg}} \right) = \frac{3\pi}{4} \text{ radians} \)

b. \( 540^\circ = (540 \text{ deg}) \left( \frac{\pi \text{ rad}}{180 \text{ deg}} \right) = 3\pi \text{ radians} \)

c. \( -270^\circ = (-270 \text{ deg}) \left( \frac{\pi \text{ rad}}{180 \text{ deg}} \right) = -\frac{3\pi}{2} \text{ radians} \)

Example 4  Converting from Radians to Degrees

a. \( -\frac{\pi}{2} \text{ rad} = \left( -\frac{\pi}{2} \text{ rad} \right) \left( \frac{180 \text{ deg}}{\pi \text{ rad}} \right) = -90^\circ \)

b. \( 9\frac{\pi}{2} \text{ rad} = \left( 9\frac{\pi}{2} \text{ rad} \right) \left( \frac{180 \text{ deg}}{\pi \text{ rad}} \right) = 810^\circ \)

c. \( 2 \text{ rad} = (2 \text{ rad}) \left( \frac{180 \text{ deg}}{\pi \text{ rad}} \right) = \frac{360^\circ}{\pi} \approx 114.59^\circ \)

If you have a calculator with a “radian-to-degree” conversion key, try using it to verify the result shown in part (b) of Example 4.
Applications

The radian measure formula, $\theta = s/r$, can be used to measure arc length along a circle.

### Arc Length

For a circle of radius $r$, a central angle $\theta$ intercepts an arc of length $s$ given by

$$s = r\theta$$

Length of circular arc

where $\theta$ is measured in radians. Note that if $r = 1$, then $s = \theta$, and the radian measure of $\theta$ equals the arc length.

**Example 5** Finding Arc Length

A circle has a radius of 4 inches. Find the length of the arc intercepted by a central angle of $240^\circ$, as shown in Figure 4.15.

#### Solution

To use the formula $s = r\theta$, first convert $240^\circ$ to radian measure.

$$240^\circ = (240 \text{ deg}) \left( \frac{\pi \text{ rad}}{180 \text{ deg}} \right)$$

$$= \frac{4\pi}{3} \text{ radians}$$

Then, using a radius of $r = 4$ inches, you can find the arc length to be

$$s = r\theta$$

$$= 4 \left( \frac{4\pi}{3} \right)$$

$$= \frac{16\pi}{3} \approx 16.76 \text{ inches.}$$

Note that the units for $r\theta$ are determined by the units for $r$ because $\theta$ is given in radian measure, which has no units.

**CHECK POINT** Now try Exercise 89.

The formula for the length of a circular arc can be used to analyze the motion of a particle moving at a constant speed along a circular path.

### Linear and Angular Speeds

Consider a particle moving at a constant speed along a circular arc of radius $r$. If $s$ is the length of the arc traveled in time $t$, then the **linear speed** $v$ of the particle is

$$v = \frac{s}{t}$$

Moreover, if $\theta$ is the angle (in radian measure) corresponding to the arc length $s$, then the **angular speed** $\omega$ (the lowercase Greek letter omega) of the particle is

$$\omega = \frac{\theta}{t}$$
Example 6  Finding Linear Speed

The second hand of a clock is 10.2 centimeters long, as shown in Figure 4.16. Find the linear speed of the tip of this second hand as it passes around the clock face.

Solution

In one revolution, the arc length traveled is

\[ s = 2\pi r \]

\[ = 2\pi (10.2) \quad \text{Substitute for } r. \]

\[ = 20.4\pi \text{ centimeters.} \]

The time required for the second hand to travel this distance is

\[ t = 1 \text{ minute} = 60 \text{ seconds}. \]

So, the linear speed of the tip of the second hand is

\[ \text{Linear speed} = \frac{s}{t} \]

\[ = \frac{20.4\pi \text{ centimeters}}{60 \text{ seconds}} \]

\[ \approx 1.068 \text{ centimeters per second.} \]

Now try Exercise 111.

Example 7  Finding Angular and Linear Speeds

The blades of a wind turbine are 116 feet long (see Figure 4.17). The propeller rotates at 15 revolutions per minute.

a. Find the angular speed of the propeller in radians per minute.

b. Find the linear speed of the tips of the blades.

Solution

a. Because each revolution generates \(2\pi\) radians, it follows that the propeller turns \((15)(2\pi) = 30\pi\) radians per minute. In other words, the angular speed is

\[ \text{Angular speed} = \frac{\theta}{t} \]

\[ = \frac{30\pi \text{ radians}}{1 \text{ minute}} = 30\pi \text{ radians per minute.} \]

b. The linear speed is

\[ \text{Linear speed} = \frac{s}{t} \]

\[ = \frac{r\theta}{t} \]

\[ = \frac{(116)(30\pi) \text{ feet}}{1 \text{ minute}} \approx 10,933 \text{ feet per minute.} \]

Now try Exercise 113.
A sector of a circle is the region bounded by two radii of the circle and their intercepted arc (see Figure 4.18).

**Area of a Sector of a Circle**

For a circle of radius $r$, the area $A$ of a sector of the circle with central angle $\theta$ is given by

$$A = \frac{1}{2} r^2 \theta$$

where $\theta$ is measured in radians.

**Example 8** Area of a Sector of a Circle

A sprinkler on a golf course fairway sprays water over a distance of 70 feet and rotates through an angle of 120° (see Figure 4.19). Find the area of the fairway watered by the sprinkler.

**Solution**

First convert 120° to radian measure as follows.

$$\theta = 120^\circ$$

$$= (120 \text{ deg}) \left( \frac{\pi \text{ rad}}{180 \text{ deg}} \right)$$

$$= \frac{2\pi}{3} \text{ radians}$$

Then, using $\theta = 2\pi/3$ and $r = 70$, the area is

$$A = \frac{1}{2} r^2 \theta$$

Formula for the area of a sector of a circle

$$= \frac{1}{2} (70)^2 \left( \frac{2\pi}{3} \right)$$

Substitute for $r$ and $\theta$.

$$= \frac{4900\pi}{3}$$

Simplify.

$$= 5131 \text{ square feet}$$

Simplify.

**CHECK** Now try Exercise 117.

**EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. ______ means “measurement of triangles.”
2. An ______ is determined by rotating a ray about its endpoint.
3. Two angles that have the same initial and terminal sides are ______.
4. One ______ is the measure of a central angle that intercepts an arc equal to the radius of the circle.
5. Angles that measure between 0 and $\pi/2$ are ______ angles, and angles that measure between $\pi/2$ and $\pi$ are ______ angles.
6. Two positive angles that have a sum of $\pi/2$ are ______ angles, whereas two positive angles that have a sum of $\pi$ are ______ angles.
7. The angle measure that is equivalent to a rotation of $\frac{1}{360}$ of a complete revolution about an angle’s vertex is one ______.
8. 180 degrees = ______ radians.
9. The ______ speed of a particle is the ratio of arc length to time traveled, and the ______ speed of a particle is the ratio of central angle to time traveled.
10. The area $A$ of a sector of a circle with radius $r$ and central angle $\theta$, where $\theta$ is measured in radians, is given by the formula ______.

**SKILLS AND APPLICATIONS**

In Exercises 11–16, estimate the angle to the nearest one-half radian.

In Exercises 17–22, determine the quadrant in which each angle lies. (The angle measure is given in radians.)

17. (a) $\frac{\pi}{4}$ (b) $\frac{5\pi}{4}$ 18. (a) $\frac{11\pi}{8}$ (b) $\frac{9\pi}{8}$ 19. (a) $-\frac{\pi}{6}$ (b) $-\frac{\pi}{3}$ 20. (a) $-\frac{5\pi}{6}$ (b) $-\frac{11\pi}{9}$ 21. (a) 3.5 (b) 2.25 22. (a) 6.02 (b) $-4.25$

In Exercises 23–26, sketch each angle in standard position.

23. (a) $\frac{\pi}{3}$ (b) $-\frac{2\pi}{3}$ 24. (a) $-\frac{7\pi}{4}$ (b) $\frac{5\pi}{2}$ 25. (a) $\frac{11\pi}{6}$ (b) $-3$ 26. (a) 4 (b) $7\pi$

In Exercises 27–30, determine two coterminal angles (one positive and one negative) for each angle. Give your answers in radians.

27. (a) 28. (a) 29. (a) 30. (a) 

(b) $\frac{\pi}{6}$ (b) $\frac{5\pi}{6}$ (b) $\frac{2\pi}{3}$ (b) $\frac{\pi}{15}$

(b) $\frac{\pi}{12}$ (b) $-\frac{2\pi}{15}$
In Exercises 31–34, find (if possible) the complement and supplement of each angle.

31. (a) $\pi/3$ (b) $\pi/4$
32. (a) $\pi/12$ (b) $11\pi/12$
33. (a) 1 (b) 2
34. (a) 3 (b) 1.5

In Exercises 35–40, estimate the number of degrees in the angle. Use a protractor to check your answer.

35.
36.
37.
38.
39.
40.

In Exercises 41–44, determine the quadrant in which each angle lies.

41. (a) $130^\circ$ (b) $285^\circ$
42. (a) $8.3^\circ$ (b) $257^\circ 30'$
43. (a) $-132^\circ 50'$ (b) $-336^\circ$
44. (a) $-260^\circ$ (b) $-3.4^\circ$

In Exercises 45–48, sketch each angle in standard position.

45. (a) $90^\circ$ (b) $180^\circ$
46. (a) $270^\circ$ (b) $120^\circ$
47. (a) $-30^\circ$ (b) $-135^\circ$
48. (a) $-750^\circ$ (b) $-600^\circ$

In Exercises 49–52, determine two coterminal angles (one positive and one negative) for each angle. Give your answers in degrees.

49. (a) $\theta = 45^\circ$ (b) $\theta = -145^\circ$
50. (a) $\theta = 120^\circ$ (b) $\theta = -420^\circ$
51. (a) $\theta = 240^\circ$ (b) $\theta = -180^\circ$
52. (a) $\theta = -390^\circ$ (b) $\theta = 230^\circ$

In Exercises 53–56, find (if possible) the complement and supplement of each angle.

53. (a) $18^\circ$ (b) $85^\circ$
54. (a) $46^\circ$ (b) $93^\circ$
55. (a) $150^\circ$ (b) $79^\circ$
56. (a) $130^\circ$ (b) $170^\circ$

In Exercises 57–60, rewrite each angle in degree measure. (Do not use a calculator.)

57. (a) $30^\circ$ (b) $45^\circ$
58. (a) $315^\circ$ (b) $120^\circ$
59. (a) $-20^\circ$ (b) $-60^\circ$
60. (a) $-270^\circ$ (b) $144^\circ$

In Exercises 61–64, rewrite each angle in degree measure. (Do not use a calculator.)

61. (a) $\frac{3\pi}{2}$ (b) $\frac{7\pi}{6}$
62. (a) $\frac{-7\pi}{12}$ (b) $\frac{\pi}{9}$
63. (a) $\frac{5\pi}{4}$ (b) $\frac{-7\pi}{3}$
64. (a) $\frac{11\pi}{6}$ (b) $\frac{34\pi}{15}$

In Exercises 65–72, convert the angle measure from degrees to radians. Round to three decimal places.

65. $45^\circ$
66. $87.4^\circ$
67. $-216.35^\circ$
68. $-48.27^\circ$
69. $532^\circ$
70. $345^\circ$
71. $-0.83^\circ$
72. $0.54^\circ$

In Exercises 73–80, convert the angle measure from radians to degrees. Round to three decimal places.

73. $\frac{\pi}{7}$
74. $\frac{5\pi}{11}$
75. $15\pi/8$
76. $13\pi/2$
77. $-4.2\pi$
78. $4.8\pi$
79. $-2$
80. $-0.57$

In Exercises 81–84, convert each angle measure to decimal degree form without using a calculator. Then check your answers using a calculator.

81. (a) $54^\circ 45'$ (b) $-128^\circ 30'$
82. (a) $245^\circ 10'$ (b) $2^\circ 12'$
83. (a) $85^\circ 18' 30''$ (b) $330^\circ 25''$
84. (a) $-135^\circ 36''$ (b) $-408^\circ 16' 20''$

In Exercises 85–88, convert each angle measure to degrees, minutes, and seconds without using a calculator. Then check your answers using a calculator.

85. (a) $240.6^\circ$ (b) $-145.8^\circ$
86. (a) $-345.12^\circ$ (b) $0.45^\circ$
87. (a) $2.5^\circ$ (b) $-3.58^\circ$
88. (a) $-0.36^\circ$ (b) $0.79^\circ$
In Exercises 89–92, find the length of the arc on a circle of radius \( r \) intercepted by a central angle \( \theta \).

<table>
<thead>
<tr>
<th>Radius ( r )</th>
<th>Central Angle ( \theta )</th>
</tr>
</thead>
<tbody>
<tr>
<td>89. 15 inches</td>
<td>120°</td>
</tr>
<tr>
<td>90. 9 feet</td>
<td>60°</td>
</tr>
<tr>
<td>91. 3 meters</td>
<td>150°</td>
</tr>
<tr>
<td>92. 20 centimeters</td>
<td>45°</td>
</tr>
</tbody>
</table>

In Exercises 93–96, find the radian measure of the central angle of a circle of radius \( r \) that intercepts an arc of length \( s \).

<table>
<thead>
<tr>
<th>Radius ( r )</th>
<th>Arc Length ( s )</th>
</tr>
</thead>
<tbody>
<tr>
<td>93. 4 inches</td>
<td>18 inches</td>
</tr>
<tr>
<td>94. 14 feet</td>
<td>8 feet</td>
</tr>
<tr>
<td>95. 25 centimeters</td>
<td>10.5 centimeters</td>
</tr>
<tr>
<td>96. 80 kilometers</td>
<td>150 kilometers</td>
</tr>
</tbody>
</table>

In Exercises 97–100, use the given arc length and radius to find the angle \( \theta \) (in radians).

97. \[
\begin{align*}
\theta &= \frac{\text{Arc Length}}{\text{Radius}} \\
&= \frac{18 \text{ inches}}{4 \text{ inches}} \\
&= 4.5 \text{ radians}
\end{align*}
\]

98. \[
\begin{align*}
\theta &= \frac{\text{Arc Length}}{\text{Radius}} \\
&= \frac{25 \text{ cm}}{10 \text{ cm}} \\
&= 2.5 \text{ radians}
\end{align*}
\]

99. \[
\begin{align*}
\theta &= \frac{\text{Arc Length}}{\text{Radius}} \\
&= \frac{7 \text{ cm}}{28 \text{ cm}} \\
&= 0.25 \text{ radians}
\end{align*}
\]

100. \[
\begin{align*}
\theta &= \frac{\text{Arc Length}}{\text{Radius}} \\
&= \frac{75 \text{ km}}{60 \text{ km}} \\
&= 1.25 \text{ radians}
\end{align*}
\]

In Exercises 101–104, find the area of the sector of the circle with radius \( r \) and central angle \( \theta \).

<table>
<thead>
<tr>
<th>Radius ( r )</th>
<th>Central Angle ( \theta )</th>
</tr>
</thead>
<tbody>
<tr>
<td>101. 6 inches</td>
<td>( \pi/3 )</td>
</tr>
<tr>
<td>102. 12 millimeters</td>
<td>( \pi/4 )</td>
</tr>
<tr>
<td>103. 2.5 feet</td>
<td>225°</td>
</tr>
<tr>
<td>104. 1.4 miles</td>
<td>330°</td>
</tr>
</tbody>
</table>

DISTANCE BETWEEN CITIES In Exercises 105 and 106, find the distance between the cities. Assume that Earth is a sphere of radius 4000 miles and that the cities are on the same longitude (one city is due north of the other).

<table>
<thead>
<tr>
<th>City</th>
<th>Latitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>105. Dallas, Texas</td>
<td>32° 47’ 39” N</td>
</tr>
<tr>
<td>Omaha, Nebraska</td>
<td>41° 15’ 50” N</td>
</tr>
</tbody>
</table>

106. San Francisco, California | 37° 47’ 36” N
Seattle, Washington          | 47° 37’ 18” N

107. DIFFERENCE IN LATITUDES Assuming that Earth is a sphere of radius 6378 kilometers, what is the difference in the latitudes of Syracuse, New York and Annapolis, Maryland, where Syracuse is about 450 kilometers due north of Annapolis?

108. DIFFERENCE IN LATITUDES Assuming that Earth is a sphere of radius 6378 kilometers, what is the difference in the latitudes of Lynchburg, Virginia and Myrtle Beach, South Carolina, where Lynchburg is about 400 kilometers due north of Myrtle Beach?

109. INSTRUMENTATION The pointer on a voltmeter is 6 centimeters in length (see figure). Find the angle through which the pointer rotates when it moves 2.5 centimeters on the scale.

110. ELECTRIC HOIST An electric hoist is being used to lift a beam (see figure). The diameter of the drum on the hoist is 10 inches, and the beam must be raised 2 feet. Find the number of degrees through which the drum must rotate.

111. LINEAR AND ANGULAR SPEEDS A circular power saw has a 7.2-inch-diameter blade that rotates at 5000 revolutions per minute.

(a) Find the angular speed of the saw blade in radians per minute.

(b) Find the linear speed (in feet per minute) of one of the 24 cutting teeth as they contact the wood being cut.

112. LINEAR AND ANGULAR SPEEDS A carousel with a 50-foot diameter makes 4 revolutions per minute.

(a) Find the angular speed of the carousel in radians per minute.

(b) Find the linear speed (in feet per minute) of the platform rim of the carousel.
113. LINEAR AND ANGULAR SPEEDS The diameter of a DVD is approximately 12 centimeters. The drive motor of the DVD player is controlled to rotate precisely between 200 and 500 revolutions per minute, depending on what track is being read.
(a) Find an interval for the angular speed of a DVD as it rotates.
(b) Find an interval for the linear speed of a point on the outermost track as the DVD rotates.

114. ANGULAR SPEED A two-inch-diameter pulley on an electric motor that runs at 1700 revolutions per minute is connected by a belt to a four-inch-diameter pulley on a saw arbor.
(a) Find the angular speed (in radians per minute) of each pulley.
(b) Find the revolutions per minute of the saw.

115. ANGULAR SPEED A car is moving at a rate of 65 miles per hour, and the diameter of its wheels is 2 feet.
(a) Find the number of revolutions per minute the wheels are rotating.
(b) Find the angular speed of the wheels in radians per minute.

116. ANGULAR SPEED A computerized spin balance machine rotates a 25-inch-diameter tire at 480 revolutions per minute.
(a) Find the road speed (in miles per hour) at which the tire is being balanced.
(b) At what rate should the spin balance machine be set so that the tire is being tested for 55 miles per hour?

117. AREA A sprinkler on a golf green is set to spray water over a distance of 15 meters and to rotate through an angle of 140°. Draw a diagram that shows the region that can be irrigated with the sprinkler. Find the area of the region.

118. AREA A car’s rear windshield wiper rotates 125°. The total length of the wiper mechanism is 25 inches and wipes the windshield over a distance of 14 inches. Find the area covered by the wiper.

119. SPEED OF A BICYCLE The radii of the pedal sprocket, the wheel sprocket, and the wheel of the bicycle in the figure are 4 inches, 2 inches, and 14 inches, respectively. A cyclist is pedaling at a rate of 1 revolution per second.
(a) Find the speed of the bicycle in feet per second and miles per hour.
(b) Use your result from part (a) to write a function for the distance $d$ (in miles) a cyclist travels in terms of the number $n$ of revolutions of the pedal sprocket.
(c) Write a function for the distance $d$ (in miles) a cyclist travels in terms of the time $t$ (in seconds). Compare this function with the function from part (b).
(d) Classify the types of functions you found in parts (b) and (c). Explain your reasoning.

120. CAPSTONE Write a short paper in your own words explaining the meaning of each of the following concepts to a classmate.
(a) an angle in standard position
(b) positive and negative angles
(c) coterminal angles
(d) angle measure in degrees and radians
(e) obtuse and acute angles
(f) complementary and supplementary angles

EXPLORATION

TRUE OR FALSE? In Exercises 121–123, determine whether the statement is true or false. Justify your answer.

121. A measurement of 4 radians corresponds to two complete revolutions from the initial side to the terminal side of an angle.

122. The difference between the measures of two coterminal angles is always a multiple of 360° if expressed in degrees and is always a multiple of $2\pi$ radians if expressed in radians.

123. An angle that measures $-1260°$ lies in Quadrant III.

124. THINK ABOUT IT A fan motor turns at a given angular speed. How does the speed of the tips of the blades change if a fan of greater diameter is installed on the motor? Explain.

125. THINK ABOUT IT Is a degree or a radian the larger unit of measure? Explain.

126. WRITING If the radius of a circle is increasing and the magnitude of a central angle is held constant, how is the length of the intercepted arc changing? Explain your reasoning.

127. PROOF Prove that the area of a circular sector of radius $r$ with central angle $\theta$ is $A = \frac{1}{2} \theta r^2$, where $\theta$ is measured in radians.
The Unit Circle

The two historical perspectives of trigonometry incorporate different methods for introducing the trigonometric functions. Our first introduction to these functions is based on the unit circle.

Consider the unit circle given by
\[ x^2 + y^2 = 1 \]
Unit circle

as shown in Figure 4.20.

Imagine that the real number line is wrapped around this circle, with positive numbers corresponding to a counterclockwise wrapping and negative numbers corresponding to a clockwise wrapping, as shown in Figure 4.21.

As the real number line is wrapped around the unit circle, each real number \( t \) corresponds to a point \((x, y)\) on the circle. For example, the real number 0 corresponds to the point \((1, 0)\). Moreover, because the unit circle has a circumference of \(2\pi\), the real number \(2\pi\) also corresponds to the point \((1, 0)\).

In general, each real number \( t \) also corresponds to a central angle \( \theta \) (in standard position) whose radian measure is \( t \). With this interpretation of \( t \), the arc length formula \( s = r\theta \) (with \( r = 1 \)) indicates that the real number \( t \) is the (directional) length of the arc intercepted by the angle \( \theta \), given in radians.
The Trigonometric Functions

From the preceding discussion, it follows that the coordinates \( x \) and \( y \) are two functions of the real variable \( t \). You can use these coordinates to define the six trigonometric functions of \( t \).

\[
\text{sine \hspace{1em} cosecant \hspace{1em} cosine \hspace{1em} secant \hspace{1em} tangent \hspace{1em} cotangent}
\]

These six functions are normally abbreviated \( \sin, \csc, \cos, \sec, \tan, \) and \( \cot \), respectively.

**Definitions of Trigonometric Functions**

Let \( t \) be a real number and let \((x, y)\) be the point on the unit circle corresponding to \( t \).

\[
\begin{align*}
\sin t &= y & \cos t &= x & \tan t &= \frac{y}{x}, & x \neq 0 \\
\csc t &= \frac{1}{y}, & y \neq 0 & \sec t &= \frac{1}{x}, & x \neq 0 \\
\cot t &= \frac{x}{y}, & y \neq 0
\end{align*}
\]

In the definitions of the trigonometric functions, note that the tangent and secant are not defined when \( x = 0 \). For instance, because \( t = \pi/2 \) corresponds to \((x, y) = (0, 1)\), it follows that \( \tan(\pi/2) \) and \( \sec(\pi/2) \) are undefined. Similarly, the cotangent and cosecant are not defined when \( y = 0 \). For instance, because \( t = 0 \) corresponds to \((x, y) = (1, 0)\), \( \cot 0 \) and \( \csc 0 \) are undefined.

In Figure 4.22, the unit circle has been divided into eight equal arcs, corresponding to \( t \)-values of

\[
0, \pi/4, \pi/2, 3\pi/4, \pi, 5\pi/4, 3\pi/2, 7\pi/4, \quad \text{and} \quad 2\pi.
\]

Similarly, in Figure 4.23, the unit circle has been divided into 12 equal arcs, corresponding to \( t \)-values of

\[
0, \pi/6, \pi/3, \pi/2, 2\pi/3, \pi, 5\pi/6, \pi, 7\pi/6, 2\pi/3, 5\pi/6, 11\pi/6, \quad \text{and} \quad 2\pi.
\]

To verify the points on the unit circle in Figure 4.22, note that \( \left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right) \) also lies on the line \( y = x \). So, substituting \( x \) for \( y \) in the equation of the unit circle produces the following.

\[
x^2 + x^2 = 1 \quad \Rightarrow \quad 2x^2 = 1 \quad \Rightarrow \quad x^2 = \frac{1}{2} \quad \Rightarrow \quad x = \pm \frac{\sqrt{2}}{2}
\]

Because the point is in the first quadrant, \( x = \frac{\sqrt{2}}{2} \) and because \( y = x \), you also have \( y = \frac{\sqrt{2}}{2} \). You can use similar reasoning to verify the rest of the points in Figure 4.22 and the points in Figure 4.23.

Using the \((x, y)\) coordinates in Figures 4.22 and 4.23, you can evaluate the trigonometric functions for common \( t \)-values. This procedure is demonstrated in Examples 1, 2, and 3. You should study and learn these exact function values for common \( t \)-values because they will help you in later sections to perform calculations.
Evaluating Trigonometric Functions

Evaluate the six trigonometric functions at each real number.

a. 
\[ t = \frac{\pi}{6} \]
\[ \sin \frac{\pi}{6} = y = \frac{1}{2} \]
\[ \cos \frac{\pi}{6} = x = \frac{\sqrt{3}}{2} \]
\[ \tan \frac{\pi}{6} = \frac{y}{x} = \frac{\sqrt{3}}{3} \]
\[ \csc \frac{\pi}{6} = \frac{1}{y} = \frac{1}{\frac{1}{2}} = 2 \]
\[ \sec \frac{\pi}{6} = \frac{1}{x} = \frac{2}{\sqrt{3}} \]
\[ \cot \frac{\pi}{6} = \frac{x}{y} = \frac{\sqrt{3}}{2} \]

b. 
\[ t = \frac{5\pi}{4} \]
\[ \sin \frac{5\pi}{4} = y = -\frac{\sqrt{2}}{2} \]
\[ \cos \frac{5\pi}{4} = x = -\frac{\sqrt{2}}{2} \]
\[ \tan \frac{5\pi}{4} = \frac{y}{x} = 1 \]
\[ \csc \frac{5\pi}{4} = \frac{1}{y} = -\frac{2}{\sqrt{2}} \]
\[ \sec \frac{5\pi}{4} = \frac{1}{x} = -\frac{2}{\sqrt{2}} \]
\[ \cot \frac{5\pi}{4} = \frac{x}{y} = -\frac{\sqrt{2}}{2} \]

c. 
\[ t = 0 \]
\[ \sin 0 = y = 0 \]
\[ \cos 0 = x = 1 \]
\[ \tan 0 = \frac{y}{x} = 0 \]
\[ \csc 0 = \frac{1}{y} \quad \text{is undefined} \]
\[ \sec 0 = \frac{1}{x} = 1 \]
\[ \cot 0 = \frac{x}{y} \quad \text{is undefined} \]

d. 
\[ t = \pi \]
\[ \sin \pi = y = 0 \]
\[ \cos \pi = x = -1 \]
\[ \tan \pi = \frac{y}{x} = 0 \]
\[ \csc \pi = \frac{1}{y} \quad \text{is undefined} \]
\[ \sec \pi = \frac{1}{x} = -1 \]
\[ \cot \pi = \frac{x}{y} \quad \text{is undefined} \]

You can review dividing fractions and rationalizing denominators in Appendix A.1 and Appendix A.2, respectively.
Section 4.2  Trigonometric Functions: The Unit Circle

Evaluating Trigonometric Functions

Solution

Moving clockwise around the unit circle, it follows that corresponds to the point $(x, y) = (1/2, -\sqrt{3}/2)$.

\[
\begin{align*}
\sin\left(-\frac{\pi}{3}\right) &= -\frac{\sqrt{3}}{2} \\
\csc\left(-\frac{\pi}{3}\right) &= -\frac{2}{\sqrt{3}} = -\frac{2\sqrt{3}}{3} \\
\cos\left(-\frac{\pi}{3}\right) &= \frac{1}{2} \\
\sec\left(-\frac{\pi}{3}\right) &= 2 \\
\tan\left(-\frac{\pi}{3}\right) &= -\frac{\sqrt{3}}{1/2} = -\sqrt{3} \\
\cot\left(-\frac{\pi}{3}\right) &= -\frac{1}{\sqrt{3}} = -\frac{\sqrt{3}}{3}
\end{align*}
\]

CHECKPOINT  Now try Exercise 33.

Domain and Period of Sine and Cosine

The domain of the sine and cosine functions is the set of all real numbers. To determine the range of these two functions, consider the unit circle shown in Figure 4.24. By definition, $\sin t = y$ and $\cos t = x$. Because $(x, y)$ is on the unit circle, you know that $-1 \leq y \leq 1$ and $-1 \leq x \leq 1$. So, the values of sine and cosine also range between $-1$ and $1$.

\[
\begin{align*}
-1 \leq y &\leq 1 & -1 \leq x &\leq 1 \\
-1 \leq \sin t &\leq 1 & -1 \leq \cos t &\leq 1
\end{align*}
\]

Adding $2\pi$ to each value of $t$ in the interval $[0, 2\pi]$ completes a second revolution around the unit circle, as shown in Figure 4.25. The values of $\sin(t+2\pi)$ and $\cos(t+2\pi)$ correspond to those of $\sin t$ and $\cos t$. Similar results can be obtained for repeated revolutions (positive or negative) on the unit circle. This leads to the general result

\[
\sin(t+2\pi n) = \sin t
\]

and

\[
\cos(t+2\pi n) = \cos t
\]

for any integer $n$ and real number $t$. Functions that behave in such a repetitive (or cyclic) manner are called periodic.

Definition of Periodic Function

A function $f$ is periodic if there exists a positive real number $c$ such that

\[f(t+c) = f(t)\]

for all $t$ in the domain of $f$. The smallest number $c$ for which $f$ is periodic is called the period of $f$. 
Recall from Section 1.5 that a function \( f \) is even if \( f(-t) = f(t) \), and is odd if \( f(-t) = -f(t) \).

### Even and Odd Trigonometric Functions

The cosine and secant functions are even.

\[
\cos(-t) = \cos t \quad \sec(-t) = \sec t
\]

The sine, cosecant, tangent, and cotangent functions are odd.

\[
\sin(-t) = -\sin t \quad \csc(-t) = -\csc t
\]
\[
\tan(-t) = -\tan t \quad \cot(-t) = -\cot t
\]

#### Example 3 Using the Period to Evaluate the Sine and Cosine

a. Because \( \frac{13\pi}{6} = 2\pi + \frac{\pi}{6} \), you have \( \sin \left( \frac{13\pi}{6} \right) = \sin \left( 2\pi + \frac{\pi}{6} \right) = \sin \frac{\pi}{6} = \frac{1}{2} \).

b. Because \( -\frac{7\pi}{2} = -4\pi + \frac{\pi}{2} \), you have

\[
\cos \left( -\frac{7\pi}{2} \right) = \cos \left( -4\pi + \frac{\pi}{2} \right) = \cos \frac{\pi}{2} = 0.
\]

c. For \( \sin t = \frac{4}{5} \), \( \sin(-t) = -\frac{4}{5} \) because the sine function is odd.

CHECKPOINT Now try Exercise 37.

### Evaluating Trigonometric Functions with a Calculator

When evaluating a trigonometric function with a calculator, you need to set the calculator to the desired mode of measurement (degree or radian).

Most calculators do not have keys for the cosecant, secant, and cotangent functions. To evaluate these functions, you can use the \( \frac{1}{\sin} \) key with their respective reciprocal functions sine, cosine, and tangent. For instance, to evaluate \( \csc(\pi/8) \), use the fact that

\[
\csc \frac{\pi}{8} = \frac{1}{\sin(\pi/8)}
\]

and enter the following keystroke sequence in radian mode.

\[ \boxed{ \sin \frac{\pi}{8} } \]

Display 2.6131259

#### Example 4 Using a Calculator

CHECKPOINT Now try Exercise 55.
4.2 EXERCISES

VOCABULARY: Fill in the blanks.

1. Each real number \( t \) corresponds to a point \((x, y)\) on the _______ _______.
2. A function \( f \) is _______ if there exists a positive real number \( c \) such that \( f(t + c) = f(t) \) for all \( t \) in the domain of \( f \).
3. The smallest number \( c \) for which a function \( f \) is periodic is called the _______ of \( f \).
4. A function \( f \) is _______ if there exists a positive real number such that for all \( t \) in the domain of \( f \).

SKILLS AND APPLICATIONS

In Exercises 5–8, determine the exact values of the six trigonometric functions of the real number \( t \).

5. \[ \left( \frac{12}{17}, \frac{5}{17} \right) \]
6. \[ \left( -\frac{8}{17}, \frac{15}{17} \right) \]
7. \[ \left( -\frac{7}{17}, -\frac{5}{17} \right) \]
8. \[ \left( \frac{12}{17}, -\frac{5}{17} \right) \]

In Exercises 9–16, find the point \((x, y)\) on the unit circle that corresponds to the real number \( t \).

9. \( t = \frac{\pi}{2} \)
10. \( t = \pi \)
11. \( t = \frac{\pi}{4} \)
12. \( t = \frac{\pi}{3} \)
13. \( t = \frac{5\pi}{6} \)
14. \( t = \frac{3\pi}{4} \)
15. \( t = \frac{4\pi}{3} \)
16. \( t = \frac{5\pi}{3} \)

In Exercises 17–26, evaluate (if possible) the sine, cosine, and tangent of the real number.

17. \( t = \frac{\pi}{4} \)
18. \( t = \frac{\pi}{3} \)
19. \( t = -\frac{\pi}{6} \)
20. \( t = -\frac{\pi}{4} \)
21. \( t = -\frac{7\pi}{4} \)
22. \( t = -\frac{4\pi}{3} \)
23. \( t = \frac{11\pi}{6} \)
24. \( t = \frac{5\pi}{3} \)
25. \( t = -\frac{3\pi}{2} \)
26. \( t = -2\pi \)

In Exercises 27–34, evaluate (if possible) the six trigonometric functions of the real number.

27. \( t = \frac{2\pi}{3} \)
28. \( t = \frac{5\pi}{6} \)
29. \( t = \frac{4\pi}{3} \)
30. \( t = \frac{7\pi}{4} \)
31. \( t = \frac{3\pi}{4} \)
32. \( t = \frac{3\pi}{2} \)
33. \( t = -\frac{\pi}{2} \)
34. \( t = -\pi \)

In Exercises 35–42, evaluate the trigonometric function using its period as an aid.

35. \( \sin 4\pi \)
36. \( \cos 3\pi \)
37. \( \cos \frac{7\pi}{3} \)
38. \( \sin \frac{9\pi}{4} \)
39. \( \cos \frac{17\pi}{4} \)
40. \( \sin \frac{19\pi}{6} \)
41. \( \sin \left(-\frac{8\pi}{3}\right) \)
42. \( \cos \left(-\frac{9\pi}{4}\right) \)

In Exercises 43–48, use the value of the trigonometric function to evaluate the indicated functions.

43. \( \sin t = \frac{1}{2} \)
   (a) \( \sin(-t) \)
   (b) \( \csc t \)
44. \( \sin(-t) = \frac{3}{5} \)
   (a) \( \sin t \)
   (b) \( \csc t \)
45. \( \cos(-t) = -\frac{1}{2} \)
   (a) \( \cos t \)
   (b) \( \sec t \)
46. \( \cos t = -\frac{3}{4} \)
   (a) \( \cos(-t) \)
   (b) \( \sec(-t) \)
47. \( \sin t = \frac{3}{5} \)
   (a) \( \sin(\pi - t) \)
   (b) \( \sin(t + \pi) \)
48. \( \cos t = \frac{4}{5} \)
   (a) \( \cos(\pi - t) \)
   (b) \( \cos(t + \pi) \)
In Exercises 49–58, use a calculator to evaluate the trigonometric function. Round your answer to four decimal places. (Be sure the calculator is set in the correct angle mode.)

49. \( \sin \frac{\pi}{4} \)  
50. \( \tan \frac{\pi}{3} \)

51. \( \cot \frac{\pi}{4} \)  
52. \( \csc \frac{2\pi}{3} \)

53. \( \cos(-1.7) \)  
54. \( \cos(-2.5) \)

55. \( \csc 0.8 \)  
56. \( \sec 1.8 \)

57. \( \sec(-22.8) \)  
58. \( \cot(-0.9) \)

59. **HARMONIC MOTION** The displacement from equilibrium of an oscillating weight suspended by a spring is given by \( y(t) = \frac{1}{2} \cos 6t \), where \( y \) is the displacement (in feet) and \( t \) is the time (in seconds). Find the displacements when (a) \( t = 0 \), (b) \( t = \frac{1}{4} \), and (c) \( t = \frac{1}{2} \).

60. **HARMONIC MOTION** The displacement from equilibrium of an oscillating weight suspended by a spring and subject to the damping effect of friction is given by \( y(t) = \frac{1}{2}e^{-\frac{t}{4}} \cos 6t \), where \( y \) is the displacement (in feet) and \( t \) is the time (in seconds).

(a) Complete the table.

<table>
<thead>
<tr>
<th>( t )</th>
<th>0</th>
<th>( \frac{1}{4} )</th>
<th>( \frac{1}{2} )</th>
<th>( \frac{3}{4} )</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Use the table feature of a graphing utility to approximate the time when the weight reaches equilibrium.

(c) What appears to happen to the displacement as \( t \) increases?

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 61–64, determine whether the statement is true or false. Justify your answer.

61. Because \( \sin(-t) = -\sin t \), it can be said that the sine of a negative angle is a negative number.

62. \( \tan a = \tan(a - 6\pi) \)

63. The real number 0 corresponds to the point (0, 1) on the unit circle.

64. \( \cos \left( -\frac{7\pi}{2} \right) = \cos \left( \pi + \frac{\pi}{2} \right) \)

65. Let \( (x_1, y_1) \) and \( (x_2, y_2) \) be points on the unit circle corresponding to \( t = t_1 \) and \( t = \pi - t_1 \), respectively.

(a) Identify the symmetry of the points \( (x_1, y_1) \) and \( (x_2, y_2) \).

(b) Make a conjecture about any relationship between \( \sin t_1 \) and \( \sin(\pi - t_1) \).

(c) Make a conjecture about any relationship between \( \cos t_1 \) and \( \cos(\pi - t_1) \).

66. Use the unit circle to verify that the cosine and secant functions are even and that the sine, cosecant, tangent, and cotangent functions are odd.

67. Verify that \( \cos 2t \neq 2 \cos t \) by approximating \( \cos 1.5 \) and \( 2 \cos 0.75 \).

68. Verify that \( \sin(t_1 + t_2) \neq \sin t_1 + \sin t_2 \) by approximating \( \sin 0.25 \), \( \sin 0.75 \), and \( \sin 1 \).

**THINK ABOUT IT**

69. Because \( f(t) = \sin t \) is an odd function and \( g(t) = \cos t \) is an even function, what can be said about the function \( h(t) = f(t)g(t) \)?

70. **THINK ABOUT IT** Because \( f(t) = \sin t \) and \( g(t) = \tan t \) are odd functions, what can be said about the function \( h(t) = f(t)g(t) \)?

71. **GRAPHICAL ANALYSIS** With your graphing utility in \( \text{radian and parametric} \) modes, enter the equations \( x(t) = \cos t \) and \( y(t) = \sin t \) and use the following settings.

\( T_{\text{min}} = 0, \quad T_{\text{max}} = 6.3, \quad T_{\text{step}} = 0.1 \)

\( X_{\text{min}} = -1.5, \quad X_{\text{max}} = 1.5, \quad X_{\text{scale}} = 1 \)

\( Y_{\text{min}} = -1, \quad Y_{\text{max}} = 1, \quad Y_{\text{scale}} = 1 \)

(a) Graph the entered equations and describe the graph.

(b) Use the \( \text{trace} \) feature to move the cursor around the graph. What do the \( t \)-values represent? What do the \( x \)- and \( y \)-values represent?

(c) What are the least and greatest values of \( x \) and \( y \)?

72. **CAPSTONE** A student you are tutoring has used a unit circle divided into 8 equal parts to complete the table for selected values of \( t \). What is wrong?

<table>
<thead>
<tr>
<th>( t )</th>
<th>0</th>
<th>( \frac{\pi}{4} )</th>

</table>
4.3 RIGHT TRIANGLE TRIGONOMETRY

What you should learn

• Evaluate trigonometric functions of acute angles.
• Use fundamental trigonometric identities.
• Use a calculator to evaluate trigonometric functions.
• Use trigonometric functions to model and solve real-life problems.

Why you should learn it

Trigonometric functions are often used to analyze real-life situations. For instance, in Exercise 76 on page 309, you can use trigonometric functions to find the height of a helium-filled balloon.

The Six Trigonometric Functions

Our second look at the trigonometric functions is from a right triangle perspective. Consider a right triangle, with one acute angle labeled \( \theta \), as shown in Figure 4.26. Relative to the angle \( \theta \), the three sides of the triangle are the hypotenuse, the opposite side (the side opposite the angle \( \theta \)), and the adjacent side (the side adjacent to the angle \( \theta \)).

Using the lengths of these three sides, you can form six ratios that define the six trigonometric functions of the acute angle \( \theta \).

\[
\begin{align*}
\sin \theta &= \frac{\text{opp}}{\text{hyp}} & \cos \theta &= \frac{\text{adj}}{\text{hyp}} & \tan \theta &= \frac{\text{opp}}{\text{adj}} \\
\csc \theta &= \frac{\text{hyp}}{\text{opp}} & \sec \theta &= \frac{\text{hyp}}{\text{adj}} & \cot \theta &= \frac{\text{adj}}{\text{opp}}
\end{align*}
\]

In the following definitions, it is important to see that \( 0^\circ < \theta < 90^\circ \) (\( \theta \) lies in the first quadrant) and that for such angles the value of each trigonometric function is positive.

Right Triangle Definitions of Trigonometric Functions

Let \( \theta \) be an acute angle of a right triangle. The six trigonometric functions of the angle \( \theta \) are defined as follows. (Note that the functions in the second row are the reciprocals of the corresponding functions in the first row.)

\[
\begin{align*}
\sin \theta &= \frac{\text{opp}}{\text{hyp}} & \cos \theta &= \frac{\text{adj}}{\text{hyp}} & \tan \theta &= \frac{\text{opp}}{\text{adj}} \\
\csc \theta &= \frac{\text{hyp}}{\text{opp}} & \sec \theta &= \frac{\text{hyp}}{\text{adj}} & \cot \theta &= \frac{\text{adj}}{\text{opp}}
\end{align*}
\]

The abbreviations opp, adj, and hyp represent the lengths of the three sides of a right triangle.

\[
\begin{align*}
\text{opp} &= \text{the length of the side opposite } \theta \\
\text{adj} &= \text{the length of the side adjacent to } \theta \\
\text{hyp} &= \text{the length of the hypotenuse}
\end{align*}
\]
Evaluating Trigonometric Functions

Use the triangle in Figure 4.27 to find the values of the six trigonometric functions of \( \theta \).

**Solution**

By the Pythagorean Theorem, \((\text{hyp})^2 = (\text{opp})^2 + (\text{adj})^2\), it follows that

\[
\text{hyp} = \sqrt{4^2 + 3^2} = \sqrt{25} = 5.
\]

So, the six trigonometric functions of \( \theta \) are

\[
\sin \theta = \frac{\text{opp}}{\text{hyp}} = \frac{4}{5}, \quad \csc \theta = \frac{\text{hyp}}{\text{opp}} = \frac{5}{4}
\]

\[
\cos \theta = \frac{\text{adj}}{\text{hyp}} = \frac{3}{5}, \quad \sec \theta = \frac{\text{hyp}}{\text{adj}} = \frac{5}{3}
\]

\[
\tan \theta = \frac{\text{opp}}{\text{adj}} = \frac{4}{3}, \quad \cot \theta = \frac{\text{adj}}{\text{opp}} = \frac{3}{4}.
\]

**CHECKPOINT**

Now try Exercise 7.

In Example 1, you were given the lengths of two sides of the right triangle, but not the angle \( \theta \). Often, you will be asked to find the trigonometric functions of a *given* acute angle \( \theta \). To do this, construct a right triangle having \( \theta \) as one of its angles.

**Example 2** Evaluating Trigonometric Functions of 45°

Find the values of \( \sin 45^\circ \), \( \cos 45^\circ \), and \( \tan 45^\circ \).

**Solution**

Construct a right triangle having 45° as one of its acute angles, as shown in Figure 4.28. Choose the length of the adjacent side to be 1. From geometry, you know that the other acute angle is also 45°. So, the triangle is isosceles and the length of the opposite side is also 1. Using the Pythagorean Theorem, you find the length of the hypotenuse to be \( \sqrt{2} \).

\[
\sin 45^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2}
\]

\[
\cos 45^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2}
\]

\[
\tan 45^\circ = \frac{\text{opp}}{\text{adj}} = \frac{1}{1} = 1
\]

**CHECKPOINT**

Now try Exercise 23.
Section 4.3 Right Triangle Trigonometry

Evaluating Trigonometric Functions of 30° and 60°

Use the equilateral triangle shown in Figure 4.29 to find the values of \( \sin 30^\circ \), \( \cos 60^\circ \), \( \sin 30^\circ \), and \( \cos 30^\circ \).

![Figure 4.29](image)

Solution

Use the Pythagorean Theorem and the equilateral triangle in Figure 4.29 to verify the lengths of the sides shown in the figure. For \( \theta = 60^\circ \), you have \( \text{adj} = 1 \), \( \text{opp} = \sqrt{3} \), and \( \text{hyp} = 2 \). So,

\[
\sin 60^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{\sqrt{3}}{2} \quad \text{and} \quad \cos 60^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{1}{2}
\]

For \( \theta = 30^\circ \), \( \text{adj} = \sqrt{3} \), \( \text{opp} = 1 \), and \( \text{hyp} = 2 \). So,

\[
\sin 30^\circ = \frac{\text{opp}}{\text{hyp}} = \frac{1}{2} \quad \text{and} \quad \cos 30^\circ = \frac{\text{adj}}{\text{hyp}} = \frac{\sqrt{3}}{2}
\]

CHECK POINT Now try Exercise 27.

Sines, Cosines, and Tangents of Special Angles

\[
\begin{align*}
\sin 30^\circ &= \sin \frac{\pi}{6} = \frac{1}{2} \\
\cos 30^\circ &= \cos \frac{\pi}{6} = \frac{\sqrt{3}}{2} \\
\tan 30^\circ &= \tan \frac{\pi}{6} = \frac{\sqrt{3}}{3} \\
\sin 45^\circ &= \sin \frac{\pi}{4} = \frac{\sqrt{2}}{2} \\
\cos 45^\circ &= \cos \frac{\pi}{4} = \frac{\sqrt{2}}{2} \\
\tan 45^\circ &= \tan \frac{\pi}{4} = 1 \\
\sin 60^\circ &= \sin \frac{\pi}{3} = \frac{\sqrt{3}}{2} \\
\cos 60^\circ &= \cos \frac{\pi}{3} = \frac{1}{2} \\
\tan 60^\circ &= \tan \frac{\pi}{3} = \sqrt{3}
\end{align*}
\]

In the box, note that \( \sin 30^\circ = \frac{1}{2} = \cos 60^\circ \). This occurs because \( 30^\circ \) and \( 60^\circ \) are complementary angles. In general, it can be shown from the right triangle definitions that **cofunctions of complementary angles are equal**. That is, if \( \theta \) is an acute angle, the following relationships are true.

\[
\begin{align*}
\sin(90^\circ - \theta) &= \cos \theta \\
\cos(90^\circ - \theta) &= \sin \theta \\
\tan(90^\circ - \theta) &= \cot \theta \\
\cot(90^\circ - \theta) &= \tan \theta \\
\sec(90^\circ - \theta) &= \csc \theta \\
\csc(90^\circ - \theta) &= \sec \theta
\end{align*}
\]
Trigonometric Identities

In trigonometry, a great deal of time is spent studying relationships between trigonometric functions (identities).

**Fundamental Trigonometric Identities**

**Reciprocal Identities**

\[ \sin \theta = \frac{1}{\csc \theta} \quad \cos \theta = \frac{1}{\sec \theta} \quad \tan \theta = \frac{1}{\cot \theta} \]

\[ \csc \theta = \frac{1}{\sin \theta} \quad \sec \theta = \frac{1}{\cos \theta} \quad \cot \theta = \frac{1}{\tan \theta} \]

**Quotient Identities**

\[ \tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{\cos \theta}{\sin \theta} \]

**Pythagorean Identities**

\[ \sin^2 \theta + \cos^2 \theta = 1 \]

\[ 1 + \tan^2 \theta = \sec^2 \theta \]

\[ 1 + \cot^2 \theta = \csc^2 \theta \]

Note that \( \sin^2 \theta \) represents \((\sin \theta)^2\), \( \cos^2 \theta \) represents \((\cos \theta)^2\), and so on.

---

**Example 4** Applying Trigonometric Identities

Let \( \theta \) be an acute angle such that \( \sin \theta = 0.6 \). Find the values of (a) \( \cos \theta \) and (b) \( \tan \theta \) using trigonometric identities.

**Solution**

**a.** To find the value of \( \cos \theta \), use the Pythagorean identity

\[ \sin^2 \theta + \cos^2 \theta = 1. \]

So, you have

\[
(0.6)^2 + \cos^2 \theta = 1 \quad \text{Substitute } 0.6 \text{ for } \sin \theta.
\]

\[
\cos^2 \theta = 1 - (0.6)^2 = 0.64 \quad \text{Subtract } (0.6)^2 \text{ from each side.}
\]

\[
\cos \theta = \sqrt{0.64} = 0.8 \quad \text{Extract the positive square root.}
\]

**b.** Now, knowing the sine and cosine of \( \theta \), you can find the tangent of \( \theta \) to be

\[
\tan \theta = \frac{\sin \theta}{\cos \theta}
\]

\[
= \frac{0.6}{0.8}
\]

\[
= 0.75.
\]

Use the definitions of \( \cos \theta \) and \( \tan \theta \), and the triangle shown in Figure 4.30, to check these results.

**CHECK POINT** Now try Exercise 33.
### Example 5  Applying Trigonometric Identities

Let \( \theta \) be an acute angle such that \( \tan \theta = 3 \). Find the values of (a) \( \cot \theta \) and (b) \( \sec \theta \) using trigonometric identities.

**Solution**

a. \( \cot \theta = \frac{1}{\tan \theta} \)  
   \[ \cot \theta = \frac{1}{3} \]

b. \( \sec^2 \theta = 1 + \tan^2 \theta \)  
   \[ \sec^2 \theta = 1 + 3^2 \]  
   \[ \sec^2 \theta = 10 \]  
   \[ \sec \theta = \sqrt{10} \]

Use the definitions of \( \cot \theta \) and \( \sec \theta \), and the triangle shown in Figure 4.31, to check these results.

**Study Tip**

You can also use the reciprocal identities for sine, cosine, and tangent to evaluate the cosecant, secant, and cotangent functions with a calculator. For instance, you could use the following keystroke sequence to evaluate \( \sec 28^\circ \).

```
1 \( \text{COS} \) \( \text{28 ENTER} \)
```

The calculator should display 1.1325701.

### Example 6  Using a Calculator

Use a calculator to evaluate \( \sec(5^\circ \ 40' \ 12'') \).

**Solution**

Begin by converting to decimal degree form. [Recall that \( 1' = \frac{1}{60} (1^\circ) \) and \( 1'' = \frac{1}{3600} (1^\circ) \)].

\[
5^\circ \ 40' \ 12'' = \left( 5^\circ \right) + \left( \frac{40}{60} \right)^\circ + \left( \frac{12}{3600} \right)^\circ = 5.67^\circ
\]

Then, use a calculator to evaluate \( \sec 5.67^\circ \).

```
sec(5^\circ \ 40' \ 12'') = \sec 5.67^\circ \ 1 \ (\text{COS}) \ 5.67 \ (\text{COS}) \ (\text{COS}) \ \text{ENTER} \ 1.0049166
```

**Check Point**

Now try Exercise 35.
Applications Involving Right Triangles

Many applications of trigonometry involve a process called solving right triangles. In this type of application, you are usually given one side of a right triangle and one of the acute angles and are asked to find one of the other sides, or you are given two sides and are asked to find one of the acute angles.

In Example 7, the angle you are given is the angle of elevation, which represents the angle from the horizontal upward to an object. For objects that lie below the horizontal, it is common to use the term angle of depression, as shown in Figure 4.32.

**Example 7** Using Trigonometry to Solve a Right Triangle

A surveyor is standing 115 feet from the base of the Washington Monument, as shown in Figure 4.33. The surveyor measures the angle of elevation to the top of the monument as 78.3°. How tall is the Washington Monument?

**Solution**

From Figure 4.33, you can see that

\[ \tan 78.3° = \frac{\text{opp}}{\text{adj}} = \frac{y}{x} \]

where \( x = 115 \) and \( y \) is the height of the monument. So, the height of the Washington Monument is

\[ y = x \tan 78.3° \approx 115(4.82882) \approx 555 \text{ feet}. \]

Now try Exercise 67.

**Example 8** Using Trigonometry to Solve a Right Triangle

A historic lighthouse is 200 yards from a bike path along the edge of a lake. A walkway to the lighthouse is 400 yards long. Find the acute angle \( \theta \) between the bike path and the walkway, as illustrated in Figure 4.34.

**Solution**

From Figure 4.34, you can see that the sine of the angle \( \theta \) is

\[ \sin \theta = \frac{\text{opp}}{\text{hyp}} = \frac{200}{400} = \frac{1}{2}. \]

Now you should recognize that \( \theta = 30° \).

Now try Exercise 69.
By now you are able to recognize that $\theta = 30^\circ$ is the acute angle that satisfies the equation $\sin \theta = \frac{1}{2}$. Suppose, however, that you were given the equation $\sin \theta = 0.6$ and were asked to find the acute angle $\theta$. Because

$$\sin 30^\circ = \frac{1}{2}$$
$$= 0.5000$$

and

$$\sin 45^\circ = \frac{1}{\sqrt{2}}$$
$$\approx 0.7071$$

you might guess that $\theta$ lies somewhere between $30^\circ$ and $45^\circ$. In a later section, you will study a method by which a more precise value of $\theta$ can be determined.

**Example 9** \hspace{1cm} **Solving a Right Triangle**

Find the length $c$ of the skateboard ramp shown in Figure 4.35.

![Figure 4.35](image)

**Solution**

From Figure 4.35, you can see that

$$\sin 18.4^\circ = \frac{\text{opp}}{\text{hyp}}$$
$$= \frac{4}{c}$$

So, the length of the skateboard ramp is

$$c = \frac{4}{\sin 18.4^\circ}$$
$$\approx \frac{4}{0.3156}$$
$$\approx 12.7 \text{ feet}.$$  

Now try Exercise 71.
4.3 EXERCISES

VOCABULARY

1. Match the trigonometric function with its right triangle definition.
   (a) Sine
   (b) Cosine
   (c) Tangent
   (d) Cosecant
   (e) Secant
   (f) Cotangent

   (i) \( \frac{\text{opposite}}{\text{hypotenuse}} \)
   (ii) \( \frac{\text{adjacent}}{\text{opposite}} \)
   (iii) \( \frac{\text{hypotenuse}}{\text{opposite}} \)
   (iv) \( \frac{\text{adjacent}}{\text{hypotenuse}} \)
   (v) \( \frac{\text{opposite}}{\text{hypotenuse}} \)
   (vi) \( \frac{\text{adjacent}}{\text{hypotenuse}} \)

In Exercises 2–4, fill in the blanks.

2. Relative to the angle \( \theta \), the three sides of a right triangle are the ________ side, the ________ side, and the ________.

3. Cofunctions of ________ angles are equal.

4. An angle that measures from the horizontal upward to an object is called the angle of ________, whereas an angle that measures from the horizontal downward to an object is called the angle of ________.

SKILLS AND APPLICATIONS

In Exercises 5–8, find the exact values of the six trigonometric functions of the angle \( \theta \) shown in the figure. (Use the Pythagorean Theorem to find the third side of the triangle.)

5.

6.

7.

8.

In Exercises 9–12, find the exact values of the six trigonometric functions of the angle \( \theta \) for each of the two triangles. Explain why the function values are the same.

9.

10.

11.

12.

In Exercises 13–20, sketch a right triangle corresponding to the trigonometric function of the acute angle \( \theta \). Use the Pythagorean Theorem to determine the third side and then find the other five trigonometric functions of \( \theta \).

13. \( \tan \theta = \frac{3}{4} \)
14. \( \cos \theta = \frac{5}{13} \)
15. \( \sec \theta = \frac{17}{7} \)
16. \( \tan \theta = \frac{4}{5} \)
17. \( \sin \theta = \frac{12}{13} \)
18. \( \sec \theta = \frac{13}{5} \)
19. \( \cot \theta = 3 \)
20. \( \csc \theta = 9 \)

In Exercises 21–30, construct an appropriate triangle to complete the table. \((0^\circ \leq \theta \leq 90^\circ, 0 \leq \theta \leq \pi/2)\)

In Exercises 31–36, use the given function value(s), and trigonometric identities (including the cofunction identities), to find the indicated trigonometric functions.

31. \( \sin 60^\circ = \frac{\sqrt{3}}{2}, \quad \cos 60^\circ = \frac{1}{2} \)
   (a) \( \sin 30^\circ \)  
   (b) \( \cos 30^\circ \)  
   (c) \( \tan 60^\circ \)  
   (d) \( \cot 60^\circ \)
32. \( \sin 30^\circ = \frac{1}{2}, \quad \tan 30^\circ = \frac{\sqrt{3}}{3} \)
   (a) \( \csc 30^\circ \)  
   (b) \( \cot 60^\circ \)  
   (c) \( \cos 30^\circ \)  
   (d) \( \cot 30^\circ \)
33. \( \cos \theta = \frac{1}{2} \)
   (a) \( \sin \theta \)  
   (b) \( \tan \theta \)  
   (c) \( \sec \theta \)  
   (d) \( \csc(90^\circ - \theta) \)
34. \( \sec \theta = 5 \)
   (a) \( \cos \theta \)  
   (b) \( \cot \theta \)  
   (c) \( \cot(90^\circ - \theta) \)  
   (d) \( \sin \theta \)
35. \( \cot \alpha = 5 \)
   (a) \( \tan \alpha \)  
   (b) \( \csc \alpha \)  
   (c) \( \cot(90^\circ - \alpha) \)  
   (d) \( \cos \alpha \)
36. \( \cos \beta = \frac{\sqrt{7}}{4} \)
   (a) \( \sec \beta \)  
   (b) \( \sin \beta \)  
   (c) \( \cot \beta \)  
   (d) \( \sin(90^\circ - \beta) \)

In Exercises 37–46, use trigonometric identities to transform the left side of the equation into the right side \((0 < \theta < \pi/2)\).
37. \( \tan \theta \cot \theta = 1 \)
38. \( \cos \theta \sec \theta = 1 \)
39. \( \tan \alpha \cos \alpha = \sin \alpha \)
40. \( \cot \alpha \sin \alpha = \cos \alpha \)
41. \( (1 + \sin \theta)(1 - \sin \theta) = \cos^2 \theta \)
42. \( (1 + \cos \theta)(1 - \cos \theta) = \sin^2 \theta \)
43. \( (\sec \theta + \tan \theta)(\sec \theta - \tan \theta) = 1 \)
44. \( \sin^2 \theta - \cos^2 \theta = 2 \sin^2 \theta - 1 \)
45. \( \frac{\sin \theta}{\cos \theta} + \frac{\cos \theta}{\sin \theta} = \csc \theta \sec \theta \)
46. \( \frac{\tan \beta + \cot \beta}{\tan \beta} = \csc^2 \beta \)

In Exercises 47–56, use a calculator to evaluate each function. Round your answers to four decimal places. (Be sure the calculator is in the correct angle mode.)
47. (a) \( \sin 10^\circ \)  
   (b) \( \cos 80^\circ \)
48. (a) \( \tan 23.5^\circ \)  
   (b) \( \cot 66.5^\circ \)
49. (a) \( \sin 16.35^\circ \)  
   (b) \( \csc 16.35^\circ \)
50. (a) \( \cot 79.56^\circ \)  
   (b) \( \sec 79.56^\circ \)
51. (a) \( \cos 4^\circ 50’ 15’’ \)  
   (b) \( \sec 4^\circ 50’ 15’’ \)
52. (a) \( \sec 42^\circ 12’ \)  
   (b) \( \cos 48^\circ 7’ \)
53. (a) \( \cot 11^\circ 15’ \)  
   (b) \( \tan 11^\circ 15’ \)
54. (a) \( \sec 56^\circ 8’ 10’’ \)  
   (b) \( \cos 56^\circ 8’ 10’’ \)
55. (a) \( \csc 32^\circ 40’ 3’’ \)  
   (b) \( \tan 44^\circ 28’ 16’’ \)
56. (a) \( \sec \left( \frac{2}{3} \cdot 20 + 32 \right)^\circ \)  
   (b) \( \cot \left( \frac{2}{3} \cdot 30 + 32 \right)^\circ \)

In Exercises 57–62, find the values of \( \theta \) in degrees \((0^\circ < \theta < 90^\circ)\) and radians \((0 < \theta < \pi/2)\) without the aid of a calculator.
57. (a) \( \sin \theta = \frac{1}{2} \)  
   (b) \( \csc \theta = 2 \)
58. (a) \( \cos \theta = \frac{\sqrt{3}}{2} \)  
   (b) \( \tan \theta = 1 \)
59. (a) \( \sec \theta = 2 \)  
   (b) \( \cot \theta = 1 \)
60. (a) \( \tan \theta = \frac{\sqrt{3}}{3} \)  
   (b) \( \cos \theta = \frac{1}{2} \)
61. (a) \( \csc \theta = \frac{2 \sqrt{3}}{3} \)  
   (b) \( \sin \theta = \frac{\sqrt{3}}{2} \)
62. (a) \( \cot \theta = \frac{\sqrt{3}}{3} \)  
   (b) \( \sec \theta = \sqrt{2} \)

In Exercises 63–66, solve for \( x, y, \) or \( r \) as indicated.
63. Solve for \( y. \)
64. Solve for \( x. \)
65. Solve for \( x. \)
66. Solve for \( r. \)

**EMPIRE STATE BUILDING** You are standing 45 meters from the base of the Empire State Building. You estimate that the angle of elevation to the top of the 86th floor (the observatory) is 82°. If the total height of the building is another 123 meters above the 86th floor, what is the approximate height of the building? One of your friends is on the 86th floor. What is the distance between you and your friend?
68. **HEIGHT** A six-foot person walks from the base of a broadcasting tower directly toward the tip of the shadow cast by the tower. When the person is 132 feet from the tower and 3 feet from the tip of the shadow, the person’s shadow starts to appear beyond the tower’s shadow.

(a) Draw a right triangle that gives a visual representation of the problem. Show the known quantities of the triangle and use a variable to indicate the height of the tower.

(b) Use a trigonometric function to write an equation involving the unknown quantity.

(c) What is the height of the tower?

69. **ANGLE OF ELEVATION** You are skiing down a mountain with a vertical height of 1500 feet. The distance from the top of the mountain to the base is 3000 feet. What is the angle of elevation from the base to the top of the mountain?

70. **WIDTH OF A RIVER** A biologist wants to know the width \( w \) of a river so that instruments for studying the pollutants in the water can be set properly. From point \( A \), the biologist walks downstream 100 feet and sights to point \( C \) (see figure). From this sighting, it is determined that \( \theta = 54^\circ \). How wide is the river?

71. **LENGTH** A guy wire runs from the ground to a cell tower. The wire is attached to the cell tower 150 feet above the ground. The angle formed between the wire and the ground is \( 43^\circ \) (see figure).

(a) How long is the guy wire?

(b) How far from the base of the tower is the guy wire anchored to the ground?

72. **HEIGHT OF A MOUNTAIN** In traveling across flat land, you notice a mountain directly in front of you. Its angle of elevation (to the peak) is \( 3.5^\circ \). After you drive 13 miles closer to the mountain, the angle of elevation is \( 9^\circ \). Approximate the height of the mountain.

73. **MACHINE SHOP CALCULATIONS** A steel plate has the form of one-fourth of a circle with a radius of 60 centimeters. Two two-centimeter holes are to be drilled in the plate positioned as shown in the figure. Find the coordinates of the center of each hole.

74. **MACHINE SHOP CALCULATIONS** A tapered shaft has a diameter of 5 centimeters at the small end and is 15 centimeters long (see figure). The taper is \( 3^\circ \). Find the diameter \( d \) of the large end of the shaft.

75. **GEOMETRY** Use a compass to sketch a quarter of a circle of radius 10 centimeters. Using a protractor, construct an angle of \( 20^\circ \) in standard position (see figure). Drop a perpendicular line from the point of intersection of the terminal side of the angle and the arc of the circle. By actual measurement, calculate the coordinates \((x, y)\) of the point of intersection and use these measurements to approximate the six trigonometric functions of a \( 20^\circ \) angle.
76. **HEIGHT** A 20-meter line is used to tether a helium-filled balloon. Because of a breeze, the line makes an angle of approximately 85° with the ground. 

(a) Draw a right triangle that gives a visual representation of the problem. Show the known quantities of the triangle and use a variable to indicate the height of the balloon.

(b) Use a trigonometric function to write an equation involving the unknown quantity.

(c) What is the height of the balloon?

(d) The breeze becomes stronger and the angle the balloon makes with the ground decreases. How does this affect the triangle you drew in part (a)?

(e) Complete the table, which shows the heights (in meters) of the balloon for decreasing angle measures θ.

<table>
<thead>
<tr>
<th>Angle, θ</th>
<th>0°</th>
<th>18°</th>
<th>36°</th>
<th>54°</th>
<th>72°</th>
<th>90°</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(f) As the angle the balloon makes with the ground approaches 0°, how does this affect the height of the balloon? Draw a right triangle to explain your reasoning.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 77–82, determine whether the statement is true or false. Justify your answer.

77. \( \sin 60° \csc 60° = 1 \)  
78. \( \sec 30° = \csc 60° \)

79. \( \sin 45° + \cos 45° = 1 \)
80. \( \cot^2 10° - \csc^2 10° = -1 \)

81. \( \frac{\sin 60°}{\sin 30°} = \sin 2° \)
82. \( \tan[(5°)^2] = \tan^2 5° \)

83. **THINK ABOUT IT**

(a) Complete the table.

<table>
<thead>
<tr>
<th>θ</th>
<th>0.1</th>
<th>0.2</th>
<th>0.3</th>
<th>0.4</th>
<th>0.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sin \theta )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Is \( \theta \) or \( \sin \theta \) greater for \( \theta \) in the interval \( (0, 0.5] \)?

(c) As \( \theta \) approaches 0, how do \( \theta \) and \( \sin \theta \) compare? Explain.

84. **THINK ABOUT IT**

(a) Complete the table.

<table>
<thead>
<tr>
<th>θ</th>
<th>0°</th>
<th>18°</th>
<th>36°</th>
<th>54°</th>
<th>72°</th>
<th>90°</th>
</tr>

</tbody>
</table>

(b) Discuss the behavior of the sine function for \( \theta \) in the range from 0° to 90°.

(c) Discuss the behavior of the cosine function for \( \theta \) in the range from 0° to 90°.

(d) Use the definitions of the sine and cosine functions to explain the results of parts (b) and (c).

85. **WRITING** In right triangle trigonometry, explain why \( \sin 30° = \frac{1}{2} \) regardless of the size of the triangle.

86. **GEOMETRY** Use the equilateral triangle shown in Figure 4.29 and similar triangles to verify the points in Figure 4.23 (in Section 4.2) that do not lie on the axes.

87. **THINK ABOUT IT** You are given only the value \( \sec \theta \). Is it possible to find the value of \( \tan \theta \) without finding the measure of \( \theta \)? Explain.

88. **CAPSTONE** The Johnstown Inclined Plane in Pennsylvania is one of the longest and steepest hoists in the world. The railway cars travel a distance of 896.5 feet at an angle of approximately 35.4°, rising to a height of 1693.5 feet above sea level.

(a) Find the vertical rise of the inclined plane.

(b) Find the elevation of the lower end of the inclined plane.

(c) The cars move up the mountain at a rate of 300 feet per minute. Find the rate at which they rise vertically.
In Section 4.3, the definitions of trigonometric functions were restricted to acute angles. In this section, the definitions are extended to cover any angle. If \( \theta \) is an acute angle, these definitions coincide with those given in the preceding section. Because \( r = \sqrt{x^2 + y^2} \) cannot be zero, it follows that the sine and cosine functions are defined for any real value of \( \theta \). However, if \( x = 0 \), the tangent and secant of \( \theta \) are undefined. For example, the tangent of 90° is undefined. Similarly, if \( y = 0 \), the cotangent and cosecant of \( \theta \) are undefined.

**Example 1** Evaluating Trigonometric Functions

Let \((-3, 4)\) be a point on the terminal side of \( \theta \). Find the sine, cosine, and tangent of \( \theta \).

**Solution**

Referring to Figure 4.36, you can see that \( x = -3, \ y = 4 \), and

\[
r = \sqrt{x^2 + y^2} = \sqrt{(-3)^2 + 4^2} = \sqrt{25} = 5.
\]

So, you have the following.

\[
\sin \theta = \frac{y}{r} = \frac{4}{5} \quad \cos \theta = \frac{x}{r} = \frac{-3}{5} \quad \tan \theta = \frac{y}{x} = \frac{-4}{3}
\]

**Algebra Help**

The formula \( r = \sqrt{x^2 + y^2} \) is a result of the Distance Formula. You can review the Distance Formula in Section 1.1.

**CHECKPOINT** Now try Exercise 9.
The signs of the trigonometric functions in the four quadrants can be determined from the definitions of the functions. For instance, because \( \cos \theta = x/r \), it follows that \( \cos \theta \) is positive wherever \( x > 0 \), which is in Quadrants I and IV. (Remember, \( r \) is always positive.) In a similar manner, you can verify the results shown in Figure 4.37.

**Example 2**  
**Evaluating Trigonometric Functions**

Given \( \tan \theta = -\frac{5}{4} \) and \( \cos \theta > 0 \), find \( \sin \theta \) and \( \sec \theta \).

**Solution**

Note that \( \theta \) lies in Quadrant IV because that is the only quadrant in which the tangent is negative and the cosine is positive. Moreover, using

\[
\tan \theta = \frac{y}{x} = -\frac{5}{4}
\]

and the fact that \( y \) is negative in Quadrant IV, you can let \( y = -5 \) and \( x = 4 \). So, \( r = \sqrt{16 + 25} = \sqrt{41} \) and you have

\[
\sin \theta = \frac{y}{r} = \frac{-5}{\sqrt{41}} \\
\approx -0.7809
\]

\[
\sec \theta = \frac{r}{x} = \frac{\sqrt{41}}{4}
\]

\[
\approx 1.6008.
\]

**CHECK POINT** Now try Exercise 23.

**Example 3**  
**Trigonometric Functions of Quadrant Angles**

Evaluate the cosine and tangent functions at the four quadrant angles 0, \( \frac{\pi}{2} \), \( \pi \), \( \frac{3\pi}{2} \).

**Solution**

To begin, choose a point on the terminal side of each angle, as shown in Figure 4.38. For each of the four points, \( r = 1 \), and you have the following.

\[
\cos 0 = \frac{x}{r} = 1 \\
\tan 0 = \frac{y}{x} = 0 \\
(x, y) = (1, 0)
\]

\[
\cos \frac{\pi}{2} = \frac{x}{r} = 0 \\
\tan \frac{\pi}{2} = \frac{y}{x} = \text{undefined} \\
(x, y) = (0, 1)
\]

\[
\cos \pi = \frac{x}{r} = -1 \\
\tan \pi = \frac{y}{x} = 0 \\
(x, y) = (-1, 0)
\]

\[
\cos \frac{3\pi}{2} = \frac{x}{r} = 0 \\
\tan \frac{3\pi}{2} = \frac{y}{x} = \text{undefined} \\
(x, y) = (0, -1)
\]

**CHECK POINT** Now try Exercise 37.
Reference Angles

The values of the trigonometric functions of angles greater than $90^\circ$ (or less than $0^\circ$) can be determined from their values at corresponding acute angles called reference angles.

**Definition of Reference Angle**

Let $\theta$ be an angle in standard position. Its reference angle $\theta'$ is the acute angle $\theta'$ formed by the terminal side of $\theta$ and the horizontal axis.

Figure 4.39 shows the reference angles for $\theta$ in Quadrants II, III, and IV.

- Quadrant II: $\theta' = \pi - \theta$ (radians)
  $\theta' = 180^\circ - \theta$ (degrees)
- Quadrant III: $\theta' = \pi - \theta$ (radians)
  $\theta' = 180^\circ - \theta$ (degrees)
- Quadrant IV: $\theta' = 2\pi - \theta$ (radians)
  $\theta' = 360^\circ - \theta$ (degrees)

**Example 4** Finding Reference Angles

Find the reference angle $\theta'$.

a. $\theta = 300^\circ$  

b. $\theta = 2.3$  

c. $\theta = -135^\circ$

**Solution**

a. Because $300^\circ$ lies in Quadrant IV, the angle it makes with the $x$-axis is

$$\theta' = 360^\circ - 300^\circ = 60^\circ.$$ 

Figure 4.40 shows the angle $\theta = 300^\circ$ and its reference angle $\theta' = 60^\circ$.

b. Because $2.3$ lies between $\pi/2 \approx 1.5708$ and $\pi \approx 3.1416$, it follows that it is in Quadrant II and its reference angle is

$$\theta' = \pi - 2.3 \approx 0.8416.$$ 

Figure 4.41 shows the angle $\theta = 2.3$ and its reference angle $\theta' = \pi - 2.3$.

c. First, determine that $-135^\circ$ is coterminal with $225^\circ$, which lies in Quadrant III. So, the reference angle is

$$\theta' = 225^\circ - 180^\circ = 45^\circ.$$ 

Figure 4.42 shows the angle $\theta = -135^\circ$ and its reference angle $\theta' = 45^\circ$.

Now try Exercise 45.
Trigonometric Functions of Real Numbers

To see how a reference angle is used to evaluate a trigonometric function, consider the point \((x, y)\) on the terminal side of \(\theta\), as shown in Figure 4.43. By definition, you know that

\[
\sin \theta = \frac{y}{r} \quad \text{and} \quad \tan \theta = \frac{y}{x}
\]

For the right triangle with acute angle \(\theta’\) and sides of lengths \(|x|\) and \(|y|\), you have

\[
\sin \theta’ = \frac{\text{opp}}{\text{hyp}} = \frac{|y|}{r}
\]

and

\[
\tan \theta’ = \frac{\text{opp}}{\text{adj}} = \frac{|y|}{|x|}
\]

So, it follows that \(\sin \theta\) and \(\sin \theta’\) are equal, except possibly in sign. The same is true for \(\tan \theta\) and \(\tan \theta’\) and for the other four trigonometric functions. In all cases, the sign of the function value can be determined by the quadrant in which \(\theta\) lies.

Evaluating Trigonometric Functions of Any Angle

To find the value of a trigonometric function of any angle \(\theta\):

1. Determine the function value for the associated reference angle \(\theta’\).
2. Depending on the quadrant in which \(\theta\) lies, affix the appropriate sign to the function value.

By using reference angles and the special angles discussed in the preceding section, you can greatly extend the scope of exact trigonometric values. For instance, knowing the function values of 30° means that you know the function values of all angles for which 30° is a reference angle. For convenience, the table below shows the exact values of the trigonometric functions of special angles and quadrant angles.

### Trigonometric Values of Common Angles

<table>
<thead>
<tr>
<th>(\theta) (degrees)</th>
<th>0°</th>

</table>

Reverse the order to get cosine values of the same angles.
Example 5 Using Reference Angles

Evaluate each trigonometric function.

a. \( \cos \frac{4\pi}{3} \)  

b. \( \tan(-210^\circ) \) 

c. \( \csc \frac{11\pi}{4} \)

Solution

a. Because \( \theta = \frac{4\pi}{3} \) lies in Quadrant III, the reference angle is 

\[
\theta' = \frac{4\pi}{3} - \pi = \frac{\pi}{3}
\]

as shown in Figure 6.41. Moreover, the cosine is negative in Quadrant III, so 

\[
\cos \frac{4\pi}{3} = (-) \cos \frac{\pi}{3} = -\frac{1}{2}
\]

b. Because \(-210^\circ + 360^\circ = 150^\circ \), it follows that \(-210^\circ \) is coterminal with the second-quadrant angle \(150^\circ \). So, the reference angle is \( \theta' = 180^\circ - 150^\circ = 30^\circ \), as shown in Figure 4.45. Finally, because the tangent is negative in Quadrant II, you have 

\[
\tan(-210^\circ) = (-) \tan 30^\circ = -\frac{\sqrt{3}}{3}
\]

c. Because \((11\pi/4) - 2\pi = 3\pi/4 \), it follows that \(11\pi/4 \) is coterminal with the second-quadrant angle \(3\pi/4 \). So, the reference angle is \( \theta' = \pi - (3\pi/4) = \pi/4 \), as shown in Figure 4.46. Because the cosecant is positive in Quadrant II, you have 

\[
csc \frac{11\pi}{4} = (+) \csc \frac{\pi}{4} = \frac{1}{\sin(\pi/4)} = \sqrt{2}
\]

Now try Exercise 59.
Example 6 Using Trigonometric Identities

Let \( \theta \) be an angle in Quadrant II such that \( \sin \theta = \frac{1}{3} \). Find (a) \( \cos \theta \) and (b) \( \tan \theta \) by using trigonometric identities.

Solution

a. Using the Pythagorean identity \( \sin^2 \theta + \cos^2 \theta = 1 \), you obtain

\[
\left( \frac{1}{3} \right)^2 + \cos^2 \theta = 1
\]

Substitute \( \frac{1}{3} \) for \( \sin \theta \).

\[
\cos^2 \theta = 1 - \frac{1}{9} = \frac{8}{9}
\]

Because \( \cos \theta < 0 \) in Quadrant II, you can use the negative root to obtain

\[
\cos \theta = -\sqrt{\frac{8}{9}} = -\frac{2\sqrt{2}}{3}.
\]

b. Using the trigonometric identity \( \tan \theta = \frac{\sin \theta}{\cos \theta} \), you obtain

\[
\tan \theta = \frac{1/3}{-2\sqrt{2}/3} = -\frac{1}{2\sqrt{2}} = -\frac{\sqrt{2}}{4}.
\]

You can use a calculator to evaluate trigonometric functions, as shown in the next example.

Example 7 Using a Calculator

Use a calculator to evaluate each trigonometric function.

a. \( \cot 410^\circ \)  
   b. \( \sin(-7) \)  
   c. \( \sec \frac{\pi}{9} \)

Solution

<table>

You can use a calculator to evaluate trigonometric functions, as shown in the next example.
4.4 EXERCISES

VOCABULARY: Fill in the blanks.

In Exercises 1–6, let \( \theta \) be an angle in standard position, with \((x, y)\) a point on the terminal side of \( \theta \) and \( r = \sqrt{x^2 + y^2} \neq 0 \).

1. \( \sin \theta = \) ________
2. \( \frac{r}{y} = \) ________
3. \( \tan \theta = \) ________
4. \( \sec \theta = \) ________
5. \( \frac{x}{r} = \) ________
6. \( \frac{x}{y} = \) ________

7. Because \( r = \sqrt{x^2 + y^2} \) cannot be ________, the sine and cosine functions are ________ for any real value of \( \theta \).
8. The acute positive angle that is formed by the terminal side of the angle \( \theta \) and the horizontal axis is called the ________ angle of \( \theta \) and is denoted by \( \theta' \).

SKILLS AND APPLICATIONS

In Exercises 9–12, determine the exact values of the six trigonometric functions of the angle \( \theta \).

9. (a) \( y \)
   \( (4, 3) \)
   (b) \( y \)
   \( (-8, 15) \)

10. (a) \( y \)
    \( (-12, -5) \)
    (b) \( y \)
    \( (1, -1) \)

11. (a) \( y \)
    \( (-\sqrt{3}, -1) \)
    (b) \( y \)
    \( (4, -1) \)

12. (a) \( y \)
    \( (3, 1) \)
    (b) \( y \)
    \( (-4, 4) \)

In Exercises 13–18, the point is on the terminal side of an angle in standard position. Determine the exact values of the six trigonometric functions of the angle.

13. \((5, 12)\)
14. \((8, 15)\)
15. \((-5, -2)\)
16. \((-4, 10)\)
17. \((-5, 4, 7.2)\)
18. \((3, \sqrt{2}, -\frac{7}{3})\)

In Exercises 19–22, state the quadrant in which \( \theta \) lies.

19. \( \sin \theta > 0 \) and \( \cos \theta > 0 \)
20. \( \sin \theta < 0 \) and \( \cos \theta < 0 \)
21. \( \sin \theta > 0 \) and \( \cos \theta < 0 \)
22. \( \sec \theta > 0 \) and \( \cot \theta < 0 \)

In Exercises 23–32, find the values of the six trigonometric functions of \( \theta \) with the given constraint.

<table>
<thead>

</table>
In Exercises 37–44, evaluate the trigonometric function of the quadrant angle.

37. \( \sin \pi \)  
38. \( \csc \frac{3\pi}{2} \)
39. \( \sec \frac{3\pi}{2} \)  
40. \( \sec \pi \)
41. \( \sin \frac{\pi}{2} \)  
42. \( \cot \pi \)
43. \( \csc \pi \)  
44. \( \cot \frac{\pi}{2} \)

In Exercises 45–52, find the reference angle \( \theta' \), and sketch \( \theta \) and \( \theta' \) in standard position.

45. \( \theta = 160^\circ \)  
46. \( \theta = 309^\circ \)
47. \( \theta = -125^\circ \)  
48. \( \theta = -215^\circ \)
49. \( \theta = \frac{2\pi}{3} \)  
50. \( \theta = \frac{7\pi}{6} \)
51. \( \theta = 4.8 \)  
52. \( \theta = 11.6 \)

In Exercises 53–68, evaluate the sine, cosine, and tangent of the angle without using a calculator.

53. \( 225^\circ \)  
54. \( 300^\circ \)
55. \( 750^\circ \)  
56. \( -405^\circ \)
57. \( -150^\circ \)  
58. \( -840^\circ \)
59. \( \frac{2\pi}{3} \)  
60. \( \frac{3\pi}{4} \)
61. \( \frac{5\pi}{4} \)  
62. \( \frac{7\pi}{6} \)
63. \( -\frac{\pi}{6} \)  
64. \( -\frac{\pi}{2} \)
65. \( \frac{9\pi}{4} \)  
66. \( \frac{10\pi}{3} \)
67. \( -\frac{3\pi}{2} \)  
68. \( -\frac{23\pi}{4} \)

In Exercises 69–74, find the indicated trigonometric value in the specified quadrant.

<table>

In Exercises 75–90, use a calculator to evaluate the trigonometric function. Round your answer to four decimal places. (Be sure the calculator is set in the correct angle mode.)

75. \( \sin 10^\circ \)  
76. \( \sec 225^\circ \)
77. \( \cos(-110^\circ) \)  
78. \( \csc(-330^\circ) \)
79. \( \tan 304^\circ \)  
80. \( \cot 178^\circ \)
81. \( \sec 72^\circ \)  
82. \( \tan(-188^\circ) \)
83. \( 4.5 \)  
84. \( 1.35 \)
85. \( \tan \frac{\pi}{9} \)  
86. \( \tan \left(-\frac{\pi}{9}\right) \)
87. \( \sin(-0.65) \)  
88. \( \sec 0.29 \)
89. \( \cot \left(-\frac{11\pi}{8}\right) \)  
90. \( \csc \left(-\frac{15\pi}{14}\right) \)

In Exercises 91–96, find two solutions of the equation. Give your answers in degrees \((0^\circ \leq \theta < 360^\circ)\) and in radians \((0 \leq \theta < 2\pi)\). Do not use a calculator.

91. (a) \( \sin \theta = \frac{1}{2} \)  
   (b) \( \sin \theta = -\frac{1}{2} \)
92. (a) \( \cos \theta = \frac{\sqrt{2}}{2} \)  
   (b) \( \cos \theta = -\frac{\sqrt{2}}{2} \)
93. (a) \( \csc \theta = \frac{2\sqrt{3}}{3} \)  
   (b) \( \cot \theta = 1 \)
94. (a) \( \sec \theta = 2 \)  
   (b) \( \sec \theta = -2 \)
95. (a) \( \tan \theta = 1 \)  
   (b) \( \cot \theta = -\sqrt{3} \)
96. (a) \( \sin \theta = \frac{\sqrt{3}}{2} \)  
   (b) \( \sin \theta = -\frac{\sqrt{3}}{2} \)

97. DISTANCE An airplane, flying at an altitude of 6 miles, is on a flight path that passes directly over an observer (see figure). If \( \theta \) is the angle of elevation from the observer to the plane, find the distance \( d \) from the observer to the plane when (a) \( \theta = 30^\circ \), (b) \( \theta = 90^\circ \), and (c) \( \theta = 120^\circ \).

98. HARMONIC MOTION The displacement from equilibrium of an oscillating weight suspended by a spring is given by \( y(t) = 2 \cos 6t \), where \( y \) is the displacement (in centimeters) and \( t \) is the time (in seconds). Find the displacement when (a) \( t = 0 \), (b) \( t = \frac{1}{4} \), and (c) \( t = \frac{1}{2} \).
99. DATA ANALYSIS: METEOROLOGY The table shows the monthly normal temperatures (in degrees Fahrenheit) for selected months in New York City (N) and Fairbanks, Alaska (F). (Source: National Climatic Data Center)

<table>
<thead>
<tr>
<th>Month</th>
<th>New York City, N</th>
<th>Fairbanks, F</th>

<tr>
<td>October</td>
<td>58</td>
<td>24</td>
</tr>
<tr>
<td>December</td>
<td>38</td>
<td>−6</td>
</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a model of the form \( y = a \sin(bt + c) + d \) for each city. Let \( t \) represent the month, with \( t = 1 \) corresponding to January.

(b) Use the models from part (a) to find the monthly normal temperatures for the two cities in February, March, May, June, August, September, and November.

(c) Compare the models for the two cities.

100. SALES A company that produces snowboards, which are seasonal products, forecasts monthly sales over the next 2 years to be \( S = 23.1 + 0.442t + 4.3 \cos(\pi t/6) \), where \( S \) is measured in thousands of units and \( t \) is the time in months, with \( t = 1 \) representing January 2010. Predict sales for each of the following months.

(a) February 2010  \( b \) February 2011  
(c) June 2010  \( d \) June 2011

101. HARMONIC MOTION The displacement from equilibrium of an oscillating weight suspended by a spring and subject to the damping effect of friction is given by \( y(t) = 2e^{-t} \cos 6t \), where \( y \) is the displacement (in centimeters) and \( t \) is the time (in seconds). Find the displacement when (a) \( t = 0 \), (b) \( t = \frac{1}{4} \), and (c) \( t = \frac{1}{2} \).

102. ELECTRIC CIRCUITS The current \( I \) (in amperes) when 100 volts is applied to a circuit is given by \( I = 5e^{-2t} \sin t \), where \( t \) is the time (in seconds) after the voltage is applied. Approximate the current at \( t = 0.7 \) second after the voltage is applied.

EXPLORATION

TRUE OR FALSE? In Exercises 103 and 104, determine whether the statement is true or false. Justify your answer.

103. In each of the four quadrants, the signs of the secant function and sine function will be the same.

104. To find the reference angle for an angle \( \theta \) (given in degrees), find the integer \( n \) such that \( 0 \leq 360^\circ n - \theta \leq 360^\circ \). The difference \( 360^\circ n - \theta \) is the reference angle.

105. WRITING Consider an angle in standard position with \( r = 12 \) centimeters, as shown in the figure. Write a short paragraph describing the changes in the values of \( x \), \( y \), \( \sin \theta \), \( \cos \theta \), and \( \tan \theta \) as \( \theta \) increases continuously from \( 0^\circ \) to \( 90^\circ \).

106. CAPSTONE Write a short paper in your own words explaining to a classmate how to evaluate the six trigonometric functions of any angle \( \theta \) in standard position. Include an explanation of reference angles and how to use them, the signs of the functions in each of the four quadrants, and the trigonometric values of common angles. Be sure to include figures or diagrams in your paper.

107. THINK ABOUT IT The figure shows point \( P(x, y) \) on a unit circle and right triangle \( OAP \).

(a) Find \( \sin t \) and \( \cos t \) using the unit circle definitions of sine and cosine (from Section 4.2).

(b) What is the value of \( r^2 \)? Explain.

(c) Use the definitions of sine and cosine given in this section to find \( \sin \theta \) and \( \cos \theta \). Write your answers in terms of \( x \) and \( y \).

(d) Based on your answers to parts (a) and (c), what can you conclude?
Basic Sine and Cosine Curves

In this section, you will study techniques for sketching the graphs of the sine and cosine functions. The graph of the sine function is a sine curve. In Figure 4.47, the black portion of the graph represents one period of the function and is called one cycle of the sine curve. The gray portion of the graph indicates that the basic sine curve repeats indefinitely in the positive and negative directions. The graph of the cosine function is shown in Figure 4.48.

Recall from Section 4.2 that the domain of the sine and cosine functions is the set of all real numbers. Moreover, the range of each function is the interval $[-1, 1]$, and each function has a period of $2\pi$. Do you see how this information is consistent with the basic graphs shown in Figures 4.47 and 4.48?

Note in Figures 4.47 and 4.48 that the sine curve is symmetric with respect to the origin, whereas the cosine curve is symmetric with respect to the $y$-axis. These properties of symmetry follow from the fact that the sine function is odd and the cosine function is even.
To sketch the graphs of the basic sine and cosine functions by hand, it helps to note five key points in one period of each graph: the intercepts, maximum points, and minimum points (see Figure 4.49).

**Example 1 Using Key Points to Sketch a Sine Curve**

Sketch the graph of \( y = 2 \sin x \) on the interval \([-\pi, 4\pi]\).

**Solution**

Note that

\[ y = 2 \sin x = 2(\sin x) \]

indicates that the \( y \)-values for the key points will have twice the magnitude of those on the graph of \( y = \sin x \). Divide the period \( 2\pi \) into four equal parts to get the key points for \( y = 2 \sin x \).

<table>
<thead>
<tr>
<th>Intercept</th>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
<th>Intercept</th>
</tr>
</thead>
<tbody>
<tr>
<td>((0, 0)), (\left(\frac{\pi}{2}, 2\right)), ((\pi, 0)), (\left(\frac{3\pi}{2}, -2\right)), and ((2\pi, 0))</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

By connecting these key points with a smooth curve and extending the curve in both directions over the interval \([-\pi, 4\pi]\), you obtain the graph shown in Figure 4.50.

**TECHNOLOGY**

When using a graphing utility to graph trigonometric functions, pay special attention to the viewing window you use. For instance, try graphing \( y = |\sin(10x)|/10 \) in the standard viewing window in radian mode. What do you observe? Use the zoom feature to find a viewing window that displays a good view of the graph.

**CHECKPOINT**

Now try Exercise 39.
Amplitude and Period

In the remainder of this section you will study the graphic effect of each of the constants $a$, $b$, $c$, and $d$ in equations of the forms

$$y = d + a \sin(bx - c)$$

and

$$y = d + a \cos(bx - c).$$

A quick review of the transformations you studied in Section 1.7 should help in this investigation.

The constant factor $a$ in $y = a \sin x$ acts as a **scaling factor** — a **vertical stretch** or **vertical shrink** of the basic sine curve. If $a > 1$, the basic sine curve is stretched, and if $|a| < 1$, the basic sine curve is shrunk. The result is that the graph of $y = a \sin x$ ranges between $-a$ and $a$ instead of between $-1$ and $1$. The absolute value of $a$ is the **amplitude** of the function $y = a \sin x$. The range of the function $y = a \sin x$ for $a > 0$ is $-a \leq y \leq a$.

**Definition of Amplitude of Sine and Cosine Curves**

The **amplitude** of $y = a \sin x$ and $y = a \cos x$ represents half the distance between the maximum and minimum values of the function and is given by

$$\text{Amplitude} = |a|.$$

**Example 2**  

**Scaling: Vertical Shrinking and Stretching**

On the same coordinate axes, sketch the graph of each function.

a. $y = \frac{1}{2} \cos x$  
b. $y = 3 \cos x$

**Solution**

a. Because the amplitude of $y = \frac{1}{2} \cos x$ is $\frac{1}{2}$, the maximum value is $\frac{1}{2}$ and the minimum value is $-\frac{1}{2}$. Divide one cycle, $0 \leq x \leq 2\pi$, into four equal parts to get the key points:

<table>
<thead>
<tr>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
<th>Intercept</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(0, \frac{1}{2})$, $(\frac{\pi}{2}, 0)$, $(\frac{\pi}{2}, 0)$, $(3\pi, \frac{1}{2})$, $(2\pi, \frac{1}{2})$</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b. A similar analysis shows that the amplitude of $y = 3 \cos x$ is 3, and the key points are:

<table>
<thead>
<tr>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
<th>Intercept</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(0, 3)$, $(\frac{\pi}{2}, 0)$, $(\pi, -3)$, $(\frac{3\pi}{2}, 0)$, $(2\pi, 3)$</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The graphs of these two functions are shown in Figure 4.51. Notice that the graph of $y = \frac{1}{2} \cos x$ is a **vertical shrink** of the graph of $y = \cos x$ and the graph of $y = 3 \cos x$ is a **vertical stretch** of the graph of $y = \cos x$.

**CHECK POINT**  
Now try Exercise 41.
You know from Section 1.7 that the graph of \( y = -f(x) \) is a reflection in the \( x \)-axis of the graph of \( y = f(x) \). For instance, the graph of \( y = -3 \cos x \) is a reflection of the graph of \( y = 3 \cos x \), as shown in Figure 4.52.

Because \( y = \sin x \) completes one cycle from \( x = 0 \) to \( x = 2\pi \), it follows that \( y = \sin bx \) completes one cycle from \( x = 0 \) to \( x = 2\pi/b \).

**Period of Sine and Cosine Functions**

Let \( b \) be a positive real number. The period of \( y = \sin bx \) and \( y = \cos bx \) is given by

\[
\text{Period} = \frac{2\pi}{b}.
\]

Note that if \( 0 < b < 1 \), the period of \( y = \sin bx \) is greater than \( 2\pi \) and represents a horizontal stretching of the graph of \( y = \sin x \). Similarly, if \( b > 1 \), the period of \( y = \sin bx \) is less than \( 2\pi \) and represents a horizontal shrinking of the graph of \( y = \sin x \). If \( b \) is negative, the identities \( \sin(-x) = -\sin x \) and \( \cos(-x) = \cos x \) are used to rewrite the function.

**Example 3** Scaling: Horizontal Stretching

Sketch the graph of \( y = \sin \frac{x}{2} \).

**Solution**

The amplitude is 1. Moreover, because \( b = \frac{1}{2} \), the period is

\[
\frac{2\pi}{b} = \frac{2\pi}{\frac{1}{2}} = 4\pi.
\]

Now, divide the period-interval \([0, 4\pi]\) into four equal parts with the values \( \pi, 2\pi, \) and \( 3\pi \) to obtain the key points on the graph.

**Intercept** | **Maximum** | **Intercept** | **Minimum** | **Intercept**
|-------|-------|-------|-------|-------|
| \((0, 0)\) | \((\pi, 1)\) | \((2\pi, 0)\) | \((3\pi, -1)\) | \((4\pi, 0)\)

The graph is shown in Figure 4.53.

**Study Tip**

In general, to divide a period-interval into four equal parts, successively add “period/4,” starting with the left endpoint of the interval. For instance, for the period-interval \([-\pi/6, \pi/2]\) of length \(2\pi/3\), you would successively add

\[
\frac{2\pi/3}{4} = \frac{\pi}{6}
\]

to get \(-\pi/6, 0, \pi/6, \pi/3, \) and \(\pi/2\) as the \(x\)-values for the key points on the graph.

**Checkpoint** Now try Exercise 43.
Translations of Sine and Cosine Curves

The constant $c$ in the general equations
\[ y = a \sin(bx - c) \quad \text{and} \quad y = a \cos(bx - c) \]
creates a horizontal translation (shift) of the basic sine and cosine curves. Comparing $y = a \sin bx$ with $y = a \sin(bx - c)$, you find that the graph of $y = a \sin(bx - c)$ completes one cycle from $bx - c = 0$ to $bx - c = 2\pi$. By solving for $x$, you can find the interval for one cycle to be
\[ \frac{c}{b} \leq x \leq \frac{c}{b} + \frac{2\pi}{b}. \]

This implies that the period of $y = a \sin(bx - c)$ is $2\pi/b$, and the graph of $y = a \sin bx$ is shifted by an amount $c/b$. The number $c/b$ is the phase shift.

Graphs of Sine and Cosine Functions

The graphs of $y = a \sin(bx - c)$ and $y = a \cos(bx - c)$ have the following characteristics. (Assume $b > 0$.)

- Amplitude = $|a|
- Period = $\frac{2\pi}{b}$

The left and right endpoints of a one-cycle interval can be determined by solving the equations $bx - c = 0$ and $bx - c = 2\pi$.

Example 4  
Horizontal Translation

Analyze the graph of $y = \frac{1}{2} \sin \left(x - \frac{\pi}{3}\right)$.

Algebraic Solution

The amplitude is $\frac{1}{2}$ and the period is $2\pi$. By solving the equations
\[ x - \frac{\pi}{3} = 0 \quad \text{and} \quad x - \frac{\pi}{3} = 2\pi \]
you see that the interval $[\pi/3, 7\pi/3]$ corresponds to one cycle of the graph. Dividing this interval into four equal parts produces the key points

<table>
<thead>
<tr>
<th>Intercept</th>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
<th>Intercept</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\left(\frac{\pi}{3}, 0\right)$, $\left(\frac{5\pi}{6}, \frac{1}{2}\right)$, $\left(\frac{4\pi}{3}, 0\right)$, $\left(\frac{11\pi}{6}, -\frac{1}{2}\right)$, and $\left(\frac{7\pi}{3}, 0\right)$.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Graphical Solution

Use a graphing utility set in radian mode to graph $y = (1/2) \sin(x - \pi/3)$, as shown in Figure 4.54. Use the minimum, maximum, and zero or root features of the graphing utility to approximate the key points $(1.05, 0)$, $(2.62, 0.5)$, $(4.19, 0)$, $(5.76, -0.5)$, and $(7.33, 0)$.

CHECKPOINT  Now try Exercise 49.
Example 5  Horizontal Translation

Sketch the graph of
\[ y = -3 \cos(2\pi x + 4\pi). \]

Solution

The amplitude is 3 and the period is \( 2\pi / 2\pi = 1 \). By solving the equations
\[
2\pi x + 4\pi = 0
\]
\[
2\pi x = -4\pi
\]
\[ x = -2 \]
and
\[
2\pi x + 4\pi = 2\pi
\]
\[
2\pi x = -2\pi
\]
\[ x = -1 \]
you see that the interval \([-2, -1]\) corresponds to one cycle of the graph. Dividing this interval into four equal parts produces the key points

<table>
<thead>
<tr>
<th>Minimum</th>
<th>Intercept</th>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-2, -3)), ((-7/4, 0))</td>
<td>((-3/2, 3)), ((-5/4, 0))</td>
<td>and ((-1, -3)).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The graph is shown in Figure 4.55.

CHECKPOINT Now try Exercise 51.

The final type of transformation is the vertical translation caused by the constant \( d \) in the equations
\[ y = d + a \sin(bx - c) \]
and
\[ y = d + a \cos(bx - c). \]
The shift is \( d \) units upward for \( d > 0 \) and \( d \) units downward for \( d < 0 \). In other words, the graph oscillates about the horizontal line \( y = d \) instead of about the \( x \)-axis.

Example 6  Vertical Translation

Sketch the graph of
\[ y = 2 + 3 \cos 2x. \]

Solution

The amplitude is 3 and the period is \( \pi \). The key points over the interval \([0, \pi]\) are
\[
(0, 5), \left( \frac{\pi}{4}, 2 \right), \left( \frac{\pi}{2}, 1 \right), \left( \frac{3\pi}{4}, 2 \right), \text{ and } (\pi, 5).
\]
The graph is shown in Figure 4.56. Compared with the graph of \( f(x) = 3 \cos 2x \), the graph of \( y = 2 + 3 \cos 2x \) is shifted upward two units.

CHECKPOINT Now try Exercise 57.
Mathematical Modeling

Sine and cosine functions can be used to model many real-life situations, including electric currents, musical tones, radio waves, tides, and weather patterns.

Example 7 Finding a Trigonometric Model

Throughout the day, the depth of water at the end of a dock in Bar Harbor, Maine varies with the tides. The table shows the depths (in feet) at various times during the morning. (Source: Nautical Software, Inc.)

a. Use a trigonometric function to model the data.

b. Find the depths at 9 A.M. and 3 P.M.

c. A boat needs at least 10 feet of water to moor at the dock. During what times in the afternoon can it safely dock?

Solution

a. Begin by graphing the data, as shown in Figure 4.57. You can use either a sine or a cosine model. Suppose you use a cosine model of the form

\[ y = a \cos(bt - c) + d. \]

The difference between the maximum height and the minimum height of the graph is twice the amplitude of the function. So, the amplitude is

\[ a = \frac{1}{2} [(\text{maximum depth}) - (\text{minimum depth})] = \frac{1}{2} (11.3 - 0.1) = 5.6. \]

The cosine function completes one half of a cycle between the times at which the maximum and minimum depths occur. So, the period is

\[ p = 2[(\text{time of min. depth}) - (\text{time of max. depth})] = 2(10 - 4) = 12 \]

which implies that \( b = 2\pi/p \approx 0.524 \). Because high tide occurs 4 hours after midnight, consider the left endpoint to be \( c/b = 4 \), so \( c \approx 2.094 \). Moreover, because the average depth is \( \frac{1}{2} (11.3 + 0.1) = 5.7 \), it follows that \( d = 5.7 \). So, you can model the depth with the function given by

\[ y = 5.6 \cos(0.524t - 2.094) + 5.7. \]

b. The depths at 9 A.M. and 3 P.M. are as follows.

\[ y = 5.6 \cos(0.524 \cdot 9 - 2.094) + 5.7 \approx 0.84 \text{ foot} \]

\[ y = 5.6 \cos(0.524 \cdot 15 - 2.094) + 5.7 \approx 10.57 \text{ feet} \]

9 A.M. 3 P.M.

To find out when the depth \( y \) is at least 10 feet, you can graph the model with the line \( y = 10 \) using a graphing utility, as shown in Figure 4.58. Using the intersect feature, you can determine that the depth is at least 10 feet between 2:42 P.M. (\( t \approx 14.7 \)) and 5:18 P.M. (\( t \approx 17.3 \)).

Now try Exercise 91.
4.5 EXERCISES

VOCABULARY: Fill in the blanks.

1. One period of a sine or cosine function is called one ________ of the sine or cosine curve.
2. The ________ of a sine or cosine curve represents half the distance between the maximum and minimum values of the function.
3. For the function given by \( y = a \sin(bx - c) \), \( \frac{c}{b} \) represents the ________ ________ of the graph of the function.
4. For the function given by \( y = d + a \cos(bx - c) \), \( d \) represents a ________ ________ of the graph of the function.

SKILLS AND APPLICATIONS

In Exercises 5–18, find the period and amplitude.

5. \( y = 2 \sin 5x \)  
6. \( y = 3 \cos 2x \)

In Exercises 19–26, describe the relationship between the graphs of \( f \) and \( g \). Consider amplitude, period, and shifts.

19. \( f(x) = \sin x \)  
   \( g(x) = \sin(x - \pi) \)
20. \( f(x) = \cos x \)  
   \( g(x) = \cos(x + \pi) \)
21. \( f(x) = \cos 2x \)  
   \( g(x) = -\cos 2x \)
22. \( f(x) = \sin 3x \)  
   \( g(x) = \sin(-3x) \)
23. \( f(x) = \cos x \)  
   \( g(x) = \cos 2x \)
24. \( f(x) = \sin x \)  
   \( g(x) = \sin 3x \)
25. \( f(x) = \sin 2x \)  
   \( g(x) = 3 + \sin 2x \)
26. \( f(x) = \cos 4x \)  
   \( g(x) = -2 + \cos 4x \)

In Exercises 27–30, describe the relationship between the graphs of \( f \) and \( g \). Consider amplitude, period, and shifts.

27. \( y \)
28. \( y \)
29. \( y \)
30. \( y \)

In Exercises 31–38, graph \( f \) and \( g \) on the same set of coordinate axes. (Include two full periods.)

31. \( f(x) = -2 \sin x \)  
   \( g(x) = 4 \sin x \)
32. \( f(x) = \sin x \)  
   \( g(x) = \sin \frac{x}{3} \)
33. \( f(x) = \cos x \)  
   \( g(x) = 2 + \cos x \)
34. \( f(x) = 2 \cos 2x \)  
   \( g(x) = -\cos 4x \)
35. \( f(x) = -\frac{1}{2} \sin \frac{x}{2} \)  \quad 36. \( f(x) = 4 \sin \pi x \)
\[ g(x) = 3 - \frac{1}{2} \sin \frac{x}{2} \]  \quad \[ g(x) = 4 \sin \pi x - 3 \]
37. \( f(x) = 2 \cos x \)  \quad 38. \( f(x) = -\cos x \)
\[ g(x) = 2 \cos (x + \pi) \]  \quad \[ g(x) = -\cos(x - \pi) \]

In Exercises 39–60, sketch the graph of the function. (Include two full periods.)
39. \( y = 5 \sin x \)  \quad 40. \( y = \frac{1}{2} \sin x \)
41. \( y = \frac{1}{3} \cos x \)  \quad 42. \( y = 4 \cos x \)
43. \( y = \cos \frac{x}{2} \)  \quad 44. \( y = 4 \sin 4x \)
45. \( y = \cos 2\pi x \)  \quad 46. \( y = \sin \frac{\pi x}{4} \)
47. \( y = -\sin \frac{2\pi x}{3} \)  \quad 48. \( y = -10 \cos \frac{\pi x}{6} \)
49. \( y = \sin \left(x - \frac{\pi}{2}\right) \)  \quad 50. \( y = \sin(x - 2\pi) \)
51. \( y = 3 \cos(x + \pi) \)  \quad 52. \( y = 4 \cos \left(x + \frac{\pi}{4}\right) \)
53. \( y = 2 - \sin \frac{2\pi x}{3} \)  \quad 54. \( y = -3 + 5 \cos \frac{\pi x}{12} \)
55. \( y = 2 + \frac{1}{10} \cos 60\pi x \)  \quad 56. \( y = 2 \cos x - 3 \)
57. \( y = 3 \cos(x + \pi) - 3 \)  \quad 58. \( y = 4 \cos \left(x + \frac{\pi}{4}\right) + 4 \)
59. \( y = \frac{2}{3} \cos \left(\frac{x}{2} - \frac{\pi}{4}\right) \)  \quad 60. \( y = -3 \cos(6x + \pi) \)

In Exercises 61–66, \( g \) is related to a parent function \( f(x) = \sin(x) \) or \( f(x) = \cos(x) \). (a) Describe the sequence of transformations from \( f \) to \( g \). (b) Sketch the graph of \( g \). (c) Use function notation to write \( g \) in terms of \( f \).
61. \( g(x) = \sin(4x - \pi) \)  \quad 62. \( g(x) = \sin(2x + \pi) \)
63. \( g(x) = \cos(x - \pi) + 2 \)  \quad 64. \( g(x) = 1 + \cos(x + \pi) \)
65. \( g(x) = 2 \sin(4x - \pi) - 3 \)  \quad 66. \( g(x) = 4 - \sin(2x + \pi) \)

In Exercises 67–72, use a graphing utility to graph the function. Include two full periods. Be sure to choose an appropriate viewing window.
67. \( y = -2 \sin(4x + \pi) \)  \quad 68. \( y = -4 \sin \left(\frac{2}{3}x - \frac{\pi}{3}\right) \)
69. \( y = \cos \left(2\pi x - \frac{\pi}{2}\right) + 1 \)
70. \( y = 3 \cos \left(\frac{\pi x}{2} + \frac{\pi}{2}\right) - 2 \)
71. \( y = -0.1 \sin \left(\frac{\pi x}{10} + \pi\right) \)  \quad 72. \( y = \frac{1}{100} \sin 120\pi t \)

**Graphical Reasoning** In Exercises 73–76, find \( a \) and \( d \) for the function \( f(x) = a \cos x + d \) such that the graph of \( f \) matches the figure.
73. \[ y = 2 \cos x \]
74. \[ y = -\cos x \]
75. \[ y = \cos(2x - 3) \]
76. \[ y = -\cos(2x + 3) \]

**Graphical Reasoning** In Exercises 77–80, find \( a, b, \) and \( c \) for the function \( f(x) = a \sin(bx - c) \) such that the graph of \( f \) matches the figure.
77. \[ y = 3 \sin(2x - \pi) \]
78. \[ y = -3 \sin(2x - \pi) \]
79. \[ y = 4 \sin(3x - \pi) \]
80. \[ y = -2 \sin(3x - \pi) \]

In Exercises 81 and 82, use a graphing utility to graph \( y_1 \) and \( y_2 \) in the interval \([-2\pi, 2\pi]\). Use the graphs to find real numbers \( x \) such that \( y_1 = y_2 \).
81. \( y_1 = \sin x \)  \quad 82. \( y_1 = \cos x \)  \quad \[ y_2 = -\frac{1}{2} \]

In Exercises 83–86, write an equation for the function that is described by the given characteristics.
83. A sine curve with a period of \( \pi \), an amplitude of 2, a right phase shift of \( \pi/2 \), and a vertical translation up 1 unit
84. A sine curve with a period of $4\pi$, an amplitude of 3, a left phase shift of $\pi/4$, and a vertical translation down 1 unit.

85. A cosine curve with a period of $\pi$, an amplitude of 1, a left phase shift of $\pi$, and a vertical translation down $\frac{3}{2}$ units.

86. A cosine curve with a period of $4\pi$, an amplitude of 3, a right phase shift of $\pi/2$, and a vertical translation up 2 units.

87. **RESPIRATORY CYCLE** For a person at rest, the velocity $v$ (in liters per second) of airflow during a respiratory cycle (the time from the beginning of one breath to the beginning of the next) is given by

$$v = 0.85 \sin \frac{\pi t}{3},$$

where $t$ is the time (in seconds). (Inhalation occurs when $v > 0$, and exhalation occurs when $v < 0$.)

(a) Find the time for one full respiratory cycle.

(b) Find the number of cycles per minute.

(c) Sketch the graph of the velocity function.

88. **RESPIRATORY CYCLE** After exercising for a few minutes, a person has a respiratory cycle for which the velocity of airflow is approximated by $v = 1.75 \sin \frac{\pi t}{2}$, where $t$ is the time (in seconds). (Inhalation occurs when $v > 0$, and exhalation occurs when $v < 0$.)

(a) Find the time for one full respiratory cycle.

(b) Find the number of cycles per minute.

(c) Sketch the graph of the velocity function.

89. **DATA ANALYSIS: METEOROLOGY** The table shows the maximum daily high temperatures in Las Vegas $L$ and International Falls $I$ (in degrees Fahrenheit) for month $t$, with $t = 1$ corresponding to January. (Source: National Climatic Data Center)

(a) A model for the temperature in Las Vegas is given by

$$L(t) = 80.60 + 23.50 \cos \left(\frac{\pi t}{6} - 3.67\right).$$

Find a trigonometric model for International Falls.

(b) Use a graphing utility to graph the data points and the model for the temperatures in Las Vegas. How well does the model fit the data?

(c) Use a graphing utility to graph the data points and the model for the temperatures in International Falls. How well does the model fit the data?

(d) Use the models to estimate the average maximum temperature in each city. Which term of the models did you use? Explain.

(e) What is the period of each model? Are the periods what you expected? Explain.

(f) Which city has the greater variability in temperature throughout the year? Which factor of the models determines this variability? Explain.

90. **HEALTH** The function given by

$$P = 100 - 20 \cos \frac{5\pi t}{3}$$

approximates the blood pressure $P$ (in millimeters of mercury) at time $t$ (in seconds) for a person at rest.

(a) Find the period of the function.

(b) Find the number of heartbeats per minute.

91. **PIANO TUNING** When tuning a piano, a technician strikes a tuning fork for the A above middle C and sets up a wave motion that can be approximated by $y = 0.001 \sin 880\pi t$, where $t$ is the time (in seconds).

(a) What is the period of the function?

(b) The frequency $f$ is given by $f = 1/p$. What is the frequency of the note?

92. **DATA ANALYSIS: ASTRONOMY** The percents $y$ (in decimal form) of the moon’s face that was illuminated on day $x$ in the year 2009, where $x = 1$ represents January 1, are shown in the table. (Source: U.S. Naval Observatory)

(a) Create a scatter plot of the data.
(b) Find a trigonometric model that fits the data.
(c) Add the graph of your model in part (b) to the scatter plot. How well does the model fit the data?
(d) What is the period of the model?
(e) Estimate the moon’s percent illumination for March 12, 2009.

93. FUEL CONSUMPTION The daily consumption $C$ (in gallons) of diesel fuel on a farm is modeled by

$$C = 30.3 + 21.6 \sin \left( \frac{2\pi t}{365} + 10.9 \right)$$

where $t$ is the time (in days), with $t = 1$ corresponding to January 1.

(a) What is the period of the model? Is it what you expected? Explain.
(b) What is the average daily fuel consumption? Which term of the model did you use? Explain.
(c) Use a graphing utility to graph the model. Use the graph to approximate the time of the year when consumption exceeds 40 gallons per day.

94. FERRIS WHEEL A Ferris wheel is built such that the height $h$ (in feet) above ground of a seat on the wheel at time $t$ (in seconds) can be modeled by

$$h(t) = 53 + 50 \sin \left( \frac{\pi}{10} t - \frac{\pi}{2} \right).$$

(a) Find the period of the model. What does the period tell you about the ride?
(b) Find the amplitude of the model. What does the amplitude tell you about the ride?
(c) Use a graphing utility to graph one cycle of the model.

EXPLORATION

TRUE OR FALSE? In Exercises 95–97, determine whether the statement is true or false. Justify your answer.

95. The graph of the function given by $f(x) = \sin(x + 2\pi)$ translates the graph of $f(x) = \sin x$ exactly one period to the right so that the two graphs look identical.

96. The function given by $y = \frac{1}{2} \cos 2x$ has an amplitude that is twice that of the function given by $y = \cos x$.

97. The graph of $y = -\cos x$ is a reflection of the graph of $y = \sin(x + \pi/2)$ in the $x$-axis.

98. WRITING Sketch the graph of $y = \cos bx$ for $b = \frac{1}{2}, 2, \text{and } 3$. How does the value of $b$ affect the graph? How many complete cycles occur between 0 and $2\pi$ for each value of $b$?

99. WRITING Sketch the graph of $y = \sin(x - c)$ for $c = -\pi/4, 0, \text{and } \pi/4$. How does the value of $c$ affect the graph?

100. CAPSTONE Use a graphing utility to graph the function given by $y = d + a \sin(bx - c)$, for several different values of $a, b, c, \text{and } d$. Write a paragraph describing the changes in the graph corresponding to changes in each constant.

CONJECTURE In Exercises 101 and 102, graph $f$ and $g$ on the same set of coordinate axes. Include two full periods. Make a conjecture about the functions.

101. $f(x) = \sin x, \quad g(x) = \cos \left( x - \frac{\pi}{2} \right)$

102. $f(x) = \sin x, \quad g(x) = -\cos \left( x + \frac{\pi}{2} \right)$

103. Using calculus, it can be shown that the sine and cosine functions can be approximated by the polynomials

$$\sin x \approx x - \frac{x^3}{3!} + \frac{x^5}{5!} \quad \text{and} \quad \cos x \approx 1 - \frac{x^2}{2!} + \frac{x^4}{4!}$$

where $x$ is in radians.

(a) Use a graphing utility to graph the sine function and its polynomial approximation in the same viewing window. How do the graphs compare?
(b) Use a graphing utility to graph the cosine function and its polynomial approximation in the same viewing window. How do the graphs compare?
(c) Study the patterns in the polynomial approximations of the sine and cosine functions and predict the next term in each. Then repeat parts (a) and (b). How did the accuracy of the approximations change when an additional term was added?

104. Use the polynomial approximations of the sine and cosine functions in Exercise 103 to approximate the following function values. Compare the results with those given by a calculator. Is the error in the approximation the same in each case? Explain.

(a) $\sin \frac{1}{2}$ \quad (b) $\sin 1$ \quad (c) $\sin \frac{\pi}{6}$
\quad (d) $\cos(-0.5)$ \quad (e) $\cos 1$ \quad (f) $\cos \frac{\pi}{4}$

PROJECT: METEOROLOGY To work an extended application analyzing the mean monthly temperature and mean monthly precipitation in Honolulu, Hawaii, visit this text’s website at academic.cengage.com. (Data Source: National Climatic Data Center)
What you should learn

• Sketch the graphs of tangent functions.
• Sketch the graphs of cotangent functions.
• Sketch the graphs of secant and cosecant functions.
• Sketch the graphs of damped trigonometric functions.

Why you should learn it

Graphs of trigonometric functions can be used to model real-life situations such as the distance from a television camera to a unit in a parade, as in Exercise 92 on page 339.

Graph of the Tangent Function

Recall that the tangent function is odd. That is, Consequently, the graph of is symmetric with respect to the origin. You also know from the identity that the tangent is undefined for values at which Two such values are As indicated in the table, tan increases without bound as approaches from the left, and decreases without bound as approaches from the right. So, the graph of has vertical asymptotes at and as shown in Figure 4.59. Moreover, because the period of the tangent function is vertical asymptotes also occur when where is an integer. The domain of the tangent function is the set of all real numbers other than and the range is the set of all real numbers.

As indicated in the table, tan increases without bound as x approaches π/2 from the left, and decreases without bound as x approaches −π/2 from the right. So, the graph of y = tan x has vertical asymptotes at x = π/2 and x = −π/2, as shown in Figure 4.59. Moreover, because the period of the tangent function is π, vertical asymptotes also occur when x = π/2 + nπ, where n is an integer. The domain of the tangent function is the set of all real numbers other than x = π/2 + nπ, and the range is the set of all real numbers.

PERIOD: π
DOMAIN: ALL x ≠ π/2 + nπ
RANGE: (−∞, ∞)
VERTICAL ASYMPTOTES: x = π/2 + nπ
SYMMETRY: ORIGIN

Sketching the graph of y = a tan(bx − c) is similar to sketching the graph of y = a sin(bx − c) in that you locate key points that identify the intercepts and asymptotes. Two consecutive vertical asymptotes can be found by solving the equations

\[ bx - c = -\frac{\pi}{2} \quad \text{and} \quad bx - c = \frac{\pi}{2}. \]

The midpoint between two consecutive vertical asymptotes is an x-intercept of the graph. The period of the function y = a tan(bx − c) is the distance between two consecutive vertical asymptotes. The amplitude of a tangent function is not defined. After plotting the asymptotes and the x-intercept, plot a few additional points between the two asymptotes and sketch one cycle. Finally, sketch one or two additional cycles to the left and right.
Example 1  Sketching the Graph of a Tangent Function

Sketch the graph of \( y = \tan(x/2) \).

Solution

By solving the equations

\[
\frac{x}{2} = -\frac{\pi}{2} \quad \text{and} \quad \frac{x}{2} = \frac{\pi}{2}
\]

you can see that two consecutive vertical asymptotes occur at \( x = -\pi \) and \( x = \pi \). Between these two asymptotes, plot a few points, including the \( x \)-intercept, as shown in the table. Three cycles of the graph are shown in Figure 4.60.

<table>
<thead>

<td>1</td>
<td>Undef.</td>
</tr>
</tbody>
</table>

Now try Exercise 15.

Example 2  Sketching the Graph of a Tangent Function

Sketch the graph of \( y = -3 \tan 2x \).

Solution

By solving the equations

\[
2x = -\frac{\pi}{2} \quad \text{and} \quad 2x = \frac{\pi}{2}
\]

you can see that two consecutive vertical asymptotes occur at \( x = -\pi/4 \) and \( x = \pi/4 \). Between these two asymptotes, plot a few points, including the \( x \)-intercept, as shown in the table. Three cycles of the graph are shown in Figure 4.61.

<table>
<thead>
<tr>
<th>( x )</th>
<th>(-\frac{\pi}{4})</th>
<th>(-\frac{\pi}{8})</th>
<th>0</th>
<th>(\frac{\pi}{8})</th>
<th>(\frac{\pi}{4})</th>

</thead>
<tbody>
<tr>
<td>(-3 \tan 2x)</td>
<td>Undef.</td>
<td>3</td>
<td>0</td>
<td>-3</td>
<td>Undef.</td>
</tr>
</tbody>
</table>

By comparing the graphs in Examples 1 and 2, you can see that the graph of \( y = a \tan(bx - c) \) increases between consecutive vertical asymptotes when \( a > 0 \), and decreases between consecutive vertical asymptotes when \( a < 0 \). In other words, the graph for \( a < 0 \) is a reflection in the \( x \)-axis of the graph for \( a > 0 \).

Now try Exercise 17.
**Graph of the Cotangent Function**

The graph of the cotangent function is similar to the graph of the tangent function. It also has a period of $\pi$. However, from the identity

$$y = \cot x = \frac{\cos x}{\sin x}$$

you can see that the cotangent function has vertical asymptotes when $\sin x$ is zero, which occurs at $x = n\pi$, where $n$ is an integer. The graph of the cotangent function is shown in Figure 4.62. Note that two consecutive vertical asymptotes of the graph of $y = a \cot(bx - c)$ can be found by solving the equations $bx - c = 0$ and $bx - c = \pi$.

**Example 3**  
**Sketching the Graph of a Cotangent Function**

Sketch the graph of $y = 2 \cot \frac{x}{3}$.

**Solution**

By solving the equations

$$\frac{x}{3} = 0 \quad \text{and} \quad \frac{x}{3} = \pi$$

$$x = 0 \quad \text{and} \quad x = 3\pi$$

you can see that two consecutive vertical asymptotes occur at $x = 0$ and $x = 3\pi$. Between these two asymptotes, plot a few points, including the $x$-intercept, as shown in the table. Three cycles of the graph are shown in Figure 4.63. Note that the period is $3\pi$; the distance between consecutive asymptotes.

Graphs of the Reciprocal Functions

The graphs of the two remaining trigonometric functions can be obtained from the graphs of the sine and cosine functions using the reciprocal identities

\[ \csc x = \frac{1}{\sin x} \quad \text{and} \quad \sec x = \frac{1}{\cos x}. \]

For instance, at a given value of \( x \), the \( y \)-coordinate of \( \sec x \) is the reciprocal of the \( y \)-coordinate of \( \cos x \). Of course, when \( \cos x = 0 \), the reciprocal does not exist. Near such values of \( x \), the behavior of the secant function is similar to that of the tangent function. In other words, the graphs of

\[ \tan x = \frac{\sin x}{\cos x} \quad \text{and} \quad \sec x = \frac{1}{\cos x} \]

have vertical asymptotes at \( x = \pi/2 + n\pi \), where \( n \) is an integer, and the cosine is zero at these \( x \)-values. Similarly,

\[ \cot x = \frac{\cos x}{\sin x} \quad \text{and} \quad \csc x = \frac{1}{\sin x} \]

have vertical asymptotes where \( \sin x = 0 \)—that is, at \( x = n\pi \).

To sketch the graph of a secant or cosecant function, you should first make a sketch of its reciprocal function. For instance, to sketch the graph of \( y = \csc x \), first sketch the graph of \( y = \sin x \). Then take reciprocals of the \( y \)-coordinates to obtain points on the graph of \( y = \csc x \). This procedure is used to obtain the graphs shown in Figure 4.64.

In comparing the graphs of the cosecant and secant functions with those of the sine and cosine functions, note that the “hills” and “valleys” are interchanged. For example, a hill (or maximum point) on the sine curve corresponds to a valley (a relative minimum) on the cosecant curve, and a valley (or minimum point) on the sine curve corresponds to a hill (a relative maximum) on the cosecant curve, as shown in Figure 4.65. Additionally, \( x \)-intercepts of the sine and cosine functions become vertical asymptotes of the cosecant and secant functions, respectively (see Figure 4.65).
Example 4  Sketching the Graph of a Cosecant Function

Sketch the graph of $y = 2 \csc \left( x + \frac{\pi}{4} \right)$.

Solution

Begin by sketching the graph of

$$y = 2 \sin \left( x + \frac{\pi}{4} \right).$$

For this function, the amplitude is 2 and the period is $2\pi$. By solving the equations

$$x + \frac{\pi}{4} = 0 \quad \text{and} \quad x + \frac{\pi}{4} = 2\pi,$$

$$x = -\frac{\pi}{4}, \quad x = \frac{7\pi}{4},$$

you can see that one cycle of the sine function corresponds to the interval from $x = -\pi/4$ to $x = 7\pi/4$. The graph of this sine function is represented by the gray curve in Figure 4.66. Because the sine function is zero at the midpoint and endpoints of this interval, the corresponding cosecant function

$$y = 2 \csc \left( x + \frac{\pi}{4} \right)$$

$$= 2 \left( \frac{1}{\sin [x + (\pi/4)]} \right)$$

has vertical asymptotes at $x = -\pi/4, x = 3\pi/4, x = 7\pi/4$, etc. The graph of the cosecant function is represented by the black curve in Figure 4.66.

CHECKPoint  Now try Exercise 33.

Example 5  Sketching the Graph of a Secant Function

Sketch the graph of $y = \sec 2x$.

Solution

Begin by sketching the graph of $y = \cos 2x$, as indicated by the gray curve in Figure 4.67. Then, form the graph of $y = \sec 2x$ as the black curve in the figure. Note that the $x$-intercepts of $y = \cos 2x$

$$\left( -\frac{\pi}{4}, 0 \right), \quad \left( \frac{\pi}{4}, 0 \right), \quad \left( \frac{3\pi}{4}, 0 \right), \ldots$$

correspond to the vertical asymptotes

$$x = -\frac{\pi}{4}, \quad x = \frac{\pi}{4}, \quad x = \frac{3\pi}{4}, \ldots$$

of the graph of $y = \sec 2x$. Moreover, notice that the period of $y = \cos 2x$ and $y = \sec 2x$ is $\pi$.

CHECKPoint  Now try Exercise 35.
Damped Trigonometric Graphs

A product of two functions can be graphed using properties of the individual functions. For instance, consider the function

\[ f(x) = x \sin x \]

as the product of the functions \( y = x \) and \( y = \sin x \). Using properties of absolute value and the fact that \( |\sin x| \leq 1 \), you have \( 0 \leq |x| |\sin x| \leq |x| \). Consequently,

\[ -|x| \leq x \sin x \leq |x| \]

which means that the graph of \( f(x) = x \sin x \) lies between the lines \( y = -x \) and \( y = x \). Furthermore, because

\[ f(x) = x \sin x = \pm x \quad \text{at} \quad x = \frac{\pi}{2} + n\pi \]

and

\[ f(x) = x \sin x = 0 \quad \text{at} \quad x = n\pi \]

the graph of \( f \) touches the line \( y = -x \) or the line \( y = x \) at \( x = \pi/2 + n\pi \) and has \( x \)-intercepts at \( x = n\pi \). A sketch of \( f \) is shown in Figure 4.68. In the function \( f(x) = x \sin x \), the factor \( x \) is called the damping factor.

Example 6  
Damped Sine Wave

Sketch the graph of \( f(x) = e^{-x} \sin 3x \).

Solution

Consider \( f(x) \) as the product of the two functions

\[ y = e^{-x} \quad \text{and} \quad y = \sin 3x \]

each of which has the set of real numbers as its domain. For any real number \( x \), you know that \( e^{-x} \geq 0 \) and \( |\sin 3x| \leq 1 \). So, \( e^{-x} |\sin 3x| \leq e^{-x} \), which means that

\[ -e^{-x} \leq e^{-x} \sin 3x \leq e^{-x}. \]

Furthermore, because

\[ f(x) = e^{-x} \sin 3x = \pm e^{-x} \quad \text{at} \quad x = \frac{\pi}{6} + \frac{n\pi}{3} \]

and

\[ f(x) = e^{-x} \sin 3x = 0 \quad \text{at} \quad x = \frac{n\pi}{3} \]

the graph of \( f \) touches the curves \( y = -e^{-x} \) and \( y = e^{-x} \) at \( x = \pi/6 + n\pi/3 \) and has \( x \)-intercepts at \( x = n\pi/3 \). A sketch is shown in Figure 4.69.

Check Point: Now try Exercise 65.
Figure 4.70 summarizes the characteristics of the six basic trigonometric functions.

**Combining Trigonometric Functions**

Recall from Section 1.8 that functions can be combined arithmetically. This also applies to trigonometric functions. For each of the functions

\[ h(x) = x + \sin x \quad \text{and} \quad h(x) = \cos x - \sin 3x \]

(a) identify two simpler functions \( f \) and \( g \) that comprise the combination, (b) use a table to show how to obtain the numerical values of \( h(x) \) from the numerical values of \( f(x) \) and \( g(x) \), and (c) use graphs of \( f \) and \( g \) to show how the graph of \( h \) may be formed.

Can you find functions

\[ f(x) = d + a \sin(bx + c) \quad \text{and} \quad g(x) = d + a \cos(bx + c) \]

such that \( f(x) + g(x) = 0 \) for all \( x \)?
VOCABULARY: Fill in the blanks.

1. The tangent, cotangent, and cosecant functions are ________, so the graphs of these functions have symmetry with respect to the ________.
2. The graphs of the tangent, cotangent, secant, and cosecant functions all have ________ asymptotes.
3. To sketch the graph of a secant or cosecant function, first make a sketch of its corresponding ________ function.
4. For the functions given by \( f(x) = g(x) \cdot \sin x \), \( g(x) \) is called the ________ factor of the function \( f(x) \).
5. The period of \( y = \tan x \) is ________.
6. The domain of \( y = \cot x \) is all real numbers such that ________.
7. The range of \( y = \sec x \) is ________.
8. The period of \( y = \csc x \) is ________.

SKILLS AND APPLICATIONS

In Exercises 9–14, match the function with its graph. State the period of the function. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

(a) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
-3 \quad -2 \quad -1 \quad 1 \quad 2 \quad 3 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]
(b) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
-3 \quad -2 \quad -1 \quad 1 \quad 2 \quad 3 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]
(c) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
3 \quad 4 \quad 5 \quad 6 \quad 7 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]
(d) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
3 \quad 4 \quad 5 \quad 6 \quad 7 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]
(e) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
-3 \quad -2 \quad -1 \quad 1 \quad 2 \quad 3 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]
(f) \[
\begin{array}{c}
\begin{array}{c}
0 \quad 1 \quad 2 \quad 3 \quad 4 \\
3 \quad 4 \quad 5 \quad 6 \quad 7 \\
y \quad y \quad y \quad y \quad y \\
x \quad x \quad x \quad x \quad x
\end{array}
\end{array}
\]

9. \( y = \sec 2x \)
10. \( y = \tan \frac{x}{2} \)
11. \( y = \frac{1}{2} \cot \pi x \)
12. \( y = -\csc x \)
13. \( y = \frac{1}{2} \sec \frac{\pi x}{2} \)
14. \( y = -2 \sec \frac{\pi x}{2} \)

In Exercises 15–38, sketch the graph of the function. Include two full periods.

15. \( y = \frac{1}{3} \tan x \)
16. \( y = \tan 4x \)
17. \( y = -2 \tan 3x \)
18. \( y = -3 \tan \frac{\pi x}{2} \)
19. \( y = -\frac{1}{2} \sec x \)
20. \( y = \frac{1}{4} \sec x \)
21. \( y = \csc \pi x \)
22. \( y = 3 \csc 4x \)
23. \( y = \frac{1}{2} \sec \pi x \)
24. \( y = -2 \sec 4x + 2 \)
25. \( y = \csc \frac{x}{2} \)
26. \( y = \csc \frac{x}{3} \)
27. \( y = 3 \cot 2x \)
28. \( y = 3 \cot \frac{\pi x}{2} \)
29. \( y = 2 \sec 3x \)
30. \( y = -\frac{1}{2} \tan x \)
31. \( y = \tan \frac{\pi x}{4} \)
32. \( y = \tan(x + \pi) \)
33. \( y = 2 \csc(x - \pi) \)
34. \( y = \csc(2x - \pi) \)
35. \( y = 2 \sec(x + \pi) \)
36. \( y = -\sec \pi x + 1 \)
37. \( y = \frac{1}{4} \csc \left( x + \frac{\pi}{4} \right) \)
38. \( y = 2 \cot \left( x + \frac{\pi}{2} \right) \)

In Exercises 39–48, use a graphing utility to graph the function. Include two full periods.

39. \( y = \tan \frac{x}{3} \)
40. \( y = -\tan 2x \)
41. \( y = -2 \sec 4x \)
42. \( y = \sec \pi x \)
43. \( y = \tan \left( x - \frac{\pi}{4} \right) \)
44. \( y = \frac{1}{4} \cot \left( x - \frac{\pi}{2} \right) \)
45. \( y = -\csc(4x - \pi) \)
46. \( y = 2 \sec(2x - \pi) \)
47. \( y = 0.1 \tan \left( \frac{\pi x}{4} + \frac{\pi}{4} \right) \)
48. \( y = \frac{1}{3} \sec \left( \frac{\pi x}{2} + \frac{\pi}{2} \right) \)
In Exercises 49–56, use a graph to solve the equation on the interval $[-2\pi, 2\pi]$.

49. $\tan x = 1$  
50. $\tan x = \sqrt{3}$  
51. $\cot x = -\sqrt{3}$  
52. $\cot x = 1$  
53. $\sec x = -2$  
54. $\sec x = 2$  
55. $\csc x = \sqrt{2}$  
56. $\csc x = -\frac{2\sqrt{3}}{3}$

In Exercises 57–64, use the graph of the function to determine whether the function is even, odd, or neither. Verify your answer algebraically.

57. $f(x) = \sec x$  
58. $f(x) = \tan x$  
59. $g(x) = \cot x$  
60. $g(x) = \csc x$  
61. $f(x) = x + \tan x$  
62. $f(x) = x^2 - \sec x$  
63. $g(x) = x \csc x$  
64. $g(x) = x^2 \cot x$

65. **GRAPHICAL REASONING** Consider the functions given by

$$f(x) = 2 \sin x \quad \text{and} \quad g(x) = \frac{1}{2} \csc x$$

on the interval $(0, \pi)$.

(a) Graph $f$ and $g$ in the same coordinate plane.
(b) Approximate the interval in which $f > g$.
(c) Describe the behavior of each of the functions as $x$ approaches $\pi$. How is the behavior of $g$ related to the behavior of $f$ as $x$ approaches $\pi$?

66. **GRAPHICAL REASONING** Consider the functions given by

$$f(x) = \tan \frac{\pi x}{2} \quad \text{and} \quad g(x) = \frac{1}{2} \sec \frac{\pi x}{2}$$

on the interval $(-1, 1)$.

(a) Use a graphing utility to graph $f$ and $g$ in the same viewing window.
(b) Approximate the interval in which $f < g$.
(c) Approximate the interval in which $2f < 2g$. How does the result compare with that of part (b)? Explain.

In Exercises 67–72, use a graphing utility to graph the two equations in the same viewing window. Use the graphs to determine whether the expressions are equivalent. Verify the results algebraically.

67. $y_1 = \sin x \csc x$, $y_2 = 1$  
68. $y_1 = \sin x \sec x$, $y_2 = \tan x$  
69. $y_1 = \frac{\cos x}{\sin x}$, $y_2 = \cot x$  
70. $y_1 = \tan x \cot^2 x$, $y_2 = \cot x$  
71. $y_1 = 1 + \cot^2 x$, $y_2 = \csc^2 x$  
72. $y_1 = \sec^2 x - 1$, $y_2 = \tan^2 x$

In Exercises 73–76, match the function with its graph. Describe the behavior of the function as $x$ approaches zero. [The graphs are labeled (a), (b), (c), and (d).]

73. $f(x) = |x \cos x|$  
74. $f(x) = x \sin x$  
75. $g(x) = |x| \sin x$  
76. $g(x) = |x| \cos x$

**CONJECTURE** In Exercises 77–80, graph the functions $f$ and $g$. Use the graphs to make a conjecture about the relationship between the functions.

77. $f(x) = \sin x + \cos\left(x + \frac{\pi}{2}\right)$, $g(x) = 0$
78. $f(x) = \sin x - \cos\left(x + \frac{\pi}{2}\right)$, $g(x) = 2 \sin x$
79. $f(x) = \sin^2 x$, $g(x) = \frac{1}{2}(1 - \cos 2x)$
80. $f(x) = \cos^2 \frac{\pi x}{2}$, $g(x) = \frac{1}{2}(1 + \cos \pi x)$

In Exercises 81–84, use a graphing utility to graph the function and the damping factor of the function in the same viewing window. Describe the behavior of the function as $x$ increases without bound.

81. $g(x) = e^{-x^3/2} \sin x$  
82. $f(x) = e^{-x} \cos x$  
83. $f(x) = 2^{-x^4} \cos \pi x$  
84. $h(x) = 2^{-x^2/4} \sin x$

In Exercises 85–90, use a graphing utility to graph the function. Describe the behavior of the function as $x$ approaches zero.

85. $y = \frac{6}{x} + \cos x$, $x > 0$  
86. $y = \frac{4}{x} + \sin 2x$, $x > 0$
87. \( g(x) = \frac{\sin x}{x} \)  
88. \( f(x) = \frac{1 - \cos x}{x} \)  
89. \( f(x) = \sin \frac{1}{x} \)  
90. \( h(x) = x \sin \frac{1}{x} \)

91. **DISTANCE** A plane flying at an altitude of 7 miles above a radar antenna will pass directly over the radar antenna (see figure). Let \( d \) be the ground distance from the antenna to the point directly under the plane and let \( x \) be the angle of elevation to the plane from the antenna. (\( d \) is positive as the plane approaches the antenna.) Write \( d \) as a function of \( x \) and graph the function over the interval \( 0 < x < \pi \).

92. **TELEVISION COVERAGE** A television camera is on a reviewing platform 27 meters from the street on which a parade will be passing from left to right (see figure). Write the distance \( d \) from the camera to a particular unit in the parade as a function of the angle \( x \), and graph the function over the interval \(-\pi/2 < x < \pi/2 \). (Consider \( x \) as negative when a unit in the parade approaches from the left.)

93. **METEOROLOGY** The normal monthly high temperatures \( H \) (in degrees Fahrenheit) in Erie, Pennsylvania are approximated by
\[
H(t) = 56.94 - 20.86 \cos(\pi t/6) - 11.58 \sin(\pi t/6)
\]
and the normal monthly low temperatures \( L \) are approximated by
\[
L(t) = 41.80 - 17.13 \cos(\pi t/6) - 13.39 \sin(\pi t/6)
\]
where \( t \) is the time (in months), with \( t = 1 \) corresponding to January (see figure). (Source: National Climatic Data Center)

(a) What is the period of each function?  
(b) During what part of the year is the difference between the normal high and normal low temperatures greatest? When is it smallest?  
(c) The sun is northernmost in the sky around June 21, but the graph shows the warmest temperatures at a later date. Approximate the lag time of the temperatures relative to the position of the sun.

94. **SALES** The projected monthly sales \( S \) (in thousands of units) of lawn mowers (a seasonal product) are modeled by
\[
S(t) = 74 + 3t - 40 \cos(\pi t/6), \quad t \geq 0
\]
where \( t \) is the time (in months), with \( t = 1 \) corresponding to January. Graph the sales function over 1 year.

95. **HARMONIC MOTION** An object weighing \( W \) pounds is suspended from the ceiling by a steel spring (see figure). The weight is pulled downward (positive direction) from its equilibrium position and released. The resulting motion of the weight is described by the function
\[
y(t) = \frac{1}{2}e^{-t} \cos 4t, \quad t > 0
\]
where \( y \) is the distance (in feet) and \( t \) is the time (in seconds).

(a) Use a graphing utility to graph the function.  
(b) Describe the behavior of the displacement function for increasing values of time \( t \).

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 96 and 97, determine whether the statement is true or false. Justify your answer.

96. The graph of \( y = \csc x \) can be obtained on a calculator by graphing the reciprocal of \( y = \sin x \).

97. The graph of \( y = \sec x \) can be obtained on a calculator by graphing a translation of the reciprocal of \( y = \sin x \).
In Exercises 99 and 100, use a graphing utility to graph the function. Use the graph to determine the behavior of the function as \( x \to c \).

99. \( f(x) = \tan x \) 
100. \( f(x) = \sec x \)

In Exercises 101 and 102, use a graphing utility to graph the function. Use the graph to determine the behavior of the function as \( x \to c \).

101. \( f(x) = \cot x \) 
102. \( f(x) = \csc x \)

103. THINK ABOUT IT Consider the function given by 
\( f(x) = x - \cos x \).

(a) Use a graphing utility to graph the function and verify that there exists a zero between 0 and 1. Use the graph to approximate the zero.

104. APPROXIMATION Using calculus, it can be shown that the tangent function can be approximated by the polynomial
\[ \tan x \approx x + \frac{2x^3}{3!} + \frac{16x^5}{5!} \]
where \( x \) is in radians. Use a graphing utility to graph the tangent function and its polynomial approximation in the same viewing window. How do the graphs compare?

105. APPROXIMATION Using calculus, it can be shown that the secant function can be approximated by the polynomial
\[ \sec x \approx 1 + \frac{x^2}{2!} + \frac{5x^4}{4!} \]
where \( x \) is in radians. Use a graphing utility to graph the secant function and its polynomial approximation in the same viewing window. How do the graphs compare?

106. PATTERN RECOGNITION

(a) Use a graphing utility to graph each function.

\[ y_1 = \frac{4}{\pi} \sin \pi x + \frac{1}{3} \sin 3\pi x \]
\[ y_2 = \frac{4}{\pi} \sin \pi x + \frac{1}{3} \sin 3\pi x + \frac{1}{5} \sin 5\pi x \]

(b) Identify the pattern started in part (a) and find a function \( y_3 \) that continues the pattern one more term. Use a graphing utility to graph \( y_3 \).

(c) The graphs in parts (a) and (b) approximate the periodic function in the figure. Find a function \( y_4 \) that is a better approximation.
Section 4.7 Inverse Trigonometric Functions

**Inverse Sine Function**

Recall from Section 1.9 that, for a function to have an inverse function, it must be one-to-one—that is, it must pass the Horizontal Line Test. From Figure 4.71, you can see that $y = \sin x$ does not pass the test because different values of $x$ yield the same $y$-value.

However, if you restrict the domain to the interval $-\pi/2 \leq x \leq \pi/2$ (corresponding to the black portion of the graph in Figure 4.71), the following properties hold.

1. On the interval $[-\pi/2, \pi/2]$, the function $y = \sin x$ is increasing.
2. On the interval $[-\pi/2, \pi/2]$, $y = \sin x$ takes on its full range of values, $-1 \leq \sin x \leq 1$.
3. On the interval $[-\pi/2, \pi/2]$, $y = \sin x$ is one-to-one.

So, on the restricted domain $-\pi/2 \leq x \leq \pi/2$, $y = \sin x$ has a unique inverse function called the *inverse sine function*. It is denoted by

$$y = \arcsin x \quad \text{or} \quad y = \sin^{-1} x.$$

The notation $\sin^{-1} x$ is consistent with the inverse function notation $f^{-1}(x)$. The arcsin $x$ notation (read as “the arcsine of $x$”) comes from the association of a central angle with its intercepted *arc length* on a unit circle. So, $\arcsin x$ means the angle (or arc) whose sine is $x$. Both notations, $\arcsin x$ and $\sin^{-1} x$, are commonly used in mathematics, so remember that $\sin^{-1} x$ denotes the *inverse* sine function rather than $1/\sin x$. The values of $\arcsin x$ lie in the interval $-\pi/2 \leq \arcsin x \leq \pi/2$. The graph of $y = \arcsin x$ is shown in Example 2.

**Definition of Inverse Sine Function**

The *inverse sine function* is defined by

$$y = \arcsin x \quad \text{if and only if} \quad \sin y = x$$

where $-1 \leq x \leq 1$ and $-\pi/2 \leq y \leq \pi/2$. The domain of $y = \arcsin x$ is $[-1, 1]$, and the range is $[-\pi/2, \pi/2]$. 

### Example 1: Evaluating the Inverse Sine Function

If possible, find the exact value.

a. \( \arcsin \left( -\frac{1}{2} \right) \)

b. \( \sin^{-1} \left( \frac{\sqrt{3}}{2} \right) \)

c. \( \sin^{-1} \left( 2 \right) \)

#### Solution

a. Because \( \sin \left( -\frac{\pi}{6} \right) = -\frac{1}{2} \) for \( -\frac{\pi}{2} \leq y \leq \frac{\pi}{2} \), it follows that

\[
\arcsin \left( -\frac{1}{2} \right) = -\frac{\pi}{6}. \quad \text{Angle whose sine is } -\frac{1}{2}
\]

b. Because \( \sin \left( \frac{\pi}{3} \right) = \frac{\sqrt{3}}{2} \) for \( -\frac{\pi}{2} \leq y \leq \frac{\pi}{2} \), it follows that

\[
\sin^{-1} \left( \frac{\sqrt{3}}{2} \right) = \frac{\pi}{3}. \quad \text{Angle whose sine is } \frac{\sqrt{3}}{2}
\]

c. It is not possible to evaluate \( y = \sin^{-1} x \) when \( x = 2 \) because there is no angle whose sine is 2. Remember that the domain of the inverse sine function is \([-1, 1]\).

**CHECKPOINT** Now try Exercise 5.

### Example 2: Graphing the Arcsine Function

Sketch a graph of

\[
y = \arcsin x.
\]

#### Solution

By definition, the equations \( y = \arcsin x \) and \( \sin y = x \) are equivalent for \(-\pi/2 \leq y \leq \pi/2\). So, their graphs are the same. From the interval \([-\pi/2, \pi/2]\), you can assign values to \( y \) in the second equation to make a table of values. Then plot the points and draw a smooth curve through the points.

<table>
<thead>
<tr>
<th>( y )</th>
<th>(-\pi/2)</th>
<th>(-\pi/4)</th>
<th>(-\pi/6)</th>
<th>0</th>
<th>(\pi/6)</th>
<th>(\pi/4)</th>
<th>(\pi/2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x = \sin y )</td>
<td>-1</td>
<td>-(\sqrt{2}/2)</td>
<td>-(1/2)</td>
<td>0</td>
<td>(1/2)</td>
<td>(\sqrt{2}/2)</td>
<td>1</td>
</tr>
</tbody>
</table>

The resulting graph for \( y = \arcsin x \) is shown in Figure 4.72. Note that it is the reflection (in the line \( y = x \)) of the black portion of the graph in Figure 4.71. Be sure you see that Figure 4.72 shows the entire graph of the inverse sine function. Remember that the domain of \( y = \arcsin x \) is the closed interval \([-1, 1]\) and the range is the closed interval \([-\pi/2, \pi/2]\).

**CHECKPOINT** Now try Exercise 21.
Other Inverse Trigonometric Functions

The cosine function is decreasing and one-to-one on the interval $0 \leq x \leq \pi$, as shown in Figure 4.73.

![Figure 4.73](image)

Consequently, on this interval the cosine function has an inverse function—the inverse cosine function—denoted by

$$y = \arccos x \quad \text{or} \quad y = \cos^{-1} x.$$

Similarly, you can define an inverse tangent function by restricting the domain of $y = \tan x$ to the interval $(-\pi/2, \pi/2)$. The following list summarizes the definitions of the three most common inverse trigonometric functions. The remaining three are defined in Exercises 115–117.

<table>
<thead>
<tr>
<th>Function</th>
<th>Domain</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>$y = \arcsin x$ if and only if $\sin y = x$</td>
<td>$-1 \leq x \leq 1$</td>
<td>$-\pi/2 \leq y \leq \pi/2$</td>
</tr>
<tr>
<td>$y = \arccos x$ if and only if $\cos y = x$</td>
<td>$-1 \leq x \leq 1$</td>
<td>$0 \leq y \leq \pi$</td>
</tr>
<tr>
<td>$y = \arctan x$ if and only if $\tan y = x$</td>
<td>$-\infty &lt; x &lt; \infty$</td>
<td>$-\pi/2 &lt; y &lt; \pi/2$</td>
</tr>
</tbody>
</table>

The graphs of these three inverse trigonometric functions are shown in Figure 4.74.
Example 3  Evaluating Inverse Trigonometric Functions

Find the exact value.

a. \( \arccos \frac{\sqrt{2}}{2} \)  

b. \( \cos^{-1}(-1) \)

c. \( \arctan 0 \)  

d. \( \tan^{-1}(-1) \)

Solution

a. Because \( \cos(\pi/4) = \sqrt{2}/2 \), and \( \pi/4 \) lies in \([0, \pi]\), it follows that
\[
\arccos \frac{\sqrt{2}}{2} = \frac{\pi}{4}.
\]
Angle whose cosine is \( \sqrt{2}/2 \)

b. Because \( \cos \theta = -1 \), and \( \theta \) lies in \([0, \pi]\), it follows that
\[
\cos^{-1}(-1) = \pi.
\]
Angle whose cosine is \(-1\)

c. Because \( \tan 0 = 0 \), and \( 0 \) lies in \((-\pi/2, \pi/2)\), it follows that
\[
\arctan 0 = 0.
\]
Angle whose tangent is \( 0 \)

d. Because \( \tan(-\pi/4) = -1 \), and \( -\pi/4 \) lies in \((-\pi/2, \pi/2)\), it follows that
\[
\tan^{-1}(-1) = -\frac{\pi}{4}.
\]
Angle whose tangent is \( -1 \)

Example 4  Calculators and Inverse Trigonometric Functions

Use a calculator to approximate the value (if possible).

a. \( \arctan(-8.45) \)

b. \( \sin^{-1} 0.2447 \)

c. \( \arccos 2 \)

Solution

<table>
<thead>
<tr>
<th>Function</th>
<th>Mode</th>
<th>Calculator Keystrokes</th>
</tr>
</thead>
<tbody>
<tr>
<td>arctan(−8.45)</td>
<td>Radian</td>
<td>( \tan^{-1} ) I 8.45 ENTER</td>
</tr>
<tr>
<td>sin(^{-1}) 0.2447</td>
<td>Radian</td>
<td>( \sin^{-1} ) I 0.2447 ENTER</td>
</tr>
<tr>
<td>arccos 2</td>
<td>Radian</td>
<td>( \cos^{-1} ) I 2 ENTER</td>
</tr>
</tbody>
</table>

From the display, it follows that \( \arctan(-8.45) \approx -1.453001 \).

From the display, it follows that \( \sin^{-1} 0.2447 \approx 0.2472103 \).

In \textit{real number} mode, the calculator should display an \textit{error message} because the domain of the inverse cosine function is \([-1, 1]\).

Example 4, if you had set the calculator to \textit{degree} mode, the displays would have been in degrees rather than radians. This convention is peculiar to calculators. By definition, the values of inverse trigonometric functions are \textit{always in radians}. 

WARNING / CAUTION

Remember that the domain of the inverse sine function and the inverse cosine function is \([-1, 1]\), as indicated in Example 4(c).
Compositions of Functions

Recall from Section 1.9 that for all \( x \) in the domains of \( f \) and \( f^{-1} \), inverse functions have the properties
\[
f(f^{-1}(x)) = x \quad \text{and} \quad f^{-1}(f(x)) = x.\]

\[ \text{Inverse Properties of Trigonometric Functions} \]

If \(-1 \leq x \leq 1\) and \(-\pi/2 \leq y \leq \pi/2\), then
\[
\sin(\arcsin x) = x \quad \text{and} \quad \arcsin(\sin y) = y.
\]
If \(-1 \leq x \leq 1\) and \(0 \leq y \leq \pi\), then
\[
\cos(\arccos x) = x \quad \text{and} \quad \arccos(\cos y) = y.
\]
If \(x\) is a real number and \(-\pi/2 < y < \pi/2\), then
\[
\tan(\arctan x) = x \quad \text{and} \quad \arctan(\tan y) = y.
\]

Keep in mind that these inverse properties do not apply for arbitrary values of \( x \) and \( y \). For instance,
\[
\arcsin\left(\sin \frac{3\pi}{2}\right) = \arcsin(-1) = -\frac{\pi}{2} \neq \frac{3\pi}{2}.
\]
In other words, the property
\[
\arcsin(\sin y) = y
\]
is not valid for values of \( y \) outside the interval \([-\pi/2, \pi/2]\).

**Example 5 Using Inverse Properties**

If possible, find the exact value.

a. \( \tan(\arctan(-5)) \)  
   b. \( \arcsin\left(\sin \frac{5\pi}{3}\right) \)  
   c. \( \cos(\cos^{-1} \pi) \)

**Solution**

a. Because \(-5\) lies in the domain of the arctan function, the inverse property applies, and you have
\[
\tan(\arctan(-5)) = -5.
\]

b. In this case, \(5\pi/3\) does not lie within the range of the arcsine function, \(-\pi/2 \leq y \leq \pi/2\). However, \(5\pi/3\) is coterminal with
\[
\frac{5\pi}{3} - 2\pi = -\frac{\pi}{3},
\]
which does lie in the range of the arcsine function, and you have
\[
\arcsin\left(\sin \frac{5\pi}{3}\right) = \arcsin\left(\sin \left(-\frac{\pi}{3}\right)\right) = -\frac{\pi}{3}.
\]

c. The expression \( \cos(\cos^{-1} \pi) \) is not defined because \( \cos^{-1} \pi \) is not defined. Remember that the domain of the inverse cosine function is \([-1, 1]\).
Example 6 shows how to use right triangles to find exact values of compositions of inverse functions. Then, Example 7 shows how to use right triangles to convert a trigonometric expression into an algebraic expression. This conversion technique is used frequently in calculus.

### Example 6 Evaluating Compositions of Functions

Find the exact value.

a. \( \tan \left( \arccos \frac{2}{3} \right) \)  
   b. \( \cos \left( \arcsin \left( -\frac{3}{5} \right) \right) \)

**Solution**

a. If you let \( u = \arccos \frac{2}{3} \), then \( \cos u = \frac{2}{3} \). Because \( \cos u \) is positive, \( u \) is a first-quadrant angle. You can sketch and label angle \( u \) as shown in Figure 4.75. Consequently,
   \[ \tan(\arccos \frac{2}{3}) = \tan u = \frac{\text{opp}}{\text{adj}} = \frac{\sqrt{5^2 - 2^2}}{2} = \frac{\sqrt{17}}{2} \]

b. If you let \( u = \arcsin \left( -\frac{3}{5} \right) \), then \( \sin u = -\frac{3}{5} \). Because \( \sin u \) is negative, \( u \) is a fourth-quadrant angle. You can sketch and label angle \( u \) as shown in Figure 4.76. Consequently,
   \[ \cos \left( \arcsin \left( -\frac{3}{5} \right) \right) = \cos u = \frac{\text{adj}}{\text{hyp}} = \frac{4}{5} \]

**CHECK POINT** Now try Exercise 57.

### Example 7 Some Problems from Calculus

Write each of the following as an algebraic expression in \( x \).

a. \( \sin(\arccos 3x) \), \( 0 \leq x \leq \frac{1}{3} \)  
   b. \( \cot(\arccos 3x) \), \( 0 \leq x < \frac{1}{3} \)

**Solution**

If you let \( u = \arccos 3x \), then \( \cos u = 3x \), where \( -1 \leq 3x \leq 1 \). Because
   \[ \cos u = \frac{\text{adj}}{\text{hyp}} = \frac{3x}{1} \]
   you can sketch a right triangle with acute angle \( u \), as shown in Figure 4.77. From this triangle, you can easily convert each expression to algebraic form.

a. \( \sin(\arccos 3x) = \sin u = \frac{\text{opp}}{\text{hyp}} = \sqrt{1 - (3x)^2}, \ 0 \leq x \leq \frac{1}{3} \)

b. \( \cot(\arccos 3x) = \cot u = \frac{\text{adj}}{\text{opp}} = \frac{3x}{\sqrt{1 - (3x)^2}}, \ 0 \leq x < \frac{1}{3} \)

**CHECK POINT** Now try Exercise 67.

In Example 7, similar arguments can be made for \( x \)-values lying in the interval \( \left[ -\frac{1}{3}, 0 \right] \).
VOCABULARY: Fill in the blanks.

SKILLS AND APPLICATIONS

In Exercises 5–20, evaluate the expression without using a calculator.

5. \( \arcsin \frac{1}{2} \)  
6. \( \arcsin 0 \)
7. \( \arccos \frac{1}{2} \)  
8. \( \arccos 0 \)
9. \( \arctan \frac{\sqrt{3}}{3} \)  
10. \( \arctan(1) \)
11. \( \cos^{-1} \left( -\frac{\sqrt{3}}{2} \right) \)  
12. \( \sin^{-1} \left( -\frac{\sqrt{2}}{2} \right) \)
13. \( \arctan \left( -\frac{\sqrt{3}}{3} \right) \)  
14. \( \arctan \sqrt{3} \)
15. \( \arccos \left( -\frac{1}{2} \right) \)  
16. \( \arcsin \frac{\sqrt{2}}{2} \)
17. \( \sin^{-1} \left( -\frac{\sqrt{3}}{3} \right) \)  
18. \( \tan^{-1} \left( -\frac{\sqrt{3}}{3} \right) \)
19. \( \tan^{-1} 0 \)  
20. \( \cos^{-1} 1 \)

In Exercises 21 and 22, use a graphing utility to graph \( f, g, \) and \( y = x \) in the same viewing window to verify geometrically that \( g \) is the inverse function of \( f \). (Be sure to restrict the domain of \( f \) properly.)

21. \( f(x) = \sin x \), \( g(x) = \arcsin x \)
22. \( f(x) = \tan x \), \( g(x) = \arctan x \)

In Exercises 23–40, use a calculator to evaluate the expression. Round your result to two decimal places.

23. \( \arccos 0.37 \)  
24. \( \arcsin 0.65 \)
25. \( \arcsin(-0.75) \)  
26. \( \arccos(-0.7) \)
27. \( \arctan(-3) \)  
28. \( \arctan 25 \)
29. \( \sin^{-1} 0.31 \)  
30. \( \cos^{-1} 0.26 \)
31. \( \arccos(-0.41) \)  
32. \( \arcsin(-0.125) \)
33. \( \arctan 0.92 \)  
34. \( \arctan 2.8 \)
35. \( \arcsin \frac{7}{8} \)  
36. \( \arccos \left( -\frac{1}{2} \right) \)
37. \( \tan^{-1} \frac{19}{7} \)  
38. \( \tan^{-1} \left( -\frac{9}{7} \right) \)
39. \( \tan^{-1} \left( -\sqrt{372} \right) \)  
40. \( \tan^{-1} \left( -\sqrt{2165} \right) \)

In Exercises 41 and 42, determine the missing coordinates of the points on the graph of the function.

41. \( y = \arctan x \)
42. \( y = \arccos x \)

In Exercises 43–48, use an inverse trigonometric function to write \( \theta \) as a function of \( x \).

43. \( \theta \)
44. \( \theta \)
45. \( \theta \)
46. \( \theta \)
47. \( \theta \)
48. \( \theta \)

In Exercises 49–54, use the properties of inverse trigonometric functions to evaluate the expression.

49. \( \sin(\arcsin 0.3) \)  
50. \( \tan(\arctan 45) \)
51. \( \cos[\arccos(-0.1)] \)  
52. \( \sin[\arcsin(-0.2)] \)
53. \( \arcsin(\sin 3\pi) \)  
54. \( \arccos \left( \cos \frac{7\pi}{2} \right) \)
In Exercises 55–66, find the exact value of the expression. 
(Hint: Sketch a right triangle.)

55. \( \sin(\arctan \frac{3}{4}) \)  
56. \( \sec(\arcsin \frac{2}{3}) \)  
57. \( \cos(\tan^{-1} 2) \)  
58. \( \sin(\cos^{-1} \frac{\sqrt{5}}{3}) \)  
59. \( \cos(\arcsin \frac{4}{5}) \)  
60. \( \csc(\arctan(\frac{5}{12})) \)  
61. \( \sec(\arcsin(\frac{3}{5})) \)  
62. \( \tan(\arcsin(\frac{3}{4})) \)  
63. \( \sin(\arccos(\frac{3}{5})) \)  
64. \( \cot(\arctan(\frac{3}{4})) \)  
65. \( \csc(\cos^{-1}(\frac{\sqrt{3}}{2})) \)  
66. \( \sec(\sin^{-1}(\frac{-\sqrt{3}}{2})) \)  

In Exercises 67–76, write an algebraic expression that is equivalent to the expression. 
(Hint: Sketch a right triangle, as demonstrated in Example 7.)

67. \( \cot(\arctan x) \)  
68. \( \sin(\arctan x) \)  
69. \( \cos(\arcsin 2x) \)  
70. \( \sec(\arctan 3x) \)  
71. \( \sin(\arccos x) \)  
72. \( \sec(\arcsin(x - 1)) \)  
73. \( \tan(\arccos(x \sqrt{2})) \)  
74. \( \cot(\arctan(x \sqrt{2})) \)  
75. \( \csc(\arctan(x \sqrt{2})) \)  
76. \( \cos(\arcsin(x - h)) \)  

In Exercises 77 and 78, use a graphing utility to graph \( f \) and \( g \) in the same viewing window to verify that the two functions are equal. Explain why they are equal. Identify any asymptotes of the graphs.

77. \( f(x) = \sin(\arctan 2x) \), \( g(x) = \frac{2x}{\sqrt{1 + 4x^2}} \)  
78. \( f(x) = \tan(\arccos \frac{x}{2}) \), \( g(x) = \frac{\sqrt{4 - x^2}}{x} \)  

In Exercises 79–82, fill in the blank.

79. \( \arctan \frac{9}{x} = \arcsin(\_\_\_\_), \; x \neq 0 \)  
80. \( \arcsin(\sqrt{\frac{36 - x^2}{6}}) = \arccos(\_\_\_), \; 0 \leq x \leq 6 \)  
81. \( \arccos(\frac{3}{\sqrt{x^2 - 2x + 10}}) = \arcsin(\_\_\_) \)  
82. \( \arccos \frac{x - 2}{2} = \arctan(\_\_\_), \; |x - 2| \leq 2 \)  

In Exercises 83 and 84, sketch a graph of the function and compare the graph of \( g \) with the graph of \( f(x) = \arcsin x \).

83. \( g(x) = \arcsin(x - 1) \)  
84. \( g(x) = \arcsin \frac{x}{2} \)  

In Exercises 85–90, sketch a graph of the function.

85. \( y = 2 \arccos x \)  
86. \( g(t) = \arccos(t + 2) \)  
87. \( f(x) = \arctan 2x \)  
88. \( f(x) = \frac{\pi}{2} + \arctan x \)  
89. \( h(v) = \tan(\arccos v) \)  
90. \( f(x) = \arccos \frac{x}{4} \)  

In Exercises 91–96, use a graphing utility to graph the function.

91. \( f(x) = 2 \arccos(2x) \)  
92. \( f(x) = \pi \arcsin(4x) \)  
93. \( f(x) = \arctan(2x - 3) \)  
94. \( f(x) = -3 + \arctan(\pi x) \)  
95. \( f(x) = \pi - \sin^{-1}(\frac{2}{3}) \)  
96. \( f(x) = \frac{\pi}{2} + \cos^{-1}(\frac{1}{\pi}) \)  

In Exercises 97 and 98, write the function in terms of the sine function by using the identity

\[ A \cos \omega t + B \sin \omega t = \sqrt{A^2 + B^2} \sin(\omega t + \arctan \frac{A}{B}) \]

Use a graphing utility to graph both forms of the function. What does the graph imply?

97. \( f(t) = 3 \cos 2t + 3 \sin 2t \)  
98. \( f(t) = 4 \cos \pi t + 3 \sin \pi t \)  

In Exercises 99–104, fill in the blank. If not possible, state the reason. (Note: The notation \( x \rightarrow c^+ \) indicates that \( x \) approaches \( c \) from the right and \( x \rightarrow c^- \) indicates that \( x \) approaches \( c \) from the left.)

99. As \( x \rightarrow 1^- \), the value of \( \arcsin x \rightarrow \_\_\_\_\_. \)  
100. As \( x \rightarrow 1^- \), the value of \( \arccos x \rightarrow \_\_\_\_. \)
101. As \( x \to \infty \), the value of \( \tan^{-1} x \to \pi / 2 \).
102. As \( x \to -1^+ \), the value of \( \arcsin x \to -\pi / 2 \).
103. As \( x \to -1^+ \), the value of \( \arccos x \to \pi \).
104. As \( x \to -\infty \), the value of \( \tan^{-1} x \to -\pi / 2 \).

105. **DOCKING A BOAT** A boat is pulled in by means of a winch located on a dock 5 feet above the deck of the boat (see figure). Let \( \theta \) be the angle of elevation from the boat to the winch and let \( s \) be the length of the rope from the winch to the boat.

(a) Write \( \theta \) as a function of \( s \).
(b) Find \( \theta \) when \( s = 40 \) feet and \( s = 20 \) feet.

106. **PHOTOGRAPHY** A television camera at ground level is filming the lift-off of a space shuttle at a point 750 meters from the launch pad (see figure). Let \( \theta \) be the angle of elevation to the shuttle and let \( s \) be the height of the shuttle.

(a) Write \( \theta \) as a function of \( s \).
(b) Find \( \theta \) when \( s = 300 \) meters and \( s = 1200 \) meters.

107. **PHOTOGRAPHY** A photographer is taking a picture of a three-foot-tall painting hung in an art gallery. The camera lens is 1 foot below the lower edge of the painting (see figure). The angle \( \beta \) subtended by the camera lens \( x \) feet from the painting is

\[
\beta = \arctan \left( \frac{3x}{x^2 + 4} \right), \quad x > 0.
\]

108. **GRANULAR ANGLE OF REPOSE** Different types of granular substances naturally settle at different angles when stored in cone-shaped piles. This angle \( \theta \) is called the angle of repose (see figure). When rock salt is stored in a cone-shaped pile 11 feet high, the diameter of the pile’s base is about 34 feet. (Source: Bulk-Store Structures, Inc.)

(a) Find the angle of repose for rock salt.
(b) How tall is a pile of rock salt that has a base diameter of 40 feet?

109. **GRANULAR ANGLE OF REPOSE** When whole corn is stored in a cone-shaped pile 20 feet high, the diameter of the pile’s base is about 82 feet.

(a) Find the angle of repose for whole corn.
(b) How tall is a pile of corn that has a base diameter of 100 feet?

110. **ANGLE OF ELEVATION** An airplane flies at an altitude of 6 miles toward a point directly over an observer. Consider \( \theta \) and \( x \) as shown in the figure.

(a) Write \( \theta \) as a function of \( x \).
(b) Find \( \theta \) when \( x = 7 \) miles and \( x = 1 \) mile.
111. **SECURITY PATROL** A security car with its spotlight on is parked 20 meters from a warehouse. Consider \( \theta \) and \( x \) as shown in the figure.

![Security Car Diagram](image)

(a) Write \( \theta \) as a function of \( x \).
(b) Find \( \theta \) when \( x = 5 \) meters and \( x = 12 \) meters.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 112–114, determine whether the statement is true or false. Justify your answer.

112. \( \sin \frac{5\pi}{6} = \frac{1}{2} \)  
113. \( \tan \frac{5\pi}{4} = 1 \)  
114. \( \arctan x = \frac{\arcsin x}{\arccos x} \)

115. Define the inverse cotangent function by restricting the domain of the cotangent function to the interval \((0, \pi)\), and sketch its graph.

116. Define the inverse secant function by restricting the domain of the secant function to the intervals \([0, \pi/2)\) and \((\pi/2, \pi]\), and sketch its graph.

117. Define the inverse cosecant function by restricting the domain of the cosecant function to the intervals \([-\pi/2, 0)\) and \((0, \pi/2]\), and sketch its graph.

118. **CAPSTONE** Use the results of Exercises 115–117 to explain how to graph (a) the inverse cotangent function, (b) the inverse secant function, and (c) the inverse cosecant function on a graphing utility.

In Exercises 119–126, use the results of Exercises 115–117 to evaluate each expression without using a calculator.

119. \( \arccsc \sqrt{2} \)  
120. \( \arccsc 1 \)  
121. \( \arccot(-1) \)  
122. \( \arccot(-\sqrt{3}) \)  
123. \( \arccsc 2 \)  
124. \( \arccsc(-1) \)  
125. \( \arccsc \left(\frac{2\sqrt{3}}{3}\right) \)  
126. \( \arccsc \left(-\frac{2\sqrt{3}}{3}\right) \)

127. \( \arccsc 2.54 \)  
128. \( \arccsc(-1.52) \)  
129. \( \arccot 5.25 \)  
130. \( \arccot(-10) \)  
131. \( \arccot \frac{5}{3} \)  
132. \( \arccot(-\frac{4}{3}) \)  
133. \( \arccsc \left(-\frac{2\sqrt{3}}{3}\right) \)  
134. \( \arccsc(-12) \)

135. **AREA** In calculus, it is shown that the area of the region bounded by the graphs of \( y = 0 \), \( y = 1/(x^2 + 1) \), \( x = a \), and \( x = b \) is given by

\[ \text{Area} = \arctan b - \arctan a \]

(see figure). Find the area for the following values of \( a \) and \( b \).

(a) \( a = 0, b = 1 \)  
(b) \( a = -1, b = 1 \)  
(c) \( a = 0, b = 3 \)  
(d) \( a = -1, b = 3 \)

136. **THINK ABOUT IT** Use a graphing utility to graph the functions

\[ f(x) = \sqrt{x} \quad \text{and} \quad g(x) = 6 \arctan x. \]

For \( x > 0 \), it appears that \( g > f \). Explain why you know that there exists a positive real number \( a \) such that \( g < f \) for \( x > a \). Approximate the number \( a \).

137. **THINK ABOUT IT** Consider the functions given by

\[ f(x) = \sin x \quad \text{and} \quad f^{-1}(x) = \arcsin x. \]

(a) Use a graphing utility to graph the composite functions \( f \circ f^{-1} \) and \( f^{-1} \circ f \).
(b) Explain why the graphs in part (a) are not the graph of the line \( y = x \). Why do the graphs of \( f \circ f^{-1} \) and \( f^{-1} \circ f \) differ?

138. **PROOF** Prove each identity.

(a) \( \arcsin(-x) = -\arcsin x \)
(b) \( \arctan(-x) = -\arctan x \)
(c) \( \arctan x + \arctan \frac{1}{x} = \frac{\pi}{2}, \quad x > 0 \)
(d) \( \arcsin x + \arccos x = \frac{\pi}{2} \)
(e) \( \arcsin x = \arctan \frac{x}{\sqrt{1 - x^2}} \)
Applications Involving Right Triangles

In this section, the three angles of a right triangle are denoted by the letters $A$, $B$, and $C$ (where $C$ is the right angle), and the lengths of the sides opposite these angles by the letters $a$, $b$, and $c$ (where $c$ is the hypotenuse).

Example 1  Solving a Right Triangle

Solve the right triangle shown in Figure 4.78 for all unknown sides and angles.

Solution

Because $C = 90^\circ$, it follows that $A + B = 90^\circ$ and $B = 90^\circ - 34.2^\circ = 55.8^\circ$. To solve for $a$, use the fact that

$$\tan A = \frac{\text{opp}}{\text{adj}} = \frac{a}{b} \implies a = b \tan A.$$  

So, $a = 19.4 \tan 34.2^\circ \approx 13.18$. Similarly, to solve for $c$, use the fact that

$$\cos A = \frac{\text{adj}}{\text{hyp}} = \frac{b}{c} \implies c = \frac{b}{\cos A}.$$  

So, $c = \frac{19.4}{\cos 34.2^\circ} \approx 23.46$.

Example 2  Finding a Side of a Right Triangle

A safety regulation states that the maximum angle of elevation for a rescue ladder is $72^\circ$. A fire department’s longest ladder is 110 feet. What is the maximum safe rescue height?

Solution

A sketch is shown in Figure 4.79. From the equation $\sin A = a/c$, it follows that

$$a = c \sin A = 110 \sin 72^\circ \approx 104.6.$$  

So, the maximum safe rescue height is about 104.6 feet above the height of the fire truck.

Now try Exercise 5.

Now try Exercise 19.
Example 3 Finding a Side of a Right Triangle

At a point 200 feet from the base of a building, the angle of elevation to the bottom of a smokestack is 35°, whereas the angle of elevation to the top is 53°, as shown in Figure 4.80. Find the height \( s \) of the smokestack alone.

Solution

Note from Figure 4.80 that this problem involves two right triangles. For the smaller right triangle, use the fact that

\[
\tan 35^\circ = \frac{a}{200}
\]

to conclude that the height of the building is

\[ a = 200 \tan 35^\circ. \]

For the larger right triangle, use the equation

\[
\tan 53^\circ = \frac{a + s}{200}
\]

to conclude that \( a + s = 200 \tan 53^\circ \). So, the height of the smokestack is

\[
\begin{align*}
\[ a & = 200 \tan 53^\circ - a \\
& = 200 \tan 53^\circ - 200 \tan 35^\circ \\
& \approx 125.4 \text{ feet.}
\end{align*}
\]

Now try Exercise 23.

Example 4 Finding an Acute Angle of a Right Triangle

A swimming pool is 20 meters long and 12 meters wide. The bottom of the pool is slanted so that the water depth is 1.3 meters at the shallow end and 4 meters at the deep end, as shown in Figure 4.81. Find the angle of depression of the bottom of the pool.

Solution

Using the tangent function, you can see that

\[
\tan A = \frac{\text{opp}}{\text{adj}}
\]

\[
= \frac{2.7}{20}
\]

\[ = 0.135. \]

So, the angle of depression is

\[ A = \arctan 0.135 \]

\[ \approx 0.13419 \text{ radian} \]

\[ \approx 7.69^\circ. \]

Now try Exercise 29.
Trigonometry and Bearings

In surveying and navigation, directions can be given in terms of bearings. A bearing measures the acute angle that a path or line of sight makes with a fixed north-south line, as shown in Figure 4.82. For instance, the bearing S 35° E in Figure 4.82 means 35 degrees east of south.

Finding Directions in Terms of Bearings

A ship leaves port at noon and heads due west at 20 knots, or 20 nautical miles (nm) per hour. At 2 P.M. the ship changes course to N 54° W, as shown in Figure 4.83. Find the ship’s bearing and distance from the port of departure at 3 P.M.

Solution

For triangle $BCD$, you have $B = 90° - 54° = 36°$. The two sides of this triangle can be determined to be

$$b = 20 \sin 36° \quad \text{and} \quad d = 20 \cos 36°.$$ 

For triangle $ACD$, you can find angle $A$ as follows.

$$\tan A = \frac{b}{d + 40} = \frac{20 \sin 36°}{20 \cos 36° + 40} \approx 0.2092494$$

$$A \approx \arctan 0.2092494 \approx 11.82°$$

The angle with the north-south line is $90° - 11.82° = 78.18°$. So, the bearing of the ship is N 78.18° W. Finally, from triangle $ACD$, you have $\sin A = b/c$, which yields

$$c = \frac{b}{\sin A} = \frac{20 \sin 36°}{\sin 11.82°} \approx 57.4 \text{ nautical miles.}$$

Distance from port

CheckPoint

Now try Exercise 37.
Harmonic Motion

The periodic nature of the trigonometric functions is useful for describing the motion of a point on an object that vibrates, oscillates, rotates, or is moved by wave motion.

For example, consider a ball that is bobbing up and down on the end of a spring, as shown in Figure 4.84. Suppose that 10 centimeters is the maximum distance the ball moves vertically upward or downward from its equilibrium (at rest) position. Suppose further that the time it takes for the ball to move from its maximum displacement above zero to its maximum displacement below zero and back again is $t = 4$ seconds. Assuming the ideal conditions of perfect elasticity and no friction or air resistance, the ball would continue to move up and down in a uniform and regular manner.

![Figure 4.84: Diagram of harmonic motion](image)

From this spring you can conclude that the period (time for one complete cycle) of the motion is

Period = 4 seconds

its amplitude (maximum displacement from equilibrium) is

Amplitude = 10 centimeters

and its frequency (number of cycles per second) is

Frequency = $\frac{1}{4}$ cycle per second.

Motion of this nature can be described by a sine or cosine function, and is called simple harmonic motion.
Simple Harmonic Motion

Write the equation for the simple harmonic motion of the ball described in Figure 4.84, where the period is 4 seconds. What is the frequency of this harmonic motion?

Solution

Because the spring is at equilibrium \((d = 0)\) when \(t = 0\), you use the equation

\[ d = a \sin \omega t \quad \text{or} \quad d = a \cos \omega t \]

where \(a\) and \(\omega\) are real numbers such that \(\omega > 0\). The motion has amplitude \(|a|\), period \(\frac{2\pi}{\omega}\), and frequency \(\frac{\omega}{2\pi}\).

Example 6  
Simple Harmonic Motion

Write the equation for the simple harmonic motion of the ball described in Figure 4.84, where the period is 4 seconds. What is the frequency of this harmonic motion?

Solution

Because the spring is at equilibrium \((d = 0)\) when \(t = 0\), you use the equation

\[ d = a \sin \omega t. \]

Moreover, because the maximum displacement from zero is 10 and the period is 4, you have

\[
\begin{align*}
\text{Amplitude} &= |a| = 10 \\
\text{Period} &= \frac{2\pi}{\omega} = 4 \\
\omega &= \frac{\pi}{2}
\end{align*}
\]

Consequently, the equation of motion is

\[ d = 10 \sin \frac{\pi}{2} t. \]

Note that the choice of \(a = 10\) or \(a = -10\) depends on whether the ball initially moves up or down. The frequency is

\[
\text{Frequency} = \frac{\omega}{2\pi} = \frac{\pi/2}{2\pi} = \frac{1}{4} \text{ cycle per second.}
\]

CHECKPOINT  
Now try Exercise 53.

One illustration of the relationship between sine waves and harmonic motion can be seen in the wave motion resulting when a stone is dropped into a calm pool of water. The waves move outward in roughly the shape of sine (or cosine) waves, as shown in Figure 4.85. As an example, suppose you are fishing and your fishing bob is attached so that it does not move horizontally. As the waves move outward from the dropped stone, your fishing bob will move up and down in simple harmonic motion, as shown in Figure 4.86.
Example 7  Simple Harmonic Motion

Given the equation for simple harmonic motion

\[ d = 6 \cos \frac{3\pi}{4} t \]

find (a) the maximum displacement, (b) the frequency, (c) the value of \( t \) when \( d = 0 \), and (d) the least positive value of \( t \) for which \( d = 0 \).

**Algebraic Solution**

The given equation has the form \( d = a \cos \omega t \), with \( a = 6 \) and \( \omega = \frac{3\pi}{4} \).

a. The maximum displacement (from the point of equilibrium) is given by the amplitude. So, the maximum displacement is 6.

b. Frequency \( \frac{\omega}{2\pi} = \frac{3\pi/4}{2\pi} \) cycle per unit of time

\[ \frac{3\pi}{8} \] cycle per unit of time

c. \( d = 6 \cos \left[ \frac{3\pi}{4} \left( \frac{4}{3} \right) \right] \)

\[ = 6 \cos \frac{3\pi}{4} \]

\[ = 6(-1) \]

\[ = -6 \]

d. To find the least positive value of \( t \) for which \( d = 0 \), solve the equation

\[ d = 6 \cos \frac{3\pi}{4} t = 0. \]

First divide each side by 6 to obtain

\[ \cos \frac{3\pi}{4} t = 0. \]

This equation is satisfied when

\[ \frac{3\pi}{4} t = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \ldots \]

Multiply these values by \( 4/(3\pi) \) to obtain

\[ t = \frac{2}{3}, \frac{2}{3}, \frac{10}{3}, \ldots \]

So, the least positive value of \( t \) is \( \frac{2}{3} \).

**Graphical Solution**

Use a graphing utility set in radian mode to graph

\[ y = 6 \cos \frac{3\pi}{4} t. \]

a. Use the maximum feature of the graphing utility to estimate that the maximum displacement from the point of equilibrium \( y = 0 \) is 6, as shown in Figure 4.87.

b. The period is the time for the graph to complete one cycle, which is \( x \approx 2.667 \). You can estimate the frequency as follows.

\[ \text{Frequency} \approx \frac{1}{2.667} \approx 0.375 \text{ cycle per unit of time} \]

c. Use the trace or value feature to estimate that the value of \( y \) when \( x = 4 \) is \( y = -6 \), as shown in Figure 4.88.

d. Use the zero or root feature to estimate that the least positive value of \( x \) for which \( y = 0 \) is \( x \approx 0.6667 \), as shown in Figure 4.89.

CHECKPOINT  Now try Exercise 57.
4.8 EXERCISES

VOCABULARY: Fill in the blanks.

1. A ______ measures the acute angle a path or line of sight makes with a fixed north-south line.
2. A point that moves on a coordinate line is said to be in simple ______ ______ if its distance $d$ from the origin at time $t$ is given by either $d = a \sin \omega t$ or $d = a \cos \omega t$.
3. The time for one complete cycle of a point in simple harmonic motion is its ______.
4. The number of cycles per second of a point in simple harmonic motion is its ______.

SKILLS AND APPLICATIONS

In Exercises 5–14, solve the right triangle shown in the figure for all unknown sides and angles. Round your answers to two decimal places.

5. $A = 30^\circ$, $b = 3$  
6. $B = 54^\circ$, $c = 15$
7. $B = 71^\circ$, $b = 24$
8. $A = 8.4^\circ$, $a = 40.5$
9. $a = 3$, $b = 4$  
10. $a = 25$, $c = 35$
11. $b = 16$, $c = 52$  
12. $b = 1.32$, $c = 9.45$
13. $A = 12^\circ 15'$, $c = 430.5$
14. $B = 65^\circ 12'$, $a = 14.2$

19. LENGTH The sun is $25^\circ$ above the horizon. Find the length of a shadow cast by a building that is 100 feet tall (see figure).

In Exercises 15–18, find the altitude of the isosceles triangle shown in the figure. Round your answers to two decimal places.

15. $\theta = 45^\circ$, $b = 6$  
16. $\theta = 18^\circ$, $b = 10$
17. $\theta = 32^\circ$, $b = 8$  
18. $\theta = 27^\circ$, $b = 11$

20. LENGTH The sun is $20^\circ$ above the horizon. Find the length of a shadow cast by a park statue that is 12 feet tall.

21. HEIGHT A ladder 20 feet long leans against the side of a house. Find the height from the top of the ladder to the ground if the angle of elevation of the ladder is $80^\circ$.

22. HEIGHT The length of a shadow of a tree is 125 feet when the angle of elevation of the sun is $33^\circ$. Approximate the height of the tree.

23. HEIGHT From a point 50 feet in front of a church, the angles of elevation to the base of the steeple and the top of the steeple are $35^\circ$ and $47^\circ 40'$, respectively. Find the height of the steeple.

24. DISTANCE An observer in a lighthouse 350 feet above sea level observes two ships directly offshore. The angles of depression to the ships are $4^\circ$ and $6.5^\circ$ (see figure). How far apart are the ships?

25. DISTANCE A passenger in an airplane at an altitude of 10 kilometers sees two towns directly to the east of the plane. The angles of depression to the towns are $28^\circ$ and $55^\circ$ (see figure). How far apart are the towns?
26. **ALTITUDE** You observe a plane approaching overhead and assume that its speed is 550 miles per hour. The angle of elevation of the plane is $16^\circ$ at one time and $57^\circ$ one minute later. Approximate the altitude of the plane.

27. **ANGLE OF ELEVATION** An engineer erects a 75-foot cellular telephone tower. Find the angle of elevation to the top of the tower at a point on level ground 50 feet from its base.

28. **ANGLE OF ELEVATION** The height of an outdoor basketball backboard is $12\frac{1}{2}$ feet, and the backboard casts a shadow 17$\frac{1}{2}$ feet long.

(a) Draw a right triangle that gives a visual representation of the problem. Label the known and unknown quantities.

(b) Use a trigonometric function to write an equation involving the unknown quantity.

(c) Find the angle of elevation of the sun.

29. **ANGLE OF DEPRESSION** A cellular telephone tower that is 150 feet tall is placed on top of a mountain that is 1200 feet above sea level. What is the angle of depression from the top of the tower to a cell phone user who is 5 horizontal miles away and 400 feet above sea level?

30. **ANGLE OF DEPRESSION** A Global Positioning System satellite orbits 12,500 miles above Earth’s surface (see figure). Find the angle of depression from the satellite to the horizon. Assume the radius of Earth is 4000 miles.

31. **HEIGHT** You are holding one of the tethers attached to the top of a giant character balloon in a parade. Before the start of the parade the balloon is upright and the bottom is floating approximately 20 feet above ground level. You are standing approximately 100 feet ahead of the balloon (see figure).

(a) Find the length $l$ of the tether you are holding in terms of $h$, the height of the balloon from top to bottom.

(b) Find an expression for the angle of elevation $\theta$ from you to the top of the balloon.

(c) Find the height $h$ of the balloon if the angle of elevation to the top of the balloon is $35^\circ$.

32. **HEIGHT** The designers of a water park are creating a new slide and have sketched some preliminary drawings. The length of the ladder is 30 feet, and its angle of elevation is $60^\circ$ (see figure).

(a) Find the height $h$ of the slide.

(b) Find the angle of depression from the top of the slide to the end of the slide at the ground in terms of the horizontal distance $d$ the rider travels.

(c) The angle of depression of the ride is bounded by safety restrictions to be no less than $25^\circ$ and not more than $30^\circ$. Find an interval for how far the rider travels horizontally.

33. **SPEED ENFORCEMENT** A police department has set up a speed enforcement zone on a straight length of highway. A patrol car is parked parallel to the zone, 200 feet from one end and 150 feet from the other end (see figure).

(a) Find the length of the zone and the measures of the angles $A$ and $B$ (in degrees).

(b) Find the minimum amount of time (in seconds) it takes for a vehicle to pass through the zone without exceeding the posted speed limit of 35 miles per hour.
34. **AIRPLANE ASCENT** During takeoff, an airplane’s angle of ascent is 18° and its speed is 275 feet per second.

(a) Find the plane’s altitude after 1 minute.

(b) How long will it take the plane to climb to an altitude of 10,000 feet?

35. **NAVIGATION** An airplane flying at 600 miles per hour has a bearing of 52°. After flying for 1.5 hours, how far north and how far east will the plane have traveled from its point of departure?

36. **NAVIGATION** A jet leaves Reno, Nevada and is headed toward Miami, Florida at a bearing of 100°. The distance between the two cities is approximately 2472 miles.

(a) How far north and how far west is Reno relative to Miami?

(b) If the jet is to return directly to Reno from Miami, at what bearing should it travel?

37. **NAVIGATION** A ship leaves port at noon and has a bearing of S 29° W. The ship sails at 20 knots.

(a) How many nautical miles south and how many nautical miles west will the ship have traveled by 6:00 P.M.?

(b) At 6:00 P.M., the ship changes course to due west. Find the ship’s bearing and distance from the port of departure at 7:00 P.M.

38. **NAVIGATION** A privately owned yacht leaves a dock in Myrtle Beach, South Carolina and heads toward Freeport in the Bahamas at a bearing of S 1.4° E. The yacht averages a speed of 20 knots over the 428 nautical-mile trip.

(a) How long will it take the yacht to make the trip?

(b) How far east and south is the yacht after 12 hours?

(c) If a plane leaves Myrtle Beach to fly to Freeport, what bearing should be taken?

39. **NAVIGATION** A ship is 45 miles east and 30 miles south of port. The captain wants to sail directly to port. What bearing should be taken?

40. **NAVIGATION** An airplane is 160 miles north and 85 miles east of an airport. The pilot wants to fly directly to the airport. What bearing should be taken?

41. **SURVEYING** A surveyor wants to find the distance across a swamp (see figure). The bearing from A to B is N 32° W. The surveyor walks 50 meters from A, and at the point C the bearing to B is N 68° W. Find (a) the bearing from A to C and (b) the distance from A to B.

![FIGURE FOR 41](image)

42. **LOCATION OF A FIRE** Two fire towers are 30 kilometers apart, where tower A is due west of tower B. A fire is spotted from the towers, and the bearings from A and B are N 76° E and N 56° W, respectively (see figure). Find the distance d of the fire from the line segment AB.

![FIGURE FOR AB](image)

43. **GEOMETRY** In Exercises 43 and 44, find the angle \( \alpha \) between two nonvertical lines \( L_1 \) and \( L_2 \). The angle \( \alpha \) satisfies the equation

\[
\tan \alpha = \frac{m_2 - m_1}{1 + m_1 m_2}
\]

where \( m_1 \) and \( m_2 \) are the slopes of \( L_1 \) and \( L_2 \), respectively. (Assume that \( m_1 m_2 \neq -1 \).)

**Exercise 43:** \( L_1: 3x - 2y = 5 \)

**Exercise 44:** \( L_2: 2x - y = 8 \)

**Exercise 44:** \( L_2: x + y = 1 \)

**Exercise 44:** \( L_2: x - 5y = -4 \)

45. **GEOMETRY** Determine the angle between the diagonal of a cube and the diagonal of its base, as shown in the figure.

![FIGURE FOR 45](image)

![FIGURE FOR 46](image)

46. **GEOMETRY** Determine the angle between the diagonal of a cube and its edge, as shown in the figure.
47. **GEOMETRY**  Find the length of the sides of a regular pentagon inscribed in a circle of radius 25 inches.

48. **GEOMETRY**  Find the length of the sides of a regular hexagon inscribed in a circle of radius 25 inches.

49. **HARDWARE**  Write the distance $y$ across the flat sides of a hexagonal nut as a function of $r$ (see figure).

50. **BOLT HOLES**  The figure shows a circular piece of sheet metal that has a diameter of 40 centimeters and contains 12 equally-spaced bolt holes. Determine the straight-line distance between the centers of consecutive bolt holes.

**TRUSSES**  In Exercises 51 and 52, find the lengths of all the unknown members of the truss.

51.

52.

53. **HARMONIC MOTION**  In Exercises 53–56, find a model for simple harmonic motion satisfying the specified conditions.

58. $d = \frac{1}{2} \cos 20\pi t$

59. $d = \frac{1}{4} \sin 6\pi t$

60. $d = \frac{1}{64} \sin 792\pi t$

61. **TUNING FORK**  A point on the end of a tuning fork moves in simple harmonic motion described by $d = a \sin \omega t$. Find $\omega$ given that the tuning fork for middle C has a frequency of 264 vibrations per second.

62. **WAVE MOTION**  A buoy oscillates in simple harmonic motion as waves go past. It is noted that the buoy moves a total of 3.5 feet from its low point to its high point (see figure), and that it returns to its high point every 10 seconds. Write an equation that describes the motion of the buoy if its high point is at $t = 0$.

63. **OSCILLATION OF A SPRING**  A ball that is bobbing up and down on the end of a spring has a maximum displacement of 3 inches. Its motion (in ideal conditions) is modeled by $y = \frac{1}{2} \cos 16\pi t$ ($t > 0$), where $y$ is measured in feet and $t$ is the time in seconds.

(a) Graph the function.

(b) What is the period of the oscillations?

(c) Determine the first time the weight passes the point of equilibrium ($y = 0$).

64. **NUMERICAL AND GRAPHICAL ANALYSIS**  The cross section of an irrigation canal is an isosceles trapezoid of which 3 of the sides are 8 feet long (see figure). The objective is to find the angle $\theta$ that maximizes the area of the cross section. [Hint: The area of a trapezoid is $(h/2)(b_1 + b_2)$.]

(b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the maximum cross-sectional area.

(c) Write the area $A$ as a function of $\theta$.

(d) Use a graphing utility to graph the function. Use the graph to estimate the maximum cross-sectional area. How does your estimate compare with that of part (b)?

65. **NUMERICAL AND GRAPHICAL ANALYSIS** A 2-meter-high fence is 3 meters from the side of a grain storage bin. A grain elevator must reach from ground level outside the fence to the storage bin (see figure). The objective is to determine the shortest elevator that meets the constraints.

(a) Complete four rows of the table.

<table>
<thead>
<tr>
<th>$\theta$</th>
<th>$L_1$</th>
<th>$L_2$</th>
<th>$L_1 + L_2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.1</td>
<td>$\frac{2}{\sin 0.1}$</td>
<td>$\frac{3}{\cos 0.1}$</td>
<td>23.0</td>
</tr>
<tr>
<td>0.2</td>
<td>$\frac{2}{\sin 0.2}$</td>
<td>$\frac{3}{\cos 0.2}$</td>
<td>13.1</td>
</tr>
</tbody>
</table>

(b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the minimum length of the elevator.

(c) Write the length $L_1 + L_2$ as a function of $\theta$.

(d) Use a graphing utility to graph the function. Use the graph to estimate the minimum length. How does your estimate compare with that of part (b)?

66. **DATA ANALYSIS** The table shows the average sales $S$ (in millions of dollars) of an outerwear manufacturer for each month $t$, where $t = 1$ represents January.

<table>
<thead>
<tr>
<th>Time, $t$</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales, $S$</td>
<td>13.46</td>
<td>11.15</td>
<td>8.00</td>
<td>4.85</td>
<td>2.54</td>
<td>1.70</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Time, $t$</th>
<th>7</th>
<th>8</th>
<th>9</th>
<th>10</th>
<th>11</th>
<th>12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales, $S$</td>
<td>2.54</td>
<td>4.85</td>
<td>8.00</td>
<td>11.15</td>
<td>13.46</td>
<td>14.30</td>
</tr>
</tbody>
</table>

(a) Create a scatter plot of the data.

(b) Find a trigonometric model that fits the data. Graph the model with your scatter plot. How well does the model fit the data?

(c) What is the period of the model? Do you think it is reasonable given the context? Explain your reasoning.

(d) Interpret the meaning of the model’s amplitude in the context of the problem.

67. **DATA ANALYSIS** The number of hours $H$ of daylight in Denver, Colorado on the 15th of each month are:

<table>
<thead>
<tr>
<th>Month</th>
<th>$t$</th>
<th>$H(t)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>January</td>
<td>1</td>
<td>12.13</td>
</tr>
<tr>
<td>February</td>
<td>2</td>
<td>9.38</td>
</tr>
<tr>
<td>March</td>
<td>3</td>
<td>10.00</td>
</tr>
<tr>
<td>April</td>
<td>4</td>
<td>11.18</td>
</tr>
<tr>
<td>May</td>
<td>5</td>
<td>11.00</td>
</tr>
<tr>
<td>June</td>
<td>6</td>
<td>12.48</td>
</tr>
<tr>
<td>July</td>
<td>7</td>
<td>13.77</td>
</tr>
<tr>
<td>August</td>
<td>8</td>
<td>14.72</td>
</tr>
<tr>
<td>September</td>
<td>9</td>
<td>14.97</td>
</tr>
<tr>
<td>October</td>
<td>10</td>
<td>13.46</td>
</tr>
<tr>
<td>November</td>
<td>11</td>
<td>14.30</td>
</tr>
<tr>
<td>December</td>
<td>12</td>
<td>13.77</td>
</tr>
</tbody>
</table>

(a) Use a graphing utility to graph the data points and the model in the same viewing window.

(b) What is the period of the model? Is it what you expected? Explain.

(c) What is the amplitude of the model? What does it represent in the context of the problem? Explain.

EXPLORATION

68. **CAPSTONE** While walking across flat land, you notice a wind turbine tower of height $h$ feet directly in front of you. The angle of elevation to the top of the tower is $A$ degrees. After you walk $d$ feet closer to the tower, the angle of elevation increases to $B$ degrees.

(a) Draw a diagram to represent the situation.

(b) Write an expression for the height $h$ of the tower in terms of the angles $A$ and $B$ and the distance $d$.

**TRUE OR FALSE?** In Exercises 69 and 70, determine whether the statement is true or false. Justify your answer.

69. The Leaning Tower of Pisa is not vertical, but if you know the angle of elevation $\theta$ to the top of the tower when you stand $d$ feet away from it, you can find its height $h$ using the formula $h = d \tan \theta$.

70. N 24° E means 24 degrees north of east.
## Chapter Summary

</table>
What Did You Learn? | Explanation/Examples | Review Exercises
--- | --- | ---
**Section 4.4** | Evaluate trigonometric functions of any angle (p. 310). | 57–70
| Let (3, 4) be a point on the terminal side of \( \theta \). Then \( \sin \theta = \frac{4}{5}, \cos \theta = \frac{3}{5}, \) and \( \tan \theta = \frac{4}{3}. \) | | |
| Find reference angles (p. 312). | Let \( \theta \) be an angle in standard position. Its reference angle is the acute angle \( \theta' \) formed by the terminal side of \( \theta \) and the horizontal axis. | 71–74
| Evaluate trigonometric functions of real numbers (p. 313). | \( \cos \frac{7\pi}{3} = \frac{1}{2} \) because \( \theta' = \frac{7\pi}{3} = 2\pi + \frac{\pi}{3}. \) So, \( \cos \frac{7\pi}{3} = \cos \frac{\pi}{3} = \frac{1}{2}. \) | 75–84
| Sketch the graphs of sine and cosine functions using amplitude and period (p. 319). | 85–88
| Sketch translations of the graphs of sine and cosine functions (p. 323). | For \( y = d + a \sin(bx - c) \) and \( y = d + a \cos(bx - c) \), the constant \( c \) creates a horizontal translation. The constant \( d \) creates a vertical translation. (See Examples 4–6.) | 89–92
| Use sine and cosine functions to model real-life data (p. 325). | A cosine function can be used to model the depth of the water at the end of a dock at various times. (See Example 7.) | 93, 94
| Sketch the graphs of tangent (p. 330), cotangent (p. 332), secant (p. 333), and cosecant (p. 333), functions. | 95–102
| Sketch the graphs of damped trigonometric functions (p. 335). | For \( f(x) = x \cos 2x \) and \( g(x) = \log x \sin 4x \), the factors \( x \) and \( \log x \) are called damping factors. | 103, 104
| Evaluate and graph inverse trigonometric functions (p. 341). | \( \sin^{-1} \frac{1}{2} = \frac{\pi}{6} \), \( \cos^{-1} \left( -\frac{\sqrt{2}}{2} \right) = \frac{3\pi}{4} \), \( \tan^{-1} \sqrt{3} = \frac{\pi}{3} \). | 105–122, 131–138
| Evaluate and graph the compositions of trigonometric functions (p. 345). | \( \cos[\arctan(5/12)] = 12/13, \sin(\sin^{-1} 0.4) = 0.4 \). | 123–130
| Solve real-life problems involving right triangles (p. 351). | A trigonometric function can be used to find the height of a smokestack on top of a building. (See Example 3.) | 139, 140
| Solve real-life problems involving directional bearings (p. 353). | Trigonometric functions can be used to find a ship’s bearing and distance from a port at a given time. (See Example 5.) | 141
| Solve real-life problems involving harmonic motion (p. 354). | Sine or cosine functions can be used to describe the motion of an object that vibrates, oscillates, rotates, or is moved by wave motion. (See Examples 6 and 7.) | 142
4.1 In Exercises 1–8, (a) sketch the angle in standard position, (b) determine the quadrant in which the angle lies, and (c) determine one positive and one negative coterminal angle.

1. \(15\pi/4\)  
2. \(2\pi/9\)  
3. \(-4\pi/3\)  
4. \(-23\pi/3\)  
5. \(70^\circ\)  
6. \(280^\circ\)  
7. \(-110^\circ\)  
8. \(-405^\circ\)

In Exercises 9–12, convert the angle measure from radians to degrees. Round your answer to three decimal places.

9. \(450^\circ\)  
10. \(-112.5^\circ\)  
11. \(-33^\circ45'\)  
12. \(197^\circ17'\)

In Exercises 13–16, convert the angle measure from radians to degrees. Round your answer to three decimal places.

13. \(3\pi/10\)  
14. \(-11\pi/6\)  
15. \(-3.5\)  
16. \(5.7\)

In Exercises 17–20, convert each angle measure to degrees, minutes, and seconds without using a calculator.

17. \(198.4^\circ\)  
18. \(-70.2^\circ\)  
19. \(0.65^\circ\)  
20. \(-5.96^\circ\)

21. **ARC LENGTH** Find the length of the arc on a circle with a radius of 20 inches intercepted by a central angle of \(138^\circ\).

22. **PHONOGRAPH** Phonograph records are vinyl discs that rotate on a turntable. A typical record album is 12 inches in diameter and plays at \(33\frac{1}{2}\) revolutions per minute.

(a) What is the angular speed of a record album?
(b) What is the linear speed of the outer edge of a record album?

23. **CIRCULAR SECTOR** Find the area of the sector of a circle with a radius of 18 inches and central angle \(\theta = 120^\circ\).

24. **CIRCULAR SECTOR** Find the area of the sector of a circle with a radius of 6.5 millimeters and central angle \(\theta = 5\pi/6\).

In Exercises 25–28, find the point \((x, y)\) on the unit circle that corresponds to the real number \(t\).

25. \(t = 2\pi/3\)  
26. \(t = 7\pi/4\)  
27. \(t = 7\pi/6\)  
28. \(t = -4\pi/3\)

In Exercises 29–32, evaluate (if possible) the six trigonometric functions of the real number.

29. \(t = 7\pi/6\)  
30. \(t = 3\pi/4\)  
31. \(t = -2\pi/3\)  
32. \(t = 2\pi\)

In Exercises 33–36, evaluate the trigonometric function using its period as an aid.

33. \(\sin(11\pi/4)\)  
34. \(\cos 4\pi\)  
35. \(\sin(-17\pi/6)\)  
36. \(\cos(-13\pi/3)\)

In Exercises 37–40, use a calculator to evaluate the trigonometric function. Round your answer to four decimal places.

37. \(\tan 33^\circ\)  
38. \(\csc 10.5\)  
39. \(\sec(12\pi/5)\)  
40. \(\sin(-\pi/9)\)

4.3 In Exercises 41 and 42, find the exact values of the six trigonometric functions of the angle \(\theta\) shown in the figure.

41.

42.

In Exercises 43–46, use the given function value and trigonometric identities (including the cofunction identities) to find the indicated trigonometric functions.

43. \(\sin \theta = \frac{1}{4}\)  
(a) \(\csc \theta\)  
(b) \(\cos \theta\)  
(c) \(\sec \theta\)  
(d) \(\tan \theta\)

44. \(\tan \theta = 4\)  
(a) \(\cot \theta\)  
(b) \(\sec \theta\)  
(c) \(\cos \theta\)  
(d) \(\csc \theta\)

45. \(\csc \theta = 4\)  
(a) \(\sin \theta\)  
(b) \(\cos \theta\)  
(c) \(\sec \theta\)  
(d) \(\tan \theta\)

46. \(\csc \theta = 5\)  
(a) \(\sin \theta\)  
(b) \(\cot \theta\)  
(c) \(\tan \theta\)  
(d) \(\sec(90^\circ - \theta)\)

In Exercises 47–54, use a calculator to evaluate the trigonometric function. Round your answer to four decimal places.

47. \(\tan 33^\circ\)  
48. \(\csc 11^\circ\)  
49. \(\sin 34.2^\circ\)  
50. \(\sec 79.3^\circ\)  
51. \(\cot 15^\circ14'\)  
52. \(\csc 44^\circ35'\)  
53. \(\tan 31^\circ24'5''\)  
54. \(\cos 78^\circ11'58''\)

55. **RAILROAD GRADE** A train travels 3.5 kilometers on a straight track with a grade of \(1^\circ10'\) (see figure on the next page). What is the vertical rise of the train in that distance?
56. **GUY WIRE** A guy wire runs from the ground to the top of a 25-foot telephone pole. The angle formed between the wire and the ground is 52°. How far from the base of the pole is the wire attached to the ground?

4.4 In Exercises 57–64, the point is on the terminal side of an angle $\theta$ in standard position. Determine the exact values of the six trigonometric functions of the angle $\theta$.

57. $(12, 16)$  
58. $(3, -4)$  
59. $(\frac{1}{2}, \frac{3}{2})$  
60. $(\frac{-10}{4}, \frac{-3}{2})$  
61. $(-0.5, 4.5)$  
62. $(0.3, 0.4)$  
63. $(x, 4x), x > 0$  
64. $(-2x, -3x), x > 0$

In Exercises 65–70, find the values of the remaining five trigonometric functions of $\theta$.

<table>
<thead>
<tr>
<th>Function Value</th>
<th>Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>65. $\sec \theta = \frac{5}{2}$</td>
<td>$\tan \theta &lt; 0$</td>
</tr>

<td>$\cos \theta &gt; 0$</td>
</tr>
</tbody>
</table>

In Exercises 71–74, find the reference angle $\theta'$ and sketch $\theta$ and $\theta'$ in standard position.

71. $\theta = 264^\circ$  
72. $\theta = 635^\circ$  
73. $\theta = -6\pi/5$  
74. $\theta = 17\pi/3$

In Exercises 75–80, evaluate the sine, cosine, and tangent of the angle without using a calculator.

75. $\pi/3$  
76. $\pi/4$  
77. $-7\pi/3$  
78. $-5\pi/4$  
79. $495^\circ$  
80. $-150^\circ$

In Exercises 81–84, use a calculator to evaluate the trigonometric function. Round your answer to four decimal places.

81. $\sin 4$  
82. $\cot(-4.8)$  
83. $\sin(12\pi/5)$  
84. $\tan(-25\pi/7)$

4.5 In Exercises 85–92, sketch the graph of the function. Include two full periods.

85. $y = \sin 6x$  
86. $y = -\cos 3x$  
87. $f(x) = 5 \sin(2x/5)$  
88. $f(x) = 8 \cos(-x/4)$  
89. $y = 5 + \sin x$  
90. $y = -4 - \cos \pi x$  
91. $g(t) = \frac{5}{3} \sin(t - \pi)$  
92. $g(t) = 3 \cos(t + \pi)$

93. **SOUND WAVES** Sound waves can be modeled by sine functions of the form $y = a \sin bx$, where $x$ is measured in seconds.

(a) Write an equation of a sound wave whose amplitude is 2 and whose period is $\frac{\pi}{2}$ second.

(b) What is the frequency of the sound wave described in part (a)?

94. **DATA ANALYSIS: METEOROLOGY** The times $S$ of sunset (Greenwich Mean Time) at 40° north latitude on the 15th of each month are: 1(16:59), 2(17:35), 3(18:06), 4(18:38), 5(19:08), 6(19:30), 7(19:28), 8(18:57), 9(18:09), 10(17:21), 11(16:44), 12(16:36). The month is represented by $t$, with $t = 1$ corresponding to January. A model (in which minutes have been converted to the decimal parts of an hour) for the data is $S(t) = 18.09 + 1.41 \sin(\frac{\pi t}{6}) + 4.60$.

(a) Use a graphing utility to graph the data points and the model in the same viewing window.

(b) What is the period of the model? Is it what you expected? Explain.

(c) What is the amplitude of the model? What does it represent in the model? Explain.

4.6 In Exercises 95–102, sketch a graph of the function. Include two full periods.

95. $f(x) = 3 \tan 2x$  
96. $f(t) = \tan \left( t + \frac{\pi}{2} \right)$

97. $f(x) = \frac{1}{2} \cot x$  
98. $g(t) = 2 \cot 2t$

99. $f(x) = 3 \sec x$  
100. $h(t) = \sec \left( t + \frac{\pi}{4} \right)$

101. $f(x) = \frac{1}{2} \csc \frac{x}{2}$  
102. $f(t) = 3 \csc \left( 2t + \frac{\pi}{4} \right)$

In Exercises 103 and 104, use a graphing utility to graph the function and the damping factor of the function in the same viewing window. Describe the behavior of the function as $x$ increases without bound.

103. $f(x) = x \cos x$  
104. $g(x) = x^4 \cos x$

4.7 In Exercises 105–110, evaluate the expression. If necessary, round your answer to two decimal places.

105. $\arcsin \left( -\frac{1}{3} \right)$  
106. $\arcsin(-1)$

107. $\arcsin 0.4$  
108. $\arcsin 0.213$

109. $\sin^{-1}(-0.44)$  
110. $\sin^{-1}0.89$
In Exercises 111–114, evaluate the expression without using a calculator.

111. \( \arccos(-\sqrt{2}/2) \) 
112. \( \arccos(\sqrt{3}/2) \) 
113. \( \cos^{-1}(-1) \) 
114. \( \cos^{-1}(\sqrt{3}/2) \)

In Exercises 115–118, use a calculator to evaluate the expression. Round your answer to two decimal places.

115. \( \arccos 0.324 \) 
116. \( \arccos(-0.888) \) 
117. \( \tan^{-1}(-1.5) \) 
118. \( \tan^{-1} 8.2 \)

In Exercises 119–122, use a graphing utility to graph the function.

119. \( f(x) = 2 \arcsin x \) 
120. \( f(x) = 3 \arccos x \) 
121. \( f(x) = \arctan(x/2) \) 
122. \( f(x) = -\arcsin 2x \)

In Exercises 123–128, find the exact value of the expression.

123. \( \cos(\arctan \frac{3}{4}) \) 
124. \( \tan(\arccos \frac{3}{4}) \) 
125. \( \sec(\arctan \frac{1}{2}) \) 
126. \( \sec\left[\sin^{-1}\left(-\frac{1}{2}\right)\right] \) 
127. \( \cot(\arctan \frac{7}{16}) \) 
128. \( \cot\left[\arcsin\left(-\frac{11}{13}\right)\right] \)

In Exercises 129 and 130, write an algebraic expression that is equivalent to the expression.

129. \( \tan[\arccos (x/2)] \) 
130. \( \sec[\arcsin(x - 1)] \)

In Exercises 131–134, evaluate each expression without using a calculator.

131. \( \arccot \sqrt{3} \) 
132. \( \arccsc(-1) \) 
133. \( \arccsc(-\sqrt{2}) \) 
134. \( \arccsc 1 \)

In Exercises 135–138, use a calculator to approximate the value of the expression. Round your result to two decimal places.

135. \( \arccot(10.5) \) 
136. \( \arccsc(-7.5) \) 
137. \( \arccsc(-\frac{3}{2}) \) 
138. \( \arccsc(-2.01) \)

4.8 ANGLE OF ELEVATION The height of a radio transmission tower is 70 meters, and it casts a shadow of length 30 meters. Draw a diagram and find the angle of elevation of the sun.

140. HEIGHT Your football has landed at the edge of the roof of your school building. When you are 25 feet from the base of the building, the angle of elevation to your football is 21°. How high off the ground is your football?

141. DISTANCE From city A to city B, a plane flies 650 miles at a bearing of 48°. From city B to city C, the plane flies 810 miles at a bearing of 115°. Find the distance from city A to city C and the bearing from city A to city C.

142. WAVE MOTION Your fishing bobber oscillates in simple harmonic motion from the waves in the lake where you fish. Your bobber moves a total of 1.5 inches from its high point to its low point and returns to its high point every 3 seconds. Write an equation modeling the motion of your bobber if it is at its high point at time \( t = 0 \).

EXPLORATION

TRUE OR FALSE? In Exercises 143 and 144, determine whether the statement is true or false. Justify your answer.

143. \( y = \sin \theta \) is not a function because \( \sin 30° = \sin 150° \).
144. Because \( \tan 3\pi/4 = -1 \), \( \arctan(-1) = 3\pi/4 \).

145. WRITING Describe the behavior of \( f(\theta) = \sec \theta \) at the zeros of \( g(\theta) = \cos \theta \). Explain your reasoning.

146. CONJECTURE

(a) Use a graphing utility to complete the table.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0.1</th>
<th>0.4</th>
<th>0.7</th>
<th>1.0</th>
<th>1.3</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \tan(\theta - \pi/2) )</td>
<td>( -\cot \theta )</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Make a conjecture about the relationship between \( \tan(\theta - (\pi/2)) \) and \( -\cot \theta \).

147. WRITING When graphing the sine and cosine functions, determining the amplitude is part of the analysis. Explain why this is not true for the other four trigonometric functions.

148. OSCILLATION OF A SPRING A weight is suspended from a ceiling by a steel spring. The weight is lifted (positive direction) from the equilibrium position and released. The resulting motion of the weight is modeled by \( y = Ae^{-kt} \cos ht = \frac{1}{2} e^{-t/10} \cos 6t \), where \( y \) is the distance in feet from equilibrium and \( t \) is the time in seconds. The graph of the function is shown in the figure. For each of the following, describe the change in the system without graphing the resulting function.

(a) \( A \) is changed from \( \frac{1}{2} \) to \( \frac{1}{4} \).
(b) \( k \) is changed from \( \frac{1}{10} \) to \( \frac{1}{8} \).
(c) \( b \) is changed from 6 to 9.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Consider an angle that measures $\frac{5\pi}{4}$ radians.
   (a) Sketch the angle in standard position.
   (b) Determine two coterminal angles (one positive and one negative).
   (c) Convert the angle to degree measure.
2. A truck is moving at a rate of 105 kilometers per hour, and the diameter of its wheels is 1 meter. Find the angular speed of the wheels in radians per minute.
3. A water sprinkler sprays water on a lawn over a distance of 25 feet and rotates through an angle of $\frac{5\pi}{4}$. Find the area of the lawn watered by the sprinkler.
4. Find the exact values of the six trigonometric functions of the angle shown in the figure.
5. Given that $\tan \theta = \frac{3}{2}$, find the other five trigonometric functions of $\theta$.
6. Determine the reference angle $\theta'$ for the angle $\theta = 205^\circ$ and sketch $\theta$ and $\theta'$ in standard position.
7. Determine the quadrant in which $\theta$ lies if $\sec \theta < 0$ and $\tan \theta > 0$.
8. Find two exact values of $\theta$ in degrees ($0 \leq \theta < 360^\circ$) if $\cos \theta = -\frac{\sqrt{3}}{2}$. (Do not use a calculator.)
9. Use a calculator to approximate two values of $\theta$ in radians ($0 \leq \theta < 2\pi$) if $\csc \theta = 1.030$. Round the results to two decimal places.

In Exercises 10 and 11, find the remaining five trigonometric functions of $\theta$ satisfying the conditions.

10. $\cos \theta = \frac{3}{5}$, $\tan \theta < 0$  
11. $\sec \theta = -\frac{20}{13}$, $\sin \theta > 0$

In Exercises 12 and 13, sketch the graph of the function. (Include two full periods.)

12. $g(x) = -2 \sin \left( x - \frac{\pi}{4} \right)$  
13. $f(\alpha) = \frac{1}{2} \tan 2\alpha$

In Exercises 14 and 15, use a graphing utility to graph the function. If the function is periodic, find its period.

14. $y = \sin 2\pi x + 2 \cos \pi x$  
15. $y = 6e^{-0.125t} \cos(0.25t)$, $0 \leq t \leq 32$

16. Find $a$, $b$, and $c$ for the function $f(x) = a \sin(bx + c)$ such that the graph of $f$ matches the figure.
17. Find the exact value of $\cot(\arcsin \frac{3}{4})$ without the aid of a calculator.
18. Graph the function $f(x) = 2 \arcsin \left( \frac{1}{2}x \right)$.
19. A plane is 90 miles south and 110 miles east of London Heathrow Airport. What bearing should be taken to fly directly to the airport?
20. Write the equation for the simple harmonic motion of a ball on a spring that starts at its lowest point of 6 inches below equilibrium, bounces to its maximum height of 6 inches above equilibrium, and returns to its lowest point in a total of 2 seconds.
The Pythagorean Theorem

In a right triangle, the sum of the squares of the lengths of the legs is equal to the square of the length of the hypotenuse, where \( a \) and \( b \) are the legs and \( c \) is the hypotenuse.

\[ a^2 + b^2 = c^2 \]

Proof

Area of trapezoid \( MNOP \) = \( \frac{\text{Area of } \triangle MNQ}{\text{Area of } \triangle PQR} + \frac{\text{Area of } \triangle MQO}{\text{Area of } \triangle NOQ} \)

\[ \frac{1}{2}(a + b)(a + b) = \frac{1}{2}ab + \frac{1}{2}ab + \frac{1}{2}c^2 \]

\[ \frac{1}{2}(a + b)(a + b) = ab + \frac{1}{2}c^2 \]

\[ (a + b)(a + b) = 2ab + c^2 \]

\[ a^2 + 2ab + b^2 = 2ab + c^2 \]

\[ a^2 + b^2 = c^2 \]
PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. The restaurant at the top of the Space Needle in Seattle, Washington is circular and has a radius of 47.25 feet. The dining part of the restaurant revolves, making about one complete revolution every 48 minutes. A dinner party was seated at the edge of the revolving restaurant at 6:45 P.M. and was finished at 8:57 P.M.
   (a) Find the angle through which the dinner party rotated.
   (b) Find the distance the party traveled during dinner.

2. A bicycle’s gear ratio is the number of times the freewheel turns for every one turn of the chainwheel (see figure). The table shows the numbers of teeth in the freewheel and chainwheel for the first five gears of an 18-speed touring bicycle. The chainwheel completes one rotation for each gear. Find the angle through which the freewheel turns for each gear. Give your answers in both degrees and radians.

<table>
<thead>
<tr>
<th>Gear number</th>
<th>Number of teeth in freewheel</th>
<th>Number of teeth in chainwheel</th>

</tbody>
</table>

(a) Explain why \( \triangle ABC, \triangle ADE, \) and \( \triangle AFG \) are similar triangles.
(b) What does similarity imply about the ratios \( \frac{BC}{DE} \), \( \frac{DF}{EF} \), and \( \frac{FG}{AF} \)?
(c) Does the value of \( \sin A \) depend on which triangle from part (a) is used to calculate it? Would the value of \( \sin A \) change if it were found using a different right triangle that was similar to the three given triangles?
(d) Do your conclusions from part (c) apply to the other five trigonometric functions? Explain.

5. Use a graphing utility to graph \( h \), and use the graph to decide whether \( h \) is even, odd, or neither.
   (a) \( h(x) = \cos^2 x \)
   (b) \( h(x) = \sin^2 x \)

6. If \( f \) is an even function and \( g \) is an odd function, use the results of Exercise 5 to make a conjecture about \( h \), where
   (a) \( h(x) = [f(x)]^2 \)
   (b) \( h(x) = [g(x)]^2 \).

7. The model for the height \( h \) (in feet) of a Ferris wheel car is
   \[
   h = 50 + 50 \sin 8\pi t
   \]
   where \( t \) is the time (in minutes). (The Ferris wheel has a radius of 50 feet.) This model yields a height of 50 feet when \( t = 0 \). Alter the model so that the height of the car is 1 foot when \( t = 0 \).

369
8. The pressure \( P \) (in millimeters of mercury) against the walls of the blood vessels of a patient is modeled by

\[
P = 100 - 20 \cos \left( \frac{8\pi}{3} t \right)
\]

where \( t \) is time (in seconds).

(a) Use a graphing utility to graph the model.
(b) What is the period of the model? What does the period tell you about this situation?
(c) If \( a \) and \( b \) are positive integers, is the function \( f(t) = a \cos \beta t + b \sin \alpha t \) periodic? Explain your reasoning.
(d) If one cycle of this model is equivalent to one heartbeat, what is the pulse of this patient?
(e) If a physician wants this patient’s pulse rate to be 64 beats per minute or less, what should the period be? What should the coefficient of \( t \) be?

9. A popular theory that attempts to explain the ups and downs of everyday life states that each of us has three cycles, called biorhythms, which begin at birth. These three cycles can be modeled by sine waves.

Physical (23 days): \( P = \sin \left( \frac{2\pi t}{23} \right), \quad t \geq 0 \)

Emotional (28 days): \( E = \sin \left( \frac{2\pi t}{28} \right), \quad t \geq 0 \)

Intellectual (33 days): \( I = \sin \left( \frac{2\pi t}{33} \right), \quad t \geq 0 \)

where \( t \) is the number of days since birth. Consider a person who was born on July 20, 1988.

(a) Use a graphing utility to graph the three models in the same viewing window for 7300 \( \leq t \leq 7380 \).
(b) Describe the person’s biorhythms during the month of September 2008.
(c) Calculate the person’s three energy levels on September 22, 2008.

10. (a) Use a graphing utility to graph the functions given by

\[
f(x) = 2 \cos 2x + 3 \sin 3x \quad \text{and} \quad g(x) = 2 \cos 2x + 3 \sin 4x.
\]

(b) Use the graphs from part (a) to find the period of each function.
(c) If \( a \) and \( \beta \) are positive integers, is the function given by \( h(x) = a \cos \alpha x + \beta \sin \beta x \) periodic? Explain your reasoning.

11. Two trigonometric functions \( f \) and \( g \) have periods of 2, and their graphs intersect at \( x = 5.35 \).
(a) Given one smaller and one larger positive value of \( x \) at which the functions have the same value.
(b) Determine one negative value of \( x \) at which the graphs intersect.
(c) Is it true that \( f(13.35) = g(-4.65) \)? Explain your reasoning.

12. The function \( f \) is periodic, with period \( c \). So, \( f(t + c) = f(t) \). Are the following equal? Explain.
(a) \( f(t - 2c) = f(t) \)
(b) \( f\left(t + \frac{1}{2}c\right) = f\left(\frac{1}{2}t\right) \)
(c) \( f\left(\frac{1}{2}(t + c)\right) = f\left(\frac{1}{2}t\right) \)

13. If you stand in shallow water and look at an object below the surface of the water, the object will look farther away from you than it really is. This is because when light rays pass between air and water, the water refracts, or bends, the light rays. The index of refraction for water is 1.333. This is the ratio of the sine of \( \theta_1 \) and the sine of \( \theta_2 \) (see figure).

(a) You are standing in water that is 2 feet deep and are looking at a rock at angle \( \theta_1 = 60^\circ \) (measured from a line perpendicular to the surface of the water). Find \( \theta_2 \).
(b) Find the distances \( x \) and \( y \).
(c) Find the distance \( d \) between where the rock is and where it appears to be.
(d) What happens to \( d \) as you move closer to the rock? Explain your reasoning.

14. In calculus, it can be shown that the arctangent function can be approximated by the polynomial

\[
\arctan x \approx x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7}
\]

where \( x \) is in radians.
(a) Use a graphing utility to graph the arctangent function and its polynomial approximation in the same viewing window. How do the graphs compare?
(b) Study the pattern in the polynomial approximation of the arctangent function and guess the next term. Then repeat part (a). How does the accuracy of the approximation change when additional terms are added?
Analytic Trigonometry

5.1 Using Fundamental Identities
5.2 Verifying Trigonometric Identities
5.3 Solving Trigonometric Equations
5.4 Sum and Difference Formulas
5.5 Multiple-Angle and Product-to-Sum Formulas

In Mathematics
Analytic trigonometry is used to simplify trigonometric expressions and solve trigonometric equations.

In Real Life
Analytic trigonometry is used to model real-life phenomena. For instance, when an airplane travels faster than the speed of sound, the sound waves form a cone behind the airplane. Concepts of trigonometry can be used to describe the apex angle of the cone. (See Exercise 137, page 415.)

IN CAREERS
There are many careers that use analytic trigonometry. Several are listed below.

• Mechanical Engineer
  Exercise 89, page 396
• Physicist
  Exercise 90, page 403
• Athletic Trainer
  Exercise 135, page 415
• Physical Therapist
  Exercise 8, page 425
Introduction

In Chapter 4, you studied the basic definitions, properties, graphs, and applications of the individual trigonometric functions. In this chapter, you will learn how to use the fundamental identities to do the following.

1. Evaluate trigonometric functions.
2. Simplify trigonometric expressions.
3. Develop additional trigonometric identities.
4. Solve trigonometric equations.

Pythagorean identities are sometimes used in radical form such as

\[ \sin u = \pm \sqrt{1 - \cos^2 u} \]

or

\[ \tan u = \pm \sqrt{\sec^2 u - 1} \]

where the sign depends on the choice of \( u \).

Fundamental Trigonometric Identities

You should learn the fundamental trigonometric identities well, because they are used frequently in trigonometry and they will also appear later in calculus. Note that \( u \) can be an angle, a real number, or a variable.

Study Tip

You should learn the fundamental trigonometric identities well, because they are used frequently in trigonometry and they will also appear later in calculus. Note that \( u \) can be an angle, a real number, or a variable.
Using the Fundamental Identities

One common application of trigonometric identities is to use given values of trigonometric functions to evaluate other trigonometric functions.

Example 1 Using Identities to Evaluate a Function

Use the values $\sec u = -\frac{3}{2}$ and $\tan u > 0$ to find the values of all six trigonometric functions.

Solution

Using a reciprocal identity, you have

$$\cos u = \frac{1}{\sec u} = -\frac{1}{3/2} = -\frac{2}{3}.$$  \hspace{1cm} \text{Pythagorean identity}

Using a Pythagorean identity, you have

$$\sin^2 u = 1 - \cos^2 u$$

Substitute $-\frac{2}{3}$ for $\cos u$.

$$= 1 - \left(-\frac{2}{3}\right)^2$$

Simplify.

$$= 1 - \frac{4}{9} = \frac{5}{9}.$$  \hspace{1cm} \text{Simplify.}

Because $\sec u < 0$ and $\tan u > 0$, it follows that $u$ lies in Quadrant III. Moreover, because $\sin u$ is negative when $u$ is in Quadrant III, you can choose the negative root and obtain $\sin u = -\sqrt{\frac{5}{3}}$. Now, knowing the values of the sine and cosine, you can find the values of all six trigonometric functions.

$$\sin u = -\frac{\sqrt{3}}{3}$$

$$\csc u = \frac{1}{\sin u} = -\frac{3}{\sqrt{5}} = -\frac{3\sqrt{3}}{5}$$

$$\cos u = -\frac{2}{3}$$

$$\sec u = \frac{1}{\cos u} = -\frac{3}{2}$$

$$\tan u = \frac{\sin u}{\cos u} = -\frac{\sqrt{5/3}}{2/3} = \frac{\sqrt{3}}{2}$$

$$\cot u = \frac{1}{\tan u} = \frac{2}{\sqrt{3}} = \frac{2\sqrt{3}}{5}$$

Example 2 Simplifying a Trigonometric Expression

Simplify $\sin x \cos^2 x - \sin x$.

Solution

First factor out a common monomial factor and then use a fundamental identity.

$$\sin x \cos^2 x - \sin x = \sin x(\cos^2 x - 1)$$

Factor out common monomial factor.

$$= -\sin x(1 - \cos^2 x)$$

Factor out $-1$.

$$= -\sin x(\sin^2 x)$$

Pythagorean identity

$$= -\sin^3 x$$

Multiply.

Now try Exercise 21.
When factoring trigonometric expressions, it is helpful to find a special polynomial factoring form that fits the expression, as shown in Example 3.

### Example 3  Factoring Trigonometric Expressions

Factor each expression.

a. \( \sec^2 \theta - 1 \)  

b. \( 4 \tan^2 \theta + \tan \theta - 3 \)

**Solution**

a. This expression has the form \( u^2 - v^2 \), which is the difference of two squares. It factors as \( \sec^2 \theta - 1 = (\sec \theta - 1)(\sec \theta + 1) \).

b. This expression has the polynomial form \( ax^2 + bx + c \), and it factors as \( 4 \tan^2 \theta + \tan \theta - 3 = (4 \tan \theta - 3)(\tan \theta + 1) \).

**CHECK Point** Now try Exercise 61.

On occasion, factoring or simplifying can best be done by first rewriting the expression in terms of just one trigonometric function or in terms of sine and cosine only. These strategies are shown in Examples 4 and 5, respectively.

### Example 4  Factoring a Trigonometric Expression

Factor \( \csc^2 x - \cot x - 3 \).

**Solution**

Use the identity \( \csc^2 x = 1 + \cot^2 x \) to rewrite the expression in terms of the cotangent.

\[
\csc^2 x - \cot x - 3 = (1 + \cot^2 x) - \cot x - 3
\]

\[
= \cot^2 x - \cot x - 2
\]

\[
= (\cot x - 2)(\cot x + 1)
\]

**CHECK Point** Now try Exercise 65.

### Example 5  Simplifying a Trigonometric Expression

Simplify \( \sin t + \cot t \cos t \).

**Solution**

Begin by rewriting \( \cot t \) in terms of sine and cosine.

\[
\sin t + \cot t \cos t = \sin t + \left( \frac{\cos t}{\sin t} \right) \cos t
\]

\[
= \frac{\sin^2 t + \cos^2 t}{\sin t}
\]

\[
= \frac{1}{\sin t}
\]

\[
= \csc t
\]

**CHECK Point** Now try Exercise 71.
Adding Trigonometric Expressions

Perform the addition and simplify.

\[
\frac{\sin \theta}{1 + \cos \theta} + \frac{\cos \theta}{\sin \theta}
\]

Solution

\[
\frac{\sin \theta}{1 + \cos \theta} + \frac{\cos \theta}{\sin \theta} = \frac{(\sin \theta)(\sin \theta) + (\cos \theta)(1 + \cos \theta)}{(1 + \cos \theta)(\sin \theta)}
\]

\[
= \frac{\sin^2 \theta + \cos^2 \theta + \cos \theta}{(1 + \cos \theta)(\sin \theta)} \\
= \frac{1 + \cos \theta}{(1 + \cos \theta)(\sin \theta)} \\
= \frac{1}{\sin \theta} \\
= \csc \theta
\]

Multiply.

Pythagorean identity: \(\sin^2 \theta + \cos^2 \theta = 1\)

Divide out common factor.

Reciprocal identity

Now try Exercise 75.

The next two examples involve techniques for rewriting expressions in forms that are used in calculus.

Rewriting a Trigonometric Expression

Rewrite \(\frac{1}{1 + \sin x}\) so that it is not in fractional form.

Solution

From the Pythagorean identity \(\cos^2 x = 1 - \sin^2 x = (1 - \sin x)(1 + \sin x)\), you can see that multiplying both the numerator and the denominator by \(1 - \sin x\) will produce a monomial denominator.

\[
\frac{1}{1 + \sin x} = \frac{1}{1 + \sin x} \cdot \frac{1 - \sin x}{1 - \sin x}
\]

\[
= \frac{1 - \sin x}{1 - \sin^2 x}
\]

\[
= \frac{1 - \sin x}{\cos^2 x}
\]

\[
= \frac{1}{\cos^2 x} - \frac{\sin x}{\cos^2 x}
\]

\[
= \frac{1}{\cos^2 x} \cdot \frac{\sin x}{\cos x} \cdot \frac{1}{\cos x}
\]

\[
= \sec^2 x - \tan x \sec x
\]

Multiply numerator and denominator by \(1 - \sin x\).

Multiply.

Pythagorean identity

Write as separate fractions.

Product of fractions

Reciprocal and quotient identities

Now try Exercise 81.
Example 8  Trigonometric Substitution

Use the substitution \( x = 2 \tan \theta \), \( 0 < \theta < \pi/2 \), to write
\[
\sqrt{4 + x^2}
\]
as a trigonometric function of \( \theta \).

Solution

Begin by letting \( x = 2 \tan \theta \). Then, you can obtain
\[
\sqrt{4 + x^2} = \sqrt{4 + (2 \tan \theta)^2} = \sqrt{4 + 4 \tan^2 \theta} = \sqrt{4(1 + \tan^2 \theta)} = \sqrt{4 \sec^2 \theta} = 2 \sec \theta.
\]

Recall that for positive real numbers \( u \) and \( v \),
\[
\ln u + \ln v = \ln(uv).
\]
You can review the properties of logarithms in Section 3.3.

Figure 5.1 shows the right triangle illustration of the trigonometric substitution \( x = 2 \tan \theta \) in Example 8. You can use this triangle to check the solution of Example 8.

For \( 0 < \theta < \pi/2 \), you have
\[
\text{opp} = x, \quad \text{adj} = 2, \quad \text{hyp} = \sqrt{4 + x^2}.
\]

With these expressions, you can write the following.
\[
\sec \theta = \frac{\text{hyp}}{\text{adj}} = \frac{\sqrt{4 + x^2}}{2} = 2 \sec \theta.
\]

So, the solution checks.

Example 9  Rewriting a Logarithmic Expression

Rewrite \( \ln|\csc \theta| + \ln|\tan \theta| \) as a single logarithm and simplify the result.

Solution

\[
\ln|\csc \theta| + \ln|\tan \theta| = \ln|\csc \theta \tan \theta| = \ln\left|\frac{1}{\sin \theta} \cdot \frac{\sin \theta}{\cos \theta}\right| = \ln\left|\frac{1}{\cos \theta}\right| = \ln|\sec \theta|.
\]

Recall that for positive real numbers \( u \) and \( v \),
\[
\ln u + \ln v = \ln(uv).
\]
You can review the properties of logarithms in Section 3.3.
5.1 EXERCISES

VOCABULARY: Fill in the blank to complete the trigonometric identity.

1. \( \frac{\sin u}{\cos u} = \) _________
2. \( \frac{1}{\csc u} = \) _________
3. \( \frac{1}{\tan u} = \) _________
4. \( \frac{1}{\cos u} = \) _________
5. \( 1 + \) _________ = \( \csc^2 u \)
6. \( 1 + \tan^2 u = \) _________
7. \( \sin \left( \frac{\pi}{2} - u \right) = \) _________
8. \( \sec \left( \frac{\pi}{2} - u \right) = \) _________
9. \( \cos(-u) = \) _________
10. \( \tan(-u) = \) _________

SKILLS AND APPLICATIONS

In Exercises 11–24, use the given values to evaluate (if possible) all six trigonometric functions.

11. \( \sin x = \frac{1}{2}, \cos x = \frac{\sqrt{3}}{2} \)
12. \( \tan x = \frac{\sqrt{3}}{3}, \cos x = -\frac{\sqrt{3}}{2} \)
13. \( \sec \theta = \frac{\sqrt{2}}{2}, \sin \theta = -\frac{\sqrt{2}}{2} \)
14. \( \csc \theta = \frac{5}{2}, \tan \theta = \frac{7}{2} \)
15. \( \tan x = \frac{9}{7}, \sec x = -\frac{17}{15} \)
16. \( \cot \phi = -3, \sin \phi = \frac{\sqrt{10}}{10} \)
17. \( \sec \phi = \frac{3}{2}, \csc \phi = -\frac{3\sqrt{3}}{5} \)
18. \( \cos \left( \frac{\pi}{2} - x \right) = \frac{3}{5}, \cos x = \frac{4}{5} \)
19. \( \sin(-x) = -\frac{1}{3}, \tan x = -\frac{\sqrt{2}}{4} \)
20. \( \sec x = 4, \sin x > 0 \)
21. \( \tan \theta = 2, \sin \theta < 0 \)
22. \( \csc \theta = -5, \cos \theta < 0 \)
23. \( \sin \theta = -1, \cot \theta = 0 \)
24. \( \tan \theta \) is undefined, \( \sin \theta > 0 \)

In Exercises 25–30, match the trigonometric expression with one of the following.

(a) \( \csc x \) \hspace{1cm} (b) \( \cot x \) \hspace{1cm} (c) \( \sin x \)
(d) \( 1 \) \hspace{1cm} (e) \( -\tan x \) \hspace{1cm} (f) \( \sin x \)
25. \( \sec x \cos x \) \hspace{1cm} 26. \( \tan x \csc x \)
27. \( \cot^2 x - \csc^2 x \) \hspace{1cm} 28. \( (1 - \cos^2 x) \csc x \)
29. \( \sin(-x) \) \hspace{1cm} 30. \( \tan \left( \frac{\pi}{2} - x \right) \frac{\cos \left( \frac{\pi}{2} - x \right)}{\cos x} \)

In Exercises 31–36, match the trigonometric expression with one of the following.

(a) \( \csc x \) \hspace{1cm} (b) \( \tan x \) \hspace{1cm} (c) \( \sin^2 x \)
(d) \( \sin x \tan x \) \hspace{1cm} (e) \( \sec^2 x \) \hspace{1cm} (f) \( \sec^2 x + \tan^2 x \)
31. \( \sin x \sec x \) \hspace{1cm} 32. \( \cos^2 x (\sec^2 x - 1) \)
33. \( \sec^2 x - \tan^4 x \) \hspace{1cm} 34. \( \cot x \sec x \)
35. \( \frac{\sec^2 x - 1}{\sin^2 x} \) \hspace{1cm} 36. \( \frac{\cos^2 \left( \frac{\pi}{2} - x \right)}{\cos x} \)

In Exercises 37–58, use the fundamental identities to simplify the expression. There is more than one correct form of each answer.

37. \( \cot \theta \sec \theta \) \hspace{1cm} 38. \( \cos \beta \tan \beta \)
39. \( \tan(-x) \cos x \) \hspace{1cm} 40. \( \sin x \cot(-x) \)
41. \( \sin(\phi \csc \phi - \sin \phi) \) \hspace{1cm} 42. \( \sec^2 x (1 - \sin^2 x) \)
43. \( \frac{\cot x}{\csc x} \) \hspace{1cm} 44. \( \frac{\csc \theta}{\sec \theta} \)
45. \( \frac{1}{\tan^2 x + 1} \) \hspace{1cm} 46. \( \frac{\sin \theta \csc \theta}{\tan \theta} \)
47. \( \tan \theta \cot \theta \) \hspace{1cm} 48. \( \frac{\tan^2 \theta}{\sec^2 \theta} \)
49. \( \frac{\sec \alpha \cdot \sin \alpha}{\tan \alpha} \) \hspace{1cm} 50. \( \frac{\cos \left( \frac{\pi}{2} - x \right)}{\cos x} \)
51. \( \cos \left( \frac{\pi}{2} - x \right) \sec x \) \hspace{1cm} 52. \( \cos \left( \frac{\pi}{2} - x \right) \cos x \)
53. \( \frac{\cos^2 y}{1 - \sin y} \) \hspace{1cm} 54. \( \cos r (1 + \tan^2 r) \)
55. \( \sin \beta \tan \beta + \cos \beta \) \hspace{1cm} 56. \( \csc \phi \tan \phi + \sec \phi \)
57. \( \cot u \sin u + \tan u \cos u \) \hspace{1cm} 58. \( \sin \theta \sec \theta + \cos \theta \csc \theta \)

In Exercises 59–70, factor the expression and use the fundamental identities to simplify. There is more than one correct form of each answer.

59. \( \tan^2 x - \tan^2 x \sin^2 x \) 
60. \( \sin^2 x \csc^2 x - \sin^2 x \) 
61. \( \tan^2 x \sec^2 x - \sin^2 x \) 
62. \( \cos^2 x + \cos^2 x \tan^2 x \) 
63. \( \sec^2 x - 1 \) \( \sec x - 1 \) 
64. \( \cos^2 x - 4 \) \( \cos x - 2 \) 
65. \( \tan^4 x + 2 \tan^2 x + 1 \) 
66. \( 1 - 2 \cos^2 x + \cos^4 x \) 
67. \( \sin^4 x - \cos^4 x \) 
68. \( \sec^4 x - \tan^4 x \) 
69. \( \csc^3 x - \csc^2 x - \csc x + 1 \) 
70. \( \sec^3 x - \sec^2 x - \sec x + 1 \) 

In Exercises 71–74, perform the multiplication and use the fundamental identities to simplify. There is more than one correct form of each answer.

71. \( \sin x + \cos x\)\(^2 \) 
72. \( \cot x + \csc x\)(\( \cot x - \csc x\)) 
73. \( 2 \csc x + 2\)(\( 2 \csc x - 2\)) 
74. \( 3 - 3 \sin x\)(\( 3 + 3 \sin x\)) 

In Exercises 75–80, perform the addition or subtraction and use the fundamental identities to simplify. There is more than one correct form of each answer.

75. \( \frac{1}{1 + \cos x} + \frac{1}{1 - \cos x} \) 
76. \( \frac{1}{\sec x + 1} - \frac{1}{\sec x - 1} \) 
77. \( \frac{\cos x}{1 + \sin x} + \frac{1 + \sin x}{\cos x} \) 
78. \( \frac{\tan x}{1 + \sec x} + \frac{1 + \sec x}{\tan x} \) 
79. \( \tan x + \frac{\cos x}{1 + \sin x} \) 
80. \( \tan x - \frac{\sec^2 x}{\tan x} \) 

In Exercises 81–84, rewrite the expression so that it is not in fractional form. There is more than one correct form of each answer.

81. \( \frac{\sin^2 y}{1 - \cos y} \) 
82. \( \frac{5}{\tan x + \sec x} \) 
83. \( \frac{3}{\sec x - \tan x} \) 
84. \( \frac{\tan^2 x}{\csc x + 1} \) 

**Numerical and Graphical Analysis** In Exercises 85–88, use a graphing utility to complete the table and graph the functions. Make a conjecture about \( y_1 \) and \( y_2 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.2</th>
<th>0.4</th>
<th>0.6</th>
<th>0.8</th>
<th>1.0</th>
<th>1.2</th>
<th>1.4</th>
</tr>
</thead>
<tbody>
<tr>
<td>( y_1 )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( y_2 )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

85. \( y_1 = \cos \left( \frac{\pi}{2} - x \right) \), \( y_2 = \sin x \) 
86. \( y_1 = \sec x - \cos x \), \( y_2 = \sin x \tan x \) 
87. \( y_1 = \frac{\cos x}{1 - \sin x} \), \( y_2 = \frac{1 + \sin x}{\cos x} \) 
88. \( y_1 = \sec^4 x - \sec^2 x \), \( y_2 = \tan^2 x + \tan^4 x \) 

In Exercises 89–92, use a graphing utility to determine which of the six trigonometric functions is equal to the expression. Verify your answer algebraically.

89. \( \cos x \cot x + \sin x \) 
90. \( \sec x \csc x - \tan x \) 
91. \( \frac{1}{\sin x \cos x} - \cos x \) 
92. \( \frac{1}{2} \) \( \frac{1 + \sin \theta}{\cos \theta} + \frac{\cos \theta}{1 + \sin \theta} \) 

In Exercises 93–104, use the trigonometric substitution to write the algebraic expression as a trigonometric function of \( \theta \), where \( 0 < \theta < \pi/2 \).

93. \( \sqrt{9 - x^2} \), \( x = 3 \cos \theta \) 
94. \( \sqrt{64 - 16x^2} \), \( x = 2 \cos \theta \) 
95. \( \sqrt{16 - x^2} \), \( x = 4 \sin \theta \) 
96. \( \sqrt{49 - x^2} \), \( x = 7 \sin \theta \) 
97. \( \sqrt{x^2 - 9} \), \( x = 3 \sec \theta \) 
98. \( \sqrt{x^2 - 4} \), \( x = 2 \sec \theta \) 
99. \( \sqrt{x^2 + 25} \), \( x = 5 \tan \theta \) 
100. \( \sqrt{x^2 + 100} \), \( x = 10 \tan \theta \) 
101. \( \sqrt{4x^2 + 9} \), \( x = 3 \tan \theta \) 
102. \( \sqrt{9x^2 + 25} \), \( x = 5 \tan \theta \) 
103. \( \sqrt{2 - x^2} \), \( x = \sqrt{2} \sin \theta \) 
104. \( \sqrt{10 - x^2} \), \( x = \sqrt{10} \sin \theta \) 

In Exercises 105–108, use the trigonometric substitution to write the algebraic equation as a trigonometric equation of \( \theta \), where \( -\pi/2 < \theta < \pi/2 \). Then find \( \sin \theta \) and \( \cos \theta \).

105. \( 3 = \sqrt{9 - x^2} \), \( x = 3 \sin \theta \) 
106. \( 3 = \sqrt{36 - x^2} \), \( x = 6 \sin \theta \) 
107. \( 2\sqrt{2} = \sqrt{16 - 4x^2} \), \( x = 2 \cos \theta \) 
108. \( -5\sqrt{3} = \sqrt{100 - x^2} \), \( x = 10 \cos \theta \) 

In Exercises 109–112, use a graphing utility to solve the equation for \( \theta \), where \( 0 \leq \theta < 2\pi \).

109. \( \sin \theta = \sqrt{1 - \cos^2 \theta} \) 
110. \( \cos \theta = -\sqrt{1 - \sin^2 \theta} \) 
111. \( \sec \theta = \sqrt{1 + \tan^2 \theta} \) 
112. \( \csc \theta = \sqrt{1 + \cot^2 \theta} \)
In Exercises 113–118, rewrite the expression as a single logarithm and simplify the result.

113. \(\ln|\cos x| - \ln|\sin x|\)

114. \(\ln|\sec x| + \ln|\sin x|\)

115. \(\ln|\sin x| + \ln|\cot x|\)

116. \(\ln|\tan x| + \ln|\csc x|\)

In Exercises 119–122, use a calculator to demonstrate the identity for each value of \(\theta\).

119. \(\csc^2 \theta - \cot^2 \theta = 1\)
   
   (a) \(\theta = 132^\circ\)  \(\theta = \frac{2\pi}{7}\)

120. \(\tan^2 \theta + 1 = \sec^2 \theta\)
   
   (a) \(\theta = 346^\circ\)  \(\theta = 3.1\)

121. \(\cos\left(\frac{\pi}{2} - \theta\right) = \sin \theta\)
   
   (a) \(\theta = 80^\circ\)  \(\theta = 0.8\)

122. \(\sin(-\theta) = -\sin \theta\)
   
   (a) \(\theta = 250^\circ\)  \(\theta = \frac{1}{2}\)

123. **Friction**

   The forces acting on an object weighing \(W\) units on an inclined plane positioned at an angle of \(\theta\) with the horizontal (see figure) are modeled by

   \[\mu W \cos \theta = W \sin \theta\]

   where \(\mu\) is the coefficient of friction. Solve the equation for \(\mu\) and simplify the result.

124. **Rate of Change**

   The rate of change of the function \(f(x) = -x + \tan x\) is given by the expression \(-1 + \sec^2 x\). Show that this expression can also be written as \(\tan^2 x\).

125. **Rate of Change**

   The rate of change of the function \(f(x) = \sec x + \cos x\) is given by the expression \(\sec x \tan x - \sin x\). Show that this expression can also be written as \(\sin x \tan^2 x\).

126. **Rate of Change**

   The rate of change of the function \(f(x) = -\csc x - \sin x\) is given by the expression \(\csc x \cot x - \cos x\). Show that this expression can also be written as \(\cos x \cot^2 x\).

**Exploration**

**True or False?**

In Exercises 127 and 128, determine whether the statement is true or false. Justify your answer.

127. The even and odd trigonometric identities are helpful for determining whether the value of a trigonometric function is positive or negative.

128. A cofunction identity can be used to transform a tangent function so that it can be represented by a cosecant function.

In Exercises 129–132, fill in the blanks. (Note: The notation \(x \to c^+\) indicates that \(x\) approaches \(c\) from the right and \(x \to c^-\) indicates that \(x\) approaches \(c\) from the left.)

129. \(\text{As } x \to \frac{\pi}{2}^-, \sin x \to \underline{\hspace{2cm}}\) and \(\csc x \to \underline{\hspace{2cm}}\).

130. \(\text{As } x \to 0^+, \cos x \to \underline{\hspace{2cm}}\) and \(\sec x \to \underline{\hspace{2cm}}\).

131. \(\text{As } x \to \frac{\pi}{2}^-, \tan x \to \underline{\hspace{2cm}}\) and \(\cot x \to \underline{\hspace{2cm}}\).

132. \(\text{As } x \to \pi^+, \sin x \to \underline{\hspace{2cm}}\) and \(\csc x \to \underline{\hspace{2cm}}\).

In Exercises 133–138, determine whether or not the equation is an identity, and give a reason for your answer.

133. \(\cos \theta = \sqrt{1 - \sin^2 \theta}\)

134. \(\cot \theta = \sqrt{\csc^2 \theta + 1}\)

135. \(\frac{(\sin k\theta)}{(\cos k\theta)} = \tan \theta\), where \(k\) is a constant.

136. \(\frac{1}{5 \cos \theta} = 5 \sec \theta\)

137. \(\sin \theta \csc \theta = 1\)

138. \(\csc^2 \theta = 1\)

139. Use the trigonometric substitution \(u = a \sin \theta\), where \(-\pi/2 < \theta < \pi/2\) and \(a > 0\), to simplify the expression \(\sqrt{a^2 - u^2}\).

140. Use the trigonometric substitution \(u = a \tan \theta\), where \(-\pi/2 < \theta < \pi/2\) and \(a > 0\), to simplify the expression \(\sqrt{a^2 + u^2}\).

141. Use the trigonometric substitution \(u = a \sec \theta\), where \(0 < \theta < \pi/2\) and \(a > 0\), to simplify the expression \(\sqrt{u^2 - a^2}\).

142. **Capstone**

   (a) Use the definitions of sine and cosine to derive the Pythagorean identity \(\sin^2 \theta + \cos^2 \theta = 1\).

   (b) Use the Pythagorean identity \(\sin^2 \theta + \cos^2 \theta = 1\) to derive the other Pythagorean identities, \(1 + \tan^2 \theta = \sec^2 \theta\) and \(1 + \cot^2 \theta = \csc^2 \theta\).

   Discuss how to remember these identities and other fundamental identities.
Chapter 5 Analytic Trigonometry

5.2 VERIFYING TRIGONOMETRIC IDENTITIES

**Introduction**

In this section, you will study techniques for verifying trigonometric identities. In the next section, you will study techniques for solving trigonometric equations. The key to verifying identities and solving equations is the ability to use the fundamental identities and the rules of algebra to rewrite trigonometric expressions.

Remember that a *conditional equation* is an equation that is true for only some of the values in its domain. For example, the conditional equation

\[ \sin x = 0 \]

is true only for \( x = n\pi \), where \( n \) is an integer. When you find these values, you are solving the equation.

On the other hand, an equation that is true for all real values in the domain of the variable is an *identity*. For example, the familiar equation

\[ \sin^2 x = 1 - \cos^2 x \]

is true for all real numbers \( x \). So, it is an identity.

**Verifying Trigonometric Identities**

Although there are similarities, verifying that a trigonometric equation is an identity is quite different from solving an equation. There is no well-defined set of rules to follow in verifying trigonometric identities, and the process is best learned by practice.

**Guidelines for Verifying Trigonometric Identities**

1. Work with one side of the equation at a time. It is often better to work with the more complicated side first.
2. Look for opportunities to factor an expression, add fractions, square a binomial, or create a monomial denominator.
3. Look for opportunities to use the fundamental identities. Note which functions are in the final expression you want. Sines and cosines pair up well, as do secants and tangents, and cosecants and cotangents.
4. If the preceding guidelines do not help, try converting all terms to sines and cosines.
5. Always try something. Even paths that lead to dead ends provide insights.

Verifying trigonometric identities is a useful process if you need to convert a trigonometric expression into a form that is more useful algebraically. When you verify an identity, you cannot assume that the two sides of the equation are equal because you are trying to verify that they are equal. As a result, when verifying identities, you cannot use operations such as adding the same quantity to each side of the equation or cross multiplication.
Example 1  Verifying a Trigonometric Identity

Verify the identity \( \sec^2 \theta - 1)/\sec^2 \theta = \sin^2 \theta. \)

Solution
The left side is more complicated, so start with it.

\[
\frac{\sec^2 \theta - 1}{\sec^2 \theta} = \frac{\tan^2 \theta + 1 - 1}{\sec^2 \theta} \quad \text{Pythagorean identity}
\]
\[
= \tan^2 \theta \quad \text{Simplify.}
\]
\[
= \frac{\sin^2 \theta (\cos^2 \theta)}{\cos^2 \theta} \quad \text{Quotient identity}
\]
\[
= \sin^2 \theta \quad \text{Simplify.}
\]

Notice how the identity is verified. You start with the left side of the equation (the more complicated side) and use the fundamental trigonometric identities to simplify it until you obtain the right side. Now try Exercise 15.

There can be more than one way to verify an identity. Here is another way to verify the identity in Example 1.

\[
\frac{\sec^2 \theta - 1}{\sec^2 \theta} = \sec^2 \theta - \sec^2 \theta \quad \text{Rewrite as the difference of fractions.}
\]
\[
= 1 - \cos^2 \theta \quad \text{Reciprocal identity}
\]
\[
= \sin^2 \theta \quad \text{Pythagorean identity}
\]

Example 2  Verifying a Trigonometric Identity

Verify the identity \( 2 \sec^2 \alpha = \frac{1}{1 - \sin \alpha} + \frac{1}{1 + \sin \alpha}. \)

Algebraic Solution
The right side is more complicated, so start with it.

\[
\frac{1}{1 - \sin \alpha} + \frac{1}{1 + \sin \alpha} = \frac{1 + \sin \alpha + 1 - \sin \alpha}{(1 - \sin \alpha)(1 + \sin \alpha)} \quad \text{Add fractions.}
\]
\[
= 2 \frac{1}{1 - \sin^2 \alpha} \quad \text{Simplify.}
\]
\[
= \frac{2}{\cos^2 \alpha} \quad \text{Pythagorean identity}
\]
\[
= 2 \sec^2 \alpha \quad \text{Reciprocal identity}
\]

Now try Exercise 31.

Numerical Solution
Use the table feature of a graphing utility set in radian mode to create a table that shows the values of \( y_1 = 2/\cos^2 x \) and \( y_2 = 1/(1 - \sin x) + 1/(1 + \sin x) \) for different values of \( x \), as shown in Figure 5.2. From the table, you can see that the values appear to be identical, so \( 2 \sec^2 x = 1/(1 - \sin x) + 1/(1 + \sin x) \) appears to be an identity.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( y_1 )</th>
<th>( y_2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 0 )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( \pi/6 )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( \pi/4 )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( \pi/3 )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( \pi/2 )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( \pi )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
<tr>
<td>( 2\pi )</td>
<td>1.3969</td>
<td>1.3969</td>
</tr>
</tbody>
</table>

Now try Exercise 31.
Converting to Sines and Cosines

Verify the identity \((\tan^2 x + 1)(\cos^2 x - 1) = -\tan^2 x\).

**Algebraic Solution**

By applying identities before multiplying, you obtain the following.

\[
(\tan^2 x + 1)(\cos^2 x - 1) = (\sec^2 x)(-\sin^2 x) \quad \text{Pythagorean identities}
\]

\[
= -\frac{\sin^2 x}{\cos^2 x} \quad \text{Reciprocal identity}
\]

\[
= -\left(\frac{\sin x}{\cos x}\right)^2 \quad \text{Rule of exponents}
\]

\[
= -\tan^2 x \quad \text{Quotient identity}
\]

**Graphical Solution**

Use a graphing utility set in *radian* mode to graph the left side of the identity \(y_1 = (\tan^2 x + 1)(\cos^2 x - 1)\) and the right side of the identity \(y_2 = -\tan^2 x\) in the same viewing window, as shown in Figure 5.3. (Select the *line* style for \(y_1\) and the *path* style for \(y_2\).) Because the graphs appear to coincide, \((\tan^2 x + 1)(\cos^2 x - 1) = -\tan^2 x\) appears to be an identity.

![Figure 5.3](image)

**CHECKPOINT**

Now try Exercise 53.

**Example 4**

Converting to Sines and Cosines

Verify the identity \(\tan x + \cot x = \sec x \csc x\).

**Solution**

Try converting the left side into sines and cosines.

\[
\tan x + \cot x = \frac{\sin x}{\cos x} + \frac{\cos x}{\sin x} \quad \text{Quotient identities}
\]

\[
= \frac{\sin^2 x + \cos^2 x}{\cos x \sin x} \quad \text{Add fractions.}
\]

\[
= \frac{1}{\cos x \sin x} \quad \text{Pythagorean identity}
\]

\[
= \frac{1}{\cos x} \cdot \frac{1}{\sin x} \quad \text{Product of fractions.}
\]

\[
= \sec x \csc x \quad \text{Reciprocal identities}
\]

**CHECKPOINT**

Now try Exercise 25.

**Study Tip**

As shown at the right, \(\csc^2 x(1 + \cos x)\) is considered a simplified form of \(1/(1 - \cos x)\) because the expression does not contain any fractions.

Recall from algebra that *rationalizing the denominator* using conjugates is, on occasion, a powerful simplification technique. A related form of this technique, shown below, works for simplifying trigonometric expressions as well.

\[
\frac{1}{1 - \cos x} = \frac{1}{1 - \cos x} \left(\frac{1 + \cos x}{1 + \cos x}\right) = \frac{1 + \cos x}{1 - \cos^2 x} = \frac{1 + \cos x}{\sin^2 x}
\]

\[
= \csc^2 x(1 + \cos x)
\]

This technique is demonstrated in the next example.
Example 5  Verifying a Trigonometric Identity

Verify the identity \( \sec x + \tan x = \frac{\cos x}{1 - \sin x} \).

**Algebraic Solution**

Begin with the right side because you can create a monomial denominator by multiplying the numerator and denominator by \( 1 + \sin x \).

\[
\begin{align*}
\frac{\cos x}{1 - \sin x} &= \frac{\cos x}{1 - \sin x} \left( \frac{1 + \sin x}{1 + \sin x} \right) \\
&= \frac{\cos x + \cos x \sin x}{1 - \sin^2 x} \\
&= \frac{\cos x + \cos x \sin x}{\cos^2 x} \\
&= \frac{\cos x}{\cos^2 x} + \frac{\cos x \sin x}{\cos^2 x} \\
&= \frac{1}{\cos x} + \frac{\sin x}{\cos x} \\
&= \sec x + \tan x.
\end{align*}
\]

**Graphical Solution**

Use a graphing utility set in the radian and dot modes to graph \( y_1 = \sec x + \tan x \) and \( y_2 = \cos x/(1 - \sin x) \) in the same viewing window, as shown in Figure 5.4. Because the graphs appear to coincide, \( \sec x + \tan x = \cos x/(1 - \sin x) \) appears to be an identity.

In Examples 1 through 5, you have been verifying trigonometric identities by working with one side of the equation and converting to the form given on the other side. On occasion, it is practical to work with each side separately, to obtain one common form equivalent to both sides. This is illustrated in Example 6.

Example 6  Working with Each Side Separately

Verify the identity \( \frac{\cot^2 \theta}{1 + \csc \theta} = \frac{1 - \sin \theta}{\sin \theta} \).

**Algebraic Solution**

Working with the left side, you have

\[
\begin{align*}
\frac{\cot^2 \theta}{1 + \csc \theta} &= \frac{\csc^2 \theta - 1}{1 + \csc \theta} \\
&= \frac{(\csc \theta - 1)(\csc \theta + 1)}{1 + \csc \theta} \\
&= \csc \theta - 1.
\end{align*}
\]

Now, simplifying the right side, you have

\[
\begin{align*}
\frac{1 - \sin \theta}{\sin \theta} &= \frac{1}{\sin \theta} - \frac{\sin \theta}{\sin \theta} \\
&= \csc \theta - 1.
\end{align*}
\]

The identity is verified because both sides are equal to \( \csc \theta - 1 \).

**Numerical Solution**

Use the table feature of a graphing utility set in radian mode to create a table that shows the values of \( y_1 = \cot^2 x/(1 + \csc x) \) and \( y_2 = (1 - \sin x)/\sin x \) for different values of \( x \), as shown in Figure 5.5. From the table you can see that the values appear to be identical, so \( \cot^2 x/(1 + \csc x) = (1 - \sin x)/\sin x \) appears to be an identity.
In Example 7, powers of trigonometric functions are rewritten as more complicated sums of products of trigonometric functions. This is a common procedure used in calculus.

### Example 7  Three Examples from Calculus

Verify each identity.

a. \( \tan^4 x = \tan^2 x \sec^2 x - \tan^2 x \)

b. \( \sin^3 x \cos^4 x = (\cos^4 x - \cos^6 x) \sin x \)

c. \( \csc^4 x \cot x = \csc^2 x (\cot x + \cot^3 x) \)

#### Solution

a. \( \tan^4 x = (\tan^2 x)(\tan^2 x) \)  
Write as separate factors.

\[ = \tan^2 x (\sec^2 x - 1) \]
Pythagorean identity

\[ = \tan^2 x \sec^2 x - \tan^2 x \]
Multiply.

b. \( \sin^3 x \cos^4 x = \sin^2 x \cos^3 x \sin x \)
Write as separate factors.

\[ = (1 - \cos^2 x) \cos^4 x \sin x \]
Pythagorean identity

\[ = (\cos^4 x - \cos^6 x) \sin x \]
Multiply.

c. \( \csc^4 x \cot x = \csc^2 x \csc^2 x \cot x \)
Write as separate factors.

\[ = \csc^2 x (1 + \cot^2 x) \cot x \]
Pythagorean identity

\[ = \csc^2 x (\cot x + \cot^3 x) \]
Multiply.

### Error Analysis

You are tutoring a student in trigonometry. One of the homework problems your student encounters asks whether the following statement is an identity.

\[ \tan^2 x \sin^2 x = \frac{5}{6} \tan^2 x \]

Your student does not attempt to verify the equivalence algebraically, but mistakenly uses only a graphical approach. Using range settings of

\[
x_{\text{min}} = -3\pi \quad \quad y_{\text{min}} = -20
\]

\[
x_{\text{max}} = 3\pi \quad \quad y_{\text{max}} = 20
\]

\[
x_{\text{scl}} = \pi/2 \quad \quad y_{\text{scl}} = 1
\]

Your student graphs both sides of the expression on a graphing utility and concludes that the statement is an identity.

**What is wrong with your student’s reasoning?** Explain. Discuss the limitations of verifying identities graphically.
VOCABULARY
In Exercises 1 and 2, fill in the blanks.
1. An equation that is true for all real values in its domain is called an ________.
2. An equation that is true for only some values in its domain is called a ________ ________.

In Exercises 3–8, fill in the blank to complete the trigonometric identity.
3. \( \frac{1}{\cot u} = \) ________
4. \( \cos u = \) ________
5. \( \sin^2 u + \) ________ = 1
6. \( \cos \left( \frac{\pi}{2} - u \right) = \) ________
7. \( \csc(-u) = \) ________
8. sec\((-u) = \) ________

SKILLS AND APPLICATIONS
In Exercises 9–50, verify the identity.
9. \( \tan t \cot t = 1 \)
10. \( \sec y \cos y = 1 \)
11. \( \cot^2 y(\sec^2 y - 1) = 1 \)
12. \( \cos x + \sin x \tan x = \sec x \)
13. \( (1 + \sin \alpha)(1 - \sin \alpha) = \cos^2 \alpha \)
14. \( \cos^2 \beta - \sin^2 \beta = 2 \cos^2 \beta - 1 \)
15. \( \cos^2 \beta - \sin^2 \beta = 1 - 2 \sin^2 \beta \)
16. \( \sin^2 \alpha - \sin^4 \alpha = \cos^2 \alpha - \cos^4 \alpha \)
17. \( \frac{\tan^2 \theta}{\sec \theta} = \sin \theta \tan \theta \)
18. \( \frac{\cot^2 t}{\csc t} = \cos t(\csc^2 t - 1) \)
19. \( \frac{\cot^2 t}{\sin t} = 1 - \sin^2 t \)
20. \( \frac{1}{\tan \beta} + \tan \beta = \frac{\sec^2 \beta}{\tan \beta} \)
21. \( \sin^{1/2} x \cos x - \sin^{1/2} x \cos x = \cos^2 x \sin x \)
22. \( \frac{\sec^2 x (\sec x \tan x) - \sin^2 x (\sec x \tan x)}{\cos x \tan x} = \sec^3 x \tan^2 x \)
23. \( \cot x = \csc x - \sin x \)
24. \( \sec \theta - 1 = \frac{1}{1 - \cos \theta} = \sec \theta \)
25. \( \csc x - \sin x = \cos x \cot x \)
26. \( \sec x - \cos x = \sin x \tan x \)
27. \( \frac{1}{\tan x} + \frac{1}{\cot x} = \tan x + \cot x \)
28. \( \frac{1}{\sin x} - \frac{1}{\csc x} = \csc x - \sin x \)
29. \( \frac{\cos \theta}{\cos \theta + \sin \theta} + \frac{\sin \theta}{1 + \sin \theta} = 2 \sec \theta \)
30. \( \frac{\cos \theta \cot \theta}{1 - \sin \theta} - 1 = \csc \theta \)
31. \( \frac{1}{\cos x} + 1 + \frac{1}{\cos x - 1} = -2 \csc x \cot x \)
32. \( \cos x - \frac{\cos x}{1 - \tan x} = \frac{\sin x \cos x}{\sin x - \cos x} \)
33. \( \tan \left( \frac{\pi}{2} - \theta \right) = \frac{\tan \theta}{1 + \tan^2 \theta} \)
34. \( \frac{\cos(\pi/2 - \theta)}{\sin(\pi/2 - \theta)} = \tan x \)
35. \( \tan x \cot x = \sec x \)
36. \( \frac{\csc(-x)}{\sec(-x)} = -\cot x \)
37. \( (1 + \sin y)(1 + \sin(-y)) = \cos^2 y \)
38. \( \tan x + \tan y = \frac{\cot x + \cot y}{1 - \tan x \tan y} \)
39. \( \tan x + \cot y = \tan x + \cot y \)
40. \( \cos x - \cos y + \sin x - \sin y = 0 \)
41. \( \frac{\sqrt{1 + \sin \theta}}{\cos \theta} = 1 + \sin \theta \)
42. \( \frac{\sqrt{1 - \cos \theta}}{1 + \cos \theta} = 1 - \cos \theta \)
43. \( \cos^2 \beta + \cos^2 \left( \frac{\pi}{2} - \beta \right) = 1 \)
44. \( \sec^2 x - \cot^2 \left( \frac{\pi}{2} - y \right) = 1 \)
45. \( \sin t \csc \left( \frac{\pi}{2} - t \right) = \tan t \)
46. \( \sec \left( \frac{\pi}{2} - x \right) = \tan t \)
47. \( \tan(\sin^{-1} x) = \frac{x}{\sqrt{1 - x^2}} \)
48. \( \cos(\sin^{-1} x) = \frac{x}{\sqrt{1 - x^2}} \)
49. \( \tan \left( \sin^{-1} \left( \frac{x - 1}{4} \right) \right) = \frac{x - 1}{\sqrt{16 - (x - 1)^2}} \)
50. \( \tan \left( \cos^{-1} \left( \frac{x + 1}{2} \right) \right) = \frac{\sqrt{4 - (x + 1)^2}}{x + 1} \)
51. \[ (1 + \tan x)[1 + \cot(-x)] \]
   \[ = (1 + \tan x)(1 + \cot x) \]
   \[ = 1 + \cot x + \tan x + \tan x \cot x \]
   \[ = 1 + \cot x + \tan x + 1 \]
   \[ = 2 + \cot x + \tan x \]

52. \[ \frac{1 + \sec(-\theta)}{\sin(-\theta) + \tan(-\theta)} = \frac{1 - \sec \theta}{\sin \theta - \tan \theta} \]
   \[ = \frac{1 - \sec \theta}{\sin \theta(1 - \sec \theta)} \]
   \[ = \frac{1}{\sin \theta} = \csc \theta \]

**ERROR ANALYSIS** In Exercises 51 and 52, describe the error(s).

**70. SHADOW LENGTH** The length \( s \) of a shadow cast by a vertical gnomon (a device used to tell time) of height \( h \) when the angle of the sun above the horizon is \( \theta \) (see figure) can be modeled by the equation

\[ s = \frac{h \sin(90^\circ - \theta)}{\sin \theta} \]

(a) Verify that the equation for \( s \) is equal to \( h \cot \theta \).
(b) Use a graphing utility to complete the table. Let \( h = 5 \) feet.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>15°</th>
<th>30°</th>
<th>45°</th>
<th>60°</th>
<th>75°</th>
<th>90°</th>
</tr>
</thead>
<tbody>
<tr>
<td>( s )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(c) Use your table from part (b) to determine the angles of the sun that result in the maximum and minimum lengths of the shadow.
(d) Based on your results from part (c), what time of day do you think it is when the angle of the sun above the horizon is 90°?

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 71 and 72, determine whether the statement is true or false. Justify your answer.

71. There can be more than one way to verify a trigonometric identity.
72. The equation \( \sin^2 \theta + \cos^2 \theta = 1 + \tan^2 \theta \) is an identity because \( \sin^2(0) + \cos^2(0) = 1 \) and \( 1 + \tan^2(0) = 1 \).

**THINK ABOUT IT** In Exercises 73–77, explain why the equation is not an identity and find one value of the variable for which the equation is not true.

73. \( \sin \theta = \sqrt{1 - \cos^2 \theta} \)
74. \( \tan \theta = \sqrt{\sec^2 \theta - 1} \)
75. \( 1 - \cos \theta = \sin \theta \)
76. \( \csc \theta - 1 = \cot \theta \)
77. \( 1 + \tan \theta = \sec \theta \)

**78. CAPSTONE** Write a short paper in your own words explaining to a classmate the difference between a trigonometric identity and a conditional equation. Include suggestions on how to verify a trigonometric identity.
Introduction

To solve a trigonometric equation, use standard algebraic techniques such as collecting like terms and factoring. Your preliminary goal in solving a trigonometric equation is to isolate the trigonometric function in the equation. For example, to solve the equation $2 \sin x = 1$, divide each side by 2 to obtain

$$\sin x = \frac{1}{2}.$$ 

To solve for $x$, note in Figure 5.6 that the equation $\sin x = \frac{1}{2}$ has solutions $x = \frac{\pi}{6}$ and $x = \frac{5\pi}{6}$ in the interval $[0, 2\pi]$. Moreover, because $\sin x$ has a period of $2\pi$, there are infinitely many other solutions, which can be written as

$$x = \frac{\pi}{6} + 2n\pi \quad \text{and} \quad x = \frac{5\pi}{6} + 2n\pi \quad \text{General solution}$$

where $n$ is an integer, as shown in Figure 5.6.

Another way to show that the equation $\sin x = \frac{1}{2}$ has infinitely many solutions is indicated in Figure 5.7. Any angles that are coterminal with $\pi/6$ or $5\pi/6$ will also be solutions of the equation.

When solving trigonometric equations, you should write your answer(s) using exact values rather than decimal approximations.
Example 1  Collecting Like Terms

Solve \( \sin x + \sqrt{3} = -\sin x \).

Solution

Begin by rewriting the equation so that \( \sin x \) is isolated on one side of the equation.

\[
\begin{align*}
\sin x + \sqrt{3} &= -\sin x & \text{Write original equation.} \\
\sin x + \sin x + \sqrt{3} &= 0 & \text{Add } \sin x \text{ to each side.} \\
\sin x + \sin x &= -\sqrt{3} & \text{Subtract } \sqrt{3} \text{ from each side.} \\
2 \sin x &= -\sqrt{3} & \text{Combine like terms.} \\
\sin x &= -\frac{\sqrt{3}}{2} & \text{Divide each side by 2.}
\end{align*}
\]

Because \( \sin x \) has a period of \( 2\pi \), first find all solutions in the interval \([0, 2\pi]\). These solutions are \( x = 5\pi/4 \) and \( x = 7\pi/4 \). Finally, add multiples of \( 2\pi \) to each of these solutions to get the general form

\[
x = \frac{5\pi}{4} + 2n\pi \quad \text{and} \quad x = \frac{7\pi}{4} + 2n\pi \quad \text{General solution}
\]

where \( n \) is an integer.

CHECKPOINT Now try Exercise 11.

Example 2  Extracting Square Roots

Solve \( 3\tan^2 x - 1 = 0 \).

Solution

Begin by rewriting the equation so that \( \tan x \) is isolated on one side of the equation.

\[
\begin{align*}
3 \tan^2 x - 1 &= 0 & \text{Write original equation.} \\
3 \tan^2 x &= 1 & \text{Add 1 to each side.} \\
\tan^2 x &= \frac{1}{3} & \text{Divide each side by 3.} \\
\tan x &= \pm \frac{1}{\sqrt{3}} = \pm \frac{\sqrt{3}}{3} & \text{Extract square roots.}
\end{align*}
\]

Because \( \tan x \) has a period of \( \pi \), first find all solutions in the interval \([0, \pi]\). These solutions are \( x = \pi/6 \) and \( x = 5\pi/6 \). Finally, add multiples of \( \pi \) to each of these solutions to get the general form

\[
x = \frac{\pi}{6} + n\pi \quad \text{and} \quad x = \frac{5\pi}{6} + n\pi \quad \text{General solution}
\]

where \( n \) is an integer.

CHECKPOINT Now try Exercise 15.
Section 5.3 Solving Trigonometric Equations

The equations in Examples 1 and 2 involved only one trigonometric function. When two or more functions occur in the same equation, collect all terms on one side and try to separate the functions by factoring or by using appropriate identities. This may produce factors that yield no solutions, as illustrated in Example 3.

**Example 3** Factoring

Solve \( \cot x \cos^2 x = 2 \cot x \).

**Solution**

Begin by rewriting the equation so that all terms are collected on one side of the equation.

\[
\cot x \cos^2 x = 2 \cot x \\
\cot x \cos^2 x - 2 \cot x = 0 \\
\cot x(\cos^2 x - 2) = 0
\]

By setting each of these factors equal to zero, you obtain

\[
\cot x = 0 \quad \text{and} \quad \cos^2 x - 2 = 0
\]

\[
x = \frac{\pi}{2} \quad \text{and} \quad \cos x = \pm \sqrt{2}.
\]

The equation \( \cot x = 0 \) has the solution \( x = \pi/2 \) [in the interval \((0, \pi]\)]. No solution is obtained for \( \cos x = \pm \sqrt{2} \) because \( \pm \sqrt{2} \) are outside the range of the cosine function. Because \( \cot x \) has a period of \( \pi \), the general form of the solution is obtained by adding multiples of \( \pi \) to \( x = \pi/2 \), to get

\[
x = \frac{\pi}{2} + n\pi
\]

where \( n \) is an integer. You can confirm this graphically by sketching the graph of \( y = \cot x \cos^2 x - 2 \cot x \), as shown in Figure 5.8. From the graph you can see that the \( x \)-intercepts occur at \(-3\pi/2, -\pi/2, \pi/2, 3\pi/2, \) and so on. These \( x \)-intercepts correspond to the solutions of \( \cot x \cos^2 x - 2 \cot x = 0 \).

**CHECK POINT** Now try Exercise 19.

**Equations of Quadratic Type**

Many trigonometric equations are of quadratic type \( ax^2 + bx + c = 0 \). Here are a couple of examples.

**Quadratic in \( \sin x \)**

\[
2 \sin^2 x - \sin x - 1 = 0 
\]

**Quadratic in \( \sec x \)**

\[
\sec^2 x - 3 \sec x - 2 = 0 
\]

\[
2(\sin x)^2 - \sin x - 1 = 0 
\]

\[
(\sec x)^2 - 3(\sec x) - 2 = 0 
\]

To solve equations of this type, factor the quadratic or, if this is not possible, use the Quadratic Formula.

**Algebra Help**

You can review the techniques for solving quadratic equations in Appendix A.5.
Example 4  Factoring an Equation of Quadratic Type

Find all solutions of $2 \sin^2 x - \sin x - 1 = 0$ in the interval $[0, 2\pi)$.

**Algebraic Solution**

Begin by treating the equation as a quadratic in $\sin x$ and factoring.

\[
2 \sin^2 x - \sin x - 1 = 0 \quad \text{Write original equation.}
\]

\[
(2 \sin x + 1)(\sin x - 1) = 0 \quad \text{Factor.}
\]

Setting each factor equal to zero, you obtain the following solutions in the interval $[0, 2\pi)$.

\[
2 \sin x + 1 = 0 \quad \text{and} \quad \sin x - 1 = 0
\]

\[
\sin x = -\frac{1}{2} \quad \text{and} \quad \sin x = 1
\]

\[
x = \frac{7\pi}{6}, \frac{11\pi}{6} \quad \text{and} \quad x = \frac{\pi}{2}
\]

**Graphical Solution**

Use a graphing utility set in radian mode to graph $y = 2 \sin^2 x - \sin x - 1$ for $0 \leq x < 2\pi$, as shown in Figure 5.9. Use the zero or root feature or the zoom and trace features to approximate the $x$-intercepts to be

\[
x \approx 1.571 \approx \frac{\pi}{2}, \quad x \approx 3.665 \approx \frac{7\pi}{6}, \quad \text{and} \quad x \approx 5.760 \approx \frac{11\pi}{6}.
\]

These values are the approximate solutions of $2 \sin^2 x - \sin x - 1 = 0$ in the interval $[0, 2\pi)$.

![Figure 5.9](image)

**CHECKPoint** Now try Exercise 33.

Example 5  Rewriting with a Single Trigonometric Function

Solve $2 \sin^2 x + 3 \cos x - 3 = 0$.

**Solution**

This equation contains both sine and cosine functions. You can rewrite the equation so that it has only cosine functions by using the identity $\sin^2 x = 1 - \cos^2 x$.

\[
2 \sin^2 x + 3 \cos x - 3 = 0 \quad \text{Write original equation.}
\]

\[
2(1 - \cos^2 x) + 3 \cos x - 3 = 0 \quad \text{Pythagorean identity}
\]

\[
2 \cos^2 x - 3 \cos x + 1 = 0
\]

\[
(2 \cos x - 1)(\cos x - 1) = 0 \quad \text{Factor.}
\]

Set each factor equal to zero to find the solutions in the interval $[0, 2\pi)$.

\[
2 \cos x - 1 = 0 \quad \Rightarrow \quad \cos x = \frac{1}{2} \quad \Rightarrow \quad x = \frac{\pi}{3}, \frac{5\pi}{3}
\]

\[
\cos x - 1 = 0 \quad \Rightarrow \quad \cos x = 1 \quad \Rightarrow \quad x = 0
\]

Because $\cos x$ has a period of $2\pi$, the general form of the solution is obtained by adding multiples of $2\pi$ to get

\[
x = 2n\pi, \quad x = \frac{\pi}{3} + 2n\pi, \quad x = \frac{5\pi}{3} + 2n\pi
\]

**CHECKPoint** Now try Exercise 35.
Sometimes you must square each side of an equation to obtain a quadratic, as demonstrated in the next example. Because this procedure can introduce extraneous solutions, you should check any solutions in the original equation to see whether they are valid or extraneous.

**Example 6**  **Squaring and Converting to Quadratic Type**

Find all solutions of \( \cos x + 1 = \sin x \) in the interval \([0, 2\pi)\).

**Solution**

It is not clear how to rewrite this equation in terms of a single trigonometric function. Notice what happens when you square each side of the equation.

\[
\begin{align*}
\cos x + 1 &= \sin x & \text{Write original equation.} \\
\cos^2 x + 2 \cos x + 1 &= \sin^2 x & \text{Square each side.} \\
\cos^2 x + 2 \cos x + 1 &= 1 - \cos^2 x & \text{Pythagorean identity} \\
\cos^2 x + \cos^2 x + 2 \cos x + 1 - 1 &= 0 & \text{Rewrite equation.} \\
2 \cos^2 x + 2 \cos x &= 0 & \text{Combine like terms.} \\
2 \cos x(\cos x + 1) &= 0 & \text{Factor.}
\end{align*}
\]

Setting each factor equal to zero produces

\[
\begin{align*}
2 \cos x &= 0 & \text{and} & \cos x + 1 &= 0 \\
\cos x &= 0 & \cos x &= -1 \\
& \\
& x = \pi, \frac{3\pi}{2}, \frac{\pi}{2} & x &= \frac{\pi}{2}
\end{align*}
\]

Because you squared the original equation, check for extraneous solutions.

**Check** \( x = \pi/2 \)

\[
\begin{align*}
\cos \frac{\pi}{2} + 1 &= \sin \frac{\pi}{2} & \text{Substitute } \pi/2 \text{ for } x. \\
0 + 1 &= 1 & \text{Solution checks.} \checkmark
\end{align*}
\]

**Check** \( x = 3\pi/2 \)

\[
\begin{align*}
\cos \frac{3\pi}{2} + 1 &= \sin \frac{3\pi}{2} & \text{Substitute } 3\pi/2 \text{ for } x. \\
0 + 1 &= -1 & \text{Solution does not check.}
\end{align*}
\]

**Check** \( x = \pi \)

\[
\begin{align*}
\cos \pi + 1 &= \sin \pi & \text{Substitute } \pi \text{ for } x. \\
-1 + 1 &= 0 & \text{Solution checks.} \checkmark
\end{align*}
\]

Of the three possible solutions, \( x = 3\pi/2 \) is extraneous. So, in the interval \([0, 2\pi)\), the only two solutions are \( x = \pi/2 \) and \( x = \pi \).

Now try Exercise 37.
Functions Involving Multiple Angles

The next two examples involve trigonometric functions of multiple angles of the forms \( \sin ku \) and \( \cos ku \). To solve equations of these forms, first solve the equation for \( ku \), then divide your result by \( k \).

**Example 7** Functions of Multiple Angles

Solve \( 2 \cos 3t - 1 = 0 \).

**Solution**

\[
\begin{align*}
2 \cos 3t - 1 &= 0 & \text{Write original equation.} \\
2 \cos 3t &= 1 & \text{Add 1 to each side.} \\
\cos 3t &= \frac{1}{2} & \text{Divide each side by 2.}
\end{align*}
\]

In the interval \([0, 2\pi]\), you know that \( 3t = \pi/3 \) and \( 3t = 5\pi/3 \) are the only solutions, so, in general, you have

\[
3t = \frac{\pi}{3} + 2n\pi \quad \text{and} \quad 3t = \frac{5\pi}{3} + 2n\pi.
\]

Dividing these results by 3, you obtain the general solution

\[
\begin{align*}
t &= \frac{\pi}{9} + \frac{2n\pi}{3} & \text{and} & \quad t &= \frac{5\pi}{9} + \frac{2n\pi}{3} \quad \text{General solution}
\end{align*}
\]

where \( n \) is an integer.

**CHECKPOINT** Now try Exercise 39.

**Example 8** Functions of Multiple Angles

Solve \( 3 \tan \frac{x}{2} + 3 = 0 \).

**Solution**

\[
\begin{align*}
3 \tan \frac{x}{2} + 3 &= 0 & \text{Write original equation.} \\
3 \tan \frac{x}{2} &= -3 & \text{Subtract 3 from each side.} \\
\tan \frac{x}{2} &= -1 & \text{Divide each side by 3.}
\end{align*}
\]

In the interval \([0, \pi]\), you know that \( x/2 = 3\pi/4 \) is the only solution, so, in general, you have

\[
\frac{x}{2} = \frac{3\pi}{4} + n\pi.
\]

Multiplying this result by 2, you obtain the general solution

\[
\frac{x}{2} = \frac{3\pi}{2} + 2n\pi \quad \text{General solution}
\]

where \( n \) is an integer.

**CHECKPOINT** Now try Exercise 43.
Using Inverse Functions

In the next example, you will see how inverse trigonometric functions can be used to solve an equation.

**Example 9** Using Inverse Functions

Solve $\sec^2 x - 2 \tan x = 4$.

**Solution**

\[
\sec^2 x - 2 \tan x = 4 \\
1 + \tan^2 x - 2 \tan x - 4 = 0 \\
\tan^2 x - 2 \tan x - 3 = 0 \\
(\tan x - 3)(\tan x + 1) = 0
\]

Setting each factor equal to zero, you obtain two solutions in the interval \((-\pi/2, \pi/2)\).
[Recall that the range of the inverse tangent function is \((-\pi/2, \pi/2)\).]

\[
\tan x - 3 = 0 \quad \text{and} \quad \tan x + 1 = 0 \\
\tan x = 3 \quad \text{and} \quad \tan x = -1 \\
x = \arctan 3 \quad \text{and} \quad x = -\frac{\pi}{4}
\]

Finally, because $\tan x$ has a period of $\pi$, you obtain the general solution by adding multiples of $\pi$

\[
x = \arctan 3 + n\pi \quad \text{and} \quad x = -\frac{\pi}{4} + n\pi
\]

where $n$ is an integer. You can use a calculator to approximate the value of $\arctan 3$.

**CHECK POINT** Now try Exercise 63.

**CLASSROOM DISCUSSION**

**Equations with No Solutions** One of the following equations has solutions and the other two do not. Which two equations do not have solutions?

a. $\sin^2 x - 5 \sin x + 6 = 0$

b. $\sin^2 x - 4 \sin x + 6 = 0$

c. $\sin^2 x - 5 \sin x - 6 = 0$

Find conditions involving the constants $b$ and $c$ that will guarantee that the equation $\sin^2 x + b \sin x + c = 0$ has at least one solution on some interval of length $2\pi$. 
5.3 EXERCISES

VOCABULARY: Fill in the blanks.
1. When solving a trigonometric equation, the preliminary goal is to ________ the trigonometric function involved in the equation.
2. The equation \(2\sin \theta + 1 = 0\) has the solutions \(\theta = \frac{7\pi}{6} + 2n\pi\) and \(\theta = \frac{11\pi}{6} + 2n\pi\), which are called ________ solutions.
3. The equation \(2\tan^2 x - 3\tan x + 1 = 0\) is a trigonometric equation that is of ________ type.
4. A solution of an equation that does not satisfy the original equation is called an ________ solution.

SKILLS AND APPLICATIONS

In Exercises 5–10, verify that the \(x\)-values are solutions of the equation.
5. \(2\cos x - 1 = 0\)
   (a) \(x = \frac{\pi}{3}\)  (b) \(x = \frac{5\pi}{3}\)
6. \(\sec x - 2 = 0\)
   (a) \(x = \frac{\pi}{3}\)  (b) \(x = \frac{5\pi}{3}\)
7. \(3\tan^2 2x - 1 = 0\)
   (a) \(x = \frac{\pi}{12}\)  (b) \(x = \frac{5\pi}{12}\)
8. \(2\cos^2 4x - 1 = 0\)
   (a) \(x = \frac{\pi}{16}\)  (b) \(x = \frac{3\pi}{16}\)
9. \(2\sin^2 x - \sin x - 1 = 0\)
   (a) \(x = \frac{\pi}{2}\)  (b) \(x = \frac{7\pi}{6}\)
10. \(\csc^2 x - 4\csc x = 0\)
   (a) \(x = \frac{\pi}{6}\)  (b) \(x = \frac{5\pi}{6}\)

In Exercises 11–24, solve the equation.
11. \(2\cos x + 1 = 0\)
12. \(2\sin x + 1 = 0\)
13. \(\sqrt{3}\csc x - 2 = 0\)
14. \(\tan x + \sqrt{3} = 0\)
15. \(3\sec^2 x - 4 = 0\)
16. \(3\cot^2 x - 1 = 0\)
17. \(\sin x(\sin x + 1) = 0\)
18. \((3\tan^2 x - 1)(\tan^2 x - 3) = 0\)
19. \(4\cos^2 x - 1 = 0\)
20. \(\sin^2 x = 3\cos^2 x\)
21. \(2\sin^2 2x = 1\)
22. \(\tan^2 3x = 3\)
23. \(\tan 3x(\tan x - 1) = 0\)
24. \(\cos 2x(2\cos x + 1) = 0\)

In Exercises 25–38, find all solutions of the equation in the interval \([0, 2\pi]\).
25. \(\cos^3 x = \cos x\)
26. \(\sec^2 x - 1 = 0\)
27. \(3\tan^3 x = \tan x\)
28. \(2\sin^2 x = 2 + \cos x\)
29. \(\sec^2 x - \sec x = 2\)
30. \(\sec x \csc x = 2 \csc x\)
31. \(2\sin x + \csc x = 0\)
32. \(\sec x + \tan x = 1\)
33. \(2\cos^2 x + \cos x - 1 = 0\)
34. \(2\sin^2 x + 3\sin x + 1 = 0\)
35. \(2\sec^2 x + \tan^2 x - 3 = 0\)
36. \(\cos x + \sin x \tan x = 2\)
37. \(\csc x + \cot x = 1\)
38. \(\sin x - 2 = \cos x - 2\)

In Exercises 39–44, solve the multiple-angle equation.
39. \(\cos 2x = \frac{1}{2}\)
40. \(\sin 2x = -\frac{\sqrt{3}}{2}\)
41. \(\tan 3x = 1\)
42. \(\sec 4x = 2\)
43. \(\cos \frac{x}{2} = \frac{\sqrt{2}}{2}\)
44. \(\sin \frac{x}{2} = -\frac{\sqrt{3}}{2}\)

In Exercises 45–48, find the \(x\)-intercepts of the graph.
45. \(y = \sin \frac{\pi x}{2} + 1\)
46. \(y = \sin \pi x + \cos \pi x\)
47. \(y = \tan^2 \left(\frac{\pi x}{6}\right) - 3\)
48. \(y = \sec^2 \left(\frac{\pi x}{8}\right) - 4\)
In Exercises 49–58, use a graphing utility to approximate the solutions (to three decimal places) of the equation in the interval \([0, 2\pi]\).

49. \(2 \sin x + \cos x = 0\)
50. \(4 \sin^2 x + 2 \sin^2 x - 2 \sin x - 1 = 0\)
51. \(\frac{1 + \sin x}{\cos x} + \frac{\cos x}{1 + \sin x} = 4\)
52. \(\frac{\cos x \cot x}{1 - \sin x} = 3\)
53. \(x \tan x - 1 = 0\)
54. \(x \cos x - 1 = 0\)
55. \(\sec^2 x + 0.5 \tan x - 1 = 0\)
56. \(\csc^2 x + 0.5 \cot x - 5 = 0\)
57. \(2 \tan^2 x + 7 \tan x - 15 = 0\)
58. \(6 \sin^2 x - 7 \sin x + 2 = 0\)

In Exercises 59–62, use the Quadratic Formula to solve the equation in the interval \([0, 2\pi]\). Then use a graphing utility to approximate the angle \(x\).

59. \(12 \sin^2 x - 13 \sin x + 3 = 0\)
60. \(3 \tan^2 x + 4 \tan x - 4 = 0\)
61. \(\tan^2 x + 3 \tan x + 1 = 0\)
62. \(4 \cos^2 x - 4 \cos x - 1 = 0\)

In Exercises 63–74, use inverse functions where needed to find all solutions of the equation in the interval \([0, 2\pi]\).

63. \(\tan^2 x + \tan x - 12 = 0\)
64. \(\tan^2 x - \tan x - 2 = 0\)
65. \(\tan^2 x - 6 \tan x + 5 = 0\)
66. \(\sec^2 x + \tan x - 3 = 0\)
67. \(2 \cos^2 x - 5 \cos x + 2 = 0\)
68. \(2 \sin^2 x - 7 \sin x + 3 = 0\)
69. \(\cot^2 x - 9 = 0\)
70. \(\cot^2 x - 6 \cot x + 5 = 0\)
71. \(\sec^2 x - 4 \sec x = 0\)
72. \(\sec^2 x + 2 \sec x - 8 = 0\)
73. \(\csc^2 x + 3 \csc x - 4 = 0\)
74. \(\csc^2 x - 5 \csc x = 0\)

In Exercises 75–78, use a graphing utility to approximate the solutions (to three decimal places) of the equation in the given interval.

75. \(3 \tan^2 x + 5 \tan x - 4 = 0, \left[\frac{-\pi}{2}, \frac{\pi}{2}\right]\)
76. \(\cos^2 x - 2 \cos x - 1 = 0, \left[0, \pi\right]\)
77. \(4 \cos^2 x - 2 \sin x + 1 = 0, \left[\frac{-\pi}{2}, \frac{\pi}{2}\right]\)
78. \(2 \sec^2 x + \tan x - 6 = 0, \left[\frac{-\pi}{2}, \frac{\pi}{2}\right]\)

In Exercises 79–84, (a) use a graphing utility to graph the function and approximate the maximum and minimum points on the graph in the interval \([0, 2\pi]\), and (b) solve the trigonometric equation and demonstrate that its solutions are the \(x\)-coordinates of the maximum and minimum points of \(f\). (Calculus is required to find the trigonometric equation.)

**FIXED POINT** In Exercises 85 and 86, find the smallest positive fixed point of the function \(f\). [A fixed point of a function \(f\) is a real number \(c\) such that \(f(c) = c\).]

85. \(f(x) = \tan \frac{\pi x}{4}\)
86. \(f(x) = \cos x\)

87. **GRAPHICAL REASONING** Consider the function given by

\[f(x) = \cos \frac{1}{x}\]

and its graph shown in the figure.

(a) What is the domain of the function?
(b) Identify any symmetry and any asymptotes of the graph.
(c) Describe the behavior of the function as \(x \to 0\).
(d) How many solutions does the equation

\[\cos \frac{1}{x} = 0\]

have in the interval \([-1, 1]\)? Find the solutions.
(e) Does the equation \(\cos(1/x) = 0\) have a greatest solution? If so, approximate the solution. If not, explain why.
88. **GRAPHICAL REASONING** Consider the function given by \( f(x) = \frac{\sin x}{x} \) and its graph shown in the figure.

(a) What is the domain of the function?
(b) Identify any symmetry and any asymptotes of the graph.
(c) Describe the behavior of the function as \( x \to 0 \).
(d) How many solutions does the equation \( \frac{\sin x}{x} = 0 \) have in the interval \([-8, 8]\)? Find the solutions.

89. **HARMONIC MOTION** A weight is oscillating on the end of a spring (see figure). The position of the weight relative to the point of equilibrium is given by \( y = \frac{1}{10}(\cos 8t - 3 \sin 8t) \), where \( y \) is the displacement (in meters) and \( t \) is the time (in seconds). Find the times when the weight is at the point of equilibrium (\( y = 0 \)) for \( 0 \leq t \leq 1 \).

90. **DAMPED HARMONIC MOTION** The displacement from equilibrium of a weight oscillating on the end of a spring is given by \( y = 1.56e^{-0.22t} \cos 4.9t \), where \( y \) is the displacement (in feet) and \( t \) is the time (in seconds). Use a graphing utility to graph the displacement function for \( 0 \leq t \leq 10 \). Find the time beyond which the displacement does not exceed 1 foot from equilibrium.

91. **SALES** The monthly sales \( S \) (in thousands of units) of a seasonal product are approximated by

\[
S = 74.50 + 43.75 \sin \frac{\pi t}{6}
\]

where \( t \) is the time (in months), with \( t = 1 \) corresponding to January. Determine the months in which sales exceed 100,000 units.

92. **SALES** The monthly sales \( S \) (in hundreds of units) of skiing equipment at a sports store are approximated by

\[
S = 58.3 + 32.5 \cos \frac{\pi t}{6}
\]

where \( t \) is the time (in months), with \( t = 1 \) corresponding to January. Determine the months in which sales exceed 7500 units.

93. **PROJECTILE MOTION** A batted baseball leaves the bat at an angle of with the horizontal and an initial velocity of \( v_0 = 100 \) feet per second. The ball is caught by an outfielder 300 feet from home plate (see figure). Find \( \theta \) if the range \( r \) of a projectile is given by

\[
r = \frac{1}{12}v_0^2 \sin 2\theta.
\]

94. **PROJECTILE MOTION** A sharpshooter intends to hit a target at a distance of 1000 yards with a gun that has a muzzle velocity of 1200 feet per second (see figure). Neglecting air resistance, determine the gun’s minimum angle of elevation \( \theta \) if the range \( r \) is given by

\[
r = \frac{1}{32}v_0^2 \sin 2\theta.
\]

95. **FERRIS WHEEL** A Ferris wheel is built such that the height \( h \) (in feet) above ground of a seat on the wheel at time \( t \) (in minutes) can be modeled by

\[
h(t) = 53 + 50 \sin \left( \frac{\pi t - \frac{\pi}{2}}{16} \right).
\]

The wheel makes one revolution every 32 seconds. The ride begins when \( t = 0 \).

(a) During the first 32 seconds of the ride, when will a person on the Ferris wheel be 53 feet above ground?
(b) When will a person be at the top of the Ferris wheel for the first time during the ride? If the ride lasts 160 seconds, how many times will a person be at the top of the ride, and at what times?
96. **DATA ANALYSIS: METEOROLOGY** The table shows the average daily high temperatures in Houston $H$ (in degrees Fahrenheit) for month $t$, with $t = 1$ corresponding to January. (Source: National Climatic Data Center)

<table>

</table>

(a) Create a scatter plot of the data.
(b) Find a cosine model for the temperatures in Houston.
(c) Use a graphing utility to graph the data points and the model for the temperatures in Houston. How well does the model fit the data?
(d) What is the overall average daily high temperature in Houston?
(e) Use a graphing utility to describe the months during which the average daily high temperature is above $86^\circ F$ and below $86^\circ F$.

97. **GEOMETRY** The area of a rectangle (see figure) inscribed in one arc of the graph of $y = \cos x$ is given by $A = 2x \cos x$, $0 < x < \pi/2$.

(a) Use a graphing utility to graph the area function, and approximate the area of the largest inscribed rectangle.
(b) Determine the values of $x$ for which $A \geq 1$.

98. **QUADRATIC APPROXIMATION** Consider the function given by $f(x) = 3 \sin(0.6x - 2)$.
(a) Approximate the zero of the function in the interval $[0, 6]$.

(b) A quadratic approximation agreeing with $f$ at $x = 5$ is $g(x) = -0.45x^2 + 5.52x - 13.70$. Use a graphing utility to graph $f$ and $g$ in the same viewing window. Describe the result.
(c) Use the Quadratic Formula to find the zeros of $g$. Compare the zero in the interval $[0, 6]$ with the result of part (a).

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 99 and 100, determine whether the statement is true or false. Justify your answer.

99. The equation $2 \sin 4t - 1 = 0$ has four times the number of solutions in the interval $[0, 2\pi)$ as the equation $2 \sin t - 1 = 0$.

100. If you correctly solve a trigonometric equation to the statement then you can finish solving the equation by using an inverse function.

101. **THINK ABOUT IT** Explain what would happen if you divided each side of the equation $\cot x \cos^2 x = 2 \cot x \cos x$ by $\cot x$. Is this a correct method to use when solving equations?

102. **GRAPHICAL REASONING** Use a graphing utility to confirm the solutions found in Example 6 in two different ways.
   (a) Graph both sides of the equation and find the x-coordinates of the points at which the graphs intersect.
   Left side: $y = \cos x + 1$
   Right side: $y = \sin x$
   (b) Graph the equation $y = \cos x + 1 - \sin x$ and find the x-intercepts of the graph. Do both methods produce the same x-values? Which method do you prefer? Explain.

103. Explain in your own words how knowledge of algebra is important when solving trigonometric equations.

104. **CAPSTONE** Consider the equation $2 \sin x - 1 = 0$.
   Explain the similarities and differences between finding all solutions in the interval $[0, \pi/2)$, finding all solutions in the interval $[0, 2\pi)$, and finding the general solution.

**PROJECT: METEOROLOGY** To work an extended application analyzing the normal daily high temperatures in Phoenix and in Seattle, visit this text’s website at academic.cengage.com. (Data Source: NOAA)
Using Sum and Difference Formulas

In this and the following section, you will study the uses of several trigonometric identities and formulas.

**Sum and Difference Formulas**

\[
\begin{align*}
\sin(u + v) &= \sin u \cos v + \cos u \sin v \\
\sin(u - v) &= \sin u \cos v - \cos u \sin v \\
\cos(u + v) &= \cos u \cos v - \sin u \sin v \\
\cos(u - v) &= \cos u \cos v + \sin u \sin v \\
\tan(u + v) &= \frac{\tan u + \tan v}{1 - \tan u \tan v} \\
\tan(u - v) &= \frac{\tan u - \tan v}{1 + \tan u \tan v}
\end{align*}
\]

For a proof of the sum and difference formulas, see Proofs in Mathematics on page 422.

Examples 1 and 2 show how **sum and difference formulas** can be used to find exact values of trigonometric functions involving sums or differences of special angles.

**Example 1** Evaluating a Trigonometric Function

Find the exact value of \( \sin \frac{\pi}{12} \).

**Solution**

To find the exact value of \( \sin \frac{\pi}{12} \), use the fact that

\[
\frac{\pi}{12} = \frac{\pi}{3} - \frac{\pi}{4}.
\]

Consequently, the formula for \( \sin(u - v) \) yields

\[
\begin{align*}
\sin \frac{\pi}{12} &= \sin \left( \frac{\pi}{3} - \frac{\pi}{4} \right) \\
&= \sin \frac{\pi}{3} \cos \frac{\pi}{4} - \cos \frac{\pi}{3} \sin \frac{\pi}{4} \\
&= \frac{\sqrt{3}}{2} \left( \frac{\sqrt{2}}{2} \right) - \frac{1}{2} \left( \frac{\sqrt{2}}{2} \right) \\
&= \frac{\sqrt{6} - \sqrt{2}}{4}.
\end{align*}
\]

Try checking this result on your calculator. You will find that \( \sin \frac{\pi}{12} \approx 0.259 \).

**CHECKPOINT** Now try Exercise 7.
Section 5.4  Sum and Difference Formulas

**Study Tip**

Another way to solve Example 2 is to use the fact that $75^\circ = 120^\circ - 45^\circ$ together with the formula for $\cos(u - v)$.

**Example 2  Evaluating a Trigonometric Function**

Find the exact value of $\cos 75^\circ$.

**Solution**

Using the fact that $75^\circ = 30^\circ + 45^\circ$, together with the formula for $\cos(u + v)$, you obtain

$$\begin{align*}
\cos 75^\circ &= \cos(30^\circ + 45^\circ) \\
&= \cos 30^\circ \cos 45^\circ - \sin 30^\circ \sin 45^\circ \\
&= \frac{\sqrt{3}}{2} \left( \frac{\sqrt{2}}{2} \right) - \frac{1}{2} \left( \frac{\sqrt{2}}{2} \right) \\
&= \frac{\sqrt{6} - \sqrt{2}}{4}.
\end{align*}$$

**CHECK Point** Now try Exercise 11.

**Example 3  Evaluating a Trigonometric Expression**

Find the exact value of $\sin(u + v)$ given

$$\sin u = \frac{4}{5}, \text{ where } 0 < u < \frac{\pi}{2}, \text{ and } \cos v = -\frac{12}{13}, \text{ where } \frac{\pi}{2} < v < \pi.$$

**Solution**

Because $\sin u = 4/5$ and $u$ is in Quadrant I, $\cos u = 3/5$, as shown in Figure 5.10. Because $\cos v = -12/13$ and $v$ is in Quadrant II, $\sin v = 5/13$, as shown in Figure 5.11. You can find $\sin(u + v)$ as follows.

$$\begin{align*}
\sin(u + v) &= \sin u \cos v + \cos u \sin v \\
&= \left( \frac{4}{5} \right) \left( -\frac{12}{13} \right) + \left( \frac{3}{5} \right) \left( \frac{5}{13} \right) \\
&= -\frac{48}{65} + \frac{15}{65} \\
&= -\frac{33}{65}.
\end{align*}$$

**CHECK Point** Now try Exercise 43.

**Example 4  An Application of a Sum Formula**

Write $\cos(\arctan 1 + \arccos x)$ as an algebraic expression.

**Solution**

This expression fits the formula for $\cos(u + v)$. Angles $u = \arctan 1$ and $v = \arccos x$ are shown in Figure 5.12. So

$$\begin{align*}
\cos(u + v) &= \cos(\arctan 1) \cos(\arccos x) - \sin(\arctan 1) \sin(\arccos x) \\
&= \frac{1}{\sqrt{2}} \cdot x - \frac{1}{\sqrt{2}} \cdot \sqrt{1-x^2} \\
&= x - \frac{\sqrt{1-x^2}}{\sqrt{2}}.
\end{align*}$$

**CHECK Point** Now try Exercise 57.
Example 5 shows how to use a difference formula to prove the cofunction identity
\[
\cos\left(\frac{\pi}{2} - x\right) = \sin x.
\]

### Example 5  Proving a Cofunction Identity

Prove the cofunction identity \(\cos\left(\frac{\pi}{2} - x\right) = \sin x\).

#### Solution

Using the formula for \(\cos(u - v)\), you have
\[
\cos\left(\frac{\pi}{2} - x\right) = \cos\frac{\pi}{2}\cos x + \sin\frac{\pi}{2}\sin x
\]
\[
= (0)(\cos x) + (1)(\sin x)
\]
\[
= \sin x.
\]

**CHECK Point** Now try Exercise 61.

Sum and difference formulas can be used to rewrite expressions such as
\[
\sin\left(\theta + \frac{n\pi}{2}\right) \text{ and } \cos\left(\theta + \frac{n\pi}{2}\right), \text{ where } n \text{ is an integer}
\]
as expressions involving only \(\sin \theta\) or \(\cos \theta\). The resulting formulas are called **reduction formulas**.

### Example 6  Deriving Reduction Formulas

Simplify each expression.

a. \(\cos\left(\theta - \frac{3\pi}{2}\right)\) 

b. \(\tan(\theta + 3\pi)\)

#### Solution

**a.** Using the formula for \(\cos(u - v)\), you have
\[
\cos\left(\theta - \frac{3\pi}{2}\right) = \cos \theta \cos \frac{3\pi}{2} + \sin \theta \sin \frac{3\pi}{2}
\]
\[
= (\cos \theta)(0) + (\sin \theta)(-1)
\]
\[
= -\sin \theta.
\]

**b.** Using the formula for \(\tan(u + v)\), you have
\[
\tan(\theta + 3\pi) = \frac{\tan \theta + \tan 3\pi}{1 - \tan \theta \tan 3\pi}
\]
\[
= \frac{\tan \theta + 0}{1 - (\tan \theta)(0)}
\]
\[
= \tan \theta.
\]

**CHECK Point** Now try Exercise 73.
Section 5.4  Sum and Difference Formulas

The next example was taken from calculus. It is used to derive the derivative of the sine function.

### Example 8  An Application from Calculus

Verify that \( \frac{\sin(x + h) - \sin x}{h} = (\cos x)\left(\frac{\sin h}{h}\right) - (\sin x)\left(\frac{1 - \cos h}{h}\right) \) where \( h \neq 0 \).

**Solution**

Using the formula for \( \sin(u + v) \), you have

\[
\frac{\sin(x + h) - \sin x}{h} = \frac{\sin x \cos h + \cos x \sin h - \sin x}{h}
\]

\[
= \frac{\cos x \sin h - \sin x(1 - \cos h)}{h}
\]

\[
= (\cos x)\left(\frac{\sin h}{h}\right) - (\sin x)\left(\frac{1 - \cos h}{h}\right).
\]

**CHECK Point**  Now try Exercise 105.
In Exercises 7–12, find the exact value of each expression.

1. \( \sin(u - v) = \) 
2. \( \cos(u + v) = \) 
3. \( \tan(u + v) = \) 
4. \( \sin(u + v) = \) 
5. \( \cos(u - v) = \) 
6. \( \tan(u - v) = \) 

**Skills and Applications**

In Exercises 7–12, find the exact value of each expression.

7. (a) \( \cos \left( \frac{\pi}{4} + \frac{\pi}{3} \right) \) (b) \( \cos \frac{\pi}{4} + \cos \frac{\pi}{3} \)
8. (a) \( \sin \left( \frac{3\pi}{4} + \frac{5\pi}{6} \right) \) (b) \( \sin \frac{3\pi}{4} + \sin \frac{5\pi}{6} \)
9. (a) \( \sin \left( \frac{7\pi}{6} - \frac{\pi}{3} \right) \) (b) \( \sin \frac{7\pi}{6} - \sin \frac{\pi}{3} \)
10. (a) \( \cos(120^\circ + 45^\circ) \) (b) \( \cos 120^\circ + \cos 45^\circ \)
11. (a) \( \sin(135^\circ - 30^\circ) \) (b) \( \sin 135^\circ - \cos 30^\circ \)
12. (a) \( \sin(315^\circ - 60^\circ) \) (b) \( \sin 315^\circ - \sin 60^\circ \)

In Exercises 13–28, find the exact values of the sine, cosine, and tangent of the angle.

13. \( \frac{11\pi}{12} = \frac{3\pi}{4} + \frac{\pi}{6} \)
14. \( \frac{7\pi}{12} = \frac{\pi}{3} + \frac{\pi}{4} \)
15. \( \frac{17\pi}{12} = \frac{9\pi}{4} - \frac{5\pi}{6} \)
16. \( \frac{\pi}{12} = \frac{\pi}{6} - \frac{\pi}{4} \)
17. \( 105^\circ = 60^\circ + 45^\circ \)
18. \( 165^\circ = 135^\circ + 30^\circ \)
19. \( 195^\circ = 225^\circ - 30^\circ \)
20. \( 255^\circ = 300^\circ - 45^\circ \)
21. \( \frac{13\pi}{12} \)
22. \( \frac{-7\pi}{12} \)
23. \( \frac{-13\pi}{12} \)
24. \( \frac{5\pi}{12} \)
25. \( 285^\circ \)
26. \( -105^\circ \)
27. \( -165^\circ \)
28. \( 15^\circ \)

In Exercises 29–36, write the expression as the sine, cosine, or tangent of an angle.

29. \( \sin 3 \cos 1.2 - \cos 3 \sin 1.2 \)
30. \( \cos \frac{\pi}{7} \cos \frac{\pi}{5} - \sin \frac{\pi}{7} \sin \frac{\pi}{5} \)
31. \( \sin 60^\circ \cos 15^\circ + \cos 60^\circ \sin 15^\circ \)
32. \( \cos 130^\circ \cos 40^\circ - \sin 130^\circ \sin 40^\circ \)
33. \( \tan 45^\circ - \tan 30^\circ \)
34. \( \tan 140^\circ - \tan 60^\circ \)
35. \( \frac{\tan 2x + \tan x}{1 - \tan 2x \tan x} \)
36. \( \cos 3x \cos 2y + \sin 3x \sin 2y \)

In Exercises 37–42, find the exact value of the expression.

37. \( \sin \frac{\pi}{12} \cos \frac{\pi}{4} + \cos \frac{\pi}{12} \sin \frac{\pi}{4} \)
38. \( \cos \frac{\pi}{16} \cos \frac{3\pi}{16} - \sin \frac{\pi}{16} \sin \frac{3\pi}{16} \)
39. \( \sin 120^\circ \cos 60^\circ - \cos 120^\circ \sin 60^\circ \)
40. \( \cos 120^\circ \cos 30^\circ + \sin 120^\circ \sin 30^\circ \)
41. \( \frac{\tan(5\pi/6) - \tan(\pi/6)}{1 + \tan(5\pi/6) \tan(\pi/6)} \)
42. \( \frac{\tan 25^\circ + \tan 110^\circ}{1 - \tan 25^\circ \tan 110^\circ} \)

In Exercises 43–50, find the exact value of the trigonometric function given that \( \sin u = \frac{\sqrt{3}}{2} \) and \( \cos v = -\frac{3}{5} \). (Both \( u \) and \( v \) are in Quadrant II.)

43. \( \sin(u + v) \)
44. \( \cos(u - v) \)
45. \( \cos(u + v) \)
46. \( \sin(v - u) \)
47. \( \tan(u + v) \)
48. \( \csc(u - v) \)
49. \( \sec(v - u) \)
50. \( \cot(u + v) \)

In Exercises 51–56, find the exact value of the trigonometric function given that \( \sin u = -\frac{1}{2} \) and \( \cos v = -\frac{3}{5} \). (Both \( u \) and \( v \) are in Quadrant III.)

51. \( \cos(u + v) \)
52. \( \sin(u + v) \)
53. \( \tan(u - v) \)
54. \( \cot(v - u) \)
55. \( \csc(u - v) \)
56. \( \sec(v - u) \)

In Exercises 57–60, write the trigonometric expression as an algebraic expression.

57. \( \sin(\arcsin x + \arccos x) \)
58. \( \sin(\arctan 2x - \arccos x) \)
59. \( \cos(\arccos x + \arcsin x) \)
60. \( \cos(\arccos x - \arctan x) \)

In Exercises 61–70, prove the identity.

61. \( \sin \left( \frac{\pi}{2} - x \right) = \cos x \)  
62. \( \sin \left( \frac{\pi}{2} + x \right) = \cos x \)

63. \( \sin \left( \frac{\pi}{6} + x \right) = \frac{1}{2} (\cos x + \sqrt{3} \sin x) \)

64. \( \cos \left( \frac{5\pi}{4} - x \right) = -\frac{\sqrt{2}}{2} (\cos x + \sin x) \)

65. \( \cos(\pi - \theta) + \sin \left( \frac{\pi}{2} + \theta \right) = 0 \)

66. \( \tan \left( \frac{\pi}{4} - \theta \right) = \frac{1 - \tan \theta}{1 + \tan \theta} \)

67. \( \cos(x + y) \cos(x - y) = \cos^2 x - \sin^2 y \)

68. \( \sin(x + y) \sin(x - y) = \sin^2 x - \sin^2 y \)

69. \( \cos(x + y) + \sin(x - y) = 2 \sin x \cos y \)

70. \( \cos(x + y) + \cos(x - y) = 2 \cos x \cos y \)

In Exercises 71–74, simplify the expression algebraically and use a graphing utility to confirm your answer graphically.

71. \( \cos \left( \frac{3\pi}{2} - x \right) \)

72. \( \cos(\pi + x) \)

73. \( \sin \left( \frac{3\pi}{2} + \theta \right) \)

74. \( \tan(\pi + \theta) \)

In Exercises 75–84, find all solutions of the equation in the interval \([0, 2\pi]\).

75. \( \sin(x + \pi) - \sin x + 1 = 0 \)

76. \( \sin(x + \pi) - \sin x - 1 = 0 \)

77. \( \cos(x + \pi) - \cos x - 1 = 0 \)

78. \( \cos(x + \pi) - \cos x + 1 = 0 \)

79. \( \sin \left( x + \frac{\pi}{6} \right) - \sin \left( x + \frac{\pi}{6} \right) = \frac{1}{2} \)

80. \( \sin \left( x + \frac{\pi}{3} \right) + \sin \left( x - \frac{\pi}{3} \right) = 1 \)

81. \( \cos \left( x + \frac{\pi}{4} \right) - \cos \left( x + \frac{\pi}{4} \right) = 1 \)

82. \( \tan(x + \pi) + 2 \sin(x + \pi) = 0 \)

83. \( \sin \left( x + \frac{\pi}{2} \right) - \cos^2 x = 0 \)

84. \( \cos \left( x - \frac{\pi}{2} \right) + \sin^2 x = 0 \)

In Exercises 85–88, use a graphing utility to approximate the solutions in the interval \([0, 2\pi]\).

85. \( \cos \left( x + \frac{\pi}{4} \right) + \cos \left( x - \frac{\pi}{4} \right) = 1 \)

86. \( \tan(x + \pi) - \cos \left( x + \frac{\pi}{2} \right) = 0 \)

87. \( \sin \left( x + \frac{\pi}{2} \right) + \cos^2 x = 0 \)

88. \( \cos \left( x - \frac{\pi}{2} \right) - \sin^2 x = 0 \)

89. HARMONIC MOTION A weight is attached to a spring suspended vertically from a ceiling. When a driving force is applied to the system, the weight moves vertically from its equilibrium position, and this motion is modeled by

\[ y = \frac{1}{3} \sin 2t + \frac{1}{4} \cos 2t \]

where \( y \) is the distance from equilibrium (in feet) and \( t \) is the time (in seconds).

(a) Use the identity

\[ a \sin B\theta + b \cos B\theta = \sqrt{a^2 + b^2} \sin(B\theta + C) \]

where \( C = \arctan(b/a) \), \( a > 0 \), to write the model in the form \( y = \sqrt{a^2 + b^2} \sin(Bt + C) \).

(b) Find the amplitude of the oscillations of the weight.

(c) Find the frequency of the oscillations of the weight.

90. STANDING WAVES The equation of a standing wave is obtained by adding the displacements of two waves traveling in opposite directions (see figure). Assume that each of the waves has amplitude \( A \), period \( T \), and wavelength \( \lambda \). If the models for these waves are

\[ y_1 = A \cos \frac{2\pi}{T} \left( \frac{t}{T} - \frac{x}{\lambda} \right) \quad \text{and} \quad y_2 = A \cos \frac{2\pi}{T} \left( \frac{t}{T} + \frac{x}{\lambda} \right) \]

show that

\[ y_1 + y_2 = 2A \cos \frac{2\pi}{T} \cos \frac{2\pi x}{\lambda} \]
EXPLORATION

TRUE OR FALSE? In Exercises 91–94, determine whether the statement is true or false. Justify your answer.

91. \( \sin(u \pm v) = \sin u \cos v \pm \cos u \sin v \)
92. \( \cos(u \pm v) = \cos u \cos v \pm \sin u \sin v \)
93. \( \tan\left(x - \frac{\pi}{4}\right) = \frac{\tan x + 1}{1 - \tan x} \)
94. \( \sin\left(x - \frac{\pi}{2}\right) = -\cos x \)

In Exercises 95–98, verify the identity.

95. \( \cos(n \pi + \theta) = (-1)^n \cos \theta, \quad n \text{ is an integer} \)
96. \( \sin(n \pi + \theta) = (-1)^n \sin \theta, \quad n \text{ is an integer} \)
97. \( a \sin B \theta + b \cos B \theta = \sqrt{a^2 + b^2} \sin(B \theta + C), \quad \text{where } C = \arctan(b/a) \text{ and } a > 0 \)
98. \( a \sin B \theta + b \cos B \theta = \sqrt{a^2 + b^2} \cos(B \theta - C), \quad \text{where } C = \arctan(a/b) \text{ and } b > 0 \)

In Exercises 99–102, use the formulas given in Exercises 97 and 98 to write the trigonometric expression in the following forms.

(a) \( \sqrt{a^2 + b^2} \sin(B \theta + C) \)
(b) \( \sqrt{a^2 + b^2} \cos(B \theta - C) \)
99. \( \sin \theta + \cos \theta \)
100. \( 3 \sin 2 \theta + 4 \cos 2 \theta \)
101. \( 12 \sin 3 \theta + 5 \cos 3 \theta \)
102. \( 2 \sin \theta + \cos \theta \)

(a) \( \frac{\cos(x + h) - \cos x}{h} = \frac{\cos x (\cos h - 1)}{h} - \frac{\sin x \sin h}{h} \)
(b) \( \frac{\sin(x + h) - \sin x}{h} = \frac{\sin x (\sin h - 1)}{h} + \frac{\cos x \cos h}{h} \)

103. \( 2 \sin\left(\theta + \frac{\pi}{4}\right) \)
104. \( 5 \cos\left(\theta - \frac{\pi}{4}\right) \)

105. Verify the following identity used in calculus.

\[ \frac{\cos(x + h) - \cos x}{h} = \frac{\cos x (\cos h - 1)}{h} - \frac{\sin x \sin h}{h} \]

106. Let \( x = \pi/6 \) in the identity in Exercise 105 and define the functions \( f \) and \( g \) as follows.

\[ f(h) = \frac{\cos((\pi/6) + h) - \cos(\pi/6)}{h} \]
\[ g(h) = \frac{\pi}{6} \left( \cos h - 1 \right) - \frac{\pi}{6} \left( \sin h \right) \]

(a) What are the domains of the functions \( f \) and \( g \)?
(b) Use a graphing utility to complete the table.

<table>
<thead>
<tr>
<th>( h )</th>
<th>0.5</th>
<th>0.2</th>
<th>0.1</th>
<th>0.05</th>
<th>0.02</th>
<th>0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(h) )</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>( g(h) )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(c) Use a graphing utility to graph the functions \( f \) and \( g \).
(d) Use the table and the graphs to make a conjecture about the values of the functions \( f \) and \( g \) as \( h \to 0 \).

In Exercises 107 and 108, use the figure, which shows two lines whose equations are \( y_1 = m_1 x + b_1 \) and \( y_2 = m_2 x + b_2 \). Assume that both lines have positive slopes. Derive a formula for the angle between the two lines. Then use your formula to find the angle between the given pair of lines.

107. \( y = x \) and \( y = \sqrt{3} x \)
108. \( y = x \) and \( y = \frac{1}{\sqrt{3}} x \)

In Exercises 109 and 110, use a graphing utility to graph \( y_1 \) and \( y_2 \) in the same viewing window. Use the graphs to determine whether \( y_1 = y_2 \). Explain your reasoning.

109. \( y_1 = \cos(x + 2), \quad y_2 = \cos x + \cos 2 \)
110. \( y_1 = \sin(x + 4), \quad y_2 = \sin x + \sin 4 \)

111. PROOF

(a) Write a proof of the formula for \( \sin(u + v) \).
(b) Write a proof of the formula for \( \sin(u - v) \).

112. CAPSTONE Give an example to justify each statement.

(a) \( \sin(u + v) \neq \sin u + \sin v \)
(b) \( \sin(u - v) \neq \sin u - \sin v \)
(c) \( \cos(u + v) \neq \cos u + \cos v \)
(d) \( \cos(u - v) \neq \cos u - \cos v \)
(e) \( \tan(u + v) \neq \tan u + \tan v \)
(f) \( \tan(u - v) \neq \tan u - \tan v \)
5.5 Multiple-Angle and Product-to-Sum Formulas

What you should learn

- Use multiple-angle formulas to rewrite and evaluate trigonometric functions.
- Use power-reducing formulas to rewrite and evaluate trigonometric functions.
- Use half-angle formulas to rewrite and evaluate trigonometric functions.
- Use product-to-sum and sum-to-product formulas to rewrite and evaluate trigonometric functions.
- Use trigonometric formulas to rewrite real-life models.

Why you should learn it

You can use a variety of trigonometric formulas to rewrite trigonometric functions in more convenient forms. For instance, in Exercise 135 on page 415, you can use a double-angle formula to determine at what angle an athlete must throw a javelin.

Multiple-Angle Formulas

In this section, you will study four other categories of trigonometric identities.

1. The first category involves functions of multiple angles such as \( \sin ku \) and \( \cos ku \).
2. The second category involves squares of trigonometric functions such as \( \sin^2 u \).
3. The third category involves functions of half-angles such as \( \sin(u/2) \).
4. The fourth category involves products of trigonometric functions such as \( \sin u \cos v \).

You should learn the double-angle formulas because they are used often in trigonometry and calculus. For proofs of these formulas, see Proofs in Mathematics on page 423.

Double-Angle Formulas

<table>
<thead>
<tr>
<th>Formula</th>
<th>Derivation</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ \sin 2u = 2 \sin u \cos u ]</td>
<td>Write original equation.</td>
</tr>
<tr>
<td>[ \cos 2u = \cos^2 u - \sin^2 u ]</td>
<td>Double-angle formula</td>
</tr>
<tr>
<td>[ \tan 2u = \frac{2 \tan u}{1 - \tan^2 u} ]</td>
<td>Factor.</td>
</tr>
</tbody>
</table>

Example 1 Solving a Multiple-Angle Equation

Solve \( 2 \cos x + \sin 2x = 0 \).

Solution

Begin by rewriting the equation so that it involves functions of \( x \) (rather than \( 2x \)). Then factor and solve.

\[
2 \cos x + \sin 2x = 0 \quad \text{Write original equation.}
\]
\[
2 \cos x + 2 \sin x \cos x = 0 \quad \text{Double-angle formula}
\]
\[
2 \cos x(1 + \sin x) = 0 \quad \text{Factor.}
\]
\[
2 \cos x = 0 \quad \text{and} \quad 1 + \sin x = 0 \quad \text{Set factors equal to zero.}
\]
\[
x = \frac{\pi}{2}, \quad \frac{3\pi}{2} \quad \text{Solutions in } \{0, 2\pi\}
\]

So, the general solution is

\[
x = \frac{\pi}{2} + 2n\pi \quad \text{and} \quad x = \frac{3\pi}{2} + 2n\pi
\]

where \( n \) is an integer. Try verifying these solutions graphically.

CHECKPOINT Now try Exercise 19.
**Example 2** Using Double-Angle Formulas to Analyze Graphs

Use a double-angle formula to rewrite the equation

\[ y = 4 \cos^2 x - 2. \]

Then sketch the graph of the equation over the interval \([0, 2\pi]\).

**Solution**

Using the double-angle formula for \(\cos 2u\), you can rewrite the original equation as

\[ y = 4 \cos^2 x - 2 \quad \text{Write original equation.} \]

\[ = 2(2 \cos^2 x - 1) \quad \text{Factor.} \]

\[ = 2 \cos 2x. \quad \text{Use double-angle formula.} \]

Using the techniques discussed in Section 4.5, you can recognize that the graph of this function has an amplitude of 2 and a period of \(\pi\). The key points in the interval \([0, \pi]\) are as follows.

<table>
<thead>
<tr>
<th>Maximum</th>
<th>Intercept</th>
<th>Minimum</th>
<th>Intercept</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>((0, 2))</td>
<td>((\frac{\pi}{4}, 0))</td>
<td>((\frac{\pi}{2}, -2))</td>
<td>((\frac{3\pi}{4}, 0))</td>
<td>((\pi, 2))</td>
</tr>
</tbody>
</table>

Two cycles of the graph are shown in Figure 5.14.

Now try Exercise 33.

**Example 3** Evaluating Functions Involving Double Angles

Use the following to find \(\sin 2\theta\), \(\cos 2\theta\), and \(\tan 2\theta\).

\[ \cos \theta = \frac{5}{13} \quad \frac{3\pi}{2} < \theta < 2\pi \]

**Solution**

From Figure 5.15, you can see that \(\sin \theta = y/r = -12/13\). Consequently, using each of the double-angle formulas, you can write

\[ \sin 2\theta = 2 \sin \theta \cos \theta = 2 \left( -\frac{12}{13} \right) \left( \frac{5}{13} \right) = -\frac{120}{169} \]

\[ \cos 2\theta = 2 \cos^2 \theta - 1 = 2 \left( \frac{25}{169} \right) - 1 = -\frac{119}{169} \]

\[ \tan 2\theta = \frac{\sin 2\theta}{\cos 2\theta} = \frac{120}{119} \]

Now try Exercise 37.

The double-angle formulas are not restricted to angles \(2\theta\) and \(\theta\). Other double combinations, such as \(4\theta\) and \(2\theta\) or \(6\theta\) and \(3\theta\), are also valid. Here are two examples.

\[ \sin 4\theta = 2 \sin 2\theta \cos 2\theta \quad \text{and} \quad \cos 6\theta = \cos^2 3\theta - \sin^2 3\theta \]

By using double-angle formulas together with the sum formulas given in the preceding section, you can form other multiple-angle formulas.
**Example 4** Deriving a Triple-Angle Formula

\[
\sin 3x = \sin (2x + x)
\]
\[
= \sin 2x \cos x + \cos 2x \sin x
\]
\[
= 2 \sin x \cos x \cos x + (1 - 2 \sin^2 x) \sin x
\]
\[
= 2 \sin x \cos^2 x + \sin x - 2 \sin^3 x
\]
\[
= 2 \sin x (1 - \sin^2 x) + \sin x - 2 \sin^3 x
\]
\[
= 2 \sin x - 2 \sin^3 x + \sin x - 2 \sin^3 x
\]
\[
= 3 \sin x - 4 \sin^3 x
\]

**Power-Reducing Formulas**

The double-angle formulas can be used to obtain the following **power-reducing formulas**. Example 5 shows a typical power reduction that is used in calculus.

<table>
<thead>
<tr>
<th>Power-Reducing Formulas</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sin^2 u = \frac{1 - \cos 2u}{2} )</td>
</tr>
<tr>
<td>( \cos^2 u = \frac{1 + \cos 2u}{2} )</td>
</tr>
<tr>
<td>( \tan^2 u = \frac{1 - \cos 2u}{1 + \cos 2u} )</td>
</tr>
</tbody>
</table>

For a proof of the power-reducing formulas, see Proofs in Mathematics on page 423.

**Example 5** Reducing a Power

Rewrite \( \sin^4 x \) as a sum of first powers of the cosines of multiple angles.

**Solution**

Note the repeated use of power-reducing formulas.

\[
\sin^4 x = (\sin^2 x)^2
\]
\[
= \left( \frac{1 - \cos 2x}{2} \right)^2
\]
\[
= \frac{1}{4} (1 - 2 \cos 2x + \cos^2 2x)
\]
\[
= \frac{1}{4} \left( 1 - 2 \cos 2x + \frac{1 + \cos 4x}{2} \right)
\]
\[
= \frac{1}{4} \left( \frac{1}{2} \cos 2x + \frac{1}{8} + \frac{1}{8} \cos 4x \right)
\]
\[
= \frac{1}{8} (3 - 4 \cos 2x + \cos 4x)
\]

**CHECK POINT** Now try Exercise 43.
Half-Angle Formulas

You can derive some useful alternative forms of the power-reducing formulas by replacing \( u \) with \( u/2 \). The results are called half-angle formulas.

\[ \sin \frac{u}{2} = \pm \sqrt{\frac{1 - \cos u}{2}} \]
\[ \cos \frac{u}{2} = \pm \sqrt{\frac{1 + \cos u}{2}} \]
\[ \tan \frac{u}{2} = \frac{1 - \cos u}{\sin u} = \frac{\sin u}{1 + \cos u} \]

The signs of \( \sin \frac{u}{2} \) and \( \cos \frac{u}{2} \) depend on the quadrant in which \( \frac{u}{2} \) lies.

Example 6 Using a Half-Angle Formula

Find the exact value of \( \sin 105^\circ \).

Solution

Begin by noting that \( 105^\circ \) is half of \( 210^\circ \). Then, using the half-angle formula for \( \sin(u/2) \) and the fact that \( 105^\circ \) lies in Quadrant II, you have

\[ \sin 105^\circ = \sqrt{\frac{1 - \cos 210^\circ}{2}} \]
\[ = \sqrt{\frac{1 - (-\cos 30^\circ)}{2}} \]
\[ = \sqrt{\frac{1 + (\sqrt{3}/2)}{2}} \]
\[ = \sqrt{\frac{2 + \sqrt{3}}{2}}. \]

The positive square root is chosen because \( \sin \theta \) is positive in Quadrant II.

**CHECKPOINT**

Now try Exercise 59.

Use your calculator to verify the result obtained in Example 6. That is, evaluate \( \sin 105^\circ \) and \( (\sqrt{2 + \sqrt{3}})/2 \).

\[ \sin 105^\circ \approx 0.9659258 \]
\[ \frac{\sqrt{2 + \sqrt{3}}}{2} \approx 0.9659258 \]

You can see that both values are approximately 0.9659258.
Example 7  Solving a Trigonometric Equation

Find all solutions of $2 - \sin^2 x = 2 \cos^2 \frac{x}{2}$ in the interval $[0, 2\pi]$.

**Algebraic Solution**

\[
2 - \sin^2 x = 2 \cos^2 \frac{x}{2}
\]
Write original equation.

\[
2 - \sin^2 x = 2 \left( \pm \sqrt{1 + \cos x} \right)^2
\]
Half-angle formula

\[
2 - \sin^2 x = 2 \left( \frac{1 + \cos x}{2} \right)
\]
Simplify.

\[
2 - \sin^2 x = 1 + \cos x
\]
Simplify.

\[
2 - (1 - \cos^2 x) = 1 + \cos x
\]
Pythagorean identity

\[
\cos^2 x - \cos x = 0
\]
Simplify.

\[
\cos x (\cos x - 1) = 0
\]
Factor.

By setting the factors $\cos x$ and $\cos x - 1$ equal to zero, you find that the solutions in the interval $[0, 2\pi]$ are

\[
x = \frac{\pi}{2}, \quad x = \frac{3\pi}{2}, \quad \text{and} \quad x = 0.
\]

**Graphical Solution**

Use a graphing utility set in radian mode to graph $y = 2 - \sin^2 x - 2 \cos^2 (x/2)$, as shown in Figure 5.16. Use the zero or root feature or the zoom and trace features to approximate the $x$-intercepts in the interval $[0, 2\pi)$ to be

\[
x = 0, \quad x \approx 1.571 \approx \frac{\pi}{2}, \quad \text{and} \quad x \approx 4.712 \approx \frac{3\pi}{2}.
\]

These values are the approximate solutions of $2 - \sin^2 x - 2 \cos^2 (x/2) = 0$ in the interval $[0, 2\pi)$.

![Figure 5.16](image)

**Product-to-Sum Formulas**

Each of the following **product-to-sum formulas** can be verified using the sum and difference formulas discussed in the preceding section.

**Product-to-Sum Formulas**

\[
\sin u \sin v = \frac{1}{2} \left[ \cos (u - v) - \cos (u + v) \right]
\]

\[
\cos u \cos v = \frac{1}{2} \left[ \cos (u - v) + \cos (u + v) \right]
\]

\[
\sin u \cos v = \frac{1}{2} \left[ \sin (u + v) + \sin (u - v) \right]
\]

\[
\cos u \sin v = \frac{1}{2} \left[ \sin (u + v) - \sin (u - v) \right]
\]

Product-to-sum formulas are used in calculus to evaluate integrals involving the products of sines and cosines of two different angles.
Chapter 5  Analytic Trigonometry

Example 8  Writing Products as Sums

Rewrite the product $\cos 5\theta \sin 4\theta$ as a sum or difference.

Solution

Using the appropriate product-to-sum formula, you obtain

$$\cos 5\theta \sin 4\theta = \frac{1}{2} [\sin (5\theta + 4\theta) - \sin (5\theta - 4\theta)]$$

$$= \frac{1}{2} \sin 9\theta - \frac{1}{2} \sin \theta.$$

CHECKPOINT  Now try Exercise 85.

Occasionally, it is useful to reverse the procedure and write a sum of trigonometric functions as a product. This can be accomplished with the following sum-to-product formulas.

<table>
<thead>
<tr>
<th>Sum-to-Product Formulas</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\sin u + \sin v = 2 \sin \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right)$</td>
</tr>
<tr>
<td>$\sin u - \sin v = 2 \cos \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right)$</td>
</tr>
<tr>
<td>$\cos u + \cos v = 2 \cos \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right)$</td>
</tr>
<tr>
<td>$\cos u - \cos v = -2 \sin \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right)$</td>
</tr>
</tbody>
</table>

For a proof of the sum-to-product formulas, see Proofs in Mathematics on page 424.

Example 9  Using a Sum-to-Product Formula

Find the exact value of $\cos 195^\circ + \cos 105^\circ$.

Solution

Using the appropriate sum-to-product formula, you obtain

$$\cos 195^\circ + \cos 105^\circ = 2 \cos \left( \frac{195^\circ + 105^\circ}{2} \right) \cos \left( \frac{195^\circ - 105^\circ}{2} \right)$$

$$= 2 \cos 150^\circ \cos 45^\circ$$

$$= 2 \left( -\frac{\sqrt{3}}{2} \right) \left( \frac{\sqrt{2}}{2} \right)$$

$$= -\frac{\sqrt{6}}{2}.$$ 

CHECKPOINT  Now try Exercise 99.
Example 10  Solving a Trigonometric Equation

Solve \( \sin 5x + \sin 3x = 0 \).

**Algebraic Solution**

\[
\begin{align*}
\sin 5x + \sin 3x &= 0 \quad \text{Write original equation.} \\
2 \sin \left( \frac{5x + 3x}{2} \right) \cos \left( \frac{5x - 3x}{2} \right) &= 0 \quad \text{Sum-to-product formula} \\
2 \sin 4x \cos x &= 0 \quad \text{Simplify.}
\end{align*}
\]

By setting the factor \( 2 \sin 4x \) equal to zero, you can find that the solutions in the interval \( [0, 2\pi] \) are

\[
x = 0, \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{3\pi}{4}, \frac{7\pi}{4}, \frac{3\pi}{4}.
\]

The equation \( \cos x = 0 \) yields no additional solutions, so you can conclude that the solutions are of the form

\[
x = \frac{n\pi}{4}
\]

where \( n \) is an integer.

**Graphical Solution**

Sketch the graph of

\[
y = \sin 5x + \sin 3x,
\]

as shown in Figure 5.17. From the graph you can see that the \( x \)-intercepts occur at multiples of \( \frac{\pi}{4} \). So, you can conclude that the solutions are of the form

\[
x = \frac{n\pi}{4}
\]

where \( n \) is an integer.

CHECK Point  Now try Exercise 103.

Example 11  Verifying a Trigonometric Identity

Verify the identity \( \frac{\sin 3x - \sin x}{\cos x + \cos 3x} = \tan x \).

**Solution**

Using appropriate sum-to-product formulas, you have

\[
\begin{align*}
\frac{\sin 3x - \sin x}{\cos x + \cos 3x} &= \frac{2 \cos \left( \frac{3x + x}{2} \right) \sin \left( \frac{3x - x}{2} \right)}{2 \cos \left( \frac{x + 3x}{2} \right) \cos \left( \frac{x - 3x}{2} \right)} \\
&= \frac{2 \cos(2x) \sin x}{2 \cos(2x) \cos(-x)} \\
&= \frac{\sin x}{\cos(-x)} \\
&= \frac{\sin x}{\cos x} = \tan x.
\end{align*}
\]

CHECK Point  Now try Exercise 121.
Application

Example 12  Projectile Motion

Ignoring air resistance, the range of a projectile fired at an angle \( \theta \) with the horizontal and with an initial velocity of \( v_0 \) feet per second is given by

\[
r = \frac{1}{16} v_0^2 \sin \theta \cos \theta
\]

where \( r \) is the horizontal distance (in feet) that the projectile will travel. A place kicker for a football team can kick a football from ground level with an initial velocity of 80 feet per second (see Figure 5.18).

a. Write the projectile motion model in a simpler form.

b. At what angle must the player kick the football so that the football travels 200 feet?

c. For what angle is the horizontal distance the football travels a maximum?

Solution

a. You can use a double-angle formula to rewrite the projectile motion model as

\[
r = \frac{1}{32} v_0^2 (2 \sin \theta \cos \theta)
\]

Rewrite original projectile motion model.

\[
= \frac{1}{32} v_0^2 \sin 2\theta.
\]

Rewrite model using a double-angle formula.

b. \( r = \frac{1}{32} v_0^2 \sin 2\theta \)

Write projectile motion model.

\[
200 = \frac{1}{32} (80)^2 \sin 2\theta
\]

Substitute 200 for \( r \) and 80 for \( v_0 \).

\[
200 = 200 \sin 2\theta
\]

Simplify.

\[
1 = \sin 2\theta
\]

Divide each side by 200.

You know that \( 2\theta = \pi/2 \), so dividing this result by 2 produces \( \theta = \pi/4 \). Because \( \pi/4 = 45^\circ \), you can conclude that the player must kick the football at an angle of \( 45^\circ \) so that the football will travel 200 feet.

c. From the model \( r = 200 \sin 2\theta \) you can see that the amplitude is 200. So the maximum range is \( r = 200 \) feet. From part (b), you know that this corresponds to an angle of \( 45^\circ \). Therefore, kicking the football at an angle of \( 45^\circ \) will produce a maximum horizontal distance of 200 feet.

Now try Exercise 135.

Classroom Discussion

Deriving an Area Formula  Describe how you can use a double-angle formula or a half-angle formula to derive a formula for the area of an isosceles triangle. Use a labeled sketch to illustrate your derivation. Then write two examples that show how your formula can be used.
5.5 \hspace{1cm} \textbf{EXERCISES}

\textbf{VOCABULARY:} Fill in the blank to complete the trigonometric formula.

1. \( \sin 2u = \underline{\text{_______}} \) \hspace{1cm} 2. \( \frac{1 + \cos 2u}{2} = \underline{\text{_______}} \)

3. \( \cos 2u = \underline{\text{_______}} \) \hspace{1cm} 4. \( \frac{1 - \cos 2u}{1 + \cos 2u} = \underline{\text{_______}} \)

5. \( \sin \frac{u}{2} = \underline{\text{_______}} \) \hspace{1cm} 6. \( \tan \frac{u}{2} = \underline{\text{_______}} \)

7. \( \cos u \cos v = \underline{\text{_______}} \) \hspace{1cm} 8. \( \sin u \cos v = \underline{\text{_______}} \)

9. \( \sin u + \sin v = \underline{\text{_______}} \) \hspace{1cm} 10. \( \cos u - \cos v = \underline{\text{_______}} \)

\textbf{SKILLS AND APPLICATIONS}

In Exercises 11–18, use the figure to find the exact value of the trigonometric function.

\begin{align*}
11. \cos 2\theta & \hspace{1cm} 12. \sin 2\theta \\
13. \tan 2\theta & \hspace{1cm} 14. \sec 2\theta \\
15. \csc 2\theta & \hspace{1cm} 16. \cot 2\theta \\
17. \sin 4\theta & \hspace{1cm} 18. \tan 4\theta
\end{align*}

In Exercises 19–28, find the exact solutions of the equation in the interval \([0, 2\pi]\).

\begin{align*}
19. \sin 2x - \sin x = 0 & \hspace{1cm} 20. \sin 2x + \cos x = 0 \\
21. 4 \sin x \cos x = 1 & \hspace{1cm} 22. \sin 2x \sin x = \cos x \\
23. \cos 2x - \cos x = 0 & \hspace{1cm} 24. \cos 2x + \sin x = 0 \\
25. \sin 4x = -2 \sin 2x & \hspace{1cm} 26. (\sin 2x + \cos 2x)^2 = 1 \\
27. \tan 2x - \cot x = 0 & \hspace{1cm} 28. \tan 2x - 2 \cos x = 0
\end{align*}

In Exercises 29–36, use a double-angle formula to rewrite the expression.

\begin{align*}
29. 6 \sin x \cos x & \hspace{1cm} 30. \sin x \cos x \\
31. 6 \cos^2 x - 3 & \hspace{1cm} 32. \cos^2 x - \frac{1}{2} \\
33. 4 - 8 \sin^2 x & \hspace{1cm} 34. 10 \sin^2 x - 5 \\
35. (\cos x + \sin x)(\cos x - \sin x) & \hspace{1cm} 36. (\sin x - \cos x)(\sin x + \cos x)
\end{align*}

In Exercises 37–42, find the exact values of \(\sin 2u\), \(\cos 2u\), and \(\tan 2u\) using the double-angle formulas.

\begin{align*}
37. \sin u = -\frac{3}{5}, \quad \frac{3\pi}{2} < u < 2\pi \\
38. \cos u = -\frac{4}{5}, \quad \frac{\pi}{2} < u < \pi \\
39. \tan u = \frac{3}{5}, \quad 0 < u < \frac{\pi}{2} \\
40. \cot u = \sqrt{2}, \quad \pi < u < \frac{3\pi}{2} \\
41. \sec u = -2, \quad \frac{\pi}{2} < u < \pi \\
42. \csc u = 3, \quad \frac{\pi}{2} < u < \pi
\end{align*}

In Exercises 43–52, use the power-reducing formulas to rewrite the expression in terms of the first power of the cosine.

\begin{align*}
43. \cos^4 x & \hspace{1cm} 44. \sin^4 2x \\
45. \cos^4 2x & \hspace{1cm} 46. \sin^8 x \\
47. \tan^4 2x & \hspace{1cm} 48. \sin^2 2x \cos^2 2x \\
49. \sin^2 2x \cos^2 2x & \hspace{1cm} 50. \tan^2 2x \cos^4 2x \\
51. \sin^4 x \cos^2 x & \hspace{1cm} 52. \sin^4 x \cos^4 x
\end{align*}

In Exercises 53–58, use the figure to find the exact value of the trigonometric function.

\begin{align*}
53. \cos \frac{\theta}{2} & \hspace{1cm} 54. \sin \frac{\theta}{2} \\
55. \tan \frac{\theta}{2} & \hspace{1cm} 56. \sec \frac{\theta}{2} \\
57. \csc \frac{\theta}{2} & \hspace{1cm} 58. \cot \frac{\theta}{2}
\end{align*}
In Exercises 59–66, use the half-angle formulas to determine the exact values of the sine, cosine, and tangent of the angle.

59. $75^\circ$  
60. $165^\circ$
61. $112^\circ\, 30'$  
62. $67^\circ\, 30'$
63. $\pi/8$  
64. $\pi/12$
65. $3\pi/8$  
66. $7\pi/12$

In Exercises 67–72, (a) determine the quadrant in which $u/2$ lies, and (b) find the exact values of $\sin(u/2), \cos(u/2),$ and $\tan(u/2)$ using the half-angle formulas.

67. $\cos u = \frac{7}{25}, \quad 0 < u < \frac{\pi}{2}$
68. $\sin u = \frac{5}{13}, \quad \frac{\pi}{2} < u < \pi$
69. $\tan u = -\frac{5}{12}, \quad \frac{3\pi}{2} < u < 2\pi$
70. $\cot u = 3, \quad \pi < u < \frac{3\pi}{2}$
71. $\csc u = -\frac{5}{3}, \quad \frac{\pi}{2} < u < \frac{3\pi}{2}$
72. $\sec u = \frac{7}{2}, \quad \frac{3\pi}{2} < u < 2\pi$

In Exercises 73–76, use the half-angle formulas to simplify the expression.

73. $\sqrt{\frac{1 - \cos 6x}{2}}$  
74. $\sqrt{\frac{1 + \cos 4x}{2}}$  
75. $-\sqrt{\frac{1 - \cos 8x}{1 + \cos 8x}}$  
76. $-\sqrt{\frac{1 - \cos(x - 1)}{2}}$

In Exercises 77–80, find all solutions of the equation in the interval $[0, 2\pi)$. Use a graphing utility to graph the equation and verify the solutions.

77. $\sin \frac{x}{2} + \cos x = 0$  
78. $\sin \frac{x}{2} + \cos x - 1 = 0$
79. $\cos \frac{x}{2} - \sin x = 0$  
80. $\tan \frac{x}{2} - \sin x = 0$

In Exercises 81–90, use the product-to-sum formulas to write the product as a sum or difference.

81. $\sin \frac{\pi}{3} \cos \frac{\pi}{6}$  
82. $4 \cos \frac{\pi}{3} \sin \frac{5\pi}{6}$
83. $10 \cos 75^\circ \cos 15^\circ$  
84. $6 \sin 45^\circ \cos 15^\circ$
85. $\sin 5\theta \sin 3\theta$  
86. $3 \sin(-4\alpha) \sin 6\alpha$
87. $7 \cos(-5\beta) \sin 3\beta$  
88. $\cos 2\theta \cos 4\theta$
89. $\sin(x + y) \sin(x - y)$  
90. $\sin(x + y) \cos(x - y)$

In Exercises 91–98, use the sum-to-product formulas to write the sum or difference as a product.

91. $\sin 3\theta + \sin \theta$  
92. $\sin 5\theta - \sin 3\theta$
93. $\cos 6x + \cos 2x$  
94. $\cos x + \cos 4x$
95. $\sin(\alpha + \beta) - \sin(\alpha - \beta)$  
96. $\cos(\phi + 2\pi) + \cos \phi$
97. $\cos\left(\theta + \frac{\pi}{2}\right) - \cos\left(\theta - \frac{\pi}{2}\right)$
98. $\sin\left(x + \frac{\pi}{2}\right) + \sin\left(x - \frac{\pi}{2}\right)$

In Exercises 99–102, use the sum-to-product formulas to find the exact value of the expression.

99. $\sin 75^\circ + \sin 15^\circ$  
100. $\cos 120^\circ + \cos 60^\circ$
101. $\frac{3\pi}{4} - \cos \frac{\pi}{4}$  
102. $\frac{5\pi}{4} - \sin \frac{3\pi}{4}$

In Exercises 103–106, find all solutions of the equation in the interval $[0, 2\pi)$. Use a graphing utility to graph the equation and verify the solutions.

103. $\sin 6x + \sin 2x = 0$  
104. $\cos 2x - \cos 6x = 0$
105. $\frac{\cos 2x}{\sin 3x - \sin x} - 1 = 0$  
106. $\sin^2 3x - \sin^2 x = 0$

In Exercises 107–110, use the figure to find the exact value of the trigonometric function.

107. $\sin 2\alpha$  
108. $\cos 2\beta$
109. $\cos(\beta/2)$  
110. $\sin(\alpha + \beta)$

In Exercises 111–124, verify the identity.

111. $\csc 2\theta = \frac{\csc \theta}{2 \cos \theta}$  
112. $\sec 2\theta = \frac{\sec^2 \theta}{2 - \sec^2 \theta}$
113. $\sin \frac{\alpha}{3} \cos \frac{\alpha}{3} = \frac{1}{2} \sin \frac{2\alpha}{3}$  
114. $\frac{\cos 3\beta}{\cos \beta} = 1 - 4 \sin^2 \beta$
115. $1 + \cos 10\alpha = 2 \cos^2 5\alpha$
116. $\cos^4 x - \sin^4 x = \cos 2x$
117. $\cos 4\alpha = \cos^2 2\alpha - \sin^2 2\alpha$
118. $(\sin x + \cos x)^2 = 1 + \sin 2x$
119. $\tan \frac{u}{2} = \csc u - \cot u$
120. $\sec \frac{u}{2} = \pm \sqrt{\frac{2 \tan u}{\tan u + \sin u}}$
121. \[
\frac{\cos 4x + \cos 2x}{\sin 4x + \sin 2x} = \cot 3x
\]

122. \[
\frac{\sin x + \sin y}{\cos x + \cos y} = \tan \frac{x + y}{2}
\]

123. \[
\sin \left( \frac{\pi}{6} + x \right) + \sin \left( \frac{\pi}{6} - x \right) = \cos x
\]

124. \[
\cos \left( \frac{\pi}{3} + x \right) + \cos \left( \frac{\pi}{3} - x \right) = \cos x
\]

In Exercises 125–128, use a graphing utility to verify the identity. Confirm that it is an identity algebraically.

125. \[
\cos 3\beta = \cos^3 \beta - 3 \sin^2 \beta \cos \beta
\]

126. \[
\sin 4\beta = 4 \sin \beta \cos \beta (1 - 2 \sin^2 \beta)
\]

127. \[
(\cos 4x - \cos 2x)/(2 \sin 3x) = -\sin x
\]

128. \[
(\cos 3x - \cos x)/(\sin 3x - \sin x) = -\tan 2x
\]

In Exercises 129 and 130, graph the function by hand in the interval \([0, 2\pi]\) by using the power-reducing formulas.

129. \(f(x) = \sin^2 x\)  
130. \(f(x) = \cos^2 x\)

In Exercises 131–134, write the trigonometric expression as an algebraic expression.

131. \(\sin(2 \arcsin x)\)  
132. \(\cos(2 \arccos x)\)  
133. \(\cos(2 \arcsin x)\)  
134. \(\sin(2 \arccos x)\)

135. PROJECTILE MOTION The range of a projectile fired at an angle \(\theta\) with the horizontal and with an initial velocity of \(v_0\) feet per second is

\[r = \frac{1}{32} v_0^2 \sin 2\theta\]

where \(r\) is measured in feet. An athlete throws a javelin at 75 feet per second. At what angle must the athlete throw the javelin so that the javelin travels 130 feet?

136. RAILROAD TRACK When two railroad tracks merge, the overlapping portions of the tracks are in the shapes of circular arcs (see figure). The radius of each arc \(r\) (in feet) and the angle \(\theta\) are related by

\[
x = 2r \sin^2 \frac{\theta}{2}
\]

Write a formula for \(x\) in terms of \(\cos \theta\).

137. MACH NUMBER The mach number \(M\) of an airplane is the ratio of its speed to the speed of sound. When an airplane travels faster than the speed of sound, the sound waves form a cone behind the airplane (see figure). The mach number is related to the apex angle \(\theta\) of the cone by \(\sin(\theta/2) = 1/M\).

(a) Find the angle \(\theta\) that corresponds to a mach number of 1.

(b) Find the angle \(\theta\) that corresponds to a mach number of 4.5.

(c) The speed of sound is about 760 miles per hour. Determine the speed of an object with the mach numbers from parts (a) and (b).

(d) Rewrite the equation in terms of \(\theta\).

EXPLORATION

138. CAPSTONE Consider the function given by

\(f(x) = \sin^4 x + \cos^4 x\)

(a) Use the power-reducing formulas to write the function in terms of cosine to the first power.

(b) Determine another way of rewriting the function. Use a graphing utility to rule out incorrectly rewritten functions.

(c) Add a trigonometric term to the function so that it becomes a perfect square trinomial. Rewrite the function as a perfect square trinomial minus the term that you added. Use a graphing utility to rule out incorrectly rewritten functions.

(d) Rewrite the result of part (c) in terms of the sine of a double angle. Use a graphing utility to rule out incorrectly rewritten functions.

(e) When you rewrite a trigonometric expression, the result may not be the same as a friend’s. Does this mean that one of you is wrong? Explain.

TRUE OR FALSE? In Exercises 139 and 140, determine whether the statement is true or false. Justify your answer.

139. Because the sine function is an odd function, for a negative number \(u\), \(\sin 2u = -\sin u \cos u\).

140. \(\sin \frac{u}{2} = \sqrt{1 - \cos u} / 2\) when \(u\) is in the second quadrant.

### Section 5.4
Use sum and difference formulas to evaluate trigonometric functions, verify identities, and solve trigonometric equations (p. 398).

**Sum and Difference Formulas**

- \( \sin(u + v) = \sin u \cos v + \cos u \sin v \)
- \( \sin(u - v) = \sin u \cos v - \cos u \sin v \)
- \( \cos(u + v) = \cos u \cos v - \sin u \sin v \)
- \( \cos(u - v) = \cos u \cos v + \sin u \sin v \)
- \( \tan(u + v) = \frac{\tan u + \tan v}{1 - \tan u \tan v} \)
- \( \tan(u - v) = \frac{\tan u - \tan v}{1 + \tan u \tan v} \)

**Exercises**
57–80

### Section 5.5
Use multiple-angle formulas to rewrite and evaluate trigonometric functions (p. 405).

**Double-Angle Formulas**

- \( \sin 2u = 2 \sin u \cos u \)
- \( \cos 2u = \cos^2 u - \sin^2 u \)
- \( \tan 2u = \frac{2 \tan u}{1 - \tan^2 u} \)

**Exercises**
81–86

Use power-reducing formulas to rewrite and evaluate trigonometric functions (p. 407).

**Power-Reducing Formulas**

- \( \sin^2 u = \frac{1 - \cos 2u}{2} \)
- \( \cos^2 u = \frac{1 + \cos 2u}{2} \)
- \( \tan^2 u = \frac{1 - \cos 2u}{1 + \cos 2u} \)

**Exercises**
87–90

Use half-angle formulas to rewrite and evaluate trigonometric functions (p. 408).

**Half-Angle Formulas**

- \( \sin \frac{u}{2} = \pm \sqrt{\frac{1 - \cos u}{2}} \)
- \( \cos \frac{u}{2} = \pm \sqrt{\frac{1 + \cos u}{2}} \)
- \( \tan \frac{u}{2} = \frac{1 - \cos u}{\sin u} = \frac{\sin u}{1 + \cos u} \)

The signs of \( \sin(u/2) \) and \( \cos(u/2) \) depend on the quadrant in which \( u/2 \) lies.

**Exercises**
91–100

Use product-to-sum formulas (p. 409) and sum-to-product formulas (p. 410) to rewrite and evaluate trigonometric functions.

**Product-to-Sum Formulas**

- \( \sin u \sin v = \frac{1}{2} [\cos(u - v) - \cos(u + v)] \)
- \( \cos u \cos v = \frac{1}{2} [\cos(u - v) + \cos(u + v)] \)
- \( \sin u \cos v = \frac{1}{2} [\sin(u + v) + \sin(u - v)] \)
- \( \cos u \sin v = \frac{1}{2} [\sin(u + v) - \sin(u - v)] \)

**Sum-to-Product Formulas**

- \( \sin u + \sin v = 2 \sin \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right) \)
- \( \sin u - \sin v = 2 \cos \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right) \)
- \( \cos u + \cos v = 2 \cos \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right) \)
- \( \cos u - \cos v = -2 \sin \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right) \)

**Exercises**
101–108

Use trigonometric formulas to rewrite real-life models (p. 412).

A trigonometric formula can be used to rewrite the projectile motion model \( r = (1/16)v^2 \sin \theta \cos \theta \). (See Example 12.)

**Exercises**
109–114
5.1 In Exercises 1–6, name the trigonometric function that is equivalent to the expression.

1. \( \frac{\sin x}{\cos x} \)  
2. \( \frac{1}{\sin x} \)

3. \( \frac{1}{\sec x} \)  
4. \( \frac{1}{\tan x} \)

5. \( \sqrt{\cot^2 x + 1} \)  
6. \( \sqrt{1 + \tan^2 x} \)

In Exercises 7–10, use the given values and trigonometric identities to evaluate (if possible) all six trigonometric functions.

7. \( \sin x = \frac{\sqrt{3}}{2}, \cos x = \frac{1}{2} \)

8. \( \tan \theta = \frac{2}{3}, \sec \theta = \frac{\sqrt{13}}{3} \)

9. \( \sin \left( \frac{\pi}{2} - x \right) = \frac{\sqrt{3}}{2}, \sin x = -\frac{\sqrt{3}}{2} \)

10. \( \csc \left( \frac{\pi}{2} - \theta \right) = 9, \sin \theta = \frac{4\sqrt{5}}{9} \)

In Exercises 11–24, use the fundamental trigonometric identities to simplify the expression.

11. \( \frac{1}{\cot^2 x + 1} \)

12. \( \tan \theta / (1 - \cos^2 \theta) \)

13. \( \tan^2 x (\csc^2 x - 1) \)

14. \( \cot^2 x (\sin^2 x) \)

15. \( \sin \left( \frac{\pi}{2} - \theta \right) / \sin \theta \)

16. \( \cot \left( \frac{\pi}{2} - u \right) / \cos u \)

17. \( \sin^2 \theta + \cos^2 \theta / \sin \theta \)

18. \( \sec^2 (\theta / \csc^2 \theta) \)

19. \( \cos^2 x + \cos^2 x \cot^2 x \)

20. \( \tan^2 \theta \cot^2 \theta - \tan^2 \theta \)

21. \( (\tan x + 1)^2 \cos x \)

22. \( (\sec x - \tan x)^2 \)

23. \( 1 / \csc \theta + 1 - 1 / \csc \theta - 1 \)

24. \( \tan^2 x / (1 + \sec x) \)

In Exercises 25 and 26, use the trigonometric substitution to write the algebraic expression as a trigonometric function of \( \theta \), where \( 0 < \theta < \pi / 2 \).

25. \( \sqrt{25 - x^2}, x = 5 \sin \theta \)

26. \( \sqrt{x^2 - 16}, x = 4 \sec \theta \)

27. RATE OF CHANGE The rate of change of the function \( f(x) = \csc x - \cot x \) is given by the expression \( \csc^2 x - \csc x \cot x \). Show that this expression can also be written as \( 1 - \cos x / \sin^2 x \).
In Exercises 61–64, write the expression as the sine, cosine, or tangent of an angle.

61. \( \sin 60^\circ \cos 45^\circ - \cos 60^\circ \sin 45^\circ \)
62. \( \cos 45^\circ \cos 120^\circ - \sin 45^\circ \sin 120^\circ \)
63. \( \tan 25^\circ + \tan 10^\circ \)
64. \( \tan 68^\circ - \tan 115^\circ \)

In Exercises 65–70, find the exact value of the trigonometric function given that \( \tan u = \frac{3}{4} \) and \( \cos v = -\frac{1}{2} \) (\( u \) is in Quadrant I and \( v \) is in Quadrant III).

65. \( \sin(u + v) \)
66. \( \tan(u + v) \)
67. \( \cos(u - v) \)
68. \( \sin(u - v) \)
69. \( \cos(u + v) \)
70. \( \tan(u - v) \)

In Exercises 71–76, verify the identity.

71. \( \cos\left(x + \frac{\pi}{2}\right) = -\sin x \)
72. \( \sin\left(x - \frac{3\pi}{2}\right) = \cos x \)
73. \( \tan\left(x - \frac{\pi}{2}\right) = -\cot x \)
74. \( \tan(\pi - x) = -\tan x \)
75. \( \cos 3x = 4 \cos^3 x - 3 \cos x \)
76. \( \sin(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{\tan \alpha + \tan \beta} \)

In Exercises 77–80, find all solutions of the equation in the interval \([0, 2\pi)\).

77. \( \sin\left(x + \frac{\pi}{4}\right) - \sin\left(x - \frac{\pi}{4}\right) = 1 \)
78. \( \cos\left(x + \frac{\pi}{6}\right) - \cos\left(x - \frac{\pi}{6}\right) = 1 \)
79. \( \sin\left(x + \frac{\pi}{2}\right) - \sin\left(x - \frac{\pi}{2}\right) = \sqrt{3} \)
80. \( \cos\left(x + \frac{3\pi}{4}\right) - \cos\left(x - \frac{3\pi}{4}\right) = 0 \)

5.5 In Exercises 81–84, find the exact values of \( \sin 2u \), \( \cos 2u \), and \( \tan 2u \) using the double-angle formulas.

81. \( \sin u = -\frac{4}{5} \), \( \pi < u < \frac{3\pi}{2} \)
82. \( \cos u = -\frac{2}{\sqrt{5}} \), \( \frac{\pi}{2} < u < \pi \)
83. \( \sec u = -3 \), \( \frac{\pi}{2} < u < \pi \)
84. \( \cot u = 2 \), \( \pi < u < \frac{3\pi}{2} \)

In Exercises 85 and 86, use double-angle formulas to verify the identity algebraically and use a graphing utility to confirm your result graphically.

85. \( \sin 4x = 8 \cos^3 x \sin x - 4 \cos x \sin x \)
86. \( \tan^2 x = \frac{1 - \cos 2x}{1 + \cos 2x} \)

In Exercises 87–90, use the power-reducing formulas to rewrite the expression in terms of the first power of the cosine.

87. \( \tan^2 2x \)
88. \( \cos^2 3x \)
89. \( \sin^2 x \tan^2 x \)
90. \( \cos^2 x \tan^2 x \)

In Exercises 91–94, use the half-angle formulas to determine the exact values of the sine, cosine, and tangent of the angle.

91. \(-75^\circ \)
92. \(15^\circ \)
93. \(-\frac{19\pi}{12} \)
94. \(1 - \frac{17\pi}{12} \)

In Exercises 95–98, (a) determine the quadrant in which \( u/2 \) lies, and (b) find the exact values of \( \sin(u/2) \), \( \cos(u/2) \), and \( \tan(u/2) \) using the half-angle formulas.

95. \( \sin u = -\frac{7}{25} \), \( 0 < u < \frac{\pi}{2} \)
96. \( \tan u = \frac{4}{3} \), \( \pi < u < \frac{3\pi}{2} \)
97. \( \cos u = -\frac{3}{5} \), \( \frac{\pi}{2} < u < \pi \)
98. \( \sec u = -6 \), \( \frac{\pi}{2} < u < \pi \)

In Exercises 99 and 100, use the half-angle formulas to simplify the expression.

99. \( \frac{\sin 6x}{1 + \cos 6x} \)
100. \( \frac{1 + \cos 10x}{2} \)

In Exercises 101–104, use the product-to-sum formulas to write the product as a sum or difference.

101. \( \cos \frac{\pi}{6} \sin \frac{\pi}{6} \)
102. \( 6 \sin 15^\circ \sin 45^\circ \)
103. \( \cos 4\theta \sin 6\theta \)
104. \( 2 \sin 7\theta \cos 3\theta \)

In Exercises 105–108, use the sum-to-product formulas to write the sum or difference as a product.

105. \( \sin 4\theta - \sin 8\theta \)
106. \( \cos 6\theta + \cos 5\theta \)
107. \( \cos\left(x + \frac{\pi}{6}\right) - \cos\left(x - \frac{\pi}{6}\right) \)
108. \( \sin\left(x + \frac{\pi}{4}\right) - \sin\left(x - \frac{\pi}{4}\right) \)
109. **PROJECTILE MOTION** A baseball leaves the hand of the player at first base at an angle of \( \theta \) with the horizontal and at an initial velocity of \( v_0 = 80 \) feet per second. The ball is caught by the player at second base 100 feet away. Find \( \theta \) if the range \( r \) of a projectile is

\[
r = \frac{1}{32} v_0^2 \sin 2\theta.
\]

110. **GEOMETRY** A trough for feeding cattle is 4 meters long and its cross sections are isosceles triangles with the two equal sides being \( \frac{1}{2} \) meter (see figure). The angle between the two sides is \( \theta \).

(a) Write the trough’s volume as a function of \( \theta/2 \).

(b) Write the volume of the trough as a function of \( \theta \) and determine the value of \( \theta \) such that the volume is maximum.

**HARMONIC MOTION** In Exercises 111–114, use the following information. A weight is attached to a spring suspended vertically from a ceiling. When a driving force is applied to the system, the weight moves vertically from its equilibrium position, and this motion is described by the model \( y = A \sin \omega t - B \cos \omega t \), where \( y \) is the distance from equilibrium (in feet) and \( t \) is the time (in seconds).

111. Use a graphing utility to graph the model.

112. Write the model in the form

\[
y = \sqrt{a^2 + b^2} \sin(Bt + C).
\]

113. Find the amplitude of the oscillations of the weight.

114. Find the frequency of the oscillations of the weight.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 115–118, determine whether the statement is true or false. Justify your answer.

115. If \( \frac{\pi}{2} < \theta < \pi \), then \( \cos \frac{\theta}{2} < 0 \).

116. \( \sin(x + y) = \sin x + \sin y \)

117. \( 4 \sin(-x) \cos(-x) = -2 \sin 2x \)

118. \( 4 \sin 45^\circ \cos 15^\circ = 1 + \sqrt{3} \)

119. List the reciprocal identities, quotient identities, and Pythagorean identities from memory.

120. **THINK ABOUT IT** If a trigonometric equation has an infinite number of solutions, is it true that the equation is an identity? Explain.

121. **THINK ABOUT IT** Explain why you know from observation that the equation has no solution if \( a \) is an integer.

122. **SURFACE AREA** The surface area of a honeycomb is given by the equation

\[
S = 6hs + \frac{3}{2}r^2 \left( \frac{\sqrt{3} - \cos \theta}{\sin \theta} \right), \quad 0 < \theta \leq 90^\circ
\]

where \( h = 2.4 \) inches, \( s = 0.75 \) inch, and \( \theta \) is the angle shown in the figure.

(a) For what value(s) of \( \theta \) is the surface area 12 square inches?

(b) What value of \( \theta \) gives the minimum surface area?

In Exercises 123 and 124, use the graphs of \( y_1 \) and \( y_2 \) to determine how to change one function to form the identity \( y_1 = y_2 \).

123. \( y_1 = \sec^2 \left( \frac{\pi}{2} - x \right) \)

124. \( y_1 = \frac{\cos 3x}{\cos x} \)

\( y_2 = \cot^2 x \)

\( y_2 = (2 \sin x)^2 \)

In Exercises 125 and 126, use the zero or root feature of a graphing utility to approximate the zeros of the function.

125. \( y = \sqrt{x + 3} + 4 \cos x \)

126. \( y = 2 - \frac{1}{2} x^2 + 3 \sin \frac{\pi x}{2} \)
Chapter Test

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. If \( \tan \theta = \frac{5}{2} \) and \( \cos \theta < 0 \), use the fundamental identities to evaluate all six trigonometric functions of \( \theta \).

2. Use the fundamental identities to simplify \( \csc^2 \beta (1 - \cos^2 \beta) \).

3. Factor and simplify \( \frac{\sec^4 x - \tan^4 x}{\sec^2 x + \tan^2 x} \)

4. Add and simplify \( \frac{\cos \theta + \sin \theta}{\sin \theta} \)

5. Determine the values of \( \theta \), \( 0 \leq \theta < 2\pi \), for which \( \tan \theta = -\sqrt{\sec^2 \theta - 1} \) is true.

6. Use a graphing utility to graph the functions \( y_1 = \cos x + \sin x \tan x \) and \( y_2 = \sec x \). Make a conjecture about \( y_1 \) and \( y_2 \). Verify the result algebraically.

In Exercises 7–12, verify the identity.

7. \( \sin \theta \sec \theta = \tan \theta \)

8. \( \sec^2 x \tan^2 x + \sec^2 x = \sec^4 x \)

9. \( \frac{\csc \alpha + \sec \alpha}{\sin \alpha + \cos \alpha} = \cot \alpha + \tan \alpha \)

10. \( \tan \left( x + \frac{\pi}{2} \right) = -\cot x \)

11. \( \sin(n \pi + \theta) = (-1)^n \sin \theta \), \( n \) is an integer.

12. \( (\sin x + \cos x)^2 = 1 + \sin 2x \)

13. Rewrite \( \sin^4 \frac{x}{2} \) in terms of the first power of the cosine.

14. Use a half-angle formula to simplify the expression \( \sin 4\theta/(1 + \cos 4\theta) \).

15. Write \( 4 \sin 3\theta \cos 2\theta \) as a sum or difference.

16. Write \( \cos 3\theta - \cos \theta \) as a product.

In Exercises 17–20, find all solutions of the equation in the interval \([0, 2\pi]\).

17. \( \tan^2 x + \tan x = 0 \)

18. \( \sin 2\alpha - \cos \alpha = 0 \)

19. \( 4 \cos^2 x - 3 = 0 \)

20. \( \csc^2 x - \csc x - 2 = 0 \)

21. Use a graphing utility to approximate the solutions of the equation \( 5 \sin x - x = 0 \) accurate to three decimal places.

22. Find the exact value of \( \cos 105^\circ \) using the fact that \( 105^\circ = 135^\circ - 30^\circ \).

23. Use the figure to find the exact values of \( \sin 2u \), \( \cos 2u \), and \( \tan 2u \).

24. Cheyenne, Wyoming has a latitude of \( 41^\circ \)N. At this latitude, the position of the sun at sunrise can be modeled by

\[
D = 31 \sin \left( \frac{2\pi}{365} t - 1.4 \right)
\]

where \( t \) is the time (in days) and \( t = 1 \) represents January 1. In this model, \( D \) represents the number of degrees north or south of due east that the sun rises. Use a graphing utility to determine the days on which the sun is more than 20° north of due east at sunrise.

25. The heights \( h \) (in feet) of two people in different seats on a Ferris wheel can be modeled by

\[
h_1 = 28 \cos 10t + 38 \quad \text{and} \quad h_2 = 28 \cos \left[ 10 \left( t - \frac{\pi}{6} \right) \right] + 38, \quad 0 \leq t \leq 2
\]

where \( t \) is the time (in minutes). When are the two people at the same height?
**Sum and Difference Formulas** \( (p. 398) \)

\[
\begin{align*}
\sin(u + v) &= \sin u \cos v + \cos u \sin v \\
\sin(u - v) &= \sin u \cos v - \cos u \sin v \\
\cos(u + v) &= \cos u \cos v - \sin u \sin v \\
\cos(u - v) &= \cos u \cos v + \sin u \sin v
\end{align*}
\]

**Proof**

You can use the figures at the left for the proofs of the formulas for \( \cos(u \pm v) \). In the top figure, let \( A \) be the point \((1, 0)\) and then use \( u \) and \( v \) to locate the points \( B = (x_1, y_1), \quad C = (x_2, y_2), \quad \) and \( D = (x_3, y_3) \) on the unit circle. So, \( x_i^2 + y_i^2 = 1 \) for \( i = 1, 2, \) and \( 3 \). For convenience, assume that \( 0 < v < u < 2\pi \). In the bottom figure, note that arcs \( AC \) and \( BD \) have the same length. So, line segments \( AC \) and \( BD \) are also equal in length, which implies that

\[
\begin{align*}
\sqrt{(x_2 - 1)^2 + (y_2 - 0)^2} &= \sqrt{(x_3 - x_1)^2 + (y_3 - y_1)^2} \\
x_2^2 - 2x_2 + 1 + y_2^2 &= x_1^2 - 2x_1x_3 + x_3^2 + y_1^2 + y_3^2 - 2y_1y_3 + y_1^2 \\
(x_2^2 + y_2^2) + 1 - 2x_2 &= (x_1^2 + y_1^2) + (x_3^2 + y_3^2) - 2x_1x_3 - 2y_1y_3 \\
1 + 1 - 2x_2 &= 1 + 1 - 2x_1x_3 - 2y_1y_3 \\
x_2 &= x_1x_3 + y_1y_3.
\end{align*}
\]

Finally, by substituting the values \( x_2 = \cos(u - v), \ x_3 = \cos u, \ x_1 = \cos v, \ y_3 = \sin u, \) and \( y_1 = \sin v, \) you obtain \( \cos(u - v) = \cos u \cos v + \sin u \sin v. \) The formula for \( \cos(u + v) \) can be established by considering \( u + v = u - (-v) \) and using the formula just derived to obtain

\[
\begin{align*}
\cos(u + v) &= \cos[u - (-v)] = \cos u \cos(-v) + \sin u \sin(-v) \\
&= \cos u \cos v - \sin u \sin v.
\end{align*}
\]

You can use the sum and difference formulas for sine and cosine to prove the formulas for \( \tan(u \pm v) \).

\[
\begin{align*}
\tan(u \pm v) &= \frac{\sin(u \pm v)}{\cos(u \pm v)} \\
&= \frac{\sin u \cos v \pm \cos u \sin v}{\cos u \cos v \mp \sin u \sin v} \\
&= \frac{\sin u \cos v \pm \cos u \sin v}{\cos u \cos v \mp \sin u \sin v} \\
&= \frac{\cos u \cos v}{\cos u \cos v} \\
&= \frac{\cos u \cos v}{\cos u \cos v} \\
&= \frac{\cos u \cos v}{\cos u \cos v}.
\end{align*}
\]

**Quotient identity**

**Sum and difference formulas**

**Divide numerator and denominator by \( \cos u \cos v).**
Trigonometry and Astronomy
Trigonometry was used by early astronomers to calculate measurements in the universe. Trigonometry was used to calculate the circumference of Earth and the distance from Earth to the moon. Another major accomplishment in astronomy using trigonometry was computing distances to stars.

Proof
To prove all three formulas, let \( v = u \) in the corresponding sum formulas.

\[
\sin 2u = \sin(u + u) = \sin u \cos u + \cos u \sin u = 2 \sin u \cos u \\
\cos 2u = \cos(u + u) = \cos u \cos u - \sin u \sin u = \cos^2 u - \sin^2 u \\
\tan 2u = \tan(u + u) = \frac{\tan u + \tan u}{1 - \tan u \tan u} = \frac{2 \tan u}{1 - \tan^2 u}
\]

Power-Reducing Formulas (p. 407)

\[
\sin^2 u = \frac{1 - \cos 2u}{2} \quad \cos^2 u = \frac{1 + \cos 2u}{2} \quad \tan^2 u = \frac{1 - \cos 2u}{1 + \cos 2u}
\]

Proof
To prove the first formula, solve for \( \sin^2 u \) in the double-angle formula \( \cos 2u = 1 - 2 \sin^2 u \), as follows.

\[
\cos 2u = 1 - 2 \sin^2 u \quad \text{Write double-angle formula.} \\
2 \sin^2 u = 1 - \cos 2u \quad \text{Subtract \( \cos 2u \) from and add \( 2 \sin^2 u \) to each side.} \\
\sin^2 u = \frac{1 - \cos 2u}{2} \quad \text{Divide each side by 2.}
\]
In a similar way you can prove the second formula, by solving for $\cos^2 u$ in the double-angle formula

$$\cos 2u = 2 \cos^2 u - 1.$$ 

To prove the third formula, use a quotient identity, as follows.

$$\tan^2 u = \frac{\sin^2 u}{\cos^2 u}$$

$$= \frac{1 - \cos 2u}{2}$$

$$= \frac{1 + \cos 2u}{2}$$

$$= \frac{1 - \cos 2u}{1 + \cos 2u}$$

### Sum-to-Product Formulas  (p. 410)

$$\sin u + \sin v = 2 \sin \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right)$$

$$\sin u - \sin v = 2 \cos \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right)$$

$$\cos u + \cos v = 2 \cos \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right)$$

$$\cos u - \cos v = -2 \sin \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right)$$

### Proof

To prove the first formula, let $x = u + v$ and $y = u - v$. Then substitute $u = (x + y)/2$ and $v = (x - y)/2$ in the product-to-sum formula.

$$\sin u \cos v = \frac{1}{2} \left[ \sin(u + v) + \sin(u - v) \right]$$

$$\sin \left( \frac{x + y}{2} \right) \cos \left( \frac{x - y}{2} \right) = \frac{1}{2} (\sin x + \sin y)$$

$$2 \sin \left( \frac{x + y}{2} \right) \cos \left( \frac{x - y}{2} \right) = \sin x + \sin y$$

The other sum-to-product formulas can be proved in a similar manner.
PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. (a) Write each of the other trigonometric functions of $\theta$ in terms of $\sin \theta$.
(b) Write each of the other trigonometric functions of $\theta$ in terms of $\cos \theta$.

2. Verify that for all integers $n$,
   $$\cos \left[ \frac{(2n + 1)\pi}{2} \right] = 0.$$ 

3. Verify that for all integers $n$,
   $$\sin \left[ \frac{(12n + 1)\pi}{6} \right] = \frac{1}{2}.$$ 

4. A particular sound wave is modeled by
   $$p(t) = \frac{1}{4\pi} \left( p_1(t) + 30p_2(t) + p_3(t) + 30p_4(t) \right)$$
   where $p_n(t) = \frac{1}{n} \sin(524n \pi t)$, and $t$ is the time (in seconds).
   (a) Find the sine components $p_n(t)$ and use a graphing utility to graph each component. Then verify the graph of $p$ that is shown.
   
   (b) Find the period of each sine component of $p$. Is $p$ periodic? If so, what is its period?
   (c) Use the zero or root feature or the zoom and trace features of a graphing utility to find the $t$-intercepts of the graph of $p$ over one cycle.
   (d) Use the maximum and minimum features of a graphing utility to approximate the absolute maximum and absolute minimum values of $p$ over one cycle.

5. Three squares of side $s$ are placed side by side (see figure). Make a conjecture about the relationship between the sum $u + v$ and $w$. Prove your conjecture by using the identity for the tangent of the sum of two angles.

6. The path traveled by an object (neglecting air resistance) that is projected at an initial height of $h_0$ feet, an initial velocity of $v_0$ feet per second, and an initial angle $\theta$ is given by
   $$y = -\frac{16}{v_0^2 \cos^2 \theta} x^2 + (\tan \theta)x + h_0$$
   where $x$ and $y$ are measured in feet. Find a formula for the maximum height of an object projected from ground level at velocity $v_0$ and angle $\theta$. To do this, find half of the horizontal distance
   $$\frac{1}{32}v_0^2 \sin 2 \theta$$
   and then substitute it for $x$ in the general model for the path of a projectile (where $h_0 = 0$).

7. Use the figure to derive the formulas for
   $$\sin \frac{\theta}{2}, \cos \frac{\theta}{2}, \text{ and } \tan \frac{\theta}{2}.$$
   where $\theta$ is an acute angle.

8. The force $F$ (in pounds) on a person’s back when he or she bends over at an angle $\theta$ is modeled by
   $$F = \frac{0.6W \sin(\theta + 90^\circ)}{\sin 12^\circ}$$
   where $W$ is the person’s weight (in pounds).
   (a) Simplify the model.
   (b) Use a graphing utility to graph the model, where $W = 185$ and $0^\circ < \theta < 90^\circ$.
   (c) At what angle is the force a maximum? At what angle is the force a minimum?
9. The number of hours of daylight that occur at any location on Earth depends on the time of year and the latitude of the location. The following equations model the numbers of hours of daylight in Seward, Alaska (60° latitude) and New Orleans, Louisiana (30° latitude).

\[ D = 12.2 - 6.4 \cos \left( \frac{\pi(t + 0.2)}{182.6} \right) \quad \text{Seward} \]

\[ D = 12.2 - 1.9 \cos \left( \frac{\pi(t + 0.2)}{182.6} \right) \quad \text{New Orleans} \]

In these models, \( D \) represents the number of hours of daylight and \( t \) represents the day, with \( t = 0 \) corresponding to January 1.

(a) Use a graphing utility to graph both models in the same viewing window. Use a viewing window of \( 0 \leq t \leq 365 \).

(b) Find the days of the year on which both cities receive the same amount of daylight.

(c) Which city has the greater variation in the number of daylight hours? Which constant in each model would you use to determine the difference between the greatest and least numbers of hours of daylight?

(d) Determine the period of each model.

10. The tide, or depth of the ocean near the shore, changes throughout the day. The water depth \( d \) (in feet) of a bay can be modeled by

\[ d = 35 - 28 \cos \left( \frac{\pi t}{6.2} \right) \]

where \( t \) is the time in hours, with \( t = 0 \) corresponding to 12:00 A.M.

(a) Algebraically find the times at which the high and low tides occur.

(b) Algebraically find the time(s) at which the water depth is 3.5 feet.

(c) Use a graphing utility to verify your results from parts (a) and (b).

11. Find the solution of each inequality in the interval \([0, 2\pi]\).

(a) \( \sin x \geq 0.5 \)

(b) \( \cos x \leq -0.5 \)

(c) \( \tan x < \sin x \)

(d) \( \cos x \geq \sin x \)

12. The index of refraction \( n \) of a transparent material is the ratio of the speed of light in a vacuum to the speed of light in the material. Some common materials and their indices are air (1.00), water (1.33), and glass (1.50). Triangular prisms are often used to measure the index of refraction based on the formula

\[ n = \frac{\sin \left( \frac{\theta}{2} + \frac{\alpha}{2} \right)}{\sin \frac{\theta}{2}} \]

For the prism shown in the figure, \( \alpha = 60^\circ \).

(a) Write the index of refraction as a function of \( \cot(\theta/2) \).

(b) Find \( \theta \) for a prism made of glass.

13. (a) Write a sum formula for \( \sin(u + v + w) \).

(b) Write a sum formula for \( \tan(u + v + w) \).

14. (a) Derive a formula for \( \cos 3\theta \).

(b) Derive a formula for \( \cos 4\theta \).

15. The heights \( h \) (in inches) of pistons 1 and 2 in an automobile engine can be modeled by

\[ h_1 = 3.75 \sin 733t + 7.5 \]

and

\[ h_2 = 3.75 \sin 733 \left( t + \frac{4\pi}{3} \right) + 7.5 \]

where \( t \) is measured in seconds.

(a) Use a graphing utility to graph the heights of these two pistons in the same viewing window for \( 0 \leq t \leq 1 \).

(b) How often are the pistons at the same height?
Additional Topics in Trigonometry

6.1 Law of Sines
6.2 Law of Cosines
6.3 Vectors in the Plane
6.4 Vectors and Dot Products
6.5 Trigonometric Form of a Complex Number

In Mathematics
Trigonometry is used to solve triangles, represent vectors, and to write trigonometric forms of complex numbers.

In Real Life
Trigonometry is used to find areas, estimate heights, and represent vectors involving force, velocity, and other quantities. For instance, trigonometry and vectors can be used to find the tension in the tow lines as a loaded barge is being towed by two tugboats. (See Exercise 93, page 456.)

IN CAREERS
There are many careers that use trigonometry. Several are listed below.

- Pilot
  Exercise 51, page 435
- Civil Engineer
  Exercise 55, page 443
- Awning Designer
  Exercise 58, page 443
- Landscaper
  Exercise 4, page 491
What you should learn
• Use the Law of Sines to solve oblique triangles (AAS or ASA).
• Use the Law of Sines to solve oblique triangles (SSA).
• Find the areas of oblique triangles.
• Use the Law of Sines to model and solve real-life problems.

Why you should learn it
You can use the Law of Sines to solve real-life problems involving oblique triangles. For instance, in Exercise 53 on page 436, you can use the Law of Sines to determine the distance from a boat to the shoreline.

Introduction
In Chapter 4, you studied techniques for solving right triangles. In this section and the next, you will solve oblique triangles—triangles that have no right angles. As standard notation, the angles of a triangle are labeled A, B, and C, and their opposite sides are labeled a, b, and c, as shown in Figure 6.1.

To solve an oblique triangle, you need to know the measure of at least one side and any two other measures of the triangle—either two sides, two angles, or one angle and one side. This breaks down into the following four cases.

1. Two angles and any side (AAS or ASA)
2. Two sides and an angle opposite one of them (SSA)
3. Three sides (SSS)
4. Two sides and their included angle (SAS)

The first two cases can be solved using the Law of Sines, whereas the last two cases require the Law of Cosines (see Section 6.2).

Law of Sines
If ABC is a triangle with sides a, b, and c, then

\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}
\]

A is acute. A is obtuse.

The Law of Sines can also be written in the reciprocal form

\[
\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}.
\]

For a proof of the Law of Sines, see Proofs in Mathematics on page 487.
Given Two Angles and One Side—AAS

For the triangle in Figure 6.2, \( C = 102^\circ, B = 29^\circ, \) and \( b = 28 \) feet. Find the remaining angle and sides.

Solution

The third angle of the triangle is

\[
A = 180^\circ - B - C \\
= 180^\circ - 29^\circ - 102^\circ \\
= 49^\circ. 
\]

By the Law of Sines, you have

\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}. 
\]

Using \( b = 28 \) produces

\[
a = \frac{b}{\sin B} \sin A = \frac{28}{\sin 29^\circ} (\sin 49^\circ) = 43.59 \text{ feet}
\]

and

\[
c = \frac{b}{\sin B} \sin C = \frac{28}{\sin 29^\circ} (\sin 102^\circ) = 56.49 \text{ feet}.
\]

Now try Exercise 5.

Example 2 Given Two Angles and One Side—ASA

A pole tilts toward the sun at an \( 8^\circ \) angle from the vertical, and it casts a 22-foot shadow. The angle of elevation from the tip of the shadow to the top of the pole is \( 43^\circ \). How tall is the pole?

Solution

From Figure 6.3, note that \( A = 43^\circ \) and \( B = 90^\circ + 8^\circ = 98^\circ. \) So, the third angle is

\[
C = 180^\circ - A - B \\
= 180^\circ - 43^\circ - 98^\circ \\
= 39^\circ. 
\]

By the Law of Sines, you have

\[
\frac{a}{\sin A} = \frac{c}{\sin C}. 
\]

Because \( c = 22 \) feet, the length of the pole is

\[
a = \frac{c}{\sin C} \sin A = \frac{22}{\sin 39^\circ} (\sin 43^\circ) = 23.84 \text{ feet}. 
\]

Now try Exercise 45.

For practice, try reworking Example 2 for a pole that tilts away from the sun under the same conditions.
The Ambiguous Case (SSA)

In Examples 1 and 2, you saw that two angles and one side determine a unique triangle. However, if two sides and one opposite angle are given, three possible situations can occur: (1) no such triangle exists, (2) one such triangle exists, or (3) two distinct triangles may satisfy the conditions.

### Example 3  Single-Solution Case—SSA

For the triangle in Figure 6.4, \(a = 22\) inches, \(b = 12\) inches, and \(A = 42^\circ\). Find the remaining side and angles.

**Solution**

By the Law of Sines, you have

\[
\sin B = \frac{b \sin A}{a} \quad \text{Reciprocal form}
\]

\[
\sin B = \frac{12 \sin 42^\circ}{22}
\]

Substitute for \(A, a,\) and \(b\).

\[
B = 21.41^\circ. \quad \text{\(B\) is acute.}
\]

Now, you can determine that

\[
C \approx 180^\circ - 42^\circ - 21.41^\circ = 116.59^\circ.
\]

Then, the remaining side is

\[
c = \frac{a}{\sin A} (\sin C) = \frac{22}{\sin 42^\circ} (\sin 116.59^\circ) \approx 29.40 \text{ inches.}
\]
Section 6.1  Law of Sines  431

No-Solution Case—SSA

Show that there is no triangle for which \( a = 15 \), \( b = 25 \), and \( A = 85^\circ \).

Solution

Begin by making the sketch shown in Figure 6.5. From this figure it appears that no triangle is formed. You can verify this using the Law of Sines.

\[
\frac{\sin B}{b} = \frac{\sin A}{a}
\]

Reciprocal form

\[
\sin B = b \left( \frac{\sin A}{a} \right)
\]

Multiply each side by \( b \).

\[
\sin B = 25 \left( \frac{\sin 85^\circ}{15} \right) \approx 1.660 > 1
\]

This contradicts the fact that \(|\sin B| \leq 1\). So, no triangle can be formed having sides \( a = 15 \) and \( b = 25 \) and an angle of \( A = 85^\circ \).

Now try Exercise 27.

Two-Solution Case—SSA

Find two triangles for which \( a = 12 \) meters, \( b = 31 \) meters, and \( A = 20.5^\circ \).

Solution

By the Law of Sines, you have

\[
\frac{\sin B}{b} = \frac{\sin A}{a}
\]

Reciprocal form

\[
\sin B = b \left( \frac{\sin A}{a} \right) = 31 \left( \frac{\sin 20.5^\circ}{12} \right) \approx 0.9047.
\]

There are two angles, \( B_1 \approx 64.8^\circ \) and \( B_2 \approx 180^\circ - 64.8^\circ = 115.2^\circ \), between \( 0^\circ \) and \( 180^\circ \) whose sine is 0.9047. For \( B_1 \approx 64.8^\circ \), you obtain

\[ C \approx 180^\circ - 20.5^\circ - 64.8^\circ = 94.7^\circ \]

\[
c = \frac{a}{\sin A} (\sin C) = \frac{12}{\sin 20.5^\circ} (\sin 94.7^\circ) \approx 34.15 \text{ meters}.
\]

For \( B_2 \approx 115.2^\circ \), you obtain

\[ C \approx 180^\circ - 20.5^\circ - 115.2^\circ = 44.3^\circ \]

\[
c = \frac{a}{\sin A} (\sin C) = \frac{12}{\sin 20.5^\circ} (\sin 44.3^\circ) \approx 23.93 \text{ meters}.
\]

The resulting triangles are shown in Figure 6.6.

Now try Exercise 29.
Area of an Oblique Triangle

The procedure used to prove the Law of Sines leads to a simple formula for the area of an oblique triangle. Referring to Figure 6.7, note that each triangle has a height of 

\[ h = b \sin(180^\circ - A) \]

\[ = b (\sin 180^\circ \cos A - \cos 180^\circ \sin A) \]

\[ = b [0 \cdot \cos A - (-1) \cdot \sin A] \]

\[ = b \sin A \]

Note that if angle \( A \) is 90°, the formula gives the area for a right triangle:

\[ \text{Area} = \frac{1}{2} bc \sin 90^\circ = \frac{1}{2} bc = \frac{1}{2} \text{(base)(height)}. \]

\[ \sin 90^\circ = 1 \]

Similar results are obtained for angles \( C \) and \( B \) equal to 90°.

Example 6  Finding the Area of a Triangular Lot

Find the area of a triangular lot having two sides of lengths 90 meters and 52 meters and an included angle of 102°.

Solution

Consider \( a = 90 \) meters, \( b = 52 \) meters, and angle \( C = 102^\circ \), as shown in Figure 6.8. Then, the area of the triangle is

\[ \text{Area} = \frac{1}{2} ab \sin C = \frac{1}{2} (90)(52)(\sin 102^\circ) \approx 2289 \text{ square meters}. \]

Now try Exercise 39.
Application

Example 7  An Application of the Law of Sines

The course for a boat race starts at point $A$ in Figure 6.9 and proceeds in the direction S 52° W to point $B$, then in the direction S 40° E to point $C$, and finally back to $A$. Point $C$ lies 8 kilometers directly south of point $A$. Approximate the total distance of the race course.

Solution

Because lines $BD$ and $AC$ are parallel, it follows that $\angle BCA \equiv \angle CBD$. Consequently, triangle $ABC$ has the measures shown in Figure 6.10. The measure of angle $B$ is

$$180° - 52° - 40° = 88°.$$  

Using the Law of Sines,

$$\frac{a}{\sin 52°} = \frac{b}{\sin 88°} = \frac{c}{\sin 40°}.$$  

Because $b = 8$,

$$a = \frac{8}{\sin 88°} (\sin 52°) \approx 6.308$$  

and

$$c = \frac{8}{\sin 88°} (\sin 40°) \approx 5.145.$$  

The total length of the course is approximately

Length $\approx 8 + 6.308 + 5.145$

$= 19.453$ kilometers.

CHECK POINT  Now try Exercise 49.

Classroom Discussion

Using the Law of Sines  In this section, you have been using the Law of Sines to solve oblique triangles. Can the Law of Sines also be used to solve a right triangle? If so, write a short paragraph explaining how to use the Law of Sines to solve each triangle. Is there an easier way to solve these triangles?

a. (AAS)  

b. (ASA)
6.1 EXERCISES

VOCABULARY: Fill in the blanks.

1. An ________ triangle is a triangle that has no right angle.

2. For triangle $ABC$, the Law of Sines is given by $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$.

3. Two ________ and one ________ determine a unique triangle.

4. The area of an oblique triangle is given by $\frac{1}{2}bc \sin A = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B$.

SKILLS AND APPLICATIONS

In Exercises 5–24, use the Law of Sines to solve the triangle. Round your answers to two decimal places.

5. $\triangle ABC$ with $b = 20$, $\angle A = 105^\circ$, $\angle C = 45^\circ$, $\angle B = 30^\circ$

6. $\triangle ABC$ with $c = 10$, $\angle A = 35^\circ$, $\angle B = 40^\circ$, $\angle C = 105^\circ$

7. $\triangle ABC$ with $a = 3.5$, $\angle B = 25^\circ$, $\angle C = 35^\circ$

8. $\triangle ABC$ with $c = 45$, $\angle A = 135^\circ$, $\angle B = 10^\circ$

9. $A = 102.4^\circ$, $C = 16.7^\circ$, $a = 21.6$

10. $A = 24.3^\circ$, $C = 54.6^\circ$, $c = 2.68$

11. $A = 83^\circ 20'$, $C = 54.6^\circ$, $c = 18.1$

12. $A = 5^\circ 40'$, $B = 8^\circ 15'$, $b = 4.8$

13. $A = 35^\circ$, $B = 65^\circ$, $c = 10$

14. $A = 120^\circ$, $B = 45^\circ$, $c = 16$

15. $A = 55^\circ$, $B = 42^\circ$, $c = \frac{3}{2}$

16. $B = 28^\circ$, $C = 104^\circ$, $a = 3\frac{3}{8}$

17. $A = 36^\circ$, $a = 8$, $b = 5$

18. $A = 60^\circ$, $a = 9$, $c = 10$

19. $B = 15^\circ 30'$, $a = 4.5$, $b = 6.8$

20. $B = 2^\circ 45'$, $b = 6.2$, $c = 5.8$

21. $A = 145^\circ$, $a = 14$, $b = 4$

22. $A = 100^\circ$, $a = 125$, $c = 10$

23. $A = 110^\circ 15'$, $a = 48$, $b = 16$

24. $C = 95.20^\circ$, $a = 35$, $c = 50$

In Exercises 25–34, use the Law of Sines to solve (if possible) the triangle. If two solutions exist, find both. Round your answers to two decimal places.

25. $A = 110^\circ$, $a = 125$, $b = 100$

26. $A = 110^\circ$, $a = 125$, $b = 200$

27. $A = 76^\circ$, $a = 18$, $b = 20$

28. $A = 76^\circ$, $a = 34$, $b = 21$

29. $A = 58^\circ$, $a = 11.4$, $b = 12.8$

30. $A = 58^\circ$, $a = 4.5$, $b = 12.8$

31. $A = 120^\circ$, $a = 25$, $b = 25$

32. $A = 120^\circ$, $a = 25$, $b = 24$

33. $A = 45^\circ$, $a = b = 1$

34. $A = 25^\circ 4'$, $a = 9.5$, $b = 22$

In Exercises 35–38, find values for $b$ such that the triangle has (a) one solution, (b) two solutions, and (c) no solution.

35. $A = 36^\circ$, $a = 5$

36. $A = 60^\circ$, $a = 10$

37. $A = 10^\circ$, $a = 10.8$

38. $A = 88^\circ$, $a = 315.6$

In Exercises 39–44, find the area of the triangle having the indicated angle and sides.

39. $C = 120^\circ$, $a = 4$, $b = 6$

40. $B = 130^\circ$, $a = 62$, $c = 20$

41. $A = 43^\circ 45'$, $b = 57$, $c = 85$

42. $A = 5^\circ 15'$, $b = 4.5$, $c = 22$

43. $B = 72^\circ 30'$, $a = 105$, $c = 64$

44. $C = 84^\circ 30'$, $a = 16$, $b = 20$
45. **HEIGHT** Because of prevailing winds, a tree grew so that it was leaning $4^\circ$ from the vertical. At a point 40 meters from the tree, the angle of elevation to the top of the tree is $30^\circ$ (see figure). Find the height $h$ of the tree.

46. **HEIGHT** A flagpole at a right angle to the horizontal is located on a slope that makes an angle of $12^\circ$ with the horizontal. The flagpole’s shadow is 16 meters long and points directly up the slope. The angle of elevation from the tip of the shadow to the sun is 20°.
   (a) Draw a triangle to represent the situation. Show the known quantities on the triangle and use a variable to indicate the height of the flagpole.
   (b) Write an equation that can be used to find the height of the flagpole.
   (c) Find the height of the flagpole.

47. **ANGLE OF ELEVATION** A 10-meter utility pole casts a 17-meter shadow directly down a slope when the angle of elevation of the sun is $42^\circ$ (see figure). Find $\theta$, the angle of elevation of the ground.

48. **FLIGHT PATH** A plane flies 500 kilometers with a bearing of $316^\circ$ from Naples to Elgin (see figure). The plane then flies 720 kilometers from Elgin to Canton (Canton is due west of Naples). Find the bearing of the flight from Elgin to Canton.

49. **BRIDGE DESIGN** A bridge is to be built across a small lake from a gazebo to a dock (see figure). The bearing from the gazebo to the dock is S 41° W. From a tree 100 meters from the gazebo, the bearings to the gazebo and the dock are S $74^\circ$ E and S $28^\circ$ E, respectively. Find the distance from the gazebo to the dock.

50. **RAILROAD TRACK DESIGN** The circular arc of a railroad curve has a chord of length 3000 feet corresponding to a central angle of $40^\circ$.
   (a) Draw a diagram that visually represents the situation. Show the known quantities on the diagram and use the variables $r$ and $s$ to represent the radius of the arc and the length of the arc, respectively.
   (b) Find the radius $r$ of the circular arc.
   (c) Find the length $s$ of the circular arc.

51. **GLIDE PATH** A pilot has just started on the glide path for landing at an airport with a runway of length 9000 feet. The angles of depression from the plane to the ends of the runway are $17.5^\circ$ and $18.8^\circ$.
   (a) Draw a diagram that visually represents the situation.
   (b) Find the air distance the plane must travel until touching down on the near end of the runway.
   (c) Find the ground distance the plane must travel until touching down.
   (d) Find the altitude of the plane when the pilot begins the descent.

52. **LOCATING A FIRE** The bearing from the Pine Knob fire tower to the Colt Station fire tower is N $65^\circ$ E, and the two towers are 30 kilometers apart. A fire spotted by rangers in each tower has a bearing of N $80^\circ$ E from Pine Knob and S $70^\circ$ E from Colt Station (see figure). Find the distance of the fire from each tower.
53. **DISTANCE** A boat is sailing due east parallel to the shoreline at a speed of 10 miles per hour. At a given time, the bearing to the lighthouse is S 70° E, and 15 minutes later the bearing is S 63° E (see figure). The lighthouse is located at the shoreline. What is the distance from the boat to the shoreline?

![Diagram](image1)

54. **DISTANCE** A family is traveling due west on a road that passes a famous landmark. At a given time the bearing to the landmark is N 62° W, and after the family travels 5 miles farther the bearing is N 38° W. What is the closest the family will come to the landmark while on the road?

55. **ALTITUDE** The angles of elevation to an airplane from two points A and B on level ground are 55° and 72°, respectively. The points A and B are 2.2 miles apart, and the airplane is east of both points in the same vertical plane. Find the altitude of the plane.

56. **DISTANCE** The angles of elevation \( \theta \) and \( \phi \) to an airplane from the airport control tower and from an observation post 2 miles away are being continuously monitored (see figure). Write an equation giving the distance \( d \) between the plane and observation post in terms of \( \theta \) and \( \phi \).

![Diagram](image2)

60. **GRAPHICAL AND NUMERICAL ANALYSIS** In the figure, \( \alpha \) and \( \beta \) are positive angles.

(a) Write \( \alpha \) as a function of \( \beta \).

(b) Use a graphing utility to graph the function in part (a). Determine its domain and range.

(c) Use the result of part (a) to write \( c \) as a function of \( \beta \).

(d) Use a graphing utility to graph the function in part (c). Determine its domain and range.

(e) Complete the table. What can you infer?

<table>

61. **GRAPHICAL ANALYSIS**

(a) Write the area \( A \) of the shaded region in the figure as a function of \( \theta \).

(b) Use a graphing utility to graph the function.

(c) Determine the domain of the function. Explain how the area of the region and the domain of the function would change if the eight-centimeter line segment were decreased in length.

62. **CAPSTONE** In the figure, a triangle is to be formed by drawing a line segment of length \( a \) from (4, 3) to the positive \( x \)-axis. For what value(s) of \( a \) can you form (a) one triangle, (b) two triangles, and (c) no triangles? Explain your reasoning.

![Diagram](image4)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 57–59, determine whether the statement is true or false. Justify your answer.

57. If a triangle contains an obtuse angle, then it must be oblique.

58. Two angles and one side of a triangle do not necessarily determine a unique triangle.

59. If three sides or three angles of an oblique triangle are known, then the triangle can be solved.
6.2 Law of Cosines

What you should learn
• Use the Law of Cosines to solve oblique triangles (SSS or SAS).
• Use the Law of Cosines to model and solve real-life problems.
• Use Heron’s Area Formula to find the area of a triangle.

Why you should learn it
You can use the Law of Cosines to solve real-life problems involving oblique triangles. For instance, in Exercise 52 on page 443, you can use the Law of Cosines to approximate how far a baseball player has to run to make a catch.

Law of Cosines

<table>
<thead>
<tr>
<th>Standard Form</th>
<th>Alternative Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>$a^2 = b^2 + c^2 - 2bc \cos A$</td>
<td>$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$</td>
</tr>
<tr>
<td>$b^2 = a^2 + c^2 - 2ac \cos B$</td>
<td>$\cos B = \frac{a^2 + c^2 - b^2}{2ac}$</td>
</tr>
<tr>
<td>$c^2 = a^2 + b^2 - 2ab \cos C$</td>
<td>$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$</td>
</tr>
</tbody>
</table>

For a proof of the Law of Cosines, see Proofs in Mathematics on page 488.

Example 1 Three Sides of a Triangle—SSS

Find the three angles of the triangle in Figure 6.11.

Solution

It is a good idea first to find the angle opposite the longest side—side $b$ in this case. Using the alternative form of the Law of Cosines, you find that

$$\cos B = \frac{a^2 + c^2 - b^2}{2ac} = \frac{8^2 + 14^2 - 19^2}{2(8)(14)} \approx -0.45089.$$ 

Because $\cos B$ is negative, you know that $B$ is an obtuse angle given by $B \approx 116.80^\circ$. At this point, it is simpler to use the Law of Sines to determine $A$.

$$\sin A = a \left(\frac{\sin B}{b}\right) = 8 \left(\frac{\sin 116.80^\circ}{19}\right) \approx 0.37583$$

You know that $A$ must be acute because $B$ is obtuse, and a triangle can have, at most, one obtuse angle. So, $A \approx 22.08^\circ$ and $C \approx 180^\circ - 22.08^\circ - 116.80^\circ = 41.12^\circ$.

Check Point Now try Exercise 5.
Do you see why it was wise to find the largest angle first in Example 1? Knowing the cosine of an angle, you can determine whether the angle is acute or obtuse. That is,

\[
\cos \theta > 0 \quad \text{for} \quad 0^\circ < \theta < 90^\circ \quad \text{Acute}
\]
\[
\cos \theta < 0 \quad \text{for} \quad 90^\circ < \theta < 180^\circ. \quad \text{Obtuse}
\]

So, in Example 1, once you found that angle was obtuse, you knew that angles \(A\) and \(C\) were both acute. If the largest angle is acute, the remaining two angles are acute also.

**Example 2** Two Sides and the Included Angle—SAS

Find the remaining angles and side of the triangle in Figure 6.12.

![Figure 6.12](image)

**Solution**

Use the Law of Cosines to find the unknown side \(a\) in the figure.

\[
a^2 = b^2 + c^2 - 2bc \cos A
\]

\[
a^2 = 9^2 + 12^2 - 2(9)(12) \cos 25^\circ
\]

\[
a^2 \approx 29.2375
\]

\[
a \approx 5.4072
\]

Because \(a \approx 5.4072\) meters, you now know the ratio \(\sin A / a\) and you can use the reciprocal form of the Law of Sines to solve for \(B\).

\[
\sin B / b = \sin A / a
\]

\[
\sin B = b \left( \frac{\sin A}{a} \right)
\]

\[
= 9 \left( \frac{\sin 25}{5.4072} \right)
\]

\[
\approx 0.7034
\]

There are two angles between 0° and 180° whose sine is 0.7034, \(B_1 \approx 44.7^\circ\) and \(B_2 \approx 180^\circ - 44.7^\circ = 135.3^\circ\).

For \(B_1 \approx 44.7^\circ\),

\[
C_1 \approx 180^\circ - 25^\circ - 44.7^\circ = 110.3^\circ.
\]

For \(B_2 \approx 135.3^\circ\),

\[
C_2 \approx 180^\circ - 25^\circ - 135.3^\circ = 19.7^\circ.
\]

Because side \(c\) is the longest side of the triangle, \(C\) must be the largest angle of the triangle. So, \(B \approx 44.7^\circ\) and \(C \approx 110.3^\circ\).

**CHECKPOINT** Now try Exercise 7.
Applications

Example 3  An Application of the Law of Cosines

The pitcher’s mound on a women’s softball field is 43 feet from home plate and the distance between the bases is 60 feet, as shown in Figure 6.13. (The pitcher’s mound is not halfway between home plate and second base.) How far is the pitcher’s mound from first base?

Solution

In triangle \( HPF \), \( H = 45^\circ \) (line \( HP \) bisects the right angle at \( H \)), \( f = 43 \), and \( p = 60 \). Using the Law of Cosines for this SAS case, you have

\[
\begin{align*}
h^2 &= f^2 + p^2 - 2fp \cos H \\
&= 43^2 + 60^2 - 2(43)(60) \cos 45^\circ \\&\approx 1800.3.
\end{align*}
\]

So, the approximate distance from the pitcher’s mound to first base is

\[
h \approx \sqrt{1800.3} \approx 42.43 \text{ feet}.
\]

Check Point  Now try Exercise 43.

Example 4  An Application of the Law of Cosines

A ship travels 60 miles due east, then adjusts its course northward, as shown in Figure 6.14. After traveling 80 miles in that direction, the ship is 139 miles from its point of departure. Describe the bearing from point \( B \) to point \( C \).

Solution

You have \( a = 80 \), \( b = 139 \), and \( c = 60 \). So, using the alternative form of the Law of Cosines, you have

\[
\begin{align*}
\cos B &= \frac{a^2 + c^2 - b^2}{2ac} \\
&= \frac{80^2 + 60^2 - 139^2}{2(80)(60)} \\
&\approx -0.97094.
\end{align*}
\]

So, \( B \approx \arccos(-0.97094) \approx 166.15^\circ \), and thus the bearing measured from due north from point \( B \) to point \( C \) is

\[
166.15^\circ - 90^\circ = 76.15^\circ \text{, or N 76.15° E}.
\]

Check Point  Now try Exercise 49.
Heron’s Area Formula

The Law of Cosines can be used to establish the following formula for the area of a triangle. This formula is called Heron’s Area Formula after the Greek mathematician Heron (c. 100 B.C.).

**Heron’s Area Formula**

Given any triangle with sides of lengths \( a, b, \) and \( c, \) the area of the triangle is

\[
\text{Area} = \sqrt{s(s - a)(s - b)(s - c)}
\]

where \( s = (a + b + c)/2. \)

For a proof of Heron’s Area Formula, see Proofs in Mathematics on page 489.

**Example 5** Using Heron’s Area Formula

Find the area of a triangle having sides of lengths \( a = 43 \) meters, \( b = 53 \) meters, and \( c = 72 \) meters.

**Solution**

Because \( s = (a + b + c)/2 = 168/2 = 84, \) Heron’s Area Formula yields

\[
\text{Area} = \sqrt{84(41)(31)(12)} \\
\approx 1131.89 \text{ square meters.}
\]

**CHECKPOINT** Now try Exercise 59.

You have now studied three different formulas for the area of a triangle.

- **Standard Formula:** \( \text{Area} = \frac{1}{2}bh \)
- **Oblique Triangle:** \( \text{Area} = \frac{1}{2}bc \sin A = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B \)
- **Heron’s Area Formula:** \( \text{Area} = \sqrt{s(s - a)(s - b)(s - c)} \)

**CLASSROOM DISCUSSION**

The Area of a Triangle Use the most appropriate formula to find the area of each triangle below. Show your work and give your reasons for choosing each formula.

a. \[
\begin{array}{c}
\text{2 ft} \\
\angle 50^\circ \\
\text{4 ft}

\text{3 ft} \\
\text{4 ft} \\
\text{5 ft}
\end{array}
\]
6.2  EXERCISES

VOCA BULARY: Fill in the blanks.
1. If you are given three sides of a triangle, you would use the Law of ________ to find the three angles of the triangle.
2. If you are given two angles and any side of a triangle, you would use the Law of ________ to solve the triangle.
3. The standard form of the Law of Cosines for \( \cos B = \frac{a^2 + c^2 - b^2}{2ac} \) is ________.
4. The Law of Cosines can be used to establish a formula for finding the area of a triangle called ________ ________ Formula.

SKILLS AND APPLICATIONS

In Exercises 5–20, use the Law of Cosines to solve the triangle. Round your answers to two decimal places.

5. 

\[ \begin{align*}
A & \quad b = 12 \\
C & \quad a = 10 \\
B & \quad c = 16
\end{align*} \]

6. 

\[ \begin{align*}
A & \quad b = 3 \\
C & \quad a = 7 \\
B & \quad c = 8
\end{align*} \]

7. 

\[ \begin{align*}
A & \quad b = 15 \\
C & \quad a = 30^\circ \\
B & \quad c = 30
\end{align*} \]

8. 

\[ \begin{align*}
A & \quad b = 4.5 \\
C & \quad a = 9 \\
B & \quad c = 105^\circ
\end{align*} \]

9. \( a = 11, \ b = 15, \ c = 21 \)

10. \( a = 55, \ b = 25, \ c = 72 \)

11. \( a = 75.4, \ b = 52, \ c = 52 \)

12. \( a = 1.42, \ b = 0.75, \ c = 1.25 \)

13. \( A = 120^\circ, \ b = 6, \ c = 7 \)

14. \( A = 48^\circ, \ b = 3, \ c = 14 \)

15. \( B = 10^\circ 35', \ a = 40, \ c = 30 \)

16. \( B = 75^\circ 20', \ a = 6.2, \ c = 9.5 \)

17. \( B = 125^\circ 40', \ a = 37, \ c = 37 \)

18. \( C = 15^\circ 15', \ a = 7.45, \ b = 2.15 \)

19. \( C = 43^\circ, \ a = \frac{7}{3}, \ b = \frac{7}{2} \)

20. \( C = 101^\circ, \ a = \frac{3}{8}, \ b = \frac{3}{4} \)

In Exercises 21–26, complete the table by solving the parallelogram shown in the figure. (The lengths of the diagonals are given by \( c \) and \( d \).)

\[ \begin{align*}
a & \quad b \\
\phi & \quad \theta \\
c & \quad d
\end{align*} \]

\[ \begin{align*}
21. & \quad a \quad b \quad c \quad d \quad \theta \quad \phi \\
22. & \quad 5 \quad 8 \quad \text{____} \quad \text{____} \quad 45^\circ \quad \text{____} \\
23. & \quad 25 \quad 35 \quad \text{____} \quad \text{____} \quad 120^\circ \\
24. & \quad 10 \quad 14 \quad 20 \quad \text{____} \quad \text{____} \\
25. & \quad 40 \quad 60 \quad 80 \quad \text{____} \quad \text{____} \\
26. & \quad 15 \quad \text{____} \quad 25 \quad 20 \quad \text{____} \quad \text{____}
\end{align*} \]

In Exercises 27–32, determine whether the Law of Sines or the Law of Cosines is needed to solve the triangle. Then solve the triangle.

27. \( a = 8, \ c = 5, \ B = 40^\circ \)

28. \( a = 10, \ b = 12, \ C = 70^\circ \)

29. \( A = 24^\circ, \ a = 4, \ b = 18 \)

30. \( a = 11, \ b = 13, \ c = 7 \)

31. \( A = 42^\circ, \ B = 35^\circ, \ c = 1.2 \)

32. \( a = 160, \ B = 12^\circ, \ C = 7^\circ \)

In Exercises 33–40, use Heron's Area Formula to find the area of the triangle.

33. \( a = 8, \ b = 12, \ c = 17 \)

34. \( a = 33, \ b = 36, \ c = 25 \)

35. \( a = 2.5, \ b = 10.2, \ c = 9 \)

36. \( a = 75.4, \ b = 52, \ c = 52 \)

37. \( a = 12.32, \ b = 8.46, \ c = 15.05 \)

38. \( a = 3.05, \ b = 0.75, \ c = 2.45 \)

39. \( a = 1, \ b = \frac{1}{2}, \ c = \frac{3}{4} \)

40. \( a = \frac{3}{5}, \ b = \frac{2}{5}, \ c = \frac{3}{2} \)
41. **NAVIGATION** A boat race runs along a triangular course marked by buoys A, B, and C. The race starts with the boats headed west for 3700 meters. The other two sides of the course lie to the north of the first side, and their lengths are 1700 meters and 3000 meters. Draw a figure that gives a visual representation of the situation, and find the bearings for the last two legs of the race.

42. **NAVIGATION** A plane flies 810 miles from Franklin to Centerville with a bearing of Then it flies 648 miles from Centerville to Rosemount with a bearing of Draw a figure that visually represents the situation, and find the straight-line distance and bearing from Franklin to Rosemount.

43. **SURVEYING** To approximate the length of a marsh, a surveyor walks 250 meters from point A to point B, then turns 75° and walks 220 meters to point C (see figure). Approximate the length AC of the marsh.

44. **SURVEYING** A triangular parcel of land has 115 meters of frontage, and the other boundaries have lengths of 76 meters and 92 meters. What angles does the frontage make with the two other boundaries?

45. **SURVEYING** A triangular parcel of ground has sides of lengths 725 feet, 650 feet, and 575 feet. Find the measure of the largest angle.

46. **STREETLIGHT DESIGN** Determine the angle θ in the design of the streetlight shown in the figure.

47. **DISTANCE** Two ships leave a port at 9 A.M. One travels at a bearing of N 53° W at 12 miles per hour, and the other travels at a bearing of S 67° W at 16 miles per hour. Approximate how far apart they are at noon that day.

48. **LENGTH** A 100-foot vertical tower is to be erected on the side of a hill that makes a 6° angle with the horizontal (see figure). Find the length of each of the two guy wires that will be anchored 75 feet uphill and downhill from the base of the tower.

49. **NAVIGATION** On a map, Orlando is 178 millimeters due south of Niagara Falls, Denver is 273 millimeters from Orlando, and Denver is 235 millimeters from Niagara Falls (see figure).

(a) Find the bearing of Denver from Orlando.

(b) Find the bearing of Denver from Niagara Falls.

50. **NAVIGATION** On a map, Minneapolis is 165 millimeters due west of Albany, Phoenix is 216 millimeters from Minneapolis, and Phoenix is 368 millimeters from Albany (see figure).

(a) Find the bearing of Minneapolis from Phoenix.

(b) Find the bearing of Albany from Phoenix.

51. **BASEBALL** On a baseball diamond with 90-foot sides, the pitcher’s mound is 60.5 feet from home plate. How far is it from the pitcher’s mound to third base?
52. **BASEBALL**  The baseball player in center field is playing approximately 330 feet from the television camera that is behind home plate. A batter hits a fly ball that goes to the wall 420 feet from the camera (see figure). The camera turns $8^\circ$ to follow the play. Approximately how far does the center fielder have to run to make the catch?

53. **AIRCRAFT TRACKING**  To determine the distance between two aircraft, a tracking station continuously determines the distance to each aircraft and the angle $A$ between them (see figure). Determine the distance $a$ between the planes when $A = 42^\circ$, $b = 35$ miles, and $c = 20$ miles.

54. **AIRCRAFT TRACKING**  Use the figure for Exercise 53 to determine the distance $a$ between the planes when $A = 11^\circ$, $b = 20$ miles, and $c = 20$ miles.

55. **TRUSSES**  $Q$ is the midpoint of the line segment $PR$ in the truss rafter shown in the figure. What are the lengths of the line segments $PQ$, $QR$, and $RS$?

56. **ENGINE DESIGN**  An engine has a seven-inch connecting rod fastened to a crank (see figure).

(a) Use the Law of Cosines to write an equation giving the relationship between $x$ and $\theta$.

(b) Write $x$ as a function of $\theta$. (Select the sign that yields positive values of $x$.)

(c) Use a graphing utility to graph the function in part (b).

(d) Use the graph in part (c) to determine the maximum distance the piston moves in one cycle.

57. **PAPER MANUFACTURING**  In a process with continuous paper, the paper passes across three rollers of radii 3 inches, 4 inches, and 6 inches (see figure). The centers of the three-inch and six-inch rollers are $d$ inches apart, and the length of the arc in contact with the paper on the four-inch roller is $s$ inches. Complete the table.

<table>

58. **AWNING DESIGN**  A retractable awning above a patio door lowers at an angle of $50^\circ$ from the exterior wall at a height of 10 feet above the ground (see figure). No direct sunlight is to enter the door when the angle of elevation of the sun is greater than $70^\circ$. What is the length $x$ of the awning?

59. **GEOMETRY**  The lengths of the sides of a triangular parcel of land are approximately 200 feet, 500 feet, and 600 feet. Approximate the area of the parcel.
60. **GEOMETRY** A parking lot has the shape of a parallelogram (see figure). The lengths of two adjacent sides are 70 meters and 100 meters. The angle between the two sides is 70°. What is the area of the parking lot?

![Parallelogram](image)

61. **GEOMETRY** You want to buy a triangular lot measuring 510 yards by 840 yards by 1120 yards. The price of the land is $2000 per acre. How much does the land cost? (Hint: 1 acre = 4840 square yards)

62. **GEOMETRY** You want to buy a triangular lot measuring 1350 feet by 1860 feet by 2490 feet. The price of the land is $2200 per acre. How much does the land cost? (Hint: 1 acre = 43,560 square yards)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 63 and 64, determine whether the statement is true or false. Justify your answer.

63. In Heron’s Area Formula, \( s \) is the average of the lengths of the three sides of the triangle.

64. In addition to SSS and SAS, the Law of Cosines can be used to solve triangles with SSA conditions.

65. **WRITING** A triangle has side lengths of 10 centimeters, 16 centimeters, and 5 centimeters. Can the Law of Cosines be used to solve the triangle? Explain.

66. **WRITING** Given a triangle with \( b = 47 \) meters, \( A = 87° \), and \( C = 110° \), can the Law of Cosines be used to solve the triangle? Explain.

67. **CIRCUMSCRIBED AND INScribed CIRCLES** Let \( R \) and \( r \) be the radii of the circumscribed and inscribed circles of a triangle \( ABC \), respectively (see figure), and let \( s = \frac{a + b + c}{2} \).

![Circumcircle and Incircle](image)

(a) Prove that \( 2R = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \).

(b) Prove that \( r = \sqrt{\frac{(s - a)(s - b)(s - c)}{s}} \).

**CIRCUMSCRIBED AND INScribed CIRCLES** In Exercises 68 and 69, use the results of Exercise 67.

68. Given a triangle with \( a = 25 \), \( b = 55 \), and \( c = 72 \), find the areas of (a) the triangle, (b) the circumscribed circle, and (c) the inscribed circle.

69. Find the length of the largest circular running track that can be built on a triangular piece of property with sides of lengths 200 feet, 250 feet, and 325 feet.

70. **THINK ABOUT IT** What familiar formula do you obtain when you use the third form of the Law of Cosines \( c^2 = a^2 + b^2 - 2ab \cos C \), and you let \( C = 90° \)? What is the relationship between the Law of Cosines and this formula?

71. **THINK ABOUT IT** In Example 2, suppose \( A = 115° \). After solving for \( a \), which angle would you solve for next, \( B \) or \( C \)? Are there two possible solutions for that angle? If so, how can you determine which angle is the correct solution?

72. **WRITING** Describe how the Law of Cosines can be used to solve the ambiguous case of the oblique triangle \( ABC \), where \( a = 12 \) feet, \( b = 30 \) feet, and \( A = 20° \). Is the result the same as when the Law of Sines is used to solve the triangle? Describe the advantages and the disadvantages of each method.

73. **WRITING** In Exercise 72, the Law of Cosines was used to solve a triangle in the two-solution case of SSA. Can the Law of Cosines be used to solve the no-solution and single-solution cases of SSA? Explain.

74. **CAPSTONE** Determine whether the Law of Sines or the Law of Cosines is needed to solve the triangle.

75. **PROOF** Use the Law of Cosines to prove that \( \frac{1}{2} bc (1 + \cos A) = \frac{a + b + c}{2} \cdot \frac{-a + b + c}{2} \).

76. **PROOF** Use the Law of Cosines to prove that \( \frac{1}{2} bc (1 - \cos A) = \frac{a - b + c}{2} \cdot \frac{a + b - c}{2} \).
6.3 VECTORS IN THE PLANE

What you should learn

- Represent vectors as directed line segments.
- Write the component forms of vectors.
- Perform basic vector operations and represent them graphically.
- Write vectors as linear combinations of unit vectors.
- Find the direction angles of vectors.
- Use vectors to model and solve real-life problems.

Why you should learn it

You can use vectors to model and solve real-life problems involving magnitude and direction. For instance, in Exercise 102 on page 457, you can use vectors to determine the true direction of a commercial jet.

Introduction

Quantities such as force and velocity involve both magnitude and direction and cannot be completely characterized by a single real number. To represent such a quantity, you can use a directed line segment, as shown in Figure 6.15. The directed line segment $\overrightarrow{PQ}$ has initial point $P$ and terminal point $Q$. Its magnitude (or length) is denoted by $|\overrightarrow{PQ}|$ and can be found using the Distance Formula.

Two directed line segments that have the same magnitude and direction are equivalent. For example, the directed line segments in Figure 6.16 are all equivalent. The set of all directed line segments that are equivalent to the directed line segment $\overrightarrow{PQ}$ is a vector $\mathbf{v}$ in the plane, written $\mathbf{v} = \overrightarrow{PQ}$. Vectors are denoted by lowercase, boldface letters such as $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$.

Example 1 Vector Representation by Directed Line Segments

Let $\mathbf{u}$ be represented by the directed line segment from $P(0, 0)$ to $Q(3, 2)$, and let $\mathbf{v}$ be represented by the directed line segment from $R(1, 2)$ to $S(4, 4)$, as shown in Figure 6.17. Show that $\mathbf{u}$ and $\mathbf{v}$ are equivalent.

Solution

From the Distance Formula, it follows that $|\overrightarrow{PQ}|$ and $|\overrightarrow{RS}|$ have the same magnitude.

$$|\overrightarrow{PQ}| = \sqrt{(3 - 0)^2 + (2 - 0)^2} = \sqrt{13}$$

$$|\overrightarrow{RS}| = \sqrt{(4 - 1)^2 + (4 - 2)^2} = \sqrt{13}$$

Moreover, both line segments have the same direction because they are both directed toward the upper right on lines having a slope of

$$\frac{4 - 2}{4 - 1} = \frac{2 - 0}{3 - 0} = \frac{2}{3}.$$ 

Because $\overrightarrow{PQ}$ and $\overrightarrow{RS}$ have the same magnitude and direction, $\mathbf{u}$ and $\mathbf{v}$ are equivalent.

CHECKPOINT Now try Exercise 11.
Component Form of a Vector

The directed line segment whose initial point is the origin is often the most convenient representative of a set of equivalent directed line segments. This representative of the vector \( \mathbf{v} \) is in standard position.

A vector whose initial point is the origin \((0, 0)\) can be uniquely represented by the coordinates of its terminal point \((v_1, v_2)\). This is the component form of a vector \( \mathbf{v} \), written as \( \mathbf{v} = \langle v_1, v_2 \rangle \). The coordinates \( v_1 \) and \( v_2 \) are the components of \( \mathbf{v} \). If both the initial point and the terminal point lie at the origin, \( \mathbf{v} \) is the zero vector and is denoted by \( \mathbf{0} = (0, 0) \).

Component Form of a Vector

The component form of the vector with initial point \( P(p_1, p_2) \) and terminal point \( Q(q_1, q_2) \) is given by

\[
PQ = \langle q_1 - p_1, q_2 - p_2 \rangle = \langle v_1, v_2 \rangle = \mathbf{v}.
\]

The magnitude (or length) of \( \mathbf{v} \) is given by

\[
\|\mathbf{v}\| = \sqrt{(q_1 - p_1)^2 + (q_2 - p_2)^2} = \sqrt{v_1^2 + v_2^2}.
\]

If \( \|\mathbf{v}\| = 1 \), \( \mathbf{v} \) is a unit vector. Moreover, \( \|\mathbf{v}\| = 0 \) if and only if \( \mathbf{v} \) is the zero vector \( \mathbf{0} \).

Example 2  Finding the Component Form of a Vector

Find the component form and magnitude of the vector \( \mathbf{v} \) that has initial point \((4, -7)\) and terminal point \((-1, 5)\).

**Algebraic Solution**

Let

\[
P(4, -7) = (p_1, p_2)
\]

and

\[
Q(-1, 5) = (q_1, q_2).
\]

Then, the components of \( \mathbf{v} = \langle v_1, v_2 \rangle \) are

\[
v_1 = q_1 - p_1 = -1 - 4 = -5
\]

\[
v_2 = q_2 - p_2 = 5 - (-7) = 12.
\]

So, \( \mathbf{v} = (-5, 12) \) and the magnitude of \( \mathbf{v} \) is

\[
\|\mathbf{v}\| = \sqrt{(-5)^2 + 12^2}
= \sqrt{169} = 13.
\]

**Graphical Solution**

Use centimeter graph paper to plot the points \( P(4, -7) \) and \( Q(-1, 5) \). Carefully sketch the vector \( \mathbf{v} \). Use the sketch to find the components of \( \mathbf{v} = \langle v_1, v_2 \rangle \). Then use a centimeter ruler to find the magnitude of \( \mathbf{v} \).

![Graphical Solution](image)

Figure 6.18 shows that the components of \( \mathbf{v} \) are \( v_1 = -5 \) and \( v_2 = 12 \), so \( \mathbf{v} = (-5, 12) \). Figure 6.18 also shows that the magnitude of \( \mathbf{v} \) is \( \|\mathbf{v}\| = 13 \).

**CHECKPoint**  Now try Exercise 19.
Vector Operations

The two basic vector operations are scalar multiplication and vector addition. In operations with vectors, numbers are usually referred to as scalars. In this text, scalars will always be real numbers. Geometrically, the product of a vector \( \mathbf{v} \) and a scalar \( k \) is the vector that is \( |k| \) times as long as \( \mathbf{v} \). If \( k \) is positive, \( k\mathbf{v} \) has the same direction as \( \mathbf{v} \), and if \( k \) is negative, \( k\mathbf{v} \) has the direction opposite that of \( \mathbf{v} \), as shown in Figure 6.19.

To add two vectors \( \mathbf{u} \) and \( \mathbf{v} \) geometrically, first position them (without changing their lengths or directions) so that the initial point of the second vector coincides with the terminal point of the first vector \( \mathbf{u} \). The sum \( \mathbf{u} + \mathbf{v} \) is the vector formed by joining the initial point of the first vector \( \mathbf{u} \) with the terminal point of the second vector \( \mathbf{v} \), as shown in Figure 6.20. This technique is called the parallelogram law for vector addition because the vector often called the resultant of vector addition, is the diagonal of a parallelogram having adjacent sides \( \mathbf{u} \) and \( \mathbf{v} \).

Definitions of Vector Addition and Scalar Multiplication

Let \( \mathbf{u} = (u_1, u_2) \) and \( \mathbf{v} = (v_1, v_2) \) be vectors and let \( k \) be a scalar (a real number). Then the sum of \( \mathbf{u} \) and \( \mathbf{v} \) is the vector

\[
\mathbf{u} + \mathbf{v} = (u_1 + v_1, u_2 + v_2)
\]

and the scalar multiple of \( k \) times \( \mathbf{u} \) is the vector

\[
k\mathbf{u} = k(u_1, u_2) = (ku_1, ku_2).
\]

The negative of \( \mathbf{v} = (v_1, v_2) \) is

\[
-\mathbf{v} = (-1)\mathbf{v} = (-v_1, -v_2)
\]

and the difference of \( \mathbf{u} \) and \( \mathbf{v} \) is

\[
\mathbf{u} - \mathbf{v} = \mathbf{u} + (-\mathbf{v}) = (u_1 - v_1, u_2 - v_2).
\]

To represent \( \mathbf{u} - \mathbf{v} \) geometrically, you can use directed line segments with the same initial point. The difference \( \mathbf{u} - \mathbf{v} \) is the vector from the terminal point of \( \mathbf{v} \) to the terminal point of \( \mathbf{u} \), which is equal to \( \mathbf{u} + (-\mathbf{v}) \), as shown in Figure 6.21.
The component definitions of vector addition and scalar multiplication are illustrated in Example 3. In this example, notice that each of the vector operations can be interpreted geometrically.

**Example 3 Vector Operations**

Let \( \mathbf{v} = (-2, 5) \) and \( \mathbf{w} = (3, 4) \), and find each of the following vectors.

a. \( 2\mathbf{v} \)  
b. \( \mathbf{w} - \mathbf{v} \)  
c. \( \mathbf{v} + 2\mathbf{w} \)

**Solution**

a. Because \( \mathbf{v} = (-2, 5) \), you have

\[
2\mathbf{v} = 2(-2, 5) = (2(-2), 2(5)) = (-4, 10).
\]

A sketch of \( 2\mathbf{v} \) is shown in Figure 6.22.

b. The difference of \( \mathbf{w} \) and \( \mathbf{v} \) is

\[
\mathbf{w} - \mathbf{v} = (3, 4) - (-2, 5) = (3 - (-2), 4 - 5) = (5, -1).
\]

A sketch of \( \mathbf{w} - \mathbf{v} \) is shown in Figure 6.23. Note that the figure shows the vector difference \( \mathbf{w} - \mathbf{v} \) as the sum \( \mathbf{w} + (-\mathbf{v}) \).

c. The sum of \( \mathbf{v} \) and \( 2\mathbf{w} \) is

\[
\mathbf{v} + 2\mathbf{w} = (-2, 5) + 2(3, 4) = (-2, 5) + (2(3), 2(4)) = (-2, 5) + (6, 8) = (-2 + 6, 5 + 8) = (4, 13).
\]

A sketch of \( \mathbf{v} + 2\mathbf{w} \) is shown in Figure 6.24.

Now try Exercise 31.
Vector addition and scalar multiplication share many of the properties of ordinary arithmetic.

**Properties of Vector Addition and Scalar Multiplication**

Let \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) be vectors and let \( c \) and \( d \) be scalars. Then the following properties are true.

1. \( \mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u} \)
2. \( (\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w}) \)
3. \( \mathbf{u} + \mathbf{0} = \mathbf{u} \)
4. \( \mathbf{u} + (-\mathbf{u}) = \mathbf{0} \)
5. \( c(d\mathbf{u}) = (cd)\mathbf{u} \)
6. \( (c + d)\mathbf{u} = c\mathbf{u} + d\mathbf{u} \)
7. \( c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v} \)
8. \( 1(\mathbf{u}) = \mathbf{u}, \quad 0(\mathbf{u}) = \mathbf{0} \)
9. \( \|c\mathbf{v}\| = |c|\|\mathbf{v}\| \)

Property 9 can be stated as follows: the magnitude of the vector \( c\mathbf{v} \) is the absolute value of \( c \) times the magnitude of \( \mathbf{v} \).

**Unit Vectors**

In many applications of vectors, it is useful to find a unit vector that has the same direction as a given nonzero vector \( \mathbf{v} \). To do this, you can divide \( \mathbf{v} \) by its magnitude to obtain

\[
\mathbf{u} = \text{unit vector} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \left( \frac{1}{\|\mathbf{v}\|} \right)\mathbf{v}. \quad \text{Unit vector in direction of } \mathbf{v}
\]

Note that \( \mathbf{u} \) is a scalar multiple of \( \mathbf{v} \). The vector \( \mathbf{u} \) has a magnitude of 1 and the same direction as \( \mathbf{v} \). The vector \( \mathbf{u} \) is called a **unit vector in the direction of** \( \mathbf{v} \).

**Example 4** Finding a Unit Vector

Find a unit vector in the direction of \( \mathbf{v} = (-2, 5) \) and verify that the result has a magnitude of 1.

**Solution**

The unit vector in the direction of \( \mathbf{v} \) is

\[
\frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{(-2, 5)}{\sqrt{(-2)^2 + (5)^2}} = \frac{(-2, 5)}{\sqrt{29}} = \left( \frac{-2}{\sqrt{29}}, \frac{5}{\sqrt{29}} \right).
\]

This vector has a magnitude of 1 because

\[
\sqrt{\left(\frac{-2}{\sqrt{29}}\right)^2 + \left(\frac{5}{\sqrt{29}}\right)^2} = \sqrt{\frac{4}{29} + \frac{25}{29}} = \sqrt{\frac{29}{29}} = 1.
\]

**CHECK POINT** Now try Exercise 41.

---

**HISTORICAL NOTE**

William Rowan Hamilton (1805–1865), an Irish mathematician, did some of the earliest work with vectors. Hamilton spent many years developing a system of vector-like quantities called quaternions. Although Hamilton was convinced of the benefits of quaternions, the operations he defined did not produce good models for physical phenomena. It was not until the latter half of the nineteenth century that the Scottish physicist James Maxwell (1831–1879) restructured Hamilton's quaternions in a form useful for representing physical quantities such as force, velocity, and acceleration.
The unit vectors \( \langle 1, 0 \rangle \) and \( \langle 0, 1 \rangle \) are called the **standard unit vectors** and are denoted by

\[
i = \langle 1, 0 \rangle \quad \text{and} \quad j = \langle 0, 1 \rangle
\]
as shown in Figure 6.25. (Note that the lowercase letter \( i \) is written in boldface to distinguish it from the imaginary number \( i = \sqrt{-1} \).) These vectors can be used to represent any vector as follows.

\[
v = \langle v_1, v_2 \rangle = v_1 i + v_2 j
\]

The scalars \( v_1 \) and \( v_2 \) are called the **horizontal** and **vertical components** of \( v \), respectively. The vector sum

\[
v_1 i + v_2 j
\]
is called a **linear combination** of the vectors \( i \) and \( j \). Any vector in the plane can be written as a linear combination of the standard unit vectors \( i \) and \( j \).

**Example 5  Writing a Linear Combination of Unit Vectors**

Let \( u \) be the vector with initial point \((-2, -5)\) and terminal point \((-1, 3)\). Write \( u \) as a linear combination of the standard unit vectors \( i \) and \( j \).

**Solution**

Begin by writing the component form of the vector \( u \).

\[
u = \langle -1 - 2, 3 - (-5) \rangle = \langle -3, 8 \rangle = -3i + 8j
\]

This result is shown graphically in Figure 6.26.

**Example 6  Vector Operations**

Let \( u = -3i + 8j \) and let \( v = 2i - j \). Find \( 2u - 3v \).

**Solution**

You could solve this problem by converting \( u \) and \( v \) to component form. This, however, is not necessary. It is just as easy to perform the operations in unit vector form.

\[
2u - 3v = 2(-3i + 8j) - 3(2i - j) = -6i + 16j - 6i + 3j = -12i + 19j
\]

Now try Exercise 59.
**Direction Angles**

If \( \mathbf{u} \) is a unit vector such that \( \theta \) is the angle (measured counterclockwise) from the positive \( x \)-axis to \( \mathbf{u} \), the terminal point of \( \mathbf{u} \) lies on the unit circle and you have

\[
\mathbf{u} = \langle x, y \rangle = \langle \cos \theta, \sin \theta \rangle = \langle \cos \theta \rangle \mathbf{i} + \langle \sin \theta \rangle \mathbf{j}
\]

as shown in Figure 6.27. The angle \( \theta \) is the direction angle of the vector \( \mathbf{u} \).

Suppose that \( \mathbf{u} \) is a unit vector with direction angle \( \theta \). If \( \mathbf{v} = a \mathbf{i} + b \mathbf{j} \) is any vector that makes an angle \( \theta \) with the positive \( x \)-axis, it has the same direction as \( \mathbf{u} \) and you can write

\[
\mathbf{v} = \| \mathbf{v} \| (\cos \theta, \sin \theta)
\]

\[
= \| \mathbf{v} \| (\cos \theta) \mathbf{i} + \| \mathbf{v} \| (\sin \theta) \mathbf{j}.
\]

Because \( \mathbf{v} = a \mathbf{i} + b \mathbf{j} = \| \mathbf{v} \| (\cos \theta) \mathbf{i} + \| \mathbf{v} \| (\sin \theta) \mathbf{j} \), it follows that the direction angle \( \theta \) for \( \mathbf{v} \) is determined from

\[
\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \text{Quotient identity}
\]

\[
= \frac{\| \mathbf{v} \| \sin \theta}{\| \mathbf{v} \| \cos \theta} \quad \text{Multiply numerator and denominator by } \| \mathbf{v} \|.
\]

\[
= \frac{b}{a} \quad \text{Simplify}.
\]

**Example 7** Finding Direction Angles of Vectors

Find the direction angle of each vector.

a. \( \mathbf{u} = 3 \mathbf{i} + 3 \mathbf{j} \)

b. \( \mathbf{v} = 3 \mathbf{i} - 4 \mathbf{j} \)

**Solution**

a. The direction angle is

\[
\tan \theta = \frac{b}{a} = \frac{3}{3} = 1.
\]

So, \( \theta = 45^\circ \), as shown in Figure 6.28.

b. The direction angle is

\[
\tan \theta = \frac{b}{a} = \frac{-4}{3}.
\]

Moreover, because \( \mathbf{v} = 3 \mathbf{i} - 4 \mathbf{j} \) lies in Quadrant IV, \( \theta \) lies in Quadrant IV and its reference angle is

\[
\theta = \left| \arctan \left( \frac{-4}{3} \right) \right| = | -53.13^\circ | = 53.13^\circ.
\]

So, it follows that \( \theta \approx 360^\circ - 53.13^\circ = 306.87^\circ \), as shown in Figure 6.29.

**Checkpoint** Now try Exercise 63.
Applications of Vectors

Example 8  Finding the Component Form of a Vector

Find the component form of the vector that represents the velocity of an airplane descending at a speed of 150 miles per hour at an angle below the horizontal, as shown in Figure 6.30.

Solution
The velocity vector \( \mathbf{v} \) has a magnitude of 150 and a direction angle of \( \theta = 200^\circ \).

\[
\mathbf{v} = \|\mathbf{v}\| (\cos \theta) \mathbf{i} + \|\mathbf{v}\| (\sin \theta) \mathbf{j}
\]
\[
= 150 (\cos 200^\circ) \mathbf{i} + 150 (\sin 200^\circ) \mathbf{j}
\]
\[
\approx 150(-0.9397) \mathbf{i} + 150(-0.3420) \mathbf{j}
\]
\[
\approx (-140.96, -51.30)
\]

You can check that \( \mathbf{v} \) has a magnitude of 150, as follows.

\[
\|\mathbf{v}\| \approx \sqrt{(-140.96)^2 + (-51.30)^2}
\]
\[
= \sqrt{22,501.41}
\]
\[
= 150
\]

Example 9  Using Vectors to Determine Weight

A force of 600 pounds is required to pull a boat and trailer up a ramp inclined at 15° from the horizontal. Find the combined weight of the boat and trailer.

Solution
Based on Figure 6.31, you can make the following observations.

\[
\|\mathbf{BA}\| = \text{force of gravity} = \text{combined weight of boat and trailer}
\]
\[
\|\mathbf{BC}\| = \text{force against ramp}
\]
\[
\|\mathbf{AC}\| = \text{force required to move boat up ramp} = 600 \text{ pounds}
\]

By construction, triangles \( \triangle BWD \) and \( \triangle ABC \) are similar. Therefore, angle \( \angle ABC \) is 15°. So, in triangle \( \triangle ABC \) you have

\[
\sin 15^\circ = \frac{\|\mathbf{AC}\|}{\|\mathbf{BA}\|}
\]
\[
\sin 15^\circ = \frac{600}{\|\mathbf{BA}\|}
\]
\[
\|\mathbf{BA}\| = \frac{600}{\sin 15^\circ}
\]
\[
\|\mathbf{BA}\| \approx 2318.
\]

Consequently, the combined weight is approximately 2318 pounds. (In Figure 6.31, note that \( \mathbf{AC} \) is parallel to the ramp.)

Now try Exercise 95.
An airplane is traveling at a speed of 500 miles per hour with a bearing of 330° at a fixed altitude with a negligible wind velocity as shown in Figure 6.32(a). When the airplane reaches a certain point, it encounters a wind with a velocity of 70 miles per hour in the direction as shown in Figure 6.32(b). What are the resultant speed and direction of the airplane?

![Figure 6.32](image)

### Solution

Using Figure 6.32, the velocity of the airplane (alone) is

\[ \mathbf{v}_1 = 500(\cos 120°, \sin 120°) \]

\[ = (-250, 250\sqrt{3}) \]

and the velocity of the wind is

\[ \mathbf{v}_2 = 70(\cos 45°, \sin 45°) \]

\[ = (35\sqrt{2}, 35\sqrt{2}) \]

So, the velocity of the airplane (in the wind) is

\[ \mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2 \]

\[ = (-250 + 35\sqrt{2}, 250\sqrt{3} + 35\sqrt{2}) \]

\[ \approx (-200.5, 482.5) \]

and the resultant speed of the airplane is

\[ ||\mathbf{v}|| \approx \sqrt{(-200.5)^2 + (482.5)^2} \]

\[ \approx 522.5 \text{ miles per hour.} \]

Finally, if \( \theta \) is the direction angle of the flight path, you have

\[ \tan \theta \approx \frac{482.5}{-200.5} \]

\[ \approx -2.4065 \]

which implies that

\[ \theta \approx 180° + \arctan(-2.4065) \approx 180° - 67.4° = 112.6°. \]

So, the true direction of the airplane is approximately

\[ 270° + (180° - 112.6°) = 337.4°. \]
6.3 EXERCISES

VOCABULARY: Fill in the blanks.

1. A ________ ________ ________ can be used to represent a quantity that involves both magnitude and direction.
2. The directed line segment \( \overrightarrow{PQ} \) has ________ point \( P \) and ________ point \( Q \).
3. The ________ of the directed line segment \( \overrightarrow{PQ} \) is denoted by \( \| \overrightarrow{PQ} \| \).
4. The set of all directed line segments that are equivalent to a given directed line segment \( \overrightarrow{PQ} \) is a ________ ________ ________ in the plane.
5. In order to show that two vectors are equivalent, you must show that they have the same ________ and the same ________ .
6. The directed line segment whose initial point is the origin is said to be in ________ ________ .
7. A vector that has a magnitude of 1 is called a ________ ________ .
8. The two basic vector operations are scalar ________ and vector ________ .
9. The vector is called the ________ of vector addition.
10. The vector sum \( v_1 \mathbf{i} + v_2 \mathbf{j} \) is called a ________ ________ of the vectors \( \mathbf{i} \) and \( \mathbf{j} \), and the scalars \( v_1 \) and \( v_2 \) are called the ________ and ________ components of \( v \), respectively.

SKILLS AND APPLICATIONS

In Exercises 11 and 12, show that \( \mathbf{u} \) and \( \mathbf{v} \) are equivalent.

11. \[ \begin{align*} y & \quad \text{Axis} \quad 6 \quad 4 \quad 2 \quad 0 \quad -2 \quad -4 \quad -6 \\ x & \quad 0 \quad 2 \quad 4 \quad 6 \quad -2 \quad -4 \quad -6 \\ \text{Initial Point} & \quad (2, 4) \\ \text{Terminal Point} & \quad (6, 5) \end{align*} \]

12. \[ \begin{align*} y & \quad \text{Axis} \quad 4 \quad 2 \quad 0 \quad -2 \quad -4 \\ x & \quad 0 \quad 2 \quad 4 \quad -2 \quad -4 \\ \text{Initial Point} & \quad (-3, -4) \\ \text{Terminal Point} & \quad (3, 3) \end{align*} \]

In Exercises 13–24, find the component form and the magnitude of the vector \( \mathbf{v} \).

13. \[ \begin{align*} y & \quad \text{Axis} \quad 4 \quad 3 \quad 2 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \quad -4 \\ x & \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad -1 \quad -2 \quad -3 \quad -4 \\ \text{Initial Point} & \quad (1, 3) \\ \text{Terminal Point} & \quad (3, 5) \end{align*} \]

14. \[ \begin{align*} y & \quad \text{Axis} \quad 4 \quad 2 \quad 0 \quad -2 \quad -4 \\ x & \quad 2 \quad 4 \quad 6 \quad 8 \quad -2 \quad -4 \quad -6 \quad -8 \\ \text{Initial Point} & \quad (-3, -2) \\ \text{Terminal Point} & \quad (0, -5) \end{align*} \]

15. \[ \begin{align*} y & \quad \text{Axis} \quad 6 \quad 4 \quad 2 \quad 0 \quad -2 \quad -4 \quad -6 \\ x & \quad 4 \quad 2 \quad 0 \quad -2 \quad -4 \quad -6 \\ \text{Initial Point} & \quad (-1, -1) \\ \text{Terminal Point} & \quad (3, 5) \end{align*} \]

16. \[ \begin{align*} y & \quad \text{Axis} \quad 5 \quad 3 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \quad -4 \quad -5 \\ x & \quad 2 \quad 4 \quad 6 \quad 8 \quad 10 \quad -2 \quad -4 \quad -6 \quad -8 \quad -10 \\ \text{Initial Point} & \quad (-1, 4) \\ \text{Terminal Point} & \quad (2, 2) \end{align*} \]

In Exercises 25–30, use the figure to sketch a graph of the specified vector. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

17. \[ \begin{align*} y & \quad \text{Axis} \quad 4 \quad 3 \quad 2 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \quad -4 \\ x & \quad 2 \quad 4 \quad 6 \quad 8 \quad 10 \quad -2 \quad -4 \quad -6 \quad -8 \quad -10 \\ \text{Initial Point} & \quad (3, 3) \\ \text{Terminal Point} & \quad (3, -2) \end{align*} \]

18. \[ \begin{align*} y & \quad \text{Axis} \quad 4 \quad 3 \quad 2 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \quad -4 \\ x & \quad 2 \quad 4 \quad 6 \quad 8 \quad 10 \quad -2 \quad -4 \quad -6 \quad -8 \quad -10 \\ \text{Initial Point} & \quad (-4, -1) \\ \text{Terminal Point} & \quad (3, -1) \end{align*} \]

19. \( (-3, -5) \) (5, 1) 
20. \( (-2, 7) \) (5, -17) 
21. \( (1, 3) \) (-8, -9) 
22. \( (1, 11) \) (9, 3) 
23. \( (-1, 5) \) (15, 12) 
24. \( (-3, 11) \) (9, 40) 

25. \( -\mathbf{v} \) 
26. \( 5\mathbf{v} \) 
27. \( \mathbf{u} + \mathbf{v} \) 
28. \( \mathbf{u} + 2\mathbf{v} \) 
29. \( \mathbf{u} - \mathbf{v} \) 
30. \( \mathbf{v} - \frac{1}{2}\mathbf{u} \)
In Exercises 31–38, find (a) \( \mathbf{u} + \mathbf{v} \), (b) \( \mathbf{u} - \mathbf{v} \), and (c) \( 2\mathbf{u} - 3\mathbf{v} \). Then sketch each resultant vector.

31. \( \mathbf{u} = (2, 1), \mathbf{v} = (1, 3) \)  
32. \( \mathbf{u} = (2, 3), \mathbf{v} = (4, 0) \)  
33. \( \mathbf{u} = (-5, 3), \mathbf{v} = (0, 0) \)  
34. \( \mathbf{u} = (0, 0), \mathbf{v} = (2, 1) \)  
35. \( \mathbf{u} = \mathbf{i} + \mathbf{j}, \mathbf{v} = 2\mathbf{i} - 3\mathbf{j} \)  
36. \( \mathbf{u} = -2\mathbf{i} + \mathbf{j}, \mathbf{v} = 3\mathbf{j} \)  
37. \( \mathbf{u} = 2\mathbf{i}, \mathbf{v} = \mathbf{j} \)  
38. \( \mathbf{u} = 2\mathbf{j}, \mathbf{v} = 3\mathbf{i} \)

In Exercises 39–48, find a unit vector in the direction of the given vector. Verify that the result has a magnitude of 1.

39. \( \mathbf{u} = (3, 0) \)  
40. \( \mathbf{u} = (0, -2) \)  
41. \( \mathbf{v} = (-2, 2) \)  
42. \( \mathbf{v} = (5, -12) \)  
43. \( \mathbf{v} = \mathbf{i} + \mathbf{j} \)  
44. \( \mathbf{v} = 6\mathbf{i} - 2\mathbf{j} \)  
45. \( \mathbf{w} = 4\mathbf{j} \)  
46. \( \mathbf{w} = -6\mathbf{i} \)  
47. \( \mathbf{w} = \mathbf{i} - 2\mathbf{j} \)  
48. \( \mathbf{w} = 7\mathbf{j} - 3\mathbf{i} \)

In Exercises 49–52, find the vector \( \mathbf{v} \) with the given magnitude and the same direction as \( \mathbf{u} \).

\[
\begin{array}{cc}
\text{Magnitude} & \text{Direction} \\
49. \|\mathbf{v}\| = 10 & \mathbf{u} = (-3, 4) \\
50. \|\mathbf{v}\| = 3 & \mathbf{u} = (-12, -5) \\
51. \|\mathbf{v}\| = 9 & \mathbf{u} = (2, 5) \\
52. \|\mathbf{v}\| = 8 & \mathbf{u} = (3, 3) \\
\end{array}
\]

In Exercises 53–56, the initial and terminal points of a vector are given. Write a linear combination of the standard unit vectors \( \mathbf{i} \) and \( \mathbf{j} \).

\[
\begin{array}{cc}
\text{Initial Point} & \text{Terminal Point} \\
53. (-2, 1) & (3, -2) \\
54. (0, -2) & (3, 6) \\
55. (-6, 4) & (0, 1) \\
56. (-1, -5) & (2, 3) \\
\end{array}
\]

In Exercises 57–62, find the component form of \( \mathbf{v} \) and sketch the specified vector operations geometrically, where \( \mathbf{u} = 2\mathbf{i} - \mathbf{j} \) and \( \mathbf{w} = \mathbf{i} + 2\mathbf{j} \).

57. \( \mathbf{v} = \frac{1}{2}\mathbf{u} \)  
58. \( \mathbf{v} = \frac{3}{2}\mathbf{w} \)  
59. \( \mathbf{v} = \mathbf{u} + 2\mathbf{w} \)  
60. \( \mathbf{v} = -\mathbf{u} + \mathbf{w} \)  
61. \( \mathbf{v} = \frac{1}{3}(3\mathbf{u} + \mathbf{w}) \)  
62. \( \mathbf{v} = \mathbf{u} - 2\mathbf{w} \)

In Exercises 63–66, find the magnitude and direction angle of the vector \( \mathbf{v} \).

63. \( \mathbf{v} = 6\mathbf{i} - 6\mathbf{j} \)  
64. \( \mathbf{v} = -5\mathbf{i} + 4\mathbf{j} \)  
65. \( \mathbf{v} = 3(\cos 60^\circ \mathbf{i} + \sin 60^\circ \mathbf{j}) \)  
66. \( \mathbf{v} = 8(\cos 135^\circ \mathbf{i} + \sin 135^\circ \mathbf{j}) \)

In Exercises 67–74, find the component form of \( \mathbf{v} \) given its magnitude and the angle it makes with the positive \( x \)-axis. Sketch \( \mathbf{v} \).

\[
\begin{array}{cc}
\text{Magnitude} & \text{Angle} \\
67. \|\mathbf{v}\| = 3 & \theta = 0^\circ \\
68. \|\mathbf{v}\| = 1 & \theta = 45^\circ \\
69. \|\mathbf{v}\| = \frac{7}{2} & \theta = 150^\circ \\
70. \|\mathbf{v}\| = \frac{3}{4} & \theta = 150^\circ \\
71. \|\mathbf{v}\| = 2\sqrt{3} & \theta = 45^\circ \\
72. \|\mathbf{v}\| = 4\sqrt{3} & \theta = 90^\circ \\
73. \|\mathbf{v}\| = 3 & \mathbf{v} \text{ in the direction } 3\mathbf{i} + 4\mathbf{j} \\
74. \|\mathbf{v}\| = 2 & \mathbf{v} \text{ in the direction } \mathbf{i} + 3\mathbf{j} \\
\end{array}
\]

In Exercises 75–78, find the component form of the sum of \( \mathbf{u} \) and \( \mathbf{v} \) with direction angles \( \theta_u \) and \( \theta_v \).

\[
\begin{array}{cc}
\text{Magnitude} & \text{Angle} \\
75. \|\mathbf{u}\| = 5 & \theta_u = 0^\circ \\
\|\mathbf{v}\| = 5 & \theta_v = 90^\circ \\
76. \|\mathbf{u}\| = 4 & \theta_u = 60^\circ \\
\|\mathbf{v}\| = 4 & \theta_v = 90^\circ \\
77. \|\mathbf{u}\| = 20 & \theta_u = 45^\circ \\
\|\mathbf{v}\| = 50 & \theta_v = 180^\circ \\
78. \|\mathbf{u}\| = 50 & \theta_u = 30^\circ \\
\|\mathbf{v}\| = 30 & \theta_v = 110^\circ \\
\end{array}
\]

In Exercises 79 and 80, use the Law of Cosines to find the angle \( \alpha \) between the vectors. (Assume \( 0^\circ \leq \alpha \leq 180^\circ \).)

79. \( \mathbf{v} = \mathbf{i} + \mathbf{j}, \mathbf{w} = 2\mathbf{i} - 2\mathbf{j} \)  
80. \( \mathbf{v} = \mathbf{i} + 2\mathbf{j}, \mathbf{w} = 2\mathbf{i} - \mathbf{j} \)

**RESULTANT FORCE** In Exercises 81 and 82, find the angle between the forces given the magnitude of their resultant. (Hint: Write force 1 as a vector in the direction of the positive \( x \)-axis and force 2 as a vector at an angle \( \theta \) with the positive \( x \)-axis.)

\[
\begin{array}{ccc}
\text{Force 1} & \text{Force 2} & \text{Resultant Force} \\
81. 45 \text{ pounds} & 60 \text{ pounds} & 90 \text{ pounds} \\
82. 3000 \text{ pounds} & 1000 \text{ pounds} & 3750 \text{ pounds} \\
\end{array}
\]

**VELOCITY** A gun with a muzzle velocity of 1200 feet per second is fired at an angle of 60° above the horizontal. Find the vertical and horizontal components of the velocity.

83. Detroit Tigers pitcher Joel Zumaya was recorded throwing a pitch at a velocity of 104 miles per hour. If he threw the pitch at an angle of 35° below the horizontal, find the vertical and horizontal components of the velocity. (Source: Damon Lichtenwalner, Baseball Info Solutions)
85. RESULTANT FORCE Forces with magnitudes of 125 newtons and 300 newtons act on a hook (see figure). The angle between the two forces is 45°. Find the direction and magnitude of the resultant of these forces.

86. RESULTANT FORCE Forces with magnitudes of 2000 newtons and 900 newtons act on a machine part at angles of 30° and -45°, respectively, with the x-axis (see figure). Find the direction and magnitude of the resultant of these forces.

87. RESULTANT FORCE Three forces with magnitudes of 75 pounds, 100 pounds, and 125 pounds act on an object at angles of 30°, 45°, and 120°, respectively, with the positive x-axis. Find the direction and magnitude of the resultant of these forces.

88. RESULTANT FORCE Three forces with magnitudes of 70 pounds, 40 pounds, and 60 pounds act on an object at angles of -30°, 45°, and 135°, respectively, with the positive x-axis. Find the direction and magnitude of the resultant of these forces.

89. A traffic light weighing 12 pounds is suspended by two cables (see figure). Find the tension in each cable.

90. Repeat Exercise 89 if \( \theta_1 = 40° \) and \( \theta_2 = 35° \).

CABLE TENSION In Exercises 91 and 92, use the figure to determine the tension in each cable supporting the load.

91. \( A \) 50° 30° \( B \)

92. 10 in. 20 in.

93. TOW LINE TENSION A loaded barge is being towed by two tugboats, and the magnitude of the resultant is 6000 pounds directed along the axis of the barge (see figure). Find the tension in the tow lines if they each make an 18° angle with the axis of the barge.

94. ROPE TENSION To carry a 100-pound cylindrical weight, two people lift on the ends of short ropes that are tied to an eyelet on the top center of the cylinder. Each rope makes a 20° angle with the vertical. Draw a figure that gives a visual representation of the situation, and find the tension in the ropes.

In Exercises 95–98, a force of \( F \) pounds is required to pull an object weighing \( W \) pounds up a ramp inclined at \( \theta \) degrees from the horizontal.

95. Find \( F \) if \( W = 100 \) pounds and \( \theta = 12° \).

96. Find \( W \) if \( F = 600 \) pounds and \( \theta = 14° \).

97. Find \( \theta \) if \( F = 5000 \) pounds and \( W = 15,000 \) pounds.

98. Find \( F \) if \( W = 5000 \) pounds and \( \theta = 26° \).

99. WORK A heavy object is pulled 30 feet across a floor, using a force of 100 pounds. The force is exerted at an angle of 50° above the horizontal (see figure). Find the work done. (Use the formula for work, \( W = FD \), where \( F \) is the component of the force in the direction of motion and \( D \) is the distance.)

100. ROPE TENSION A tetherball weighing 1 pound is pulled outward from the pole by a horizontal force \( u \) until the rope makes a 45° angle with the pole (see figure). Determine the resulting tension in the rope and the magnitude of \( u \).
101. **NAVIGATION** An airplane is flying in the direction of $148^\circ$, with an airspeed of 875 kilometers per hour. Because of the wind, its groundspeed and direction are 800 kilometers per hour and $140^\circ$, respectively (see figure). Find the direction and speed of the wind.

102. **NAVIGATION** A commercial jet is flying from Miami to Seattle. The jet’s velocity with respect to the air is 580 miles per hour, and its bearing is $332^\circ$. The wind, at the altitude of the plane, is blowing from the southwest with a velocity of 60 miles per hour.

(a) Draw a figure that gives a visual representation of the situation.

(b) Write the velocity of the wind as a vector in component form.

(c) Write the velocity of the jet relative to the air in component form.

(d) What is the speed of the jet with respect to the ground?

(e) What is the true direction of the jet?

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 103–110, use the figure to determine whether the statement is true or false. Justify your answer.

- 103. $a = -d$
- 104. $c = s$
- 105. $a + u = c$
- 106. $v + w = -s$
- 107. $a + w = -2d$
- 108. $a + d = 0$
- 109. $u - v = -2(b + t)$
- 110. $t - w = b - a$

111. **PROOF** Prove that $(\cos \theta)i + (\sin \theta)j$ is a unit vector for any value of $\theta$.

112. **CAPSTONE** The initial and terminal points of vector $v$ are $(3, -4)$ and $(9, 1)$, respectively.

(a) Write $v$ in component form.

(b) Write $v$ as the linear combination of the standard unit vectors $i$ and $j$.

(c) Sketch $v$ with its initial point at the origin.

(d) Find the magnitude of $v$.

113. **GRAPHICAL REASONING** Consider two forces $F_1 = \langle 10, 0 \rangle$ and $F_2 = 5(\cos \theta, \sin \theta)$.

(a) Find $||F_1 + F_2||$ as a function of $\theta$.

(b) Use a graphing utility to graph the function in part (a) for $0 \leq \theta < 2\pi$.

(c) Use the graph in part (b) to determine the range of the function. What is its maximum, and for what value of $\theta$ does it occur? What is its minimum, and for what value of $\theta$ does it occur?

(d) Explain why the magnitude of the resultant is never 0.

114. **TECHNOLOGY** Write a program for your graphing utility that graphs two vectors and their difference given the vectors in component form.

In Exercises 115 and 116, use the program in Exercise 114 to find the difference of the vectors shown in the figure.

115.

116.

117. **WRITING** In your own words, state the difference between a scalar and a vector. Give examples of each.

118. **WRITING** Give geometric descriptions of the operations of addition of vectors and multiplication of a vector by a scalar.

119. **WRITING** Identify the quantity as a scalar or as a vector. Explain your reasoning.

(a) The muzzle velocity of a bullet

(b) The price of a company’s stock

(c) The air temperature in a room

(d) The weight of an automobile
The Dot Product of Two Vectors

So far you have studied two vector operations—vector addition and multiplication by a scalar—each of which yields another vector. In this section, you will study a third vector operation, the **dot product**. This product yields a scalar, rather than a vector.

**Definition of the Dot Product**

The dot product of \( \mathbf{u} = (u_1, u_2) \) and \( \mathbf{v} = (v_1, v_2) \) is

\[ \mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2. \]

**Properties of the Dot Product**

Let \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) be vectors in the plane or in space and let \( c \) be a scalar.

1. \( \mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u} \)
2. \( 0 \cdot \mathbf{v} = \mathbf{0} \)
3. \( \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w} \)
4. \( \mathbf{v} \cdot \mathbf{v} = ||\mathbf{v}||^2 \)
5. \( c(\mathbf{u} \cdot \mathbf{v}) = c\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot c\mathbf{v} \)

For proofs of the properties of the dot product, see Proofs in Mathematics on page 490.

**Example 1** Finding Dot Products

Find each dot product.

a. \( (4, 5) \cdot (2, 3) \)

b. \( (2, -1) \cdot (1, 2) \)

c. \( (0, 3) \cdot (4, -2) \)

**Solution**

a. \( (4, 5) \cdot (2, 3) = 4(2) + 5(3) = 8 + 15 = 23 \)

b. \( (2, -1) \cdot (1, 2) = 2(1) + (-1)(2) = 2 - 2 = 0 \)

c. \( (0, 3) \cdot (4, -2) = 0(4) + 3(-2) = 0 - 6 = -6 \)

Now try Exercise 7.

In Example 1, be sure you see that the dot product of two vectors is a scalar (a real number), not a vector. Moreover, notice that the dot product can be positive, zero, or negative.
Example 2  Using Properties of Dot Products

Let \( \mathbf{u} = (-1, 3) \), \( \mathbf{v} = (2, -4) \), and \( \mathbf{w} = (1, -2) \). Find each dot product.

a. \( (\mathbf{u} \cdot \mathbf{v}) \mathbf{w} \)

b. \( \mathbf{u} \cdot 2\mathbf{v} \)

Solution

Begin by finding the dot product of \( \mathbf{u} \) and \( \mathbf{v} \).

\[
\mathbf{u} \cdot \mathbf{v} = (-1, 3) \cdot (2, -4) = (-1)(2) + 3(-4) = -14
\]

a. \( (\mathbf{u} \cdot \mathbf{v}) \mathbf{w} = -14(1, -2) = (-14, 28) \)

b. \( \mathbf{u} \cdot 2\mathbf{v} = 2(\mathbf{u} \cdot \mathbf{v}) = 2(-14) = -28 \)

Notice that the product in part (a) is a vector, whereas the product in part (b) is a scalar. Can you see why?

Check Point  Now try Exercise 17.

Example 3  Dot Product and Magnitude

The dot product of \( \mathbf{u} \) with itself is 5. What is the magnitude of \( \mathbf{u} \)?

Solution

Because \( \|\mathbf{u}\|^2 = \mathbf{u} \cdot \mathbf{u} \) and \( \mathbf{u} \cdot \mathbf{u} = 5 \), it follows that

\[
\|\mathbf{u}\| = \sqrt{\mathbf{u} \cdot \mathbf{u}} = \sqrt{5}.
\]

Check Point  Now try Exercise 25.

The Angle Between Two Vectors

The angle between two nonzero vectors is the angle \( \theta \), \( 0 \leq \theta \leq \pi \), between their respective standard position vectors, as shown in Figure 6.33. This angle can be found using the dot product.

Angle Between Two Vectors

If \( \theta \) is the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), then

\[
\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|}.
\]

For a proof of the angle between two vectors, see Proofs in Mathematics on page 490.
**Example 4**  Finding the Angle Between Two Vectors

Find the angle $\theta$ between $\mathbf{u} = \langle 4, 3 \rangle$ and $\mathbf{v} = \langle 3, 5 \rangle$.

**Solution**

The two vectors and $\theta$ are shown in Figure 6.34.

$$\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\| \mathbf{u} \| \| \mathbf{v} \|}$$

$$= \frac{(4, 3) \cdot (3, 5)}{\| (4, 3) \| \| (3, 5) \|}$$

$$= \frac{27}{5\sqrt{34}}$$

This implies that the angle between the two vectors is

$$\theta = \arccos \frac{27}{5\sqrt{34}} \approx 22.2^\circ.$$  

**CHECKPOINT**  Now try Exercise 35.

Rewriting the expression for the angle between two vectors in the form

$$\mathbf{u} \cdot \mathbf{v} = \| \mathbf{u} \| \| \mathbf{v} \| \cos \theta$$

produces an alternative way to calculate the dot product. From this form, you can see that because $\| \mathbf{u} \|$ and $\| \mathbf{v} \|$ are always positive, $\mathbf{u} \cdot \mathbf{v}$ and $\cos \theta$ will always have the same sign. Figure 6.35 shows the five possible orientations of two vectors.

**Definition of Orthogonal Vectors**

The vectors $\mathbf{u}$ and $\mathbf{v}$ are **orthogonal** if $\mathbf{u} \cdot \mathbf{v} = 0$.

The terms **orthogonal** and **perpendicular** mean essentially the same thing—meeting at right angles. Note that the zero vector is orthogonal to every vector $\mathbf{u}$, because $\mathbf{0} \cdot \mathbf{u} = 0$. 
Determining Orthogonal Vectors

Are the vectors $\mathbf{u} = \langle 2, -3 \rangle$ and $\mathbf{v} = \langle 6, 4 \rangle$ orthogonal?

**Solution**

Find the dot product of the two vectors.

$$\mathbf{u} \cdot \mathbf{v} = (2, -3) \cdot (6, 4) = 2(6) + (-3)(4) = 0$$

Because the dot product is 0, the two vectors are orthogonal (see Figure 6.36).

**Finding Vector Components**

You have already seen applications in which two vectors are added to produce a resultant vector. Many applications in physics and engineering pose the reverse problem—decomposing a given vector into the sum of two vector components.

Consider a boat on an inclined ramp, as shown in Figure 6.37. The force $\mathbf{F}$ due to gravity pulls the boat down the ramp and against the ramp. These two orthogonal forces, $\mathbf{w}_1$ and $\mathbf{w}_2$, are vector components of $\mathbf{F}$. That is,

$$\mathbf{F} = \mathbf{w}_1 + \mathbf{w}_2.$$  

The negative of component $\mathbf{w}_1$ represents the force needed to keep the boat from rolling down the ramp, whereas $\mathbf{w}_2$ represents the force that the tires must withstand against the ramp. A procedure for finding $\mathbf{w}_1$ and $\mathbf{w}_2$ is shown on the following page.
From the definition of vector components, you can see that it is easy to find the component \( \mathbf{w}_2 \) once you have found the projection of \( \mathbf{u} \) onto \( \mathbf{v} \). To find the projection, you can use the dot product, as follows.

\[
\mathbf{u} = \mathbf{w}_1 + \mathbf{w}_2 = c\mathbf{v} + \mathbf{w}_2
\]

where \( \mathbf{w}_1 \) and \( \mathbf{w}_2 \) are orthogonal and \( \mathbf{w}_1 \) is parallel to (or a scalar multiple of) \( \mathbf{v} \), as shown in Figure 6.38. The vectors \( \mathbf{w}_1 \) and \( \mathbf{w}_2 \) are called vector components of \( \mathbf{u} \). The vector \( \mathbf{w}_1 \) is the projection of \( \mathbf{u} \) onto \( \mathbf{v} \) and is denoted by

\[
\mathbf{w}_1 = \text{proj}_\mathbf{v} \mathbf{u}.
\]

The vector \( \mathbf{w}_2 \) is given by \( \mathbf{w}_2 = \mathbf{u} - \mathbf{w}_1 \).

From the definition of vector components, you can see that it is easy to find the component \( \mathbf{w}_2 \) once you have found the projection of \( \mathbf{u} \) onto \( \mathbf{v} \). To find the projection, you can use the dot product, as follows.

\[
\mathbf{u} \cdot \mathbf{v} = (c\mathbf{v} + \mathbf{w}_2) \cdot \mathbf{v} = c\mathbf{v} \cdot \mathbf{v} + \mathbf{w}_2 \cdot \mathbf{v} = c\|\mathbf{v}\|^2 + 0 \]

where \( \mathbf{w}_1 \) is a scalar multiple of \( \mathbf{v} \).

Take dot product of each side with \( \mathbf{v} \).

So,

\[
c = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2}
\]

and

\[
\mathbf{w}_1 = \text{proj}_\mathbf{v} \mathbf{u} = c\mathbf{v} = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2} \mathbf{v}.
\]

**Projection of \( \mathbf{u} \) onto \( \mathbf{v} \)**

Let \( \mathbf{u} \) and \( \mathbf{v} \) be nonzero vectors. The projection of \( \mathbf{u} \) onto \( \mathbf{v} \) is

\[
\text{proj}_\mathbf{v} \mathbf{u} = \left( \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2} \right) \mathbf{v}.
\]
Decomposing a Vector into Components

Find the projection of $\mathbf{u} = (3, -5)$ onto $\mathbf{v} = (6, 2)$. Then write $\mathbf{u}$ as the sum of two orthogonal vectors, one of which is $\text{proj}_\mathbf{v} \mathbf{u}$.

**Solution**

The projection of $\mathbf{u}$ onto $\mathbf{v}$ is

$$w_1 = \text{proj}_\mathbf{v} \mathbf{u} = \left( \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{v}\|^2} \right) \mathbf{v} = \left( \frac{8}{40} \right) (6, 2) = \left( \frac{6}{5}, \frac{2}{5} \right),$$

as shown in Figure 6.39. The other component, $w_2$, is

$$w_2 = \mathbf{u} - w_1 = (3, -5) - \left( \frac{6}{5}, \frac{2}{5} \right) = \left( \frac{9}{5}, -\frac{27}{5} \right).$$

So,

$$\mathbf{u} = w_1 + w_2 = \left( \frac{6}{5}, \frac{2}{5} \right) + \left( \frac{9}{5}, -\frac{27}{5} \right) = (3, -5).$$

**Example 7** Finding a Force

A 200-pound cart sits on a ramp inclined at $30^\circ$, as shown in Figure 6.40. What force is required to keep the cart from rolling down the ramp?

**Solution**

Because the force due to gravity is vertical and downward, you can represent the gravitational force by the vector

$$\mathbf{F} = -200 \mathbf{j}.$$  

**Force due to gravity**

To find the force required to keep the cart from rolling down the ramp, project $\mathbf{F}$ onto a unit vector $\mathbf{v}$ in the direction of the ramp, as follows.

$$\mathbf{v} = (\cos 30^\circ) \mathbf{i} + (\sin 30^\circ) \mathbf{j} = \frac{\sqrt{3}}{2} \mathbf{i} + \frac{1}{2} \mathbf{j} \quad \text{Unit vector along ramp}$$

Therefore, the projection of $\mathbf{F}$ onto $\mathbf{v}$ is

$$w_1 = \text{proj}_\mathbf{v} \mathbf{F}$$

$$\begin{align*}
&= \left( \frac{\mathbf{F} \cdot \mathbf{v}}{\|\mathbf{v}\|^2} \right) \mathbf{v} \\
&= (\mathbf{F} \cdot \mathbf{v}) \mathbf{v} \\
&= (-200) \left( \frac{1}{2} \right) \mathbf{v} \\
&= -100 \left( \frac{\sqrt{3}}{2} \mathbf{i} + \frac{1}{2} \mathbf{j} \right).
\end{align*}$$

The magnitude of this force is 100, and so a force of 100 pounds is required to keep the cart from rolling down the ramp.

**Example 6** Decomposing a Vector into Components

Now try Exercise 59.

**Example 7** Finding a Force

Now try Exercise 75.
Work

The work done by a constant force $\mathbf{F}$ acting along the line of motion of an object is given by

$$W = \text{(magnitude of force)} \times \text{(distance)} = \|\mathbf{F}\| \|\mathbf{PQ}\|$$

as shown in Figure 6.41. If the constant force $\mathbf{F}$ is not directed along the line of motion, as shown in Figure 6.42, the work $W$ done by the force is given by

$$W = \|\text{proj}_{\mathbf{PQ}} \mathbf{F}\| \|\mathbf{PQ}\| \quad \text{Projection form for work}$$

$$= (\cos \theta)\|\mathbf{F}\| \|\mathbf{PQ}\| \quad \|\text{proj}_{\mathbf{PQ}} \mathbf{F}\| = (\cos \theta)\|\mathbf{F}\|$$

$$= \mathbf{F} \cdot \mathbf{PQ}. \quad \text{Alternative form of dot product}$$

This notion of work is summarized in the following definition.

**Definition of Work**

The work $W$ done by a constant force $\mathbf{F}$ as its point of application moves along the vector $\mathbf{PQ}$ is given by either of the following.

1. $W = \|\text{proj}_{\mathbf{PQ}} \mathbf{F}\| \|\mathbf{PQ}\| \quad \text{Projection form}$
2. $W = \mathbf{F} \cdot \mathbf{PQ} \quad \text{Dot product form}$

**Example 8** Finding Work

To close a sliding barn door, a person pulls on a rope with a constant force of 50 pounds at a constant angle of 60°, as shown in Figure 6.43. Find the work done in moving the barn door 12 feet to its closed position.

**Solution**

Using a projection, you can calculate the work as follows.

$$W = \|\text{proj}_{\mathbf{PQ}} \mathbf{F}\| \|\mathbf{PQ}\| \quad \text{Projection form for work}$$

$$= (\cos 60°)\|\mathbf{F}\| \|\mathbf{PQ}\|$$

$$= \frac{1}{2}(50)(12) = 300 \text{ foot-pounds}$$

So, the work done is 300 foot-pounds. You can verify this result by finding the vectors $\mathbf{F}$ and $\mathbf{PQ}$ and calculating their dot product.

**CHECK Point** Now try Exercise 79.
VOCABULARY: Fill in the blanks.
1. The ________ ________ of two vectors yields a scalar, rather than a vector.
2. The dot product of \( \mathbf{u} = (u_1, u_2) \) and \( \mathbf{v} = (v_1, v_2) \) is \( \mathbf{u} \cdot \mathbf{v} = ________ \).
3. If \( \theta \) is the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), then \( \cos \theta = ________ \).
4. The vectors \( \mathbf{u} \) and \( \mathbf{v} \) are ________ if \( \mathbf{u} \cdot \mathbf{v} = 0 \).
5. The projection of \( \mathbf{u} \) onto \( \mathbf{v} \) is given by \( \text{proj}_\mathbf{v} \mathbf{u} = ________ \).
6. The work \( W \) done by a constant force \( \mathbf{F} \) as its point of application moves along the vector \( \overrightarrow{PQ} \) is given by \( W = ________ \) or \( W = ________ \).

SKILLS AND APPLICATIONS

In Exercises 7–14, find the dot product of \( \mathbf{u} \) and \( \mathbf{v} \).
7. \( \mathbf{u} = (7, 1) \) \( \mathbf{v} = (-3, 2) \)
8. \( \mathbf{u} = (6, 10) \) \( \mathbf{v} = (-2, 3) \)
9. \( \mathbf{u} = (-4, 1) \) \( \mathbf{v} = (2, -3) \)
10. \( \mathbf{u} = (-2, 5) \) \( \mathbf{v} = (-1, -8) \)
11. \( \mathbf{u} = 4i - 2j \) \( \mathbf{v} = 3i + 4j \)
12. \( \mathbf{u} = 3i - j \) \( \mathbf{v} = 7i - 2j \)
13. \( \mathbf{u} = 3i + 2j \) \( \mathbf{v} = -2i - 3j \)
14. \( \mathbf{u} = i - 2j \) \( \mathbf{v} = -2i + j \)

In Exercises 15–24, use the vectors \( \mathbf{u} = (3, 3), \mathbf{v} = (-4, 2), \) and \( \mathbf{w} = (3, -1) \) to find the indicated quantity. State whether the result is a vector or a scalar.
15. \( \mathbf{u} \cdot \mathbf{u} \)
16. \( 3\mathbf{u} \cdot \mathbf{v} \)
17. \( (\mathbf{u} \cdot \mathbf{v})\mathbf{v} \)
18. \( (\mathbf{v} \cdot \mathbf{u})\mathbf{w} \)
19. \( (3\mathbf{w} \cdot \mathbf{v})\mathbf{u} \)
20. \( (\mathbf{u} \cdot 2\mathbf{v})\mathbf{w} \)
21. \( \|\mathbf{w}\| - 1 \)
22. \( 2 - \|\mathbf{u}\| \)
23. \( (\mathbf{u} \cdot \mathbf{v}) - (\mathbf{u} \cdot \mathbf{w}) \)
24. \( (\mathbf{v} \cdot \mathbf{u}) - (\mathbf{w} \cdot \mathbf{v}) \)

In Exercises 25–30, use the dot product to find the magnitude of \( \mathbf{u} \).
25. \( \mathbf{u} = (-8, 15) \)
26. \( \mathbf{u} = (4, -6) \)
27. \( \mathbf{u} = 20i + 25j \)
28. \( \mathbf{u} = 12i - 16j \)
29. \( \mathbf{u} = 6j \)
30. \( \mathbf{u} = -21i \)

In Exercises 31–40, find the angle \( \theta \) between the vectors.
31. \( \mathbf{u} = (1, 0) \) \( \mathbf{v} = (0, -2) \)
32. \( \mathbf{u} = (3, 2) \) \( \mathbf{v} = (4, 0) \)
33. \( \mathbf{u} = 3i + 4j \) \( \mathbf{v} = -2j \)
34. \( \mathbf{u} = 2i - 3j \) \( \mathbf{v} = i - 2j \)
35. \( \mathbf{u} = 2i - j \) \( \mathbf{v} = 6i - 3j \)
36. \( \mathbf{u} = -6i - 3j \) \( \mathbf{v} = -8i + 4j \)
37. \( \mathbf{u} = 5i + 5j \)
38. \( \mathbf{u} = 2i - 3j \)
39. \( \mathbf{u} = \cos\left(\frac{\pi}{3}\right)i + \sin\left(\frac{\pi}{3}\right)j \)
40. \( \mathbf{u} = \cos\left(\frac{\pi}{4}\right)i + \sin\left(\frac{\pi}{4}\right)j \)

In Exercises 41–44, graph the vectors and find the degree measure of the angle \( \theta \) between the vectors.
41. \( \mathbf{u} = 3i + 4j \) \( \mathbf{v} = -7i + 5j \)
42. \( \mathbf{u} = 6i + 3j \) \( \mathbf{v} = -4i + 4j \)
43. \( \mathbf{u} = 5i + 5j \) \( \mathbf{v} = -8i + 8j \)
44. \( \mathbf{u} = 2i - 3j \) \( \mathbf{v} = 8i + 3j \)

In Exercises 45–48, use vectors to find the interior angles of the triangle with the given vertices.
45. \( (1, 2), (3, 4), (2, 5) \)
46. \( (-3, -4), (1, 7), (8, 2) \)
47. \( (-3, 0), (2, 2), (0, 6) \)
48. \( (-3, 5), (-1, 9), (7, 9) \)

In Exercises 49–52, find \( \mathbf{u} \cdot \mathbf{v} \), where \( \theta \) is the angle between \( \mathbf{u} \) and \( \mathbf{v} \).
49. \( \|\mathbf{u}\| = 4, \|\mathbf{v}\| = 10, \theta = \frac{2\pi}{3} \)
50. \( \|\mathbf{u}\| = 100, \|\mathbf{v}\| = 250, \theta = \frac{\pi}{6} \)
51. \( \|\mathbf{u}\| = 9, \|\mathbf{v}\| = 36, \theta = \frac{3\pi}{4} \)
52. \( \|\mathbf{u}\| = 4, \|\mathbf{v}\| = 12, \theta = \frac{\pi}{3} \)
In Exercises 53–58, determine whether \( u \) and \( v \) are orthogonal, parallel, or neither.

53. \( u = (-12, 30) \)
\( v = (\frac{1}{2}, -\frac{3}{2}) \)

54. \( u = (3, 15) \)
\( v = (-1, 5) \)

55. \( u = 3(3i - j) \)
\( v = 5i + 6j \)

56. \( u = i \)
\( v = -2i + 2j \)

57. \( u = 2i - 2j \)
\( v = -i - j \)

58. \( u = (\cos \theta, \sin \theta) \)
\( v = (\sin \theta, -\cos \theta) \)

In Exercises 59–62, find the projection of \( u \) onto \( v \). Then write \( u \) as the sum of two orthogonal vectors, one of which is \( \text{proj}_v u \).

59. \( u = (2, 2) \)
\( v = (6, 1) \)

60. \( u = (4, 2) \)
\( v = (1, -2) \)

61. \( u = (0, 3) \)
\( v = (2, 15) \)

62. \( u = (-3, -2) \)
\( v = (-4, -1) \)

In Exercises 63–66, use the graph to determine mentally the projection of \( u \) onto \( v \). (The coordinates of the terminal points of the vectors in standard position are given.) Use the formula for the projection of \( u \) onto \( v \) to verify your result.

63. \( u = \begin{pmatrix} 3 \ 2 \end{pmatrix} \)
\( v = \begin{pmatrix} 6 \ 4 \end{pmatrix} \)

64. \( u = \begin{pmatrix} 6 \ 4 \end{pmatrix} \)
\( v = \begin{pmatrix} 3 \ 15 \end{pmatrix} \)

65. \( u = \begin{pmatrix} -2 \ 3 \end{pmatrix} \)
\( v = \begin{pmatrix} 6 \ 4 \end{pmatrix} \)

66. \( u = \begin{pmatrix} 2 \ -3 \end{pmatrix} \)
\( v = \begin{pmatrix} 6 \ 4 \end{pmatrix} \)

In Exercises 67–70, find two vectors in opposite directions that are orthogonal to the vector \( u \). (There are many correct answers.)

67. \( u = (3, 5) \)

68. \( u = (-8, 3) \)

69. \( u = \frac{7}{2}i - \frac{3}{2}j \)

70. \( u = -\frac{5}{2}i - 3j \)

WORK In Exercises 71 and 72, find the work done in moving a particle from \( P \) to \( Q \) if the magnitude and direction of the force are given by \( v \).

71. \( P(0, 0), \ Q(4, 7), \ v = (1, 4) \)

72. \( P(1, 3), \ Q(-3, 5), \ v = -2i + 3j \)

73. **REVENUE** The vector \( u = (4600, 5250) \) gives the numbers of units of two models of cellular phones produced by a telecommunications company. The vector \( v = (7999, 9999) \) gives the prices (in dollars) of the two models of cellular phones, respectively.

(a) Find the dot product \( u \cdot v \) and interpret the result in the context of the problem.

(b) Identify the vector operation used to increase the prices by 5%.

74. **REVENUE** The vector \( u = (3140, 2750) \) gives the numbers of hamburgers and hot dogs, respectively, sold at a fast-food stand in one month. The vector \( v = (2.25, 1.75) \) gives the prices (in dollars) of the food items.

(a) Find the dot product \( u \cdot v \) and interpret the result in the context of the problem.

(b) Identify the vector operation used to increase the prices by 2.5%.

75. **BRAKING LOAD** A truck with a gross weight of 30,000 pounds is parked on a slope of \( d \)° (see figure). Assume that the only force to overcome is the force of gravity.

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{truck_slope.png}
\caption{A truck parked on a slope.}
\end{figure}

(a) Find the force required to keep the truck from rolling down the hill in terms of the slope \( d \).

(b) Use a graphing utility to complete the table.

\begin{tabular}{|c|c|c|c|c|c|}
\hline
\( d \) & 0° & 1° & 2° & 3° & 4° & 5° \\
\hline
\hline
\( \text{Force} \) & & & & & & \\
\hline
\hline
\end{tabular}

(c) Find the force perpendicular to the hill when \( d = 5° \).

76. **BRAKING LOAD** A sport utility vehicle with a gross weight of 5400 pounds is parked on a slope of 10°. Assume that the only force to overcome is the force of gravity. Find the force required to keep the vehicle from rolling down the hill. Find the force perpendicular to the hill.
77. **WORK** Determine the work done by a person lifting a 245-newton bag of sugar 3 meters.

78. **WORK** Determine the work done by a crane lifting a 2400-pound car 5 feet.

79. **WORK** A force of 45 pounds exerted at an angle of 30° above the horizontal is required to slide a table across a floor (see figure). The table is dragged 20 feet. Determine the work done in sliding the table.

80. **WORK** A tractor pulls a log 800 meters, and the tension in the cable connecting the tractor and log is approximately 15,691 newtons. The direction of the force is 35° above the horizontal. Approximate the work done in pulling the log.

81. **WORK** One of the events in a local strongman contest is to pull a cement block 100 feet. One competitor pulls the block by exerting a force of 250 pounds on a rope attached to the block at an angle of 30° with the horizontal (see figure). Find the work done in pulling the block.

82. **WORK** A toy wagon is pulled by exerting a force of 25 pounds on a handle that makes a 20° angle with the horizontal (see figure). Find the work done in pulling the wagon 50 feet.

83. **PROGRAMMING** Given vectors \( \mathbf{u} \) and \( \mathbf{v} \) in component form, write a program for your graphing utility in which the output is (a) \( ||\mathbf{u}|| \), (b) \( ||\mathbf{v}|| \), and (c) the angle between \( \mathbf{u} \) and \( \mathbf{v} \).

84. **PROGRAMMING** Use the program you wrote in Exercise 83 to find the angle between the given vectors.
   (a) \( \mathbf{u} = \langle 8, -4 \rangle \) and \( \mathbf{v} = \langle 2, 5 \rangle \)
   (b) \( \mathbf{u} = \langle 2, -6 \rangle \) and \( \mathbf{v} = \langle 4, 1 \rangle \)

85. **PROGRAMMING** Given vectors \( \mathbf{u} \) and \( \mathbf{v} \) in component form, write a program for your graphing utility in which the output is the component form of the projection of \( \mathbf{u} \) onto \( \mathbf{v} \).

86. **PROGRAMMING** Use the program you wrote in Exercise 85 to find the projection of \( \mathbf{u} \) onto \( \mathbf{v} \) for the given vectors.
   (a) \( \mathbf{u} = \langle 5, 6 \rangle \) and \( \mathbf{v} = \langle -1, 3 \rangle \)
   (b) \( \mathbf{u} = \langle 3, -2 \rangle \) and \( \mathbf{v} = \langle -2, 1 \rangle \)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 87 and 88, determine whether the statement is true or false. Justify your answer.

87. The work done by a constant force \( \mathbf{F} \) acting along the line of motion of an object is represented by a vector.

88. A sliding door moves along the line of vector \( \mathbf{PQ} \). If a force is applied to the door along a vector that is orthogonal to \( \mathbf{PQ} \), then no work is done.

89. **PROOF** Use vectors to prove that the diagonals of a rhombus are perpendicular.

90. **CAPSTONE** What is known about \( \theta \), the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), under each condition (see figure)?
   (a) \( \mathbf{u} \cdot \mathbf{v} = 0 \)
   (b) \( \mathbf{u} \cdot \mathbf{v} > 0 \)
   (c) \( \mathbf{u} \cdot \mathbf{v} < 0 \)

91. **THINK ABOUT IT** What can be said about the vectors \( \mathbf{u} \) and \( \mathbf{v} \) under each condition?
   (a) The projection of \( \mathbf{u} \) onto \( \mathbf{v} \) equals \( \mathbf{u} \).
   (b) The projection of \( \mathbf{u} \) onto \( \mathbf{v} \) equals \( \mathbf{0} \).

92. **PROOF** Prove the following.
   \[ ||\mathbf{u} - \mathbf{v}||^2 = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2\mathbf{u} \cdot \mathbf{v} \]

93. **PROOF** Prove that if \( \mathbf{u} \) is a unit vector and \( \theta \) is the angle between \( \mathbf{u} \) and \( \mathbf{i} \), then \( \mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j} \).

94. **PROOF** Prove that if \( \mathbf{u} \) is a unit vector and \( \theta \) is the angle between \( \mathbf{u} \) and \( \mathbf{j} \), then
   \[ \mathbf{u} = \cos \left( \frac{\pi}{2} - \theta \right) \mathbf{i} + \sin \left( \frac{\pi}{2} - \theta \right) \mathbf{j}. \]
6.5 TRIGONOMETRIC FORM OF A COMPLEX NUMBER

What you should learn
- Plot complex numbers in the complex plane and find absolute values of complex numbers.
- Write the trigonometric forms of complex numbers.
- Multiply and divide complex numbers written in trigonometric form.
- Use DeMoivre's Theorem to find powers of complex numbers.
- Find \( n \)th roots of complex numbers.

Why you should learn it
You can use the trigonometric form of a complex number to perform operations with complex numbers. For instance, in Exercises 99–106 on page 477, you can use the trigonometric forms of complex numbers to help you solve polynomial equations.

The Complex Plane
Just as real numbers can be represented by points on the real number line, you can represent a complex number

\[ z = a + bi \]

as the point \((a, b)\) in a coordinate plane (the complex plane). The horizontal axis is called the real axis and the vertical axis is called the imaginary axis, as shown in Figure 6.44.

![Figure 6.44](image)

The absolute value of the complex number \( a + bi \) is defined as the distance between the origin \((0, 0)\) and the point \((a, b)\).

** Definition of the Absolute Value of a Complex Number **

The absolute value of the complex number \( z = a + bi \) is

\[ |a + bi| = \sqrt{a^2 + b^2}. \]

If the complex number \( a + bi \) is a real number (that is, if \( b = 0 \)), then this definition agrees with that given for the absolute value of a real number

\[ |a + 0i| = \sqrt{a^2 + 0^2} = |a|. \]

**Example 1** Finding the Absolute Value of a Complex Number

Plot \( z = -2 + 5i \) and find its absolute value.

**Solution**
The number is plotted in Figure 6.45. It has an absolute value of

\[ |z| = \sqrt{(-2)^2 + 5^2} = \sqrt{29}. \]
Trigonometric Form of a Complex Number

In Section 2.4, you learned how to add, subtract, multiply, and divide complex numbers. To work effectively with powers and roots of complex numbers, it is helpful to write complex numbers in trigonometric form. In Figure 6.46, consider the nonzero complex number \( z = a + bi \). By letting \( \theta \) be the angle from the positive real axis (measured counterclockwise) to the line segment connecting the origin and the point \((a, b)\), you can write

\[
\begin{align*}
a &= r \cos \theta \\
b &= r \sin \theta
\end{align*}
\]

where \( r = \sqrt{a^2 + b^2} \). Consequently, you have

\[
a + bi = (r \cos \theta) + (r \sin \theta)i
\]

from which you can obtain the **trigonometric form** of a complex number.

![Figure 6.46](image)

The trigonometric form of a complex number is also called the **polar form**. Because there are infinitely many choices for \( \theta \), the trigonometric form of a complex number is not unique. Normally, \( \theta \) is restricted to the interval \( 0 \leq \theta < 2\pi \), although on occasion it is convenient to use \( \theta < 0 \).

**Example 2**  Writing a Complex Number in Trigonometric Form

Write the complex number \( z = -2 - 2\sqrt{3}i \) in trigonometric form.

**Solution**

The absolute value of \( z \) is

\[
r = \left| -2 - 2\sqrt{3}i \right| = \sqrt{(-2)^2 + (-2\sqrt{3})^2} = \sqrt{16} = 4
\]

and the reference angle \( \theta' \) is given by

\[
\tan \theta' = \frac{b}{a} = \frac{-2\sqrt{3}}{-2} = \sqrt{3}.
\]

Because \( \tan(\pi/3) = \sqrt{3} \) and because \( z = -2 - 2\sqrt{3}i \) lies in Quadrant III, you choose \( \theta \) to be \( \theta = \pi + \pi/3 = 4\pi/3 \). So, the trigonometric form is

\[
z = r(\cos \theta + i \sin \theta)
\]

\[
= 4 \left( \cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3} \right).
\]

See Figure 6.47.

**Checkpoint**  Now try Exercise 17.
Writing a Complex Number in Standard Form

Write the complex number in standard form $a + bi$.

$$z = \sqrt{8} \left[ \cos \left( -\frac{\pi}{3} \right) + i \sin \left( -\frac{\pi}{3} \right) \right]$$

Solution

Because $\cos \left( -\frac{\pi}{3} \right) = \frac{1}{2}$ and $\sin \left( -\frac{\pi}{3} \right) = -\frac{\sqrt{3}}{2}$, you can write

$$z = \sqrt{8} \left[ \cos \left( -\frac{\pi}{3} \right) + i \sin \left( -\frac{\pi}{3} \right) \right]$$

$$= 2\sqrt{2} \left( \frac{1}{2} - \frac{\sqrt{3}}{2} i \right)$$

$$= \sqrt{2} - \sqrt{6} i.$$  

Now try Exercise 35.

Multiplication and Division of Complex Numbers

The trigonometric form adapts nicely to multiplication and division of complex numbers. Suppose you are given two complex numbers

$$z_1 = r_1(\cos \theta_1 + i \sin \theta_1) \quad \text{and} \quad z_2 = r_2(\cos \theta_2 + i \sin \theta_2).$$

The product of $z_1$ and $z_2$ is given by

$$z_1 z_2 = r_1 r_2 (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2)$$

$$= r_1 r_2 \left[ \cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2) \right].$$

Using the sum and difference formulas for cosine and sine, you can rewrite this equation as

$$z_1 z_2 = r_1 r_2 \left[ \cos \left( \theta_1 + \theta_2 \right) + i \sin \left( \theta_1 + \theta_2 \right) \right].$$

This establishes the first part of the following rule. The second part is left for you to verify (see Exercise 109).

Product and Quotient of Two Complex Numbers

Let $z_1 = r_1(\cos \theta_1 + i \sin \theta_1)$ and $z_2 = r_2(\cos \theta_2 + i \sin \theta_2)$ be complex numbers.

$$z_1 z_2 = r_1 r_2 \left[ \cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2) \right] \quad \text{Product}$$

$$\frac{z_1}{z_2} = \frac{r_1}{r_2} \left[ \cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2) \right], \quad z_2 \neq 0 \quad \text{Quotient}$$

Note that this rule says that to multiply two complex numbers you multiply moduli and add arguments, whereas to divide two complex numbers you divide moduli and subtract arguments.
Example 4  Multiplying Complex Numbers

Find the product $z_1z_2$ of the complex numbers.

$$z_1 = 2 \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right) \quad z_2 = 8 \left( \cos \frac{11\pi}{6} + i \sin \frac{11\pi}{6} \right)$$

Solution

$$z_1z_2 = 2 \left( \cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} \right) \cdot 8 \left( \cos \frac{11\pi}{6} + i \sin \frac{11\pi}{6} \right)$$

$$= 16 \left[ \cos \left( \frac{2\pi}{3} + \frac{11\pi}{6} \right) + i \sin \left( \frac{2\pi}{3} + \frac{11\pi}{6} \right) \right] \quad \text{Multiply moduli and add arguments.}$$

$$= 16 \left( \cos \frac{5\pi}{2} + i \sin \frac{5\pi}{2} \right)$$

$$= 16 \left( \cos \frac{\pi}{2} + i \sin \frac{\pi}{2} \right)$$

$$= 16 \left[ 0 + i(1) \right]$$

$$= 16i$$

You can check this result by first converting the complex numbers to the standard forms $z_1 = -1 + \sqrt{3}i$ and $z_2 = 4\sqrt{3} - 4i$ and then multiplying algebraically, as in Section 2.4.

$$z_1z_2 = (-1 + \sqrt{3}i)(4\sqrt{3} - 4i)$$

$$= -4\sqrt{3} + 4i + 12i + 4\sqrt{3}$$

$$= 16i$$

CHECKPOINT Now try Exercise 47.

Example 5  Dividing Complex Numbers

Find the quotient $z_1/z_2$ of the complex numbers.

$$z_1 = 24(\cos 300^\circ + i \sin 300^\circ) \quad z_2 = 8(\cos 75^\circ + i \sin 75^\circ)$$

Solution

$$\frac{z_1}{z_2} = \frac{24(\cos 300^\circ + i \sin 300^\circ)}{8(\cos 75^\circ + i \sin 75^\circ)}$$

$$= \frac{24}{8} \left[ \cos(300^\circ - 75^\circ) + i \sin(300^\circ - 75^\circ) \right] \quad \text{Divide moduli and subtract arguments.}$$

$$= 3(\cos 225^\circ + i \sin 225^\circ)$$

$$= 3 \left[ -\frac{\sqrt{2}}{2} + i \left( -\frac{\sqrt{2}}{2} \right) \right]$$

$$= -\frac{3\sqrt{2}}{2} - \frac{3\sqrt{2}}{2}i$$

CHECKPOINT Now try Exercise 53.
Powers of Complex Numbers

The trigonometric form of a complex number is used to raise a complex number to a power. To accomplish this, consider repeated use of the multiplication rule.

\[ z = r(\cos \theta + i \sin \theta) \]
\[ z^2 = r(\cos \theta + i \sin \theta)r(\cos \theta + i \sin \theta) = r^2(\cos 2\theta + i \sin 2\theta) \]
\[ z^3 = r^2(\cos 2\theta + i \sin 2\theta)r(\cos \theta + i \sin \theta) = r^3(\cos 3\theta + i \sin 3\theta) \]
\[ z^4 = r^4(\cos 4\theta + i \sin 4\theta) \]
\[ z^5 = r^5(\cos 5\theta + i \sin 5\theta) \]

This pattern leads to DeMoivre’s Theorem, which is named after the French mathematician Abraham DeMoivre (1667–1754).

**DeMoivre’s Theorem**

If \( z = r(\cos \theta + i \sin \theta) \) is a complex number and \( n \) is a positive integer, then

\[ z^n = [r(\cos \theta + i \sin \theta)]^n = r^n(\cos n\theta + i \sin n\theta). \]

**Example 6** Finding Powers of a Complex Number

Use DeMoivre’s Theorem to find \((-1 + \sqrt{3}i)^{12}\).

**Solution**

First convert the complex number to trigonometric form using

\[ r = \sqrt{(-1)^2 + (\sqrt{3})^2} = 2 \quad \text{and} \quad \theta = \arctan \frac{\sqrt{3}}{-1} = \frac{2\pi}{3}. \]

So, the trigonometric form is

\[ z = -1 + \sqrt{3}i = 2\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right). \]

Then, by DeMoivre’s Theorem, you have

\[ (-1 + \sqrt{3}i)^{12} = \left[2\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)\right]^{12} = 2^{12}\left(\cos \frac{12(2\pi)}{3} + i \sin \frac{12(2\pi)}{3}\right) = 4096(\cos 8\pi + i \sin 8\pi) = 4096(1 + 0) = 4096. \]

**CHECKPOINT** Now try Exercise 69.
Roots of Complex Numbers

Recall that a consequence of the Fundamental Theorem of Algebra is that a polynomial equation of degree \( n \) has \( n \) solutions in the complex number system. So, the equation \( x^n = 1 \) has six solutions, and in this particular case you can find the six solutions by factoring and using the Quadratic Formula.

Consequently, the solutions are

\[
x = \pm 1, \quad x = \frac{-1 \pm \sqrt{3}i}{2}, \quad \text{and} \quad x = \frac{1 \pm \sqrt{3}i}{2}.
\]

Each of these numbers is a sixth root of 1. In general, an \( n \)th root of a complex number is defined as follows.

**Definition of an \( n \)th Root of a Complex Number**

The complex number \( u = a + bi \) is an \( n \)th root of the complex number \( z \) if

\[
z = u^n = (a + bi)^n.
\]

To find a formula for an \( n \)th root of a complex number, let \( u \) be an \( n \)th root of \( z \), where

\[
u = s(\cos \beta + i \sin \beta)
\]

and

\[
z = r(\cos \theta + i \sin \theta).
\]

By DeMoivre’s Theorem and the fact that \( u^n = z \), you have

\[
s^n(\cos n\beta + i \sin n\beta) = r(\cos \theta + i \sin \theta).
\]

Taking the absolute value of each side of this equation, it follows that \( s^n = r \). Substituting back into the previous equation and dividing by \( r \), you get

\[
\cos n\beta + i \sin n\beta = \cos \theta + i \sin \theta.
\]

So, it follows that

\[
\cos n\beta = \cos \theta \quad \text{and} \quad \sin n\beta = \sin \theta.
\]

Because both sine and cosine have a period of \( 2\pi \), these last two equations have solutions if and only if the angles differ by a multiple of \( 2\pi \). Consequently, there must exist an integer \( k \) such that

\[
n\beta = \theta + 2\pi k
\]

\[
\beta = \frac{\theta + 2\pi k}{n}.
\]

By substituting this value of \( \beta \) into the trigonometric form of \( u \), you get the result stated on the following page.
When $\theta$ exceeds the roots begin to repeat. For instance, if the angle is coterminal with which is also obtained when $\theta = 0$. The formula for the $n$th roots of a complex number has a nice geometrical interpretation, as shown in Figure 6.48. Note that because the $n$th roots of all have the same magnitude they all lie on a circle of radius $\sqrt[n]{r}$ with center at the origin. Furthermore, because successive $n$th roots have arguments that differ by $\frac{2\pi}{n}$, the $n$ roots are equally spaced around the circle.

You have already found the sixth roots of 1 by factoring and by using the Quadratic Formula. Example 7 shows how you can solve the same problem with the formula for $n$th roots.

### Finding $n$th Roots of a Complex Number

For a positive integer $n$, the complex number $z = r(\cos \theta + i \sin \theta)$ has exactly $n$ distinct $n$th roots given by

$$
\sqrt[n]{r} \left( \cos \frac{\theta + 2\pi k}{n} + i \sin \frac{\theta + 2\pi k}{n} \right)
$$

where $k = 0, 1, 2, \ldots, n - 1$.

When $k$ exceeds $n - 1$, the roots begin to repeat. For instance, if $k = n$, the angle $\frac{\theta + 2\pi n}{n} = \frac{\theta}{n} + 2\pi$ is coterminal with $\theta/n$, which is also obtained when $k = 0$.

The formula for the $n$th roots of a complex number $z$ has a nice geometrical interpretation, as shown in Figure 6.48. Note that because the $n$th roots of $z$ all have the same magnitude $\sqrt[n]{r}$, they all lie on a circle of radius $\sqrt[n]{r}$ with center at the origin. Furthermore, because successive $n$th roots have arguments that differ by $\frac{2\pi}{n}$, the $n$ roots are equally spaced around the circle.

You have already found the sixth roots of 1 by factoring and by using the Quadratic Formula. Example 7 shows how you can solve the same problem with the formula for $n$th roots.

### Example 7 Finding the $n$th Roots of a Real Number

Find all sixth roots of 1.

#### Solution

First write 1 in the trigonometric form $1 = 1(\cos 0 + i \sin 0)$. Then, by the $n$th root formula, with $n = 6$ and $r = 1$, the roots have the form

$$
\sqrt[6]{1} \left( \cos \frac{0 + 2\pi k}{6} + i \sin \frac{0 + 2\pi k}{6} \right) = \cos \frac{\pi k}{3} + i \sin \frac{\pi k}{3}.
$$

So, for $k = 0, 1, 2, 3, 4, \text{and } 5$, the sixth roots are as follows. (See Figure 6.49.)

- $\cos 0 + i \sin 0 = 1$
- $\cos \frac{\pi}{3} + i \sin \frac{\pi}{3} = \frac{1}{2} + \frac{\sqrt{3}}{2} i$
- $\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3} = -\frac{1}{2} + \frac{\sqrt{3}}{2} i$
- $\cos \pi + i \sin \pi = -1$
- $\cos \frac{4\pi}{3} + i \sin \frac{4\pi}{3} = -\frac{1}{2} - \frac{\sqrt{3}}{2} i$
- $\cos \frac{5\pi}{3} + i \sin \frac{5\pi}{3} = \frac{1}{2} - \frac{\sqrt{3}}{2} i$

**CHECKPOINT** Now try Exercise 91.
In Figure 6.49, notice that the roots obtained in Example 7 all have a magnitude of 1 and are equally spaced around the unit circle. Also notice that the complex roots occur in conjugate pairs, as discussed in Section 2.5. The \( n \) distinct \( n \)th roots of 1 are called the \( n \)th roots of unity.

### Example 8  Finding the \( n \)th Roots of a Complex Number

Find the three cube roots of \( z = -2 + 2i \).

**Solution**

Because \( z \) lies in Quadrant II, the trigonometric form of \( z \) is

\[
z = -2 + 2i = \sqrt{8} \left( \cos 135^\circ + i \sin 135^\circ \right).
\]

\[
\theta = \arctan \left( \frac{2}{-2} \right) = 135^\circ
\]

By the formula for \( n \)th roots, the cube roots have the form

\[
\sqrt[3]{8} \left( \cos \frac{135^\circ + 360^\circ k}{3} + i \sin \frac{135^\circ + 360^\circ k}{3} \right),
\]

Finally, for \( k = 0, 1, \) and 2, you obtain the roots

\[
\begin{align*}
\sqrt[3]{8} \left( \cos \frac{135^\circ + 360^\circ(0)}{3} + i \sin \frac{135^\circ + 360^\circ(0)}{3} \right) &= \sqrt[3]{8} \left( \cos 45^\circ + i \sin 45^\circ \right) \\
&= 1 + i \\
\sqrt[3]{8} \left( \cos \frac{135^\circ + 360^\circ(1)}{3} + i \sin \frac{135^\circ + 360^\circ(1)}{3} \right) &= \sqrt[3]{8} \left( \cos 165^\circ + i \sin 165^\circ \right) \\
&= -1.3660 + 0.3660i \\
\sqrt[3]{8} \left( \cos \frac{135^\circ + 360^\circ(2)}{3} + i \sin \frac{135^\circ + 360^\circ(2)}{3} \right) &= \sqrt[3]{8} \left( \cos 285^\circ + i \sin 285^\circ \right) \\
&= 0.3660 - 1.3660i.
\end{align*}
\]

See Figure 6.50.

**CHECK POINT** Now try Exercise 97.

### Classroom Discussion

**A Famous Mathematical Formula**  The famous formula

\[
e^{a + bi} = e^a (\cos b + i \sin b)
\]

is called Euler’s Formula, after the Swiss mathematician Leonhard Euler (1707–1783). Although the interpretation of this formula is beyond the scope of this text, we decided to include it because it gives rise to one of the most wonderful equations in mathematics.

\[
e^{i \pi} + 1 = 0
\]

This elegant equation relates the five most famous numbers in mathematics—0, 1, \( \pi \), \( e \), and \( i \)—in a single equation. Show how Euler’s Formula can be used to derive this equation.
6.5  EXERCISES

VOCABULARY: Fill in the blanks.
1. The ________ ________ of a complex number \( a + bi \) is the distance between the origin \((0, 0)\) and the point \((a, b)\).
2. The ________ ________ of a complex number \( z = a + bi \) is given by \( z = r(\cos \theta + i \sin \theta) \), where \( r \) is the ________ of \( z \) and \( \theta \) is the ________ of \( z \).
3. ___________ Theorem states that if \( z = r(\cos \theta + i \sin \theta) \) is a complex number and \( n \) is a positive integer, then \( z^n = r^n(\cos n\theta + i \sin n\theta) \).
4. The complex number \( u = a + bi \) is an ________ ________ of the complex number \( z \) if \( z = u^n = (a + bi)^n \).

SKILLS AND APPLICATIONS

In Exercises 5–10, plot the complex number and find its absolute value.
5. \(-6 + 8i\)  
6. \(5 - 12i\)  
7. \(-7i\)  
8. \(-7\)  
9. \(4 - 6i\)  
10. \(-8 + 3i\)

In Exercises 11–14, write the complex number in trigonometric form.
11. \(z = 3i\)  
12. \(z = -2 + 4i\)  
13. \(z = -3 - 3i\)  
14. \(z = -1 + \sqrt{3}i\)

In Exercises 15–32, represent the complex number graphically, and find the trigonometric form of the number.
15. \(1 + i\)  
16. \(5 - 5i\)  
17. \(1 - \sqrt{3}i\)  
18. \(4 - 4\sqrt{3}i\)  
19. \(-2(1 + \sqrt{3}i)\)  
20. \(-2(\sqrt{3} - i)\)  
21. \(-5i\)  
22. \(12i\)  
23. \(-7 + 4i\)  
24. \(3 - i\)  
25. \(2\)  
26. \(4\)  
27. \(2\sqrt{2} - i\)  
28. \(-3 - i\)  
29. \(5 + 2i\)  
30. \(8 + 3i\)  
31. \(-8 - 5\sqrt{3}i\)  
32. \(-9 - 2\sqrt{10}i\)

In Exercises 33–42, find the standard form of the complex number. Then represent the complex number graphically.
33. \(2(\cos 60° + i \sin 60°)\)  
34. \(5(\cos 135° + i \sin 135°)\)  
35. \(\sqrt{48}(\cos(-30°) + i \sin(-30°))\)  
36. \(\sqrt{8}(\cos 225° + i \sin 225°)\)  
37. \(\frac{9}{4}(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4})\)  
38. \(6(\cos \frac{5\pi}{12} + i \sin \frac{5\pi}{12})\)  
39. \(7(\cos 0° + i \sin 0°)\)  
40. \(8(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2})\)  
41. \(5(\cos(198° 45') + i \sin(198° 45'))\)  
42. \(9.75[\cos(280° 30') + i \sin(280° 30')]\)

In Exercises 43–46, use a graphing utility to represent the complex number in standard form.
43. \(5(\cos \frac{\pi}{9} + i \sin \frac{\pi}{9})\)  
44. \(10(\cos \frac{2\pi}{5} + i \sin \frac{2\pi}{5})\)  
45. \(2(\cos 155° + i \sin 155°)\)  
46. \(9(\cos 58° + i \sin 58°)\)

In Exercises 47–58, perform the operation and leave the result in trigonometric form.
47. \(\left[\frac{\sqrt{2}(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4})}{\sqrt{6}(\cos \frac{\pi}{12} + i \sin \frac{\pi}{12})}\right]\)  
48. \(\left[\frac{3(\cos \frac{\pi}{3} + i \sin \frac{\pi}{3})}{4(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4})}\right]\)  
49. \(\left[\frac{3(\cos 120° + i \sin 120°)}{3(\cos 300° + i \sin 300°)}\right]\)  
50. \(\left[\frac{2(\cos 100° + i \sin 100°)}{2(\cos 300° + i \sin 300°)}\right]\)  
51. \((\cos 80° + i \sin 80°)(\cos 330° + i \sin 330°)\)  
52. \((\cos 5° + i \sin 5°)(\cos 20° + i \sin 20°)\)  
53. \(3(\cos 50° + i \sin 50°)\)  
54. \(\cos 120° + i \sin 120°\)  
55. \(9(\cos 20° + i \sin 20°)\)  
56. \(5(\cos 4.3° + i \sin 4.3°)\)  
57. \(12(\cos 92° + i \sin 92°)\)  
58. \(6(\cos 40° + i \sin 40°)\)
In Exercises 59–64, (a) write the trigonometric forms of the complex numbers, (b) perform the indicated operation using the trigonometric forms, and (c) perform the indicated operation using the standard forms, and check your result with that of part (b).

59. \((2 + 2i)(1 - i)\)
60. \((\sqrt[3]{3} + i)(1 + i)\)
61. \(-2i(1 + i)\)
62. \(3(1 - \sqrt[2]{2}i)\)
63. \(\frac{3 + 4i}{1 - \sqrt[3]{3}i}\)
64. \(\frac{1 + \sqrt[3]{3}i}{6 - 3i}\)

In Exercises 65 and 66, represent the powers \(z, z^2, z^3,\) and \(z^4\) graphically. Describe the pattern.

65. \(z = \frac{\sqrt{3}}{2}(1 + i)\)
66. \(z = \frac{1}{2}(1 + \sqrt{3}i)\)

In Exercises 67–82, use DeMoivre’s Theorem to find the indicated power of the complex number. Write the result in standard form.

67. \((1 + i)^4\)
68. \((2 + 2i)^6\)
69. \((-1 + i)^6\)
70. \((3 - 2i)^8\)
71. \(2(\sqrt{3} + i)^{10}\)
72. \(4(1 - \sqrt{3}i)^3\)
73. \([5(\cos 20^\circ + i \sin 20^\circ)]^4\)
74. \([3(\cos 60^\circ + i \sin 60^\circ)]^4\)
75. \(\left(\cos \frac{\pi}{4} + i \sin \frac{\pi}{4}\right)^{12}\)
76. \(2\left(\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}\right)^8\)
77. \([5(\cos 3.2 + i \sin 3.2)]^4\)
78. \((\cos 0 + i \sin 0)^{20}\)
79. \((3 - 2i)^5\)
80. \(\left(\sqrt{3} - 4i\right)^3\)
81. \([3(\cos 15^\circ + i \sin 15^\circ)]^4\)
82. \(\left(2\left(\cos \frac{\pi}{8} + i \sin \frac{\pi}{8}\right)\right)^6\)

In Exercises 83–98, (a) use the formula on page 474 to find the indicated roots of the complex number, (b) represent each of the roots graphically, and (c) write each of the roots in standard form.

83. Square roots of \(5(\cos 120^\circ + i \sin 120^\circ)\)
84. Square roots of \(16(\cos 60^\circ + i \sin 60^\circ)\)
85. Cube roots of \(8\left(\cos \frac{2\pi}{3} + i \sin \frac{2\pi}{3}\right)\)
86. Fifth roots of \(32\left(\cos \frac{5\pi}{6} + i \sin \frac{5\pi}{6}\right)\)
87. Cube roots of \(-\frac{125}{2}(1 + \sqrt{3}i)\)
88. Cube roots of \(-4\sqrt[3]{2}(-1 + i)\)
89. Square roots of \(-25i\)
90. Fourth roots of \(625i\)
91. Fourth roots of \(16\)
92. Fourth roots of \(i\)
93. Fifth roots of \(1\)
94. Cube roots of \(1000\)
95. Cube roots of \(-125\)
96. Fourth roots of \(-4\)
97. Fifth roots of \(4(1 - i)\)
98. Sixth roots of \(64i\)

In Exercises 99–106, use the formula on page 474 to find all the solutions of the equation and represent the solutions graphically.

99. \(x^4 + i = 0\)
100. \(x^3 + 1 = 0\)
101. \(x^5 + 243 = 0\)
102. \(x^3 - 27 = 0\)
103. \(x^4 + 16i = 0\)
104. \(x^6 + 64i = 0\)
105. \(x^4 - (1 - i) = 0\)
106. \(x^4 + (1 + i) = 0\)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 107 and 108, determine whether the statement is true or false. Justify your answer.

107. Geometrically, the \(n\)th roots of any complex number \(z\) are all equally spaced around the unit circle centered at the origin.

108. The product of two complex numbers is zero only when the modulus of one (or both) of the complex numbers is zero.

109. Given two complex numbers \(z_1 = r_1(\cos \theta_1 + i \sin \theta_1)\) and \(z_2 = r_2(\cos \theta_2 + i \sin \theta_2), z_2 \neq 0,\) show that \(\frac{z_1}{z_2} = r_1 \left[ \cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2) \right].\)

110. Show that \(z = r[\cos(-\theta) + i \sin(-\theta)]\) is the complex conjugate of \(z = r(\cos \theta + i \sin \theta)\).

111. Use the trigonometric forms of \(z\) and \(\bar{z}\) in Exercise 110 to find (a) \(z\bar{z}\) and (b) \(z/\bar{z}, \bar{z} \neq 0\).

112. Show that the negative of \(z = r(\cos \theta + i \sin \theta)\) is \(-z = r[\cos(\theta + \pi) + i \sin(\theta + \pi)].\)

113. Show that \(\frac{1}{2}(1 - \sqrt{3}i)\) is a ninth root of \(-1.

114. Show that \(2^{-1/4}(1 - i)\) is a fourth root of \(-2.

115. **THINK ABOUT IT** Explain how you can use DeMoivre’s Theorem to solve the polynomial equation \(x^4 + 16 = 0.\) [Hint: Write \(-16\) as \(16(\cos \pi + i \sin \pi).\)]

**116. CAPSTONE** Use the graph of the roots of a complex number.

(a) Write each of the roots in trigonometric form.

(b) Identify the complex number whose roots are given.

Use a graphing utility to verify your results.

(i) Imaginary axis
(ii) Imaginary axis

[Graphs showing roots of a complex number with axes labeled Real and Imaginary]
### Chapter Summary

**What Did You Learn?**

<table>
<thead>

<tr>
<td>$A$ is obtuse.</td>
<td></td>
</tr>
</tbody>
</table>

**Section 6.1**

- Use the Law of Sines to solve oblique triangles (AAS or ASA) ($p. 428$).
- If two sides and one opposite angle are given, three possible situations can occur: (1) no such triangle exists (see Example 4), (2) one such triangle exists (see Example 3), or (3) two distinct triangles may satisfy the conditions. (see Example 5).
- The area of any triangle is one-half the product of the lengths of two sides times the sine of their included angle. That is, $\text{Area} = \frac{1}{2}bc \sin A = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B$.

**Section 6.2**

- Use the Law of Cosines to solve oblique triangles (SSS or SAS) ($p. 437$).
- The Law of Cosines can be used to approximate the total distance of a boat race course. (See Example 7.)

**Section 6.3**

- Use the Law of Cosines to model and solve real-life problems ($p. 439$).
- The Law of Cosines can be used to find the distance between a pitcher’s mound and first base on a women’s softball field. (See Example 3.)
- Use Heron’s Area Formula to find the area of a triangle ($p. 440$).
- **Heron’s Area Formula:** Given any triangle with sides of lengths $a$, $b$, and $c$, the area of the triangle is $\text{Area} = \sqrt{s(s-a)(s-b)(s-c)}$, where $s = (a + b + c)/2$.

- Represent vectors as directed line segments ($p. 445$).
- The component form of the vector with initial point $P(p_1, p_2)$ and terminal point $Q(q_1, q_2)$ is given by $\vec{PQ} = (q_1 - p_1, q_2 - p_2) = (v_1, v_2) = \vec{v}$.

- Write the component forms of vectors ($p. 446$).
## What Did You Learn?  | Explanation/Examples  | Review Exercises
---|---|---
Perform basic vector operations and represent them graphically (p. 447).  | Let \( u = \langle u_1, u_2 \rangle \) and \( v = \langle v_1, v_2 \rangle \) be vectors and let \( k \) be a scalar (a real number).  
\[ u + v = \langle u_1 + v_1, u_2 + v_2 \rangle \quad \text{and} \quad k u = \langle k u_1, k u_2 \rangle \]  
\[ -v = \langle -v_1, -v_2 \rangle \quad \text{and} \quad u - v = \langle u_1 - v_1, u_2 - v_2 \rangle \]  | 51–62
Write vectors as linear combinations of unit vectors (p. 449).  | \( \mathbf{v} = \langle v_1, v_2 \rangle = v_1 \mathbf{i} + v_2 \mathbf{j} \)  
The scalars \( v_1 \) and \( v_2 \) are the horizontal and vertical components of \( \mathbf{v} \), respectively. The vector sum \( v_1 \mathbf{i} + v_2 \mathbf{j} \) is the linear combination of the vectors \( \mathbf{i} \) and \( \mathbf{j} \).  | 63–68
Find the direction angles of vectors (p. 451).  | If \( \mathbf{u} = 2i + 2j \), then the direction angle is  
\( \tan \theta = \frac{2}{2} = 1 \). So, \( \theta = 45^\circ \).  | 69–74
Use vectors to model and solve real-life problems (p. 452).  | Vectors can be used to find the resultant speed and direction of an airplane. (See Example 10.)  | 75–78
Find the dot product of two vectors and use the properties of the dot product (p. 458).  | The dot product of \( \mathbf{u} = \langle u_1, u_2 \rangle \) and \( \mathbf{v} = \langle v_1, v_2 \rangle \) is  
\[ \mathbf{u} \cdot \mathbf{v} = u_1 v_1 + u_2 v_2. \]  | 79–90
Find the angle between two vectors and determine whether two vectors are orthogonal (p. 459).  | If \( \mathbf{u} \) and \( \mathbf{v} \) are nonzero vectors, then  
\[ \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{||\mathbf{u}|| ||\mathbf{v}||}. \]  
Vectors \( \mathbf{u} \) and \( \mathbf{v} \) are orthogonal if \( \mathbf{u} \cdot \mathbf{v} = 0 \).  | 91–98
Write a vector as the sum of two vector components (p. 461).  | Many applications in physics and engineering require the decomposition of a given vector into the sum of two vector components. (See Example 7.)  | 99–102
Use vectors to find the work done by a force (p. 464).  | The work \( W \) done by a constant force \( \mathbf{F} \) as its point of application moves along the vector \( \overrightarrow{PQ} \) is given by either of the following.  
1.  
\[ W = \|\text{proj}_{\overrightarrow{PQ}} \mathbf{F}\| \|\overrightarrow{PQ}\| \]  
2.  
\[ W = \mathbf{F} \cdot \overrightarrow{PQ} \]  | 103–106
Plot complex numbers in the complex plane and find absolute values of complex numbers (p. 468).  | A complex number \( z = a + bi \) can be represented as the point \( (a, b) \) in the complex plane. The horizontal axis is the real axis and the vertical axis is the imaginary axis. The absolute value of \( z = a + bi \) is  
\[ |z| = \sqrt{a^2 + b^2}. \]  | 107–112
Write the trigonometric forms of complex numbers (p. 469).  | The trigonometric form of the complex number \( z = a + bi \) is  
\[ z = r(\cos \theta + i \sin \theta) \]  
where \( a = r \cos \theta, b = r \sin \theta \),  
\( r = \sqrt{a^2 + b^2} \), and \( \tan \theta = b/a \).  | 113–118
Multiply and divide complex numbers written in trigonometric form (p. 470).  | Let \( z_1 = r_1(\cos \theta_1 + i \sin \theta_1) \) and \( z_2 = r_2(\cos \theta_2 + i \sin \theta_2) \).  
\[ z_1 z_2 = r_1 r_2[\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)] \]  
\[ z_1/z_2 = (r_1/r_2)[\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)], \quad z_2 \neq 0 \]  | 119, 120
Use DeMoivre’s Theorem to find powers of complex numbers (p. 472).  | DeMoivre’s Theorem: If \( z = r(\cos \theta + i \sin \theta) \) is a complex number and \( n \) is a positive integer, then  
\[ z^n = [r(\cos \theta + i \sin \theta)]^n = r^n(\cos n\theta + i \sin n\theta). \]  | 121–124
Find \( n \)th roots of complex numbers (p. 473).  | The complex number \( u = a + bi \) is an \( n \)th root of the complex number \( z \) if \( z = u^n = (a + bi)^n \).  | 125–124
In Exercises 1–12, use the Law of Sines to solve (if possible) the triangle. If two solutions exist, find both. Round your answers to two decimal places.

1. \[
\begin{array}{c}
\text{A} \\
\text{B} \\
\text{C}
\end{array}
\]
\[
\begin{array}{c}
a = 8 \\
b \\
c \\
\angle A = 70^\circ \\
\angle B = 38^\circ
\end{array}
\]

2. \[
\begin{array}{c}
\text{A} \\
\text{B} \\
\text{C}
\end{array}
\]
\[
\begin{array}{c}
a = 19 \\
b \\
c \\
\angle A = 122^\circ \\
\angle B = 121^\circ
\end{array}
\]

3. \(B = 72^\circ, C = 82^\circ, b = 54\)
4. \(B = 10^\circ, C = 20^\circ, c = 33\)
5. \(A = 16^\circ, B = 98^\circ, c = 8.4\)
6. \(A = 95^\circ, B = 45^\circ, c = 104.8\)
7. \(A = 24^\circ, C = 48^\circ, b = 27.5\)
8. \(B = 64^\circ, C = 36^\circ, a = 367\)
9. \(B = 150^\circ, b = 30, c = 10\)
10. \(B = 150^\circ, a = 10, b = 3\)
11. \(A = 75^\circ, a = 51.2, b = 33.7\)
12. \(B = 25^\circ, a = 6.2, b = 4\)

In Exercises 13–16, find the area of the triangle having the indicated angle and sides.

13. \(A = 33^\circ, b = 7, c = 10\)
14. \(B = 80^\circ, a = 4, c = 8\)
15. \(C = 119^\circ, a = 18, b = 6\)
16. \(A = 11^\circ, b = 22, c = 21\)

17. **HEIGHT** From a certain distance, the angle of elevation to the top of a building is \(17^\circ\). At a point 50 meters closer to the building, the angle of elevation is \(31^\circ\). Approximate the height of the building.

18. **GEOMETRY** Find the length of the side \(w\) of the parallelogram.

19. **HEIGHT** A tree stands on a hillside of slope \(28^\circ\) from the horizontal. From a point 75 feet down the hill, the angle of elevation to the top of the tree is \(45^\circ\) (see figure). Find the height of the tree.

---

20. **RIVER WIDTH** A surveyor finds that a tree on the opposite bank of a river flowing due east has a bearing of N \(22^\circ\) \(30^\prime\) E from a certain point and a bearing of N \(15^\circ\) W from a point 400 feet downstream. Find the width of the river.

In Exercises 21–30, use the Law of Cosines to solve the triangle. Round your answers to two decimal places.

21. \[
\begin{array}{c}
\text{A} \\
\text{B} \\
\text{C}
\end{array}
\]
\[
\begin{array}{c}
a = 8 \\
b \\
c \\
\angle A = 140^\circ
\end{array}
\]

22. \[
\begin{array}{c}
\text{A} \\
\text{B} \\
\text{C}
\end{array}
\]
\[
\begin{array}{c}
a = 7 \\
b \\
c \\
\angle A = 100^\circ
\end{array}
\]

23. \(a = 6, b = 9, c = 14\)
24. \(a = 75, b = 50, c = 110\)
25. \(a = 2.5, b = 5.0, c = 4.5\)
26. \(a = 16.4, b = 8.8, c = 12.2\)
27. \(B = 108^\circ, a = 11, c = 11\)
28. \(B = 150^\circ, a = 10, c = 20\)
29. \(C = 43^\circ, a = 22.5, b = 31.4\)
30. \(A = 62^\circ, b = 11.34, c = 19.52\)

In Exercises 31–34, determine whether the Law of Sines or the Law of Cosines is needed to solve the triangle. Then solve the triangle.

31. \(b = 9, c = 13, C = 64^\circ\)
32. \(a = 4, c = 5, B = 52^\circ\)
33. \(a = 13, b = 15, c = 24\)
34. \(A = 44^\circ, B = 31^\circ, c = 2.8\)
35. **GEOMETRY** The lengths of the diagonals of a parallelogram are 10 feet and 16 feet. Find the lengths of the sides of the parallelogram if the diagonals intersect at an angle of 28°.

36. **GEOMETRY** The lengths of the diagonals of a parallelogram are 30 meters and 40 meters. Find the lengths of the sides of the parallelogram if the diagonals intersect at an angle of 34°.

37. **SURVEYING** To approximate the length of a marsh, a surveyor walks 425 meters from point A to point B. Then the surveyor turns and walks 300 meters to point C (see figure). Approximate the length AC of the marsh.

38. **NAVIGATION** Two planes leave an airport at approximately the same time. One is flying 425 miles per hour at a bearing of 355°, and the other is flying 530 miles per hour at a bearing of 67°. Draw a figure that gives a visual representation of the situation and determine the distance between the planes after they have flown for 2 hours.

In Exercises 39–42, use Heron's Area Formula to find the area of the triangle.

39. \(a = 3, \ b = 6, \ c = 8\)
40. \(a = 15, \ b = 8, \ c = 10\)
41. \(a = 12.3, \ b = 15.8, \ c = 3.7\)
42. \(a = \frac{4}{5}, \ b = \frac{3}{4}, \ c = \frac{5}{8}\)

6.3 In Exercises 43 and 44, show that \(\mathbf{u}\) and \(\mathbf{v}\) are equivalent.

43. ![Image](image1.png)

44. ![Image](image2.png)

In Exercises 45–50, find the component form of the vector \(\mathbf{v}\) satisfying the conditions.

45. \(\mathbf{v}\)  
   ![Graph](image3.png)

46. \(\mathbf{v}\)  
   ![Graph](image4.png)

47. Initial point: \((0, 10)\); terminal point: \((7, 3)\)
48. Initial point: \((1, 5)\); terminal point: \((15, 9)\)
49. \(\|\mathbf{v}\| = 8, \ \theta = 120^\circ\)
50. \(\|\mathbf{v}\| = \frac{1}{5}, \ \theta = 225^\circ\)

In Exercises 51–58, find (a) \(\mathbf{u} + \mathbf{v}\), (b) \(\mathbf{u} - \mathbf{v}\), (c) \(4\mathbf{u}\), and (d) \(3\mathbf{v} + 5\mathbf{u}\).

51. \(\mathbf{u} = (-1, -3), \ \mathbf{v} = (-3, 6)\)
52. \(\mathbf{u} = (4, 5), \ \mathbf{v} = (0, -1)\)
53. \(\mathbf{u} = (-5, 2), \ \mathbf{v} = (4, 4)\)
54. \(\mathbf{u} = (1, -8), \ \mathbf{v} = (3, -2)\)
55. \(\mathbf{u} = 2\mathbf{i} - \mathbf{j}, \ \mathbf{v} = 5\mathbf{i} + 3\mathbf{j}\)
56. \(\mathbf{u} = -7\mathbf{i} - 3\mathbf{j}, \ \mathbf{v} = 4\mathbf{i} - \mathbf{j}\)
57. \(\mathbf{u} = 4\mathbf{i}, \ \mathbf{v} = -\mathbf{i} + 6\mathbf{j}\)
58. \(\mathbf{u} = -6\mathbf{j}, \ \mathbf{v} = \mathbf{i} + \mathbf{j}\)

In Exercises 59–62, find the component form of \(\mathbf{w}\) and sketch the specified vector operations geometrically, where \(\mathbf{u} = 6\mathbf{i} - 5\mathbf{j}\) and \(\mathbf{v} = 10\mathbf{i} + 3\mathbf{j}\).

59. \(\mathbf{w} = 2\mathbf{u} + \mathbf{v}\)  
   ![Graph](image5.png)

60. \(\mathbf{w} = 4\mathbf{u} - 5\mathbf{v}\)  
   ![Graph](image6.png)

61. \(\mathbf{w} = 3\mathbf{v}\)  
   ![Graph](image7.png)

62. \(\mathbf{w} = \frac{1}{2}\mathbf{v}\)  
   ![Graph](image8.png)

In Exercises 63–66, write vector \(\mathbf{u}\) as a linear combination of the standard unit vectors \(\mathbf{i}\) and \(\mathbf{j}\).

63. \(\mathbf{u} = (-1, 5)\)  
64. \(\mathbf{u} = (-6, -8)\)
65. \(\mathbf{u}\) has initial point \((3, 4)\) and terminal point \((9, 8)\).
66. \(\mathbf{u}\) has initial point \((-2, 7)\) and terminal point \((5, -9)\).

In Exercises 67 and 68, write the vector \(\mathbf{v}\) in the form \(\|\mathbf{v}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})\).

67. \(\mathbf{v} = -10\mathbf{i} + 10\mathbf{j}\)  
68. \(\mathbf{v} = 4\mathbf{i} - \mathbf{j}\)

In Exercises 69–74, find the magnitude and the direction angle of the vector \(\mathbf{v}\).

69. \(\mathbf{v} = 7(\cos 60^\circ \mathbf{i} + \sin 60^\circ \mathbf{j})\)
70. \(\mathbf{v} = 3(\cos 150^\circ \mathbf{i} + \sin 150^\circ \mathbf{j})\)
71. \(\mathbf{v} = 5\mathbf{i} + 4\mathbf{j}\)  
72. \(\mathbf{v} = -4\mathbf{i} + 7\mathbf{j}\)
73. \( v = -3i - 3j \) \quad 74. \( v = 8i - j \)

75. **RESULTANT FORCE** Forces with magnitudes of 85 pounds and 50 pounds act on a single point. The angle between the forces is 15°. Describe the resultant force.

76. **ROPE TENSION** A 180-pound weight is supported by two ropes, as shown in the figure. Find the tension in each rope.

\[
\begin{align*}
\text{30°} & \quad 30° \downarrow \\
\text{180 lb} &
\end{align*}
\]

77. **NAVIGATION** An airplane has an airspeed of 430 miles per hour at a bearing of 135°. The wind velocity is 35 miles per hour in the direction of N 30°E. Find the resultant speed and direction of the airplane.

78. **NAVIGATION** An airplane has an airspeed of 724 kilometers per hour at a bearing of 30°. The wind velocity is 32 kilometers per hour from the west. Find the resultant speed and direction of the airplane.

6.4 In Exercises 79–82, find the dot product of \( u \) and \( v \).

79. \( u = (6, 7) \quad 80. \ u = (-7, 12) \)
\[ v = (-3, 9) \quad v = (-4, -14) \]

81. \( u = 3i + 7j \quad 82. \ u = -7i + 2j \)
\[ v = 11i - 5j \quad v = 16i - 12j \]

In Exercises 83–90, use the vectors \( u = (-4, 2) \) and \( v = (5, 1) \) to find the indicated quantity. State whether the result is a vector or a scalar.

83. \( 2u \cdot u \) \quad 84. \( 3u \cdot v \)
\( 85. \ |u| \quad 86. \ |v| \)
\( 87. \ (u \cdot v) \quad 88. \ (u \cdot v) \)
\( 89. \ (u \cdot u) - (u \cdot v) \quad 90. \ (v \cdot v) - (v \cdot u) \)

In Exercises 91–94, find the angle \( \theta \) between the vectors.

91. \( u = \cos \frac{7\pi}{4}i + \sin \frac{7\pi}{4}j \)
\[ v = \cos \frac{5\pi}{6}i + \sin \frac{5\pi}{6}j \]

92. \( u = \cos 45°i + \sin 45°j \)
\[ v = \cos 300°i + \sin 300°j \]

93. \( u = (2\sqrt{2}, -4), \quad v = (-\sqrt{2}, 1) \)

94. \( u = (3, \sqrt{3}), \quad v = (4, 3\sqrt{3}) \)

In Exercises 95–98, determine whether \( u \) and \( v \) are orthogonal, parallel, or neither.

95. \( u = (-3, 8) \quad 96. \ u = \left( \frac{1}{2}, -\frac{1}{2} \right) \)
\[ v = (8, 3) \quad v = (-2, 4) \]

97. \( u = -i \quad 98. \ u = -2i + j \)
\[ v = i + 2j \quad v = 3i + 6j \]

In Exercises 99–102, find the projection of \( u \) onto \( v \). Then write \( u \) as the sum of two orthogonal vectors, one of which is \( \text{proj}_v u \).

99. \( u = (-4, 3), \quad v = (-8, -2) \)

100. \( u = (5, 6), \quad v = (10, 0) \)

101. \( u = (2, 7), \quad v = (1, -1) \)

102. \( u = (-3, 5), \quad v = (-5, 2) \)

**WORK** In Exercises 103 and 104, find the work done in moving a particle from \( P \) to \( Q \) if the magnitude and direction of the force are given by \( v \).

103. \( P(5, 3), \quad Q(8, 9), \quad v = (2, 7) \)

104. \( P(-2, -9), \quad Q(-12, 8), \quad v = 3i - 6j \)

105. **WORK** Determine the work done (in foot-pounds) by a crane lifting an 18,000-pound truck 48 inches.

106. **WORK** A mover exerts a horizontal force of 25 pounds on a crate as it is pushed up a ramp that is 12 feet long and inclined at an angle of 20° above the horizontal. Find the work done in pushing the crate.

6.5 In Exercises 107–112, plot the complex number and find its absolute value.

107. \( 7i \quad 108. \ -6i \)

109. \( 5 + 3i \quad 110. \ -10 - 4i \)

111. \( \sqrt{2} - \sqrt{2}i \quad 112. \ -\sqrt{2} + \sqrt{2}i \)

In Exercises 113–118, write the complex number in trigonometric form.

113. \( 4i \quad 114. \ -7 \)

115. \( 5 - 5i \quad 116. \ 5 + 12i \)

117. \( -5 - 12i \quad 118. \ -3\sqrt{3} + 3i \)

In Exercises 119 and 120, (a) write the two complex numbers in trigonometric form, and (b) use the trigonometric forms to find \( z_1z_2 \) and \( z_1/z_2 \), where \( z_2 \neq 0 \).

119. \( z_1 = 2\sqrt{3} - 2i, \quad z_2 = -10i \)

120. \( z_1 = -3(1 + i), \quad z_2 = 2(\sqrt{3} + i) \)
In Exercises 121–124, use DeMoivre's Theorem to find the indicated power of the complex number. Write the result in standard form.

121. \( \left[ 5 \left( \cos \frac{\pi}{12} + i \sin \frac{\pi}{12} \right) \right]^4 \)
122. \( \left[ 2 \left( \cos \frac{4\pi}{15} + i \sin \frac{4\pi}{15} \right) \right]^5 \)
123. \( (2 + 3i)^6 \)
124. \( (1 - i)^8 \)

In Exercises 125–128, (a) use the formula on page 474 to find the indicated roots of the complex number, (b) represent each of the roots graphically, and (c) write each of the roots in standard form.

125. Sixth roots of \(-729i\)
126. Fourth roots of \(256i\)
127. Cube roots of 8
128. Fifth roots of \(-1024\)

In Exercises 129–134, use the formula on page 474 to find all solutions of the equation and represent the solutions graphically.

129. \( x^4 + 81 = 0 \)
130. \( x^3 - 32 = 0 \)
131. \( x^3 + 8i = 0 \)
132. \( x^4 - 64i = 0 \)
133. \( x^5 + x^3 - x^2 - 1 = 0 \)
134. \( x^5 + 4x^3 - 8x^2 - 32 = 0 \)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 135–139, determine whether the statement is true or false. Justify your answer.

135. The Law of Sines is true if one of the angles in the triangle is a right angle.
136. When the Law of Sines is used, the solution is always unique.
137. If \( \mathbf{u} \) is a unit vector in the direction of \( \mathbf{v} \), then \( \mathbf{v} = ||\mathbf{v}||\mathbf{u} \).
138. If \( \mathbf{v} = ai + bj = 0 \), then \( a = -b \).
139. \( x = \sqrt{3} + i \) is a solution of the equation \( x^2 - 8i = 0 \).
140. State the Law of Sines from memory.
141. State the Law of Cosines from memory.
142. What characterizes a vector in the plane?
143. Which vectors in the figure appear to be equivalent?

144. The vectors \( \mathbf{u} \) and \( \mathbf{v} \) have the same magnitudes in the two figures. In which figure will the magnitude of the sum be greater? Give a reason for your answer.

145. Give a geometric description of the scalar multiple \( k \mathbf{u} \) of the vector \( \mathbf{u} \), for \( k > 0 \) and for \( k < 0 \).
146. Give a geometric description of the sum of the vectors \( \mathbf{u} \) and \( \mathbf{v} \).

**GRAPHICAL REASONING** In Exercises 147 and 148, use the graph of the roots of a complex number.

(a) Write each of the roots in trigonometric form.
(b) Identify the complex number whose roots are given. Use a graphing utility to verify your results.

147. \( z^4 = 1 \)
148. \( z^4 = -1 \)
149. The figure shows \( z_1 \) and \( z_2 \). Describe \( z_1 z_2 \) and \( z_1 / z_2 \).
150. One of the fourth roots of a complex number \( z \) is shown in the figure.

(a) How many roots are not shown?
(b) Describe the other roots.
CHAPTER TEST

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1–6, use the information to solve (if possible) the triangle. If two solutions exist, find both solutions. Round your answers to two decimal places.

1. \( A = 24^\circ, \ B = 68^\circ, \ c = 12.2 \)
2. \( B = 110^\circ, \ C = 28^\circ, \ a = 15.6 \)
3. \( A = 24^\circ, \ a = 11.2, \ b = 13.4 \)
4. \( a = 4.0, \ b = 7.3, \ c = 12.4 \)
5. \( B = 100^\circ, \ a = 15, \ b = 23 \)
6. \( C = 121^\circ, \ a = 34, \ b = 55 \)

7. A triangular parcel of land has borders of lengths 60 meters, 70 meters, and 82 meters. Find the area of the parcel of land.

8. An airplane flies 370 miles from point \( A \) to point \( B \) with a bearing of \( 24^\circ \). It then flies 240 miles from point \( B \) to point \( C \) with a bearing of \( 37^\circ \) (see figure). Find the distance and bearing from point \( A \) to point \( C \).

In Exercises 9 and 10, find the component form of the vector \( \mathbf{v} \) satisfying the given conditions.

9. Initial point of \( \mathbf{v} \): \((-3, 7)\); terminal point of \( \mathbf{v} \): \((11, -16)\)
10. Magnitude of \( \mathbf{v} \): \(|\mathbf{v}| = 12\); direction of \( \mathbf{v} \): \( \mathbf{u} = (3, -5) \)

In Exercises 11–14, \( \mathbf{u} = \langle 2, 7 \rangle \) and \( \mathbf{v} = \langle -6, 5 \rangle \). Find the resultant vector and sketch its graph.

11. \( \mathbf{u} + \mathbf{v} \)
12. \( \mathbf{u} - \mathbf{v} \)
13. \( 5\mathbf{u} - 3\mathbf{v} \)
14. \( 4\mathbf{u} + 2\mathbf{v} \)

15. Find a unit vector in the direction of \( \mathbf{u} = (24, -7) \).
16. Forces with magnitudes of 250 pounds and 130 pounds act on an object at angles of \( 45^\circ \) and \( -60^\circ \), respectively, with the \( x \)-axis. Find the direction and magnitude of the resultant of these forces.

17. Find the angle between the vectors \( \mathbf{u} = \langle -1, 5 \rangle \) and \( \mathbf{v} = \langle 3, -2 \rangle \).
18. Are the vectors \( \mathbf{u} = \langle 6, -10 \rangle \) and \( \mathbf{v} = \langle 5, 3 \rangle \) orthogonal?
19. Find the projection of \( \mathbf{u} = \langle 6, 7 \rangle \) onto \( \mathbf{v} = \langle -5, -1 \rangle \). Then write \( \mathbf{u} \) as the sum of two orthogonal vectors.

20. A 500-pound motorcycle is headed up a hill inclined at \( 12^\circ \). What force is required to keep the motorcycle from rolling down the hill when stopped at a red light?

21. Write the complex number \( z = 5 - 5i \) in trigonometric form.
22. Write the complex number \( z = 6(\cos 120^\circ + i \sin 120^\circ) \) in standard form.

In Exercises 23 and 24, use DeMoivre’s Theorem to find the indicated power of the complex number. Write the result in standard form.

23. \( \left[ 3(\cos \frac{7\pi}{6} + i \sin \frac{7\pi}{6}) \right]^8 \)
24. \( (3 - 3i)^6 \)

25. Find the fourth roots of \( 256(1 + \sqrt{3} i) \).
26. Find all solutions of the equation \( x^3 - 27i = 0 \) and represent the solutions graphically.
CUMULATIVE TEST FOR CHAPTERS 4–6

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Consider the angle \( \theta = -120^\circ \).
   (a) Sketch the angle in standard position.
   (b) Determine a coterminal angle in the interval \([0^\circ, 360^\circ]\).
   (c) Convert the angle to radian measure.
   (d) Find the reference angle \( \theta' \).
   (e) Find the exact values of the six trigonometric functions of \( \theta \).

2. Convert the angle \( \frac{4\pi}{3} \) radians to degrees. Round the answer to one decimal place.

3. Find \( a, b, \) and \( c \) such that the graph of the function matches the graph in the figure.

   \[ f(x) = 3 - 2 \sin \pi x \]

   \[ g(x) = \frac{1}{2} \tan \left( x - \frac{\pi}{2} \right) \]

   \[ h(x) = -\sec(x + \pi) \]

In Exercises 4–6, sketch the graph of the function. (Include two full periods.)

4. \[ f(x) = 3 - 2 \sin \pi x \]

5. \[ g(x) = \frac{1}{2} \tan \left( x - \frac{\pi}{2} \right) \]

6. \[ h(x) = -\sec(x + \pi) \]

7. Find \( a, b, \) and \( c \) such that the graph of the function \( h(x) = a \cos(bx + c) \) matches the graph in the figure.

8. Sketch the graph of the function \( f(x) = \frac{1}{2}x \sin x \) over the interval \(-3\pi \leq x \leq 3\pi\).

In Exercises 9 and 10, find the exact value of the expression without using a calculator.

9. \( \tan(\arctan 4.9) \)

10. \( \tan(\arcsin \frac{3}{2}) \)

11. Write an algebraic expression equivalent to \( \sin(\arccos 2x) \).

12. Use the fundamental identities to simplify: \( \cos \left( \frac{\pi}{2} - x \right) \csc x \).

13. Subtract and simplify: \( \frac{\sin \theta - 1}{\cos \theta} - \frac{\cos \theta}{\sin \theta - 1} \).

In Exercises 14–16, verify the identity.

14. \( \cot^2 \alpha (\sec^2 \alpha - 1) = 1 \)

15. \( \sin(x + y) \sin(x - y) = \sin^2 x - \sin^2 y \)

16. \( \sin^2 x \cos^2 x = \frac{1}{8}(1 - \cos 4x) \)

In Exercises 17 and 18, find all solutions of the equation in the interval \([0, 2\pi]\).

17. \( 2 \cos^2 \beta - \cos \beta = 0 \)

18. \( 3 \tan \theta - \cot \theta = 0 \)

19. Use the Quadratic Formula to solve the equation in the interval \([0, 2\pi]\): \( \sin^2 x + 2 \sin x + 1 = 0 \).

20. Given that \( \sin u = \frac{12}{13} \), \( \cos v = \frac{3}{5} \), and angles \( u \) and \( v \) are both in Quadrant I, find \( \tan(u - v) \).

21. If \( \tan \theta = \frac{4}{3} \), find the exact value of \( \tan(2\theta) \).

22. If \( \tan \theta = \frac{4}{3} \), find the exact value of \( \sin \frac{\theta}{2} \).
23. Write the product \(5 \sin \frac{3\pi}{4} \cdot \cos \frac{7\pi}{4}\) as a sum or difference.

24. Write \(\cos 9x - \cos 7x\) as a product.

In Exercises 25–28, use the information to solve the triangle shown in the figure. Round your answers to two decimal places.

25. \(A = 30^\circ, a = 9, b = 8\)

26. \(A = 30^\circ, b = 8, c = 10\)

27. \(A = 30^\circ, C = 90^\circ, b = 10\)

28. \(a = 4.7, b = 8.1, c = 10.3\)

In Exercises 29 and 30, determine whether the Law of Sines or the Law of Cosines is needed to solve the triangle. Then solve the triangle.

29. \(A = 45^\circ, B = 26^\circ, c = 20\)

30. \(a = 1.2, b = 10, C = 80^\circ\)

31. Two sides of a triangle have lengths 7 inches and 12 inches. Their included angle measures 99°. Find the area of the triangle.

32. Find the area of a triangle with sides of lengths 30 meters, 41 meters, and 45 meters.

33. Write the vector \(\mathbf{u} = (7, 8)\) as a linear combination of the standard unit vectors \(\mathbf{i}\) and \(\mathbf{j}\).

34. Find a unit vector in the direction of \(\mathbf{v} = \mathbf{i} + \mathbf{j}\).

35. Find \(\mathbf{u} \cdot \mathbf{v}\) for \(\mathbf{u} = 3\mathbf{i} + 4\mathbf{j}\) and \(\mathbf{v} = \mathbf{i} - 2\mathbf{j}\).

36. Find the projection of \(\mathbf{u} = (8, -2)\) onto \(\mathbf{v} = (1, 5)\). Then write \(\mathbf{u}\) as the sum of two orthogonal vectors.

37. Write the complex number \(-2 + 2i\) in trigonometric form.

38. Find the product of \([4(\cos 30^\circ + i \sin 30^\circ)] [6(\cos 120^\circ + i \sin 120^\circ)]\). Write the answer in standard form.

39. Find the three cube roots of 1.

40. Find all the solutions of the equation \(x^3 + 243 = 0\).

41. A ceiling fan with 21-inch blades makes 63 revolutions per minute. Find the angular speed of the fan in radians per minute. Find the linear speed of the tips of the blades in inches per minute.

42. Find the area of the sector of a circle with a radius of 12 yards and a central angle of 105°.

43. From a point 200 feet from a flagpole, the angles of elevation to the bottom and top of the flag are 16° 45’ and 18°, respectively. Approximate the height of the flag to the nearest foot.

44. To determine the angle of elevation of a star in the sky, you get the star in your line of vision with the backboard of a basketball hoop that is 5 feet higher than your eyes (see figure). Your horizontal distance from the backboard is 12 feet. What is the angle of elevation of the star?

45. Write a model for a particle in simple harmonic motion with a displacement of 4 inches and a period of 8 seconds.

46. An airplane’s velocity with respect to the air is 500 kilometers per hour, with a bearing of 30°. The wind at the altitude of the plane has a velocity of 50 kilometers per hour with a bearing of N 60°E. What is the true direction of the plane, and what is its speed relative to the ground?

47. A force of 85 pounds exerted at an angle of 60° above the horizontal is required to slide an object across a floor. The object is dragged 10 feet. Determine the work done in sliding the object.
**Law of Tangents**

Besides the Law of Sines and the Law of Cosines, there is also a Law of Tangents, which was developed by François Viète (1540–1603). The Law of Tangents follows from the Law of Sines and the sum-to-product formulas for sine and is defined as follows.

\[
\frac{a + b}{a - b} = \tan\left(\frac{A + B}{2}\right) / \tan\left(\frac{A - B}{2}\right)
\]

The Law of Tangents can be used to solve a triangle when two sides and the included angle are given (SAS). Before calculators were invented, the Law of Tangents was used to solve the SAS case instead of the Law of Cosines, because computation with a table of tangent values was easier.

**Law of Sines (p. 428)**

If \(ABC\) is a triangle with sides \(a\), \(b\), and \(c\), then

\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}.
\]

**Proof**

Let \(h\) be the altitude of either triangle found in the figure above. Then you have

\[
\sin A = \frac{h}{b} \quad \text{or} \quad h = b \sin A
\]

\[
\sin B = \frac{h}{a} \quad \text{or} \quad h = a \sin B.
\]

Equating these two values of \(h\), you have

\[
a \sin B = b \sin A \quad \text{or} \quad \frac{a \sin B}{b} = \frac{b \sin B}{a}.
\]

Note that \(\sin A \neq 0\) and \(\sin B \neq 0\) because no angle of a triangle can have a measure of \(0^\circ\) or \(180^\circ\). In a similar manner, construct an altitude from vertex \(B\) to side \(AC\) (extended in the obtuse triangle), as shown at the left. Then you have

\[
\sin A = \frac{h}{c} \quad \text{or} \quad h = c \sin A
\]

\[
\sin C = \frac{h}{a} \quad \text{or} \quad h = a \sin C.
\]

Equating these two values of \(h\), you have

\[
a \sin C = c \sin A \quad \text{or} \quad \frac{a \sin C}{c} = \frac{c \sin C}{a}.
\]

By the Transitive Property of Equality you know that

\[
\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}.
\]

So, the Law of Sines is established.
Proof
To prove the first formula, consider the top triangle at the left, which has three acute angles. Note that vertex $B$ has coordinates $(c, 0)$. Furthermore, $C$ has coordinates $(x, y)$, where $x = b \cos A$ and $y = b \sin A$. Because $a$ is the distance from vertex $C$ to vertex $B$, it follows that

\[
\begin{align*}
    a &= \sqrt{(x - c)^2 + (y - 0)^2} \\
    a^2 &= (x - c)^2 + (y - 0)^2 \\
    a^2 &= (b \cos A - c)^2 + (b \sin A)^2 \\
    a^2 &= b^2 \cos^2 A - 2bc \cos A + c^2 + b^2 \sin^2 A \\
    a^2 &= b^2 (\sin^2 A + \cos^2 A) + c^2 - 2bc \cos A \\
    a^2 &= b^2 + c^2 - 2bc \cos A. 
\end{align*}
\]

Distance Formula
Square each side.
Substitute for $x$ and $y$.
Expand.
Factor out $b^2$.
sin²$A$ + cos²$A = 1$

To prove the second formula, consider the bottom triangle at the left, which also has three acute angles. Note that vertex $A$ has coordinates $(c, 0)$. Furthermore, $C$ has coordinates $(x, y)$, where $x = a \cos B$ and $y = a \sin B$. Because $b$ is the distance from vertex $C$ to vertex $A$, it follows that

\[
\begin{align*}
    b &= \sqrt{(x - c)^2 + (y - 0)^2} \\
    b^2 &= (x - c)^2 + (y - 0)^2 \\
    b^2 &= (a \cos B - c)^2 + (a \sin B)^2 \\
    b^2 &= a^2 \cos^2 B - 2ac \cos B + c^2 + a^2 \sin^2 B \\
    b^2 &= a^2 (\sin^2 B + \cos^2 B) + c^2 - 2ac \cos B \\
    b^2 &= a^2 + c^2 - 2ac \cos B. 
\end{align*}
\]

Distance Formula
Square each side.
Substitute for $x$ and $y$.
Expand.
Factor out $a^2$.
sin²$B$ + cos²$B = 1$

A similar argument is used to establish the third formula.

\[
\begin{align*}
    \text{Law of Cosines} \quad (p. \ 437) \\
    \text{Standard Form} & \quad \text{Alternative Form} \\
    a^2 = b^2 + c^2 - 2bc \cos A & \quad \cos A = \frac{b^2 + c^2 - a^2}{2bc} \\
    b^2 = a^2 + c^2 - 2ac \cos B & \quad \cos B = \frac{a^2 + c^2 - b^2}{2ac} \\
    c^2 = a^2 + b^2 - 2ab \cos C & \quad \cos C = \frac{a^2 + b^2 - c^2}{2ab}
\end{align*}
\]
Heron’s Area Formula  (p. 440)

Given any triangle with sides of lengths a, b, and c, the area of the triangle is

\[ \text{Area} = \sqrt{s(s - a)(s - b)(s - c)} \]

where \( s = \frac{a + b + c}{2} \).

Proof

From Section 6.1, you know that

\[ \text{Area} = \frac{1}{2} bc \sin A \]

Formula for the area of an oblique triangle

\[ (\text{Area})^2 = \frac{1}{4} b^2 c^2 \sin^2 A \]

Square each side.

\[ \text{Area} = \sqrt{\frac{1}{4} b^2 c^2 \sin^2 A} \]

Take the square root of each side.

\[ = \sqrt{\frac{1}{4} b^2 c^2 (1 - \cos^2 A)} \]

Pythagorean Identity

\[ = \sqrt{\frac{1}{4} bc(1 + \cos A) \left[ \frac{1}{2} bc(1 - \cos A) \right]} \]

Factor.

Using the Law of Cosines, you can show that

\[ \frac{1}{2} bc(1 + \cos A) = \frac{a + b + c}{2} \cdot \frac{-a + b + c}{2} \]

and

\[ \frac{1}{2} bc(1 - \cos A) = \frac{a - b + c}{2} \cdot \frac{a + b - c}{2} . \]

Letting \( s = (a + b + c)/2 \), these two equations can be rewritten as

\[ \frac{1}{2} bc(1 + \cos A) = s(s - a) \]

Formula for the area of an oblique triangle

and

\[ \frac{1}{2} bc(1 - \cos A) = (s - b)(s - c). \]

By substituting into the last formula for area, you can conclude that

\[ \text{Area} = \sqrt{s(s - a)(s - b)(s - c)}. \]
Properties of the Dot Product (p. 458)
Let \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) be vectors in the plane or in space and let \( c \) be a scalar.

1. \( \mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u} \)
2. \( \mathbf{0} \cdot \mathbf{v} = 0 \)
3. \( \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w} \)
4. \( \mathbf{v} \cdot \mathbf{v} = ||\mathbf{v}||^2 \)
5. \( c(\mathbf{u} \cdot \mathbf{v}) = c\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot c\mathbf{v} \)

Proof
Let \( \mathbf{u} = (u_1, u_2), \mathbf{v} = (v_1, v_2), \mathbf{w} = (w_1, w_2), \mathbf{0} = (0, 0), \) and let \( c \) be a scalar.

1. \( \mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 = v_1u_1 + v_2u_2 = \mathbf{v} \cdot \mathbf{u} \)
2. \( \mathbf{0} \cdot \mathbf{v} = 0 \cdot v_1 + 0 \cdot v_2 = 0 \)
3. \( \mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot (v_1 + w_1, v_2 + w_2) \)
   \[ = u_1(v_1 + w_1) + u_2(v_2 + w_2) \]
   \[ = u_1v_1 + u_1w_1 + u_2v_2 + u_2w_2 \]
   \[ = (u_1v_1 + u_2v_2) + (u_1w_1 + u_2w_2) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w} \]

4. \( \mathbf{v} \cdot \mathbf{v} = v_1^2 + v_2^2 = (\sqrt{v_1^2 + v_2^2})^2 = ||\mathbf{v}||^2 \)

5. \( c(\mathbf{u} \cdot \mathbf{v}) = c(u_1v_1 + u_2v_2) \)
   \[ = c(u_1v_1) + c(u_2v_2) \]
   \[ = (cu_1)v_1 + (cu_2)v_2 \]
   \[ = (cu_1, cu_2) \cdot (v_1, v_2) \]
   \[ = c\mathbf{u} \cdot \mathbf{v} \)

Angle Between Two Vectors (p. 459)
If \( \theta \) is the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), then \( \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{||\mathbf{u}|| ||\mathbf{v}||} \).

Proof
Consider the triangle determined by vectors \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{v} - \mathbf{u} \), as shown in the figure. By the Law of Cosines, you can write
\[
||\mathbf{v} - \mathbf{u}||^2 = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2||\mathbf{u}|| ||\mathbf{v}|| \cos \theta \\
(\mathbf{v} - \mathbf{u}) \cdot (\mathbf{v} - \mathbf{u}) = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2||\mathbf{u}|| ||\mathbf{v}|| \cos \theta \\
(\mathbf{v} - \mathbf{u}) \cdot \mathbf{v} - (\mathbf{v} - \mathbf{u}) \cdot \mathbf{u} = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2||\mathbf{u}|| ||\mathbf{v}|| \cos \theta \\
\mathbf{v} \cdot \mathbf{v} - \mathbf{u} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{u} + \mathbf{u} \cdot \mathbf{u} = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2||\mathbf{u}|| ||\mathbf{v}|| \cos \theta \\
||\mathbf{v}||^2 - 2\mathbf{u} \cdot \mathbf{v} + ||\mathbf{u}||^2 = ||\mathbf{u}||^2 + ||\mathbf{v}||^2 - 2||\mathbf{u}|| ||\mathbf{v}|| \cos \theta \\
\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{||\mathbf{u}|| ||\mathbf{v}||}.\]
1. In the figure, a beam of light is directed at the blue mirror, reflected to the red mirror, and then reflected back to the blue mirror. Find the distance PT that the light travels from the red mirror back to the blue mirror.

2. A triathlete sets a course to swim S 25° E from a point on shore to a buoy ¾ mile away. After swimming 300 yards through a strong current, the triathlete is off course at a bearing of S 35° E. Find the bearing and distance the triathlete needs to swim to correct her course.

3. A hiking party is lost in a national park. Two ranger stations have received an emergency SOS signal from the party. Station B is 75 miles due east of station A. The bearing from station A to the signal is S 60° E and the bearing from station B to the signal is S 75° W.
   (a) Draw a diagram that gives a visual representation of the problem.
   (b) Find the distance from each station to the SOS signal.
   (c) A rescue party is in the park 20 miles from station A at a bearing of S 80° E. Find the distance and the bearing the rescue party must travel to reach the lost hiking party.

4. You are seeding a triangular courtyard. One side of the courtyard is 52 feet long and another side is 46 feet long. The angle opposite the 52-foot side is 65°.
   (a) Draw a diagram that gives a visual representation of the situation.
   (b) How long is the third side of the courtyard?
   (c) One bag of grass seed covers an area of 50 square feet. How many bags of grass seed will you need to cover the courtyard?

5. For each pair of vectors, find the following.
   (i) \( \| \mathbf{u} \| \)  (ii) \( \| \mathbf{v} \| \)  (iii) \( \| \mathbf{u} + \mathbf{v} \| \)
   (iv) \( \mathbf{u} / \| \mathbf{u} \| \)  (v) \( \mathbf{v} / \| \mathbf{v} \| \)  (vi) \( \mathbf{u} + \mathbf{v} / \| \mathbf{u} + \mathbf{v} \| \)
   (a) \( \mathbf{u} = (1, -1), \mathbf{v} = (-1, 2) \)
   (b) \( \mathbf{u} = (0, 1), \mathbf{v} = (3, -3) \)
   (c) \( \mathbf{u} = (1, \frac{1}{2}), \mathbf{v} = (2, -4), \mathbf{v} = (2, 3) \)
   (d) \( \mathbf{u} = (2, -4) \)

6. A skydiver is falling at a constant downward velocity of 120 miles per hour. In the figure, vector \( \mathbf{u} \) represents the skydiver’s velocity. A steady breeze pushes the skydiver to the east at 40 miles per hour. Vector \( \mathbf{v} \) represents the wind velocity.
   (a) Write the vectors \( \mathbf{u} \) and \( \mathbf{v} \) in component form.
   (b) Let \( \mathbf{s} = \mathbf{u} + \mathbf{v} \). Use the figure to sketch \( \mathbf{s} \). To print an enlarged copy of the graph, go to the website www.mathgraphs.com.
   (c) Find the magnitude of \( \mathbf{s} \). What information does the magnitude give you about the skydiver’s fall?
   (d) If there were no wind, the skydiver would fall in a path perpendicular to the ground. At what angle to the ground is the path of the skydiver when the skydiver is affected by the 40-mile-per-hour wind from due west?
   (e) The skydiver is blown to the west at 30 miles per hour. Draw a new figure that gives a visual representation of the problem and find the skydiver’s new velocity.
7. Write the vector \( \mathbf{w} \) in terms of \( \mathbf{u} \) and \( \mathbf{v} \), given that the terminal point of \( \mathbf{w} \) bisects the line segment (see figure).

\[
\mathbf{w} = c\mathbf{u} + d\mathbf{v}
\]

for any scalars \( c \) and \( d \) (see figure).

8. Prove that if \( \mathbf{u} \) is orthogonal to \( \mathbf{v} \) and \( \mathbf{w} \), then \( \mathbf{u} \) is orthogonal to \( c\mathbf{v} + d\mathbf{w} \) for any scalars \( c \) and \( d \) (see figure).

9. Two forces of the same magnitude \( \mathbf{F}_1 \) and \( \mathbf{F}_2 \) act at angles \( \theta_1 \) and \( \theta_2 \), respectively. Use a diagram to compare the work done by \( \mathbf{F}_1 \) with the work done by \( \mathbf{F}_2 \) in moving along the vector \( \mathbf{PQ} \) if

(a) \( \theta_1 = -\theta_2 \)
(b) \( \theta_1 = 60^\circ \) and \( \theta_2 = 30^\circ \).

10. Four basic forces are in action during flight: weight, lift, thrust, and drag. To fly through the air, an object must overcome its own weight. To do this, it must create an upward force called lift. To generate lift, a forward motion called thrust is needed. The thrust must be great enough to overcome air resistance, which is called drag.

For a commercial jet aircraft, a quick climb is important to maximize efficiency because the performance of an aircraft at high altitudes is enhanced. In addition, it is necessary to clear obstacles such as buildings and mountains and to reduce noise in residential areas. In the diagram, the angle \( \theta \) is called the climb angle. The velocity of the plane can be represented by a vector \( \mathbf{v} \) with a vertical component \( \|\mathbf{v}\| \sin \theta \) (called climb speed) and a horizontal component \( \|\mathbf{v}\| \cos \theta \), where \( \|\mathbf{v}\| \) is the speed of the plane.

When taking off, a pilot must decide how much of the thrust to apply to each component. The more the thrust is applied to the horizontal component, the faster the airplane will gain speed. The more the thrust is applied to the vertical component, the quicker the airplane will climb.

(a) Complete the table for an airplane that has a speed \( \|\mathbf{v}\| = 100 \) miles per hour.

(b) Does an airplane’s speed equal the sum of the vertical and horizontal components of its velocity? If not, how could you find the speed of an airplane whose velocity components were known?

(c) Use the result of part (b) to find the speed of an airplane with the given velocity components.

(i) \( \|\mathbf{v}\| \sin \theta = 5.235 \) miles per hour
(\( \|\mathbf{v}\| \cos \theta = 149.909 \) miles per hour

(ii) \( \|\mathbf{v}\| \sin \theta = 10.463 \) miles per hour
(\( \|\mathbf{v}\| \cos \theta = 149.634 \) miles per hour
7 Systems of Equations and Inequalities

7.1 Linear and Nonlinear Systems of Equations
7.2 Two-Variable Linear Systems
7.3 Multivariable Linear Systems
7.4 Partial Fractions
7.5 Systems of Inequalities
7.6 Linear Programming

In Mathematics
You can use a system of equations to solve a problem involving two or more equations.

In Real Life
Systems of equations and inequalities are used to determine the correct amounts to use in making an acid mixture, how much to invest in different funds, a break-even point for a business, and many other real-life applications. Systems of equations are also used to find least squares regression parabolas. For instance, a wildlife management team can use a system to model the reproduction rates of deer. (See Exercise 81, page 528.)

IN CAREERS
There are many careers that use systems of equations and inequalities. Several are listed below.

• Economist
  Exercise 72, page 503

• Investor
  Exercises 53 and 54, page 515

• Dietitian
  Example 9, page 544

• Concert Promoter
  Exercise 78, page 546
**The Method of Substitution**

Up to this point in the text, most problems have involved either a function of one variable or a single equation in two variables. However, many problems in science, business, and engineering involve two or more equations in two or more variables. To solve such problems, you need to find solutions of a system of equations. Here is an example of a system of two equations in two unknowns.

\[
\begin{align*}
2x + y &= 5 & \text{Equation 1} \\
3x - 2y &= 4 & \text{Equation 2}
\end{align*}
\]

A solution of this system is an ordered pair that satisfies each equation in the system. Finding the set of all solutions is called solving the system of equations. For instance, the ordered pair \((2, 1)\) is a solution of this system. To check this, you can substitute 2 for \(x\) and 1 for \(y\) in each equation.

**Check \((2, 1)\) in Equation 1 and Equation 2:**

\[
\begin{align*}
2(2) + 1 &= 5 & \text{Write Equation 1.} \\
4 + 1 &= 5 & \text{Substitute 2 for } x \text{ and 1 for } y. \\
\checkmark & \text{Solution checks in Equation 1.}
\end{align*}
\]

\[
\begin{align*}
3(2) - 2(1) &= 4 & \text{Write Equation 2.} \\
6 - 2 &= 4 & \text{Substitute 2 for } x \text{ and 1 for } y. \\
\checkmark & \text{Solution checks in Equation 2.}
\end{align*}
\]

In this chapter, you will study four ways to solve systems of equations, beginning with the method of substitution.

<table>
<thead>
<tr>
<th>Method</th>
<th>Section</th>
<th>Type of System</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Substitution</td>
<td>7.1</td>
<td>Linear or nonlinear, two variables</td>

<td>4. Gaussian elimination</td>
<td>7.3</td>
<td>Linear, three or more variables</td>
</tr>
</tbody>
</table>

**Method of Substitution**

1. **Solve** one of the equations for one variable in terms of the other.
2. **Substitute** the expression found in Step 1 into the other equation to obtain an equation in one variable.
3. **Solve** the equation obtained in Step 2.
4. **Back-substitute** the value obtained in Step 3 into the expression obtained in Step 1 to find the value of the other variable.
5. **Check** that the solution satisfies each of the original equations.
Example 1  Solving a System of Equations by Substitution

Solve the system of equations.
\[
\begin{align*}
x + y &= 4 & \text{Equation 1} \\
x - y &= 2 & \text{Equation 2}
\end{align*}
\]

Solution

Begin by solving for \( y \) in Equation 1.
\[
y = 4 - x \quad \text{Solve for } y \text{ in Equation 1.}
\]

Next, substitute this expression for \( y \) into Equation 2 and solve the resulting single-variable equation for \( x \).
\[
\begin{align*}
x - (4 - x) &= 2 & \text{Substitute } 4 - x \text{ for } y. \\
x - 4 + x &= 2 & \text{Distributive Property} \\
2x &= 6 & \text{Combine like terms.} \\
x &= 3 & \text{Divide each side by 2.}
\end{align*}
\]

Finally, you can solve for \( y \) by back-substituting \( x = 3 \) into the equation \( y = 4 - x \), to obtain
\[
\begin{align*}
y &= 4 - x & \text{Write revised Equation 1.} \\
y &= 4 - 3 & \text{Substitute 3 for } x. \\
y &= 1 & \text{Solve for } y.
\end{align*}
\]

The solution is the ordered pair \((3, 1)\). You can check this solution as follows.

Check

Substitute \((3, 1)\) into Equation 1:
\[
\begin{align*}
x + y &= 4 & \text{Write Equation 1.} \\
3 + 1 & \neq 4 & \text{Substitute for } x \text{ and } y. \\
4 &= 4 & \text{Solution checks in Equation 1.} \checkmark
\end{align*}
\]

Substitute \((3, 1)\) into Equation 2:
\[
\begin{align*}
x - y &= 2 & \text{Write Equation 2.} \\
3 - 1 & \neq 2 & \text{Substitute for } x \text{ and } y. \\
2 &= 2 & \text{Solution checks in Equation 2.} \checkmark
\end{align*}
\]

Because \((3, 1)\) satisfies both equations in the system, it is a solution of the system of equations.

CHECKPOINT  Now try Exercise 11.

The term back-substitution implies that you work backwards. First you solve for one of the variables, and then you substitute that value back into one of the equations in the system to find the value of the other variable.
Example 2  Solving a System by Substitution

A total of $12,000 is invested in two funds paying 5% and 3% simple interest. (Recall that the formula for simple interest is $I = Prt$, where $P$ is the principal, $r$ is the annual interest rate, and $t$ is the time.) The yearly interest is $500. How much is invested at each rate?

Solution

Verbal Model:

<table>
<thead>
<tr>
<th>Label</th>
<th>Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount in 5% fund</td>
<td>$x$</td>
</tr>
<tr>
<td>Interest for 5% fund</td>
<td>$0.05x$</td>
</tr>
<tr>
<td>Amount in 3% fund</td>
<td>$y$</td>
</tr>
<tr>
<td>Interest for 3% fund</td>
<td>$0.03y$</td>
</tr>
<tr>
<td>Total investment</td>
<td>$12,000$</td>
</tr>
<tr>
<td>Total interest</td>
<td>$500$</td>
</tr>
</tbody>
</table>

System:

\[
\begin{align*}
\frac{5x + 3y}{2} & = 12,000 \\
0.05x + 0.03y & = 500
\end{align*}
\]

To begin, it is convenient to multiply each side of Equation 2 by 100. This eliminates the need to work with decimals.

\[
100(0.05x + 0.03y) = 100(500)
\]

To solve this system, you can solve for $x$ in Equation 1.

\[
x = 12,000 - y
\]

Then, substitute this expression for $x$ into revised Equation 2 and solve the resulting equation for $y$.

\[
5x + 3y = 50,000
\]

Next, back-substitute the value $y = 5000$ to solve for $x$.

\[
x = 12,000 - 5000
\]

The solution is $(7000, 5000)$. So, $7000 is invested at 5% and $5000 is invested at 3%. Check this in the original system.

CHECKPOINT Now try Exercise 25.
Nonlinear Systems of Equations

The equations in Examples 1 and 2 are linear. The method of substitution can also be used to solve systems in which one or both of the equations are nonlinear.

Example 3 Substitution: Two-Solution Case

Solve the system of equations.

\[
\begin{align*}
3x^2 + 4x - y &= 7 \\
2x - y &= -1
\end{align*}
\]

Solution

Begin by solving for \( y \) in Equation 2 to obtain \( y = 2x + 1 \). Next, substitute this expression for \( y \) into Equation 1 and solve for \( x \).

\[
\begin{align*}
3x^2 + 4x - (2x + 1) &= 7 \\
3x^2 + 2x - 1 &= 7 \\
3x^2 + 2x - 8 &= 0 \\
(3x - 4)(x + 2) &= 0
\end{align*}
\]

Write in general form.

Factor.

\[
x = \frac{4}{3}, -2
\]

Solve for \( x \).

Back-substituting these values of \( x \) to solve for the corresponding values of \( y \) produces the solutions \( \left( \frac{4}{3}, -\frac{11}{3} \right) \) and \( (-2, -3) \). Check these in the original system.

CHECKPOINT Now try Exercise 31.

When using the method of substitution, you may encounter an equation that has no solution, as shown in Example 4.

Example 4 Substitution: No-Real-Solution Case

Solve the system of equations.

\[
\begin{align*}
x^2 + y &= 4 \\
x^2 + y &= 3
\end{align*}
\]

Solution

Begin by solving for \( y \) in Equation 1 to obtain \( y = x + 4 \). Next, substitute this expression for \( y \) into Equation 2 and solve for \( x \).

\[
\begin{align*}
x^2 + (x + 4) &= 3 \\
x^2 + x + 1 &= 0
\end{align*}
\]

Substitute \( x + 4 \) for \( y \) in Equation 2.

Simplify.

Use the Quadratic Formula.

\[
x = \frac{-1 \pm \sqrt{-3}}{2}
\]

Because the discriminant is negative, the equation \( x^2 + x + 1 = 0 \) has no (real) solution. So, the original system has no (real) solution.

CHECKPOINT Now try Exercise 33.
Graphical Approach to Finding Solutions

From Examples 2, 3, and 4, you can see that a system of two equations in two unknowns can have exactly one solution, more than one solution, or no solution. By using a graphical method, you can gain insight about the number of solutions and the location(s) of the solution(s) of a system of equations by graphing each of the equations in the same coordinate plane. The solutions of the system correspond to the point(s) of intersection of the graphs. For instance, the two equations in Figure 7.1 graph as two lines with a single point of intersection; the two equations in Figure 7.2 graph as a parabola and a line with two points of intersection; and the two equations in Figure 7.3 graph as a line and a parabola that have no points of intersection.

One intersection point Two intersection points No intersection points

FIGURE 7.1 FIGURE 7.2 FIGURE 7.3

Example 5 shows the value of a graphical approach to solving systems of equations in two variables. Notice what would happen if you tried only the substitution method in Example 5. You would obtain the equation $x + \ln x = 1$. It would be difficult to solve this equation for $x$ using standard algebraic techniques.
Applications

The total cost \( C \) of producing \( x \) units of a product typically has two components—the initial cost and the cost per unit. When enough units have been sold so that the total revenue \( R \) equals the total cost \( C \), the sales are said to have reached the break-even point. You will find that the break-even point corresponds to the point of intersection of the cost and revenue curves.

**Example 6  Break-Even Analysis**

A shoe company invests $300,000 in equipment to produce a new line of athletic footwear. Each pair of shoes costs $5 to produce and is sold for $60. How many pairs of shoes must be sold before the business breaks even?

**Algebraic Solution**

The total cost of producing \( x \) units is

\[
C = 5x + 300,000. \quad \text{Equation 1}
\]

The revenue obtained by selling \( x \) units is

\[
R = 60x. \quad \text{Equation 2}
\]

Because the break-even point occurs when \( R = C \), you have \( C = 60x \), and the system of equations to solve is

\[
\begin{align*}
C &= 5x + 300,000 \\
C &= 60x
\end{align*}
\]

Solve by substitution.

\[
\begin{align*}
60x &= 5x + 300,000 \\
55x &= 300,000 \\
x &= 5455
\end{align*}
\]

So, the company must sell about 5455 pairs of shoes to break even.

**Graphical Solution**

The total cost of producing \( x \) units is

\[
C = 5x + 300,000. \quad \text{Equation 1}
\]

The revenue obtained by selling \( x \) units is

\[
R = 60x. \quad \text{Equation 2}
\]

Because the break-even point occurs when \( R = C \), you have \( C = 60x \), and the system of equations to solve is

\[
\begin{align*}
C &= 5x + 300,000 \\
C &= 60x
\end{align*}
\]

Use a graphing utility to graph \( y_1 = 5x + 300,000 \) and \( y_2 = 60x \) in the same viewing window. Use the `intersect` feature or the `zoom` and `trace` features of the graphing utility to approximate the point of intersection of the graphs. The point of intersection (break-even point) occurs at \( x \approx 5455 \), as shown in Figure 7.5. So, the company must sell about 5455 pairs of shoes to break even.

Another way to view the solution in Example 6 is to consider the profit function

\[
P = R - C.
\]

The break-even point occurs when the profit is 0, which is the same as saying that \( R = C \).
Chapter 7 Systems of Equations and Inequalities

Example 7 Movie Ticket Sales

The weekly ticket sales for a new comedy movie decreased each week. At the same time, the weekly ticket sales for a new drama movie increased each week. Models that approximate the weekly ticket sales \( S \) (in millions of dollars) for each movie are

\[
\begin{align*}
S &= 60 - 8x & \text{Comedy} \\
S &= 10 + 4.5x & \text{Drama}
\end{align*}
\]

where \( x \) represents the number of weeks each movie was in theaters, with \( x = 0 \) corresponding to the ticket sales during the opening weekend. After how many weeks will the ticket sales for the two movies be equal?

Algebraic Solution

Because the second equation has already been solved for \( S \) in terms of \( x \), substitute this value into the first equation and solve for \( x \), as follows.

\[
\begin{align*}
10 + 4.5x &= 60 - 8x \\
4.5x + 8x &= 60 - 10 \\
12.5x &= 50 \\
\frac{12.5x}{12.5} &= \frac{50}{12.5} \\
x &= 4
\end{align*}
\]

So, the weekly ticket sales for the two movies will be equal after 4 weeks.

Numerical Solution

You can create a table of values for each model to determine when the ticket sales for the two movies will be equal.

<table>
<thead>
<tr>
<th>Number of weeks, ( x )</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales, ( S ) (comedy)</td>
<td>60</td>
<td>52</td>
<td>44</td>
<td>36</td>
<td>28</td>
<td>20</td>
<td>12</td>
</tr>
<tr>
<td>Sales, ( S ) (drama)</td>
<td>10</td>
<td>14.5</td>
<td>19</td>
<td>23.5</td>
<td>28</td>
<td>32.5</td>
<td>37</td>
</tr>
</tbody>
</table>

So, from the table above, you can see that the weekly ticket sales for the two movies will be equal after 4 weeks.

Classroom Discussion

Interpreting Points of Intersection You plan to rent a 14-foot truck for a two-day local move. At truck rental agency A, you can rent a truck for $29.95 per day plus $0.49 per mile. At agency B, you can rent a truck for $50 per day plus $0.25 per mile.

a. Write a total cost equation in terms of \( x \) and \( y \) for the total cost of renting the truck from each agency.

b. Use a graphing utility to graph the two equations in the same viewing window and find the point of intersection. Interpret the meaning of the point of intersection in the context of the problem.

c. Which agency should you choose if you plan to travel a total of 100 miles during the two-day move? Why?

d. How does the situation change if you plan to drive 200 miles during the two-day move?
In Exercises 11–20, solve the system by the method of substitution. Check your solution(s) graphically.

11. \[ \begin{aligned} 2x + y &= 6 \\ -x + y &= 0 \end{aligned} \]

12. \[ \begin{aligned} x - 4y &= -11 \\ x + 3y &= 3 \end{aligned} \]

13. \[ \begin{aligned} x - y &= -4 \\ x^2 - y &= -2 \end{aligned} \]

14. \[ \begin{aligned} 3x + y &= 2 \\ x^3 - 2 + y &= 0 \end{aligned} \]

15. \[ \begin{aligned} - \frac{1}{2} x + y &= - \frac{3}{2} \\ x^2 + y^2 &= 25 \end{aligned} \]

16. \[ \begin{aligned} x + y &= 0 \\ x^3 - 5x - y &= 0 \end{aligned} \]

17. \[ \begin{aligned} x^2 + y &= 0 \\ x^2 - 4x - y &= 0 \end{aligned} \]

18. \[ \begin{aligned} y &= -2x^2 + 2 \\ y &= 2(x^4 - 2x^2 + 1) \end{aligned} \]

19. \[ \begin{aligned} y &= x^3 - 3x^2 + 1 \\ y &= x^2 - 3x + 1 \end{aligned} \]

20. \[ \begin{aligned} y &= x^3 - 3x^2 + 4 \\ y &= -2x + 4 \end{aligned} \]
In Exercises 55–64, solve the system graphically or algebraically. Explain your choice of method.

51. \( \begin{align*}
\frac{\sqrt{x}}{3} & + \frac{2}{y} = 8 \\
x - 2y & = 0
\end{align*} \)

52. \( \begin{align*}
\frac{x}{3} & + \frac{2}{y} = 4 \\
x^2 - y & = 0
\end{align*} \)

53. \( \begin{align*}
\frac{x}{2} & + \frac{2}{y} = 169 \\
x^2 - 8y & = 104
\end{align*} \)

In Exercises 55–64, solve the system graphically or algebraically. Explain your choice of method.

55. \( \begin{align*}
y & = 2x \\
y & = x^2 + 1
\end{align*} \)

56. \( \begin{align*}
y & = x^2 + y^2 = 25 \\
2x & + y = 10
\end{align*} \)

57. \( \begin{align*}
x - 2y & = 0 \\
x^2 & - y = 0
\end{align*} \)

58. \( \begin{align*}
y & = (x + 1)^3 \\
y & = \sqrt{x - 1}
\end{align*} \)

59. \( \begin{align*}
y - \frac{1}{x} & = 1 \\
y - \ln x & = 3
\end{align*} \)

In Exercises 49–54, use a graphing utility to solve the system of equations. Find the solution(s) accurate to two decimal places.

61. \( \begin{align*}
y & = x^4 - 2x^2 + 1 \\
y & = 1 - x^2
\end{align*} \)

62. \( \begin{align*}
y & = x^3 - 2x^2 + x - 1 \\
y & = -x^2 + 3x - 1
\end{align*} \)

63. \( \begin{align*}
xy & = 1 \\
x - 2y & = 1
\end{align*} \)

64. \( \begin{align*}
2x & - 4y = 7 \\
y & = \sqrt{x - 1}
\end{align*} \)

65. \( C = 8650x + 250,000, \quad R = 9950x \)

66. \( C = 5.5 \sqrt{x} + 10,000, \quad R = 3.29x \)

67. **BREAK-EVEN ANALYSIS** A small software company invests $25,000 to produce a software package that will sell for $69.95. Each unit can be produced for $45.25.

(a) How many units must be sold to break even?
(b) How many units must be sold to make a profit of $100,000?

68. **BREAK-EVEN ANALYSIS** A small fast-food restaurant invests $10,000 to produce a new food item that will sell for $3.99. Each item can be produced for $1.90.

(a) How many items must be sold to break even?
(b) How many items must be sold to make a profit of $12,000?

69. **DVD RENTALS** The weekly rentals for a newly released DVD of an animated film at a local video store decreased each week. At the same time, the weekly rentals for a newly released DVD of a horror film increased each week. Models that approximate the weekly rentals \( R \) for each DVD are

\[
\begin{align*}
R &= 360 - 24x \\
R &= 24 + 18x
\end{align*}
\]

where \( x \) represents the number of weeks each DVD was in the store, with \( x = 1 \) corresponding to the first week.

(a) After how many weeks will the rentals for the two movies be equal?
(b) Use a table to solve the system of equations numerically. Compare your result with that of part (a).

70. **SALES** The total weekly sales for a newly released portable media player (PMP) increased each week. At the same time, the total weekly sales for another newly released PMP decreased each week. Models that approximate the total weekly sales \( S \) (in thousands of units) for each PMP are

\[
\begin{align*}
S &= 15x + 50 \\
S &= -20x + 190
\end{align*}
\]

where \( x \) represents the number of weeks each PMP was in stores, with \( x = 0 \) corresponding to the PMP sales on the day each PMP was first released in stores.
(a) After how many weeks will the sales for the two PMPs be equal?
(b) Use a table to solve the system of equations numerically. Compare your result with that of part (a).

71. **CHOICE OF TWO JOBS** You are offered two jobs selling dental supplies. One company offers a straight commission of 6% of sales. The other company offers a salary of $500 per week plus 3% of sales. How much would you have to sell in a week in order to make the straight commission offer better?

72. **SUPPLY AND DEMAND** The supply and demand curves for a business dealing with wheat are

Supply: \( p = 1.45 + 0.00014x^2 \)

Demand: \( p = (2.388 - 0.007)x^2 \)

where \( p \) is the price in dollars per bushel and \( x \) is the quantity in bushels per day. Use a graphing utility to graph the supply and demand equations and find the market equilibrium. (The market equilibrium is the point of intersection of the graphs for \( x > 0 \).)

73. **INVESTMENT PORTFOLIO** A total of $25,000 is invested in two funds paying 6% and 8.5% simple interest. (The 6% investment has a lower risk.) The investor wants a yearly interest income of $2000 from the two investments.

(a) Write a system of equations in which one equation represents the total amount invested and the other equation represents the $2000 required in interest. Let \( x \) and \( y \) represent the amounts invested at 6% and 8.5%, respectively.

(b) Use a graphing utility to graph the two equations in the same viewing window. As the amount invested at 6% increases, how does the amount invested at 8.5% change? How does the amount of interest income change? Explain.

(c) What amount should be invested at 6% to meet the requirement of $2000 per year in interest?

74. **LOG VOLUME** You are offered two different rules for estimating the number of board feet in a 16-foot log. (A board foot is a unit of measure for lumber equal to a board 1 foot square and 1 inch thick.) The first rule is the **Doyle Log Rule** and is modeled by \( V_1 = (D - 4)^2 \), \( 5 \leq D \leq 40 \), and the other is the **Scribner Log Rule** and is modeled by \( V_2 = 0.79D^2 - 2D - 4 \), \( 5 \leq D \leq 40 \), where \( D \) is the diameter (in inches) of the log and \( V \) is its volume (in board feet).

(a) Use a graphing utility to graph the two log rules in the same viewing window.

(b) For what diameter do the two scales agree?

(c) You are selling large logs by the board foot. Which scale would you use? Explain your reasoning.

75. **DATA ANALYSIS: RENEWABLE ENERGY** The table shows the consumption \( C \) (in trillions of Btus) of solar energy and wind energy in the United States from 1998 through 2006. (Source: Energy Information Administration)

<table>
<thead>
<tr>
<th>Year</th>
<th>Solar, ( C )</th>
<th>Wind, ( C )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1998</td>
<td>70</td>
<td>31</td>
</tr>
<tr>
<td>1999</td>
<td>69</td>
<td>46</td>
</tr>
<tr>
<td>2000</td>
<td>66</td>
<td>57</td>
</tr>
<tr>
<td>2001</td>
<td>65</td>
<td>70</td>
</tr>
<tr>
<td>2002</td>
<td>64</td>
<td>105</td>
</tr>
<tr>
<td>2003</td>
<td>64</td>
<td>115</td>
</tr>
<tr>
<td>2004</td>
<td>65</td>
<td>142</td>
</tr>
<tr>
<td>2005</td>
<td>66</td>
<td>178</td>
</tr>
<tr>
<td>2006</td>
<td>72</td>
<td>264</td>
</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a cubic model for the solar energy consumption data and a quadratic model for the wind energy consumption data. Let \( t \) represent the year, with \( t = 8 \) corresponding to 1998.

(b) Use a graphing utility to graph the data and the two models in the same viewing window.

(c) Use the graph from part (b) to approximate the point of intersection of the graphs of the models. Interpret your answer in the context of the problem.

(d) Describe the behavior of each model. Do you think the models can be used to predict consumption of solar energy and wind energy in the United States for future years? Explain.

(e) Use your school’s library, the Internet, or some other reference source to research the advantages and disadvantages of using renewable energy.

76. **DATA ANALYSIS: POPULATION** The table shows the populations \( P \) (in millions) of Georgia, New Jersey, and North Carolina from 2002 through 2007. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>
<th>Georgia, ( G )</th>
<th>New Jersey, ( J )</th>
<th>North Carolina, ( N )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>
<td>8.59</td>
<td>8.56</td>
<td>8.32</td>
</tr>
<tr>
<td>2003</td>
<td>8.74</td>
<td>8.61</td>
<td>8.42</td>
</tr>
<tr>
<td>2004</td>
<td>8.92</td>
<td>8.64</td>
<td>8.54</td>
</tr>
<tr>
<td>2005</td>
<td>9.11</td>

<td>8.87</td>
</tr>
<tr>
<td>2007</td>
<td>9.55</td>
<td>8.69</td>
<td>9.06</td>
</tr>
</tbody>
</table>
(a) Use the regression feature of a graphing utility to find linear models for each set of data. Let \( t \) represent the year, with \( t = 2 \) corresponding to 2002.

(b) Use a graphing utility to graph the data and the models in the same viewing window.

(c) Use the graph from part (b) to approximate any points of intersection of the graphs of the models. Interpret the points of intersection in the context of the problem.

(d) Verify your answers from part (c) algebraically.

77. **DATA ANALYSIS: TUITION** The table shows the average costs (in dollars) of one year’s tuition for public and private universities in the United States from 2000 through 2006. (Source: U.S. National Center for Education Statistics)

<table>
<thead>
<tr>
<th>Year</th>

(a) Use the regression feature of a graphing utility to find a quadratic model for tuition at public universities and a linear model for tuition at private universities. Let \( t \) represent the year, with \( t = 0 \) corresponding to 2000.

(b) Use a graphing utility to graph the data and the two models in the same viewing window.

(c) Use the graph from part (b) to determine the year after 2006 in which tuition at public universities will exceed tuition at private universities.

(d) Verify your answer from part (c) algebraically.

**GEOMETRY** In Exercises 78–82, find the dimensions of the rectangle meeting the specified conditions.

78. The perimeter is 56 meters and the length is 4 meters greater than the width.

79. The perimeter is 280 centimeters and the width is 20 centimeters less than the length.

80. The perimeter is 42 inches and the width is three-fourths the length.

81. The perimeter is 484 feet and the length is \( 4 \frac{1}{2} \) times the width.

82. The perimeter is 30.6 millimeters and the length is 2.4 times the width.

83. **GEOMETRY** What are the dimensions of a rectangular tract of land if its perimeter is 44 kilometers and its area is 120 square kilometers?

84. **GEOMETRY** What are the dimensions of an isosceles right triangle with a two-inch hypotenuse and an area of 1 square inch?

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 85 and 86, determine whether the statement is true or false. Justify your answer.

85. In order to solve a system of equations by substitution, you must always solve for \( y \) in one of the two equations and then back-substitute.

86. If a system consists of a parabola and a circle, then the system can have at most two solutions.

87. **GRAPHICAL REASONING** Use a graphing utility to graph \( y_1 = 4 - x \) and \( y_2 = x - 2 \) in the same viewing window. Use the zoom and trace features to find the coordinates of the point of intersection. What is the relationship between the point of intersection and the solution found in Example 1?

88. **GRAPHICAL REASONING** Use a graphing utility to graph the two equations in Example 3, \( y_1 = 3x^2 + 4x - 7 \) and \( y_2 = 2x + 1 \), in the same viewing window. How many solutions do you think this system has? Repeat this experiment for the equations in Example 4. How many solutions does this system have? Explain your reasoning.

89. **THINK ABOUT IT** When solving a system of equations by substitution, how do you recognize that the system has no solution?

90. **CAPSTONE** Consider the system of equations

\[
\begin{align*}
ax + by &= c \\
dx + ey &= f
\end{align*}
\]

(a) Find values for \( a, b, c, d, e, \) and \( f \) so that the system has one distinct solution. (There is more than one correct answer.)

(b) Explain how to solve the system in part (a) by the method of substitution and graphically.

(c) Write a brief paragraph describing any advantages of the method of substitution over the graphical method of solving a system of equations.

91. Find equations of lines whose graphs intersect the graph of the parabola \( y = x^2 \) at (a) two points, (b) one point, and (c) no points. (There is more than one correct answer.) Use graphs to support your answers.
The Method of Elimination

In Section 7.1, you studied two methods for solving a system of equations: substitution and graphing. Now you will study the method of elimination. The key step in this method is to obtain, for one of the variables, coefficients that differ only in sign so that adding the equations eliminates the variable.

\[
\begin{align*}
3x + 5y &= 7 \\
-3x - 2y &= -1
\end{align*}
\]

Add equations.

Note that by adding the two equations, you eliminate the \(x\)-terms and obtain a single equation in \(y\). Solving this equation for \(y\) produces \(y = 2\), which you can then back-substitute into one of the original equations to solve for \(x\).

Example 1  Solving a System of Equations by Elimination

Solve the system of linear equations.

\[
\begin{align*}
3x + 2y &= 4 \\
5x - 2y &= 12
\end{align*}
\]

Solution

Because the coefficients of \(y\) differ only in sign, you can eliminate the \(y\)-terms by adding the two equations.

\[
\begin{align*}
3x + 2y &= 4 \\
5x - 2y &= 12
\end{align*}
\]

Add equations.

By back-substituting \(x = 2\) into Equation 1, you can solve for \(y\).

\[
\begin{align*}
3(2) + 2y &= 4 \\
6 + 2y &= 4
\end{align*}
\]

Substitute for \(x\).

Simplify.

Solve for \(y\).

The solution is \((2, -1)\). Check this in the original system, as follows.

Check

\[
\begin{align*}
3(2) + 2(-1) &= 4 \\
6 - 2 &= 4 \\
5(2) - 2(-1) &= 12 \\
10 + 2 &= 12
\end{align*}
\]

Substitute into Equation 1.

Equation 1 checks. ✓

Substitute into Equation 2.

Equation 2 checks. ✓

CHECK Point  Now try Exercise 13.
**Method of Elimination**

To use the method of elimination to solve a system of two linear equations in $x$ and $y$, perform the following steps.

1. **Obtain coefficients** for $x$ (or $y$) that differ only in sign by multiplying all terms of one or both equations by suitably chosen constants.
2. **Add** the equations to eliminate one variable.
3. **Solve** the equation obtained in Step 2.
4. **Back-substitute** the value obtained in Step 3 into either of the original equations and solve for the other variable.
5. **Check** that the solution satisfies each of the original equations.

**Example 2 Solving a System of Equations by Elimination**

Solve the system of linear equations.

\[
\begin{align*}
2x - 4y &= -7 \\
5x + y &= -1
\end{align*}
\]

**Solution**

For this system, you can obtain coefficients that differ only in sign by multiplying Equation 2 by 4.

\[
\begin{align*}
2x - 4y &= -7 & \text{Write Equation 1.} \\
20x + 4y &= -4 & \text{Multiply Equation 2 by 4.} \\
22x &= -11 & \text{Add equations.} \\
x &= -\frac{1}{2} & \text{Solve for } x.
\end{align*}
\]

By back-substituting $x = -\frac{1}{2}$ into Equation 1, you can solve for $y$.

\[
\begin{align*}
2x - 4y &= -7 & \text{Write Equation 1.} \\
2\left(-\frac{1}{2}\right) - 4y &= -7 & \text{Substitute } -\frac{1}{2} \text{ for } x. \\
-4y &= -6 & \text{Combine like terms.} \\
y &= \frac{3}{2} & \text{Solve for } y.
\end{align*}
\]

The solution is $\left(-\frac{1}{2}, \frac{3}{2}\right)$. Check this in the original system, as follows.

**Check**

\[
\begin{align*}
2x - 4y &= -7 & \text{Write original Equation 1.} \\
2\left(-\frac{1}{2}\right) - 4\left(\frac{3}{2}\right) &= -7 & \text{Substitute into Equation 1.} \\
-1 - 6 &= -7 & \text{Equation 1 checks.} \\
5x + y &= -1 & \text{Write original Equation 2.} \\
5\left(-\frac{1}{2}\right) + \frac{3}{2} &= -1 & \text{Substitute into Equation 2.} \\
-\frac{5}{2} + \frac{3}{2} &= -1 & \text{Equation 2 checks.}
\end{align*}
\]

**CHECKPOINT** Now try Exercise 15.
In Example 2, the two systems of linear equations (the original system and the system obtained by multiplying by constants)
\[
\begin{align*}
2x - 4y &= -7 \\
5x + y &= -1
\end{align*}
\quad \text{and} \quad
\begin{align*}
20x + 4y &= -4
\end{align*}
\]
are called equivalent systems because they have precisely the same solution set. The operations that can be performed on a system of linear equations to produce an equivalent system are (1) interchanging any two equations, (2) multiplying an equation by a nonzero constant, and (3) adding a multiple of one equation to any other equation in the system.

**Example 3**  \hspace{1cm} **Solving the System of Equations by Elimination**

Solve the system of linear equations.
\[
\begin{align*}
5x + 3y &= 9 \\
2x - 4y &= 14
\end{align*}
\]

**Algebraic Solution**

You can obtain coefficients that differ only in sign by multiplying Equation 1 by 4 and multiplying Equation 2 by 3.
\[
\begin{align*}
5x + 3y &= 9 \\
2x - 4y &= 14
\end{align*} \quad \rightarrow \quad
\begin{align*}
20x + 12y &= 36 \\
6x - 12y &= 42
\end{align*}
\]

\[
26x = 78
\]

\[
x = 3 \quad \text{Solve for } x.
\]

By back-substituting \( x = 3 \) into Equation 2, you can solve for \( y \).
\[
2x - 4y = 14 \quad \rightarrow \quad
2(3) - 4y = 14 \quad \rightarrow \quad
-4y = 8 \quad \rightarrow \quad
y = -2
\]

The solution is \((3, -2)\). Check this in the original system.

**Graphical Solution**

Solve each equation for \( y \). Then use a graphing utility to graph \( y_1 = \frac{-5}{3}x + 3 \) and \( y_2 = \frac{1}{2}x - \frac{7}{2} \) in the same viewing window. Use the \textit{intersect} feature or the \textit{zoom} and \textit{trace} features to approximate the point of intersection of the graphs. From the graph in Figure 7.6, you can see that the point of intersection is \((3, -2)\). You can determine that this is the exact solution by checking \((3, -2)\) in both equations.

You can check the solution from Example 3 as follows.
\[
\begin{align*}
5(3) + 3(-2) &= 9 & \text{Substitute 3 for } x \text{ and } -2 \text{ for } y \text{ in Equation 1.} \\
15 - 6 &= 9 & \text{Equation 1 checks.} \quad \checkmark \\
2(3) - 4(-2) &= 14 & \text{Substitute 3 for } x \text{ and } -2 \text{ for } y \text{ in Equation 2.} \\
6 + 8 &= 14 & \text{Equation 2 checks.} \quad \checkmark
\end{align*}
\]

Keep in mind that the terminology and methods discussed in this section apply only to systems of \textit{linear} equations.
Graphical Interpretation of Solutions

It is possible for a general system of equations to have exactly one solution, two or more solutions, or no solution. If a system of linear equations has two different solutions, it must have an infinite number of solutions.

A system of linear equations is consistent if it has at least one solution. A consistent system with exactly one solution is independent, whereas a consistent system with infinitely many solutions is dependent. A system is inconsistent if it has no solution.

Example 4 Recognizing Graphs of Linear Systems

Match each system of linear equations with its graph in Figure 7.7. Describe the number of solutions and state whether the system is consistent or inconsistent.

**Graphical Interpretations of Solutions**

For a system of two linear equations in two variables, the number of solutions is one of the following.

<table>
<thead>
<tr>
<th>Number of Solutions</th>
<th>Graphical Interpretation</th>
<th>Slopes of Lines</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <strong>Exactly one solution</strong></td>
<td>The two lines intersect at one point.</td>
<td>The slopes of the two lines are not equal.</td>
</tr>
<tr>
<td>2. <strong>Infinitely many solutions</strong></td>
<td>The two lines coincide (are identical).</td>
<td>The slopes of the two lines are equal.</td>
</tr>
<tr>
<td>3. <strong>No solution</strong></td>
<td>The two lines are parallel.</td>
<td>The slopes of the two lines are equal.</td>
</tr>
</tbody>
</table>

A system of linear equations is **consistent** if it has at least one solution. A consistent system with exactly one solution is **independent**, whereas a consistent system with infinitely many solutions is **dependent**. A system is **inconsistent** if it has no solution.

**Study Tip**

A comparison of the slopes of two lines gives useful information about the number of solutions of the corresponding system of equations. To solve a system of equations graphically, it helps to begin by writing the equations in slope-intercept form. Try doing this for the systems in Example 4.

**Solution**

a. The graph of system (a) is a pair of parallel lines (ii). The lines have no point of intersection, so the system has no solution. The system is inconsistent.

b. The graph of system (b) is a pair of intersecting lines (iii). The lines have one point of intersection, so the system has exactly one solution. The system is consistent.

c. The graph of system (c) is a pair of lines that coincide (i). The lines have infinitely many points of intersection, so the system has infinitely many solutions. The system is consistent.

Now try Exercises 31–34.
In Examples 5 and 6, note how you can use the method of elimination to determine that a system of linear equations has no solution or infinitely many solutions.

**Example 5  No-Solution Case: Method of Elimination**

Solve the system of linear equations.
\[
\begin{align*}
2x - 2y &= 3 \quad \text{Equation 1} \\
-2x + 4y &= 1 \quad \text{Equation 2}
\end{align*}
\]

**Solution**

To obtain coefficients that differ only in sign, you can multiply Equation 1 by 2.

\[
\begin{align*}
2x - 2y &= 3 \\
-2x + 4y &= 1 \\
\hline
0 &= 7
\end{align*}
\]

Because there are no values of \(x\) and \(y\) for which \(0 = 7\), you can conclude that the system is inconsistent and has no solution. The lines corresponding to the two equations in this system are shown in Figure 7.8. Note that the two lines are parallel and therefore have no point of intersection.

**CHECK Point** Now try Exercise 21.

In Example 5, note that the occurrence of a false statement, such as \(0 = 7\), indicates that the system has no solution. In the next example, note that the occurrence of a statement that is true for all values of the variables, such as \(0 = 0\), indicates that the system has infinitely many solutions.

**Example 6  Many-Solution Case: Method of Elimination**

Solve the system of linear equations.
\[
\begin{align*}
2x - y &= 1 \quad \text{Equation 1} \\
4x - 2y &= 2 \quad \text{Equation 2}
\end{align*}
\]

**Solution**

To obtain coefficients that differ only in sign, you can multiply Equation 1 by \(-2\).

\[
\begin{align*}
2x - y &= 1 \\
4x - 2y &= 2 \\
\hline
0 &= 0
\end{align*}
\]

Because the two equations are equivalent (have the same solution set), you can conclude that the system has infinitely many solutions. The solution set consists of all points \((x, y)\) lying on the line \(2x - y = 1\), as shown in Figure 7.9. Letting \(x = a\), where \(a\) is any real number, you can see that the solutions of the system are \((a, 2a - 1)\).

**CHECK Point** Now try Exercise 23.
Example 7 illustrates a strategy for solving a system of linear equations that has decimal coefficients.

### A Linear System Having Decimal Coefficients

Solve the system of linear equations.

\[
\begin{align*}
0.02x - 0.05y &= -0.38 \\
0.03x + 0.04y &= 1.04
\end{align*}
\]

#### Solution

Because the coefficients in this system have two decimal places, you can begin by multiplying each equation by 100. This produces a system in which the coefficients are all integers.

\[
\begin{align*}
2x - 5y &= -38 \\
3x + 4y &= 104
\end{align*}
\]

Now, to obtain coefficients that differ only in sign, multiply Equation 1 by 3 and multiply Equation 2 by −2.

\[
\begin{align*}
2x - 5y &= -38 & \quad \Rightarrow & & 6x - 15y &= -114 \\
3x + 4y &= 104 & \quad \Rightarrow & & -6x - 8y &= -208 \quad \text{Multiply Equation 1 by 3.}
\end{align*}
\]

\[
\begin{align*}
-23y &= -322 & \quad \Rightarrow & & 23y &= 322 \\
\text{Add equations.}
\end{align*}
\]

So, you can conclude that

\[
y = \frac{-322}{-23} = 14.
\]

Back-substituting \(y = 14\) into revised Equation 2 produces the following.

\[
\begin{align*}
3x + 4y &= 104 & \quad \Rightarrow & & 3x &= 48 \\
3x &= 48 & \quad \Rightarrow & & x &= 16
\end{align*}
\]

Write revised Equation 2. Substitute 14 for \(y\). Combine like terms. Solve for \(x\).

The solution is \((16, 14)\). Check this in the original system, as follows.

#### Check

\[
\begin{align*}
0.02x - 0.05y &= -0.38 & \quad \Rightarrow & & 0.02(16) - 0.05(14) &= -0.38 \\
0.02(16) - 0.05(14) &= -0.38 & \quad \Rightarrow & & 0.32 - 0.70 &= -0.38 \quad \text{Equation 1 checks.} \quad \checkmark
\end{align*}
\]

\[
\begin{align*}
0.03x + 0.04y &= 1.04 & \quad \Rightarrow & & 0.03(16) + 0.04(14) &= 1.04 \\
0.03(16) + 0.04(14) &= 1.04 & \quad \Rightarrow & & 0.48 + 0.56 &= 1.04 \quad \text{Equation 2 checks.} \quad \checkmark
\end{align*}
\]

\[\text{CHECK POINT} \quad \text{Now try Exercise 25.}\]
Applications

At this point, you may be asking the question “How can I tell which application problems can be solved using a system of linear equations?” The answer comes from the following considerations.

1. Does the problem involve more than one unknown quantity?
2. Are there two (or more) equations or conditions to be satisfied?

If one or both of these situations occur, the appropriate mathematical model for the problem may be a system of linear equations.

Example 8 An Application of a Linear System

An airplane flying into a headwind travels the 2000-mile flying distance between Chicopee, Massachusetts and Salt Lake City, Utah in 4 hours and 24 minutes. On the return flight, the same distance is traveled in 4 hours. Find the airspeed of the plane and the speed of the wind, assuming that both remain constant.

Solution

The two unknown quantities are the speeds of the wind and the plane. If is the speed of the plane and is the speed of the wind, then

\[ r_1 - r_2 = \text{speed of the plane against the wind} \]
\[ r_1 + r_2 = \text{speed of the plane with the wind} \]

as shown in Figure 7.10. Using the formula distance = (rate)(time) for these two speeds, you obtain the following equations.

\[
2000 = (r_1 - r_2)\left(\frac{4 + \frac{24}{60}}{1}\right) \\
2000 = (r_1 + r_2)(4)
\]

These two equations simplify as follows.

\[
\begin{align*}
5000 &= 11r_1 - 11r_2 \\
500 &= r_1 + r_2
\end{align*}
\]

Equation 1

Equation 2

To solve this system by elimination, multiply Equation 2 by 11.

\[
\begin{align*}
5000 &= 11r_1 - 11r_2 \\
5500 &= 11r_1 + 11r_2
\end{align*}
\]

Write Equation 1.

Multiply Equation 2 by 11.

Add equations.

So,

\[ r_1 = \frac{10,500}{22} = \frac{5250}{11} \approx 477.27 \text{ miles per hour} \]

Speed of plane

and

\[ r_2 = 500 - \frac{5250}{11} = \frac{250}{11} \approx 22.73 \text{ miles per hour.} \]

Speed of wind

Check this solution in the original statement of the problem.

CHECK POINT Now try Exercise 43.
In a free market, the demands for many products are related to the prices of the products. As the prices decrease, the demands by consumers increase and the amounts that producers are able or willing to supply decrease.

### Example 9 Finding the Equilibrium Point

The demand and supply equations for a new type of personal digital assistant are

\[
\begin{align*}
  p &= 150 - 0.00001x & \text{Demand equation} \\
  p &= 60 + 0.00002x & \text{Supply equation}
\end{align*}
\]

where \( p \) is the price in dollars and \( x \) represents the number of units. Find the equilibrium point for this market. The equilibrium point is the price \( p \) and number of units \( x \) that satisfy both the demand and supply equations.

#### Solution

Because \( p \) is written in terms of \( x \), begin by substituting the value of \( p \) given in the supply equation into the demand equation.

\[
\begin{align*}
  p &= 150 - 0.00001x \\
  60 + 0.00002x &= 150 - 0.00001x \\
  0.00003x &= 90 \\
  x &= 3,000,000
\end{align*}
\]

So, the equilibrium point occurs when the demand and supply are each 3 million units. (See Figure 7.11.) The price that corresponds to this \( x \)-value is obtained by back-substituting \( x = 3,000,000 \) into either of the original equations. For instance, back-substituting into the demand equation produces

\[
\begin{align*}
  p &= 150 - 0.00001(3,000,000) \\
  &= 150 - 30 \\
  &= 120.
\end{align*}
\]

The solution is \((3,000,000, 120)\). You can check this as follows.

#### Check

Substitute \((3,000,000, 120)\) into the demand equation.

\[
\begin{align*}
  p &= 150 - 0.00001x & \text{Write demand equation.} \\
  120 &= 150 - 0.00001(3,000,000) & \text{Substitute 120 for } p \text{ and } 3,000,000 \text{ for } x. \\
  120 &= 120 & \text{Solution checks in demand equation. ✓}
\end{align*}
\]

Substitute \((3,000,000, 120)\) into the supply equation.

\[
\begin{align*}
  p &= 60 + 0.00002x & \text{Write supply equation.} \\
  120 &= 60 + 0.00002(3,000,000) & \text{Substitute 120 for } p \text{ and } 3,000,000 \text{ for } x. \\
  120 &= 120 & \text{Solution checks in supply equation. ✓}
\end{align*}
\]

### CheckPoint

Now try Exercise 45.
7.2 EXERCISES

VOCABULARY: Fill in the blanks.
1. The first step in solving a system of equations by the method of ________ is to obtain coefficients for x (or y) that differ only in sign.
2. Two systems of equations that have the same solution set are called ________ systems.
3. A system of linear equations that has at least one solution is called ________, whereas a system of linear equations that has no solution is called ________.
4. In business applications, the ________ is defined as the price \( p \) and the number of units \( x \) that satisfy both the demand and supply equations.

SKILLS AND APPLICATIONS

In Exercises 5–12, solve the system by the method of elimination. Label each line with its equation. To print an enlarged copy of the graph, go to the website www.mathgraphs.com.

5. \[ \begin{align*}
2x + y &= 5 \\
x - y &= 1
\end{align*} \]

6. \[ \begin{align*}
x + 3y &= 1 \\
-x + 2y &= 4
\end{align*} \]

7. \[ \begin{align*}
x + y &= 0 \\
3x + 2y &= 1
\end{align*} \]

8. \[ \begin{align*}
2x - y &= -3 \\
4x + 3y &= -21
\end{align*} \]

9. \[ \begin{align*}
x - y &= 2 \\
-2x + 2y &= 5
\end{align*} \]

10. \[ \begin{align*}
3x + 2y &= 3 \\
6x + 4y &= 14
\end{align*} \]

11. \[ \begin{align*}
3x - 2y &= 5 \\
-6x + 4y &= -10
\end{align*} \]

12. \[ \begin{align*}
9x - 3y &= -15 \\
-3x + y &= 5
\end{align*} \]

In Exercises 13–30, solve the system by the method of elimination and check any solutions algebraically.

13. \[ \begin{align*}
x + 2y &= 6 \\
x - 2y &= 2
\end{align*} \]

14. \[ \begin{align*}
3x - 5y &= 8 \\
2x + 5y &= 22
\end{align*} \]

15. \[ \begin{align*}
5x + 3y &= 6 \\
3x - y &= 5
\end{align*} \]

16. \[ \begin{align*}
x + 5y &= 10 \\
3x - 10y &= -5
\end{align*} \]

17. \[ \begin{align*}
3x + 2y &= 10 \\
2x + 5y &= 3
\end{align*} \]

18. \[ \begin{align*}
2r + 4s &= 5 \\
16r + 50s &= 55
\end{align*} \]

19. \[ \begin{align*}
5r + 6v &= 24 \\
3u + 5v &= 18
\end{align*} \]

20. \[ \begin{align*}
3x + 11y &= 4 \\
-2x - 5y &= 9
\end{align*} \]

21. \[ \begin{align*}
\frac{3}{2}x + \frac{3}{2}y &= 4 \\
9x + 6y &= 3
\end{align*} \]

22. \[ \begin{align*}
\frac{3}{2}x + y &= \frac{5}{2} \\
\frac{9}{2}x + 3y &= \frac{3}{2}
\end{align*} \]

23. \[ \begin{align*}
-5x + 6y &= -3 \\
20x - 24y &= 12
\end{align*} \]

24. \[ \begin{align*}
7x + 8y &= 6 \\
-14x - 16y &= -12
\end{align*} \]

25. \[ \begin{align*}
0.2x - 0.5y &= -27.8 \\
0.3x + 0.4y &= 68.7
\end{align*} \]

26. \[ \begin{align*}
0.05x - 0.03y &= 0.21 \\
0.07x + 0.02y &= 0.16
\end{align*} \]

27. \[ \begin{align*}
4b + 3m &= 3 \\
3b + 11m &= 13
\end{align*} \]

28. \[ \begin{align*}
2x + 5y &= 8 \\
5x + 8y &= 10
\end{align*} \]

29. \[ \begin{align*}
\frac{x + 3}{4} + \frac{y - 1}{3} &= 1 \\
2x - y &= 12
\end{align*} \]

30. \[ \begin{align*}
\frac{x - 1}{2} + \frac{y + 2}{3} &= 4 \\
x - 2y &= 5
\end{align*} \]
In Exercises 31–34, match the system of linear equations with its graph. Describe the number of solutions and state whether the system is consistent or inconsistent. [The graphs are labeled (a), (b), (c) and (d).]

(a) \[
\begin{align*}
2x - 5y &= 0 \\
x - y &= 3
\end{align*}
\]
(b) \[
\begin{align*}
2x - 5y &= 0 \\
2x - 3y &= -4
\end{align*}
\]
(c) \[
\begin{align*}
-7x + 6y &= -4 \\
14x - 12y &= 8
\end{align*}
\]
(d) \[
\begin{align*}
7x - 6y &= -6 \\
-7x + 6y &= -4
\end{align*}
\]

In Exercises 35–42, use any method to solve the system.

35. \[
\begin{align*}
3x - 5y &= 7 \\
2x + y &= 9
\end{align*}
\]
36. \[
\begin{align*}
-x + 3y &= 17 \\
4x + 3y &= 7
\end{align*}
\]
37. \[
\begin{align*}
y &= 2x - 5 \\
y &= 5x - 11
\end{align*}
\]
38. \[
\begin{align*}
7x + 3y &= 16 \\
y &= x + 2
\end{align*}
\]
39. \[
\begin{align*}
x - 5y &= 21 \\
6x + 5y &= 21
\end{align*}
\]
40. \[
\begin{align*}
y &= -2x - 17 \\
y &= 2 - 3x
\end{align*}
\]
41. \[
\begin{align*}
-5x + 9y &= 13 \\
y &= x - 4
\end{align*}
\]
42. \[
\begin{align*}
4x - 3y &= 6 \\
-5x + 7y &= -1
\end{align*}
\]

43. **AIRPLANE SPEED** An airplane flying into a headwind travels the 1800-mile flying distance between Pittsburgh, Pennsylvania and Phoenix, Arizona in 3 hours and 36 minutes. On the return flight, the distance is traveled in 3 hours. Find the airspeed of the plane and the speed of the wind, assuming that both remain constant.

44. **AIRPLANE SPEED** Two planes start from Los Angeles International Airport and fly in opposite directions. The second plane starts \( \frac{1}{2} \) hour after the first plane, but its speed is 80 kilometers per hour faster. Find the airspeed of each plane if 2 hours after the first plane departs the planes are 3200 kilometers apart.

**SUPPLY AND DEMAND** In Exercises 45–48, find the equilibrium point of the demand and supply equations. The equilibrium point is the price \( p \) and number of units \( x \) that satisfy both the demand and supply equations.

**Demand** \[
p = 500 - 0.4x
\]
**Supply** \[
p = 380 + 0.1x
\]
45. \[
p = 500 - 0.4x \\
p = 380 + 0.1x
\]
46. \[
p = 100 - 0.05x \\
p = 25 + 0.1x
\]
47. \[
p = 140 - 0.00002x \\
p = 80 + 0.00001x
\]
48. \[
p = 400 - 0.0002x \\
p = 225 + 0.00005x
\]

49. **NUTRITION** Two cheeseburgers and one small order of French fries from a fast-food restaurant contain a total of 830 calories. Three cheeseburgers and two small orders of French fries contain a total of 1360 calories. Find the caloric content of each item.

50. **NUTRITION** One eight-ounce glass of apple juice and one eight-ounce glass of orange juice contain a total of 177.4 milligrams of vitamin C. Two eight-ounce glasses of apple juice and three eight-ounce glasses of orange juice contain a total of 436.7 milligrams of vitamin C. How much vitamin C is in an eight-ounce glass of each type of juice?

51. **ACID MIXTURE** Thirty liters of a 40% acid solution is obtained by mixing a 25% solution with a 50% solution.

(a) Write a system of equations in which one equation represents the amount of final mixture required and the other represents the percent of acid in the final mixture. Let \( x \) and \( y \) represent the amounts of the 25% and 50% solutions, respectively.

(b) Use a graphing utility to graph the two equations in part (a) in the same viewing window. As the amount of the 25% solution increases, how does the amount of the 50% solution change?

(c) How much of each solution is required to obtain the specified concentration of the final mixture?

52. **FUEL MIXTURE** Five hundred gallons of 89-octane gasoline is obtained by mixing 87-octane gasoline with 92-octane gasoline.

(a) Write a system of equations in which one equation represents the amount of final mixture required and the other represents the amounts of 87- and 92-octane gasolines in the final mixture. Let \( x \) and \( y \) represent the numbers of gallons of 87-octane and 92-octane gasolines, respectively.

(b) Use a graphing utility to graph the two equations in part (a) in the same viewing window. As the amount of 87-octane gasoline increases, how does the amount of 92-octane gasoline change?

(c) How much of each type of gasoline is required to obtain the 500 gallons of 89-octane gasoline?
53. **INVESTMENT PORTFOLIO** A total of $24,000 is invested in two corporate bonds that pay 3.5% and 5% simple interest. The investor wants an annual interest income of $930 from the investments. What amount should be invested in the 3.5% bond? A total of $24,000 is invested in two municipal bonds that pay 5.75% and 6.25% simple interest. The investor wants an annual interest income of $1900 from the investments. What amount should be invested in the 5.75% bond? 

54. **INVESTMENT PORTFOLIO** A total of $32,000 is invested in two municipal bonds that pay 5.75% and 6.25% simple interest. The investor wants an annual interest income of $1900 from the investments. What amount should be invested in the 5.75% bond? 

55. **PRESCRIPTIONS** The numbers of prescriptions $P$ (in thousands) filled at two pharmacies from 2006 through 2010 are shown in the table.

<table>
<thead>
<tr>
<th>Year</th>
<th>Pharmacy A</th>
<th>Pharmacy B</th>
</tr>
</thead>
<tbody>
<tr>
<td>2006</td>
<td>19.2</td>
<td>20.4</td>
</tr>
<tr>
<td>2007</td>
<td>19.6</td>
<td>20.8</td>
</tr>
<tr>
<td>2008</td>
<td>20.0</td>
<td>21.1</td>
</tr>
<tr>
<td>2009</td>
<td>20.6</td>
<td>21.5</td>
</tr>
<tr>
<td>2010</td>
<td>21.3</td>
<td>22.0</td>
</tr>
</tbody>
</table>

(a) Use a graphing utility to create a scatter plot of the data for pharmacy A and use the regression feature to find a linear model. Let $t$ represent the year, with $t = 6$ corresponding to 2006. Repeat the procedure for pharmacy B.

(b) Assuming the numbers for the given five years are representative of future years, will the number of prescriptions filled at pharmacy A ever exceed the number of prescriptions filled at pharmacy B? If so, when?

56. **DATA ANALYSIS** A store manager wants to know the demand for a product as a function of the price. The daily sales for different prices of the product are shown in the table.

<table>
<thead>
<tr>
<th>Price, $x$</th>
<th>Demand, $y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$1.00$</td>
<td>45</td>
</tr>
<tr>
<td>$1.20$</td>
<td>37</td>
</tr>
<tr>
<td>$1.50$</td>
<td>23</td>
</tr>
</tbody>
</table>

(a) Find the least squares regression line $y = ax + b$ for the data by solving the system for $a$ and $b$.

\[3.00b + 3.70a = 105.00\]
\[3.70b + 4.69a = 123.90\]

(b) Use the regression feature of a graphing utility to confirm the result in part (a).

(c) Use the graphing utility to plot the data and graph the linear model from part (a) in the same viewing window.

(d) Use the linear model from part (a) to predict the demand when the price is $1.75$.

57. **FITTING A LINE TO DATA** In Exercises 57–60, find the least squares regression line $y = ax + b$ for the points $(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$ by solving the system for $a$ and $b$.

\[nb + \left(\sum_{i=1}^{n} x_i\right)a = \left(\sum_{i=1}^{n} y_i\right)\]
\[\left(\sum_{i=1}^{n} x_i\right)b + \left(\sum_{i=1}^{n} x_i^2\right)a = \left(\sum_{i=1}^{n} x_iy_i\right)\]

Then use a graphing utility to confirm the result. (If you are unfamiliar with summation notation, look at the discussion in Section 9.1 or in Appendix B at the website for this text at academic.cengage.com.)

58. (c) Use the graphing utility to plot the data and graph the linear model from part (a) in the same viewing window.

59. (0, 8), (1, 6), (2, 4), (3, 2)

60. (1, 0.0), (2, 1.1), (3, 2.3), (4, 3.8), (5, 4.0), (6, 5.5), (7, 6.7), (8, 6.9)

61. **DATA ANALYSIS** An agricultural scientist used four test plots to determine the relationship between wheat yield $y$ (in bushels per acre) and the amount of fertilizer $x$ (in hundreds of pounds per acre). The results are shown in the table.

<table>
<thead>
<tr>
<th>Fertilizer, $x$</th>
<th>Yield, $y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>32</td>
</tr>
<tr>
<td>1.5</td>
<td>41</td>
</tr>
<tr>
<td>2.0</td>
<td>48</td>
</tr>
<tr>
<td>2.5</td>
<td>53</td>
</tr>
</tbody>
</table>

(a) Use the technique demonstrated in Exercises 57–60 to set up a system of equations for the data and to find the least squares regression line $y = ax + b$.

(b) Use the linear model to predict the yield for a fertilizer application of 160 pounds per acre.
62. **DEFENSE DEPARTMENT OUTLAYS** The table shows the total national outlays \( y \) for defense functions (in billions of dollars) for the years 2000 through 2007. (Source: U.S. Office of Management and Budget)

<table>
<thead>
<tr>
<th>Year</th>
<th>Outlays, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>294.4</td>
</tr>
<tr>
<td>2001</td>
<td>304.8</td>
</tr>
<tr>
<td>2002</td>
<td>348.5</td>
</tr>
<tr>
<td>2003</td>
<td>404.8</td>
</tr>
<tr>
<td>2004</td>
<td>455.8</td>
</tr>
<tr>
<td>2005</td>
<td>495.3</td>
</tr>
<tr>
<td>2006</td>
<td>521.8</td>
</tr>
<tr>
<td>2007</td>
<td>552.6</td>
</tr>
</tbody>
</table>

(a) Use the technique demonstrated in Exercises 57–60 to set up a system of equations for the data and to find the least squares regression line \( y = at + b \). Let \( t \) represent the year, with \( t = 0 \) corresponding to 2000.

(b) Use the regression feature of a graphing utility to find a linear model for the data. How does this model compare with the model obtained in part (a)?

(c) Use the linear model to create a table of estimated values of \( y \). Compare the estimated values with the actual data.

(d) Use the linear model to estimate the total national outlay for 2008.

(e) Use the Internet, your school’s library, or some other reference source to find the total national outlay for 2008. How does this value compare with your answer in part (d)?

(f) Is the linear model valid for long-term predictions of total national outlays? Explain.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 63 and 64, determine whether the statement is true or false. Justify your answer.

63. If two lines do not have exactly one point of intersection, then they must be parallel.

64. Solving a system of equations graphically will always give an exact solution.

65. **WRITING** Briefly explain whether or not it is possible for a consistent system of linear equations to have exactly two solutions.

66. **THINK ABOUT IT** Give examples of a system of linear equations that has (a) no solution and (b) an infinite number of solutions.

67. **COMPARING METHODS** Use the method of substitution to solve the system in Example 1. Is the method of substitution or the method of elimination easier? Explain.

68. **CAPSTONE** Rewrite each system of equations in slope-intercept form and sketch the graph of each system. What is the relationship among the slopes of the two lines, the number of points of intersection, and the number of solutions?

(a) \[
\begin{align*}
5x - y &= -1 \\
-x + y &= -5
\end{align*}
\]

(b) \[
\begin{align*}
4x - 3y &= 1 \\
-8x + 6y &= -2
\end{align*}
\]

(c) \[
\begin{align*}
x + 2y &= 3 \\
x + 2y &= -8
\end{align*}
\]

**THINK ABOUT IT** In Exercises 69 and 70, the graphs of the two equations appear to be parallel. Yet, when the system is solved algebraically, you find that the system does have a solution. Find the solution and explain why it does not appear on the portion of the graph that is shown.

69. \[
\begin{align*}
100y - x &= 200 \\
99y - x &= -198
\end{align*}
\]

70. \[
\begin{align*}
21x - 20y &= 0 \\
13x - 12y &= 120
\end{align*}
\]

In Exercises 71 and 72, find the value of \( k \) such that the system of linear equations is inconsistent.

71. \[
\begin{align*}
4x - 8y &= -3 \\
2x + ky &= 16
\end{align*}
\]

72. \[
\begin{align*}
15x + 3y &= 6 \\
-10x + ky &= 9
\end{align*}
\]

**ADVANCED APPLICATIONS** In Exercises 73 and 74, solve the system of equations for \( u \) and \( v \). While solving for these variables, consider the transcendental functions as constants. (Systems of this type are found in a course in differential equations.)

73. \[
\begin{align*}
u \sin x + v \cos x &= 0 \\
u \cos x - v \sin x &= \sec x
\end{align*}
\]

74. \[
\begin{align*}
u \cos 2x + v \sin 2x &= 0 \\
u(-2 \sin 2x) + v(2 \cos 2x) &= \csc x
\end{align*}
\]

**PROJECT: COLLEGE EXPENSES** To work an extended application analyzing the average undergraduate tuition, room, and board charges at private degree-granting institutions in the United States from 1990 through 2007, visit this text’s website at academic.cengage.com. (Data Source: U.S. Dept. of Education)
Row-Echelon Form and Back-Substitution
The method of elimination can be applied to a system of linear equations in more than two variables. In fact, this method easily adapts to computer use for solving linear systems with dozens of variables.

When elimination is used to solve a system of linear equations, the goal is to rewrite the system in a form to which back-substitution can be applied. To see how this works, consider the following two systems of linear equations.

System of Three Linear Equations in Three Variables: (See Example 3.)

\[
\begin{align*}
x - 2y + 3z &= 9 \\
-x + 3y &= -4 \\
2x - 5y + 5z &= 17
\end{align*}
\]

Equivalent System in Row-Echelon Form: (See Example 1.)

\[
\begin{align*}
x - 2y + 3z &= 9 \\
y + 3z &= 5 \\
z &= 2
\end{align*}
\]

The second system is said to be in row-echelon form, which means that it has a “stair-step” pattern with leading coefficients of 1. After comparing the two systems, it should be clear that it is easier to solve the system in row-echelon form, using back-substitution.

Example 1 Using Back-Substitution in Row-Echelon Form
Solve the system of linear equations.

\[
\begin{align*}
x - 2y + 3z &= 9 & \text{Equation 1} \\
y + 3z &= 5 & \text{Equation 2} \\
z &= 2 & \text{Equation 3}
\end{align*}
\]

Solution
From Equation 3, you know the value of \(z\). To solve for \(y\), substitute \(z = 2\) into Equation 2 to obtain

\[
y + 3(2) = 5 \quad \text{Substitute 2 for } z.
\]

\[
y = -1. \quad \text{Solve for } y.
\]

Then substitute \(y = -1\) and \(z = 2\) into Equation 1 to obtain

\[
x - 2(-1) + 3(2) = 9 \quad \text{Substitute } -1 \text{ for } y \text{ and 2 for } z.
\]

\[
x = 1. \quad \text{Solve for } x.
\]

The solution is \(x = 1\), \(y = -1\), and \(z = 2\), which can be written as the ordered triple \((1, -1, 2)\). Check this in the original system of equations.

CHECK POINT Now try Exercise 11.
Gaussian Elimination

Two systems of equations are equivalent if they have the same solution set. To solve a system that is not in row-echelon form, first convert it to an equivalent system that is in row-echelon form by using the following operations.

**Operations That Produce Equivalent Systems**

Each of the following row operations on a system of linear equations produces an equivalent system of linear equations.

1. Interchange two equations.
2. Multiply one of the equations by a nonzero constant.
3. Add a multiple of one of the equations to another equation to replace the latter equation.

To see how this is done, take another look at the method of elimination, as applied to a system of two linear equations.

**Example 2**  Using Gaussian Elimination to Solve a System

Solve the system of linear equations.

\[
\begin{align*}
3x - 2y &= -1 & \text{Equation 1} \\
x - y &= 0 & \text{Equation 2}
\end{align*}
\]

**Solution**

There are two strategies that seem reasonable: eliminate the variable \(x\) or eliminate the variable \(y\). The following steps show how to use the first strategy.

\[
\begin{align*}
x - y &= 0 \\
3x - 2y &= -1 & \text{Interchange the two equations in the system.}
\end{align*}
\]

\[
\begin{align*}
-3x + 3y &= 0 \\
3x - 2y &= -1 & \text{Multiply the first equation by } -3.
\end{align*}
\]

\[
\begin{align*}
-3x + 3y &= 0 \\
3x - 2y &= -1 & \text{Add the multiple of the first equation to the second equation to obtain a new second equation.}
\end{align*}
\]

\[
\begin{align*}
y &= -1 \\
3x - 2y &= -1 & \text{New system in row-echelon form}
\end{align*}
\]

Notice in the first step that interchanging rows is an easy way of obtaining a leading coefficient of 1. Now back-substitute \(y = -1\) into Equation 2 and solve for \(x\).

\[
\begin{align*}
x - (-1) &= 0 & \text{Substitute } -1 \text{ for } y. \\
x &= -1 & \text{Solve for } x.
\end{align*}
\]

The solution is \(x = -1\) and \(y = -1\), which can be written as the ordered pair \((-1, -1)\).
Rewriting a system of linear equations in row-echelon form usually involves a chain of equivalent systems, each of which is obtained by using one of the three basic row operations listed on the previous page. This process is called **Gaussian elimination**, after the German mathematician Carl Friedrich Gauss (1777–1855).

### Example 3 Using Gaussian Elimination to Solve a System

Solve the system of linear equations.

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Equation 1} \\
  -x + 3y &= -4 & \text{Equation 2} \\
  2x - 5y + 5z &= 17 & \text{Equation 3}
\end{align*}
\]

**Solution**

Because the leading coefficient of the first equation is 1, you can begin by saving $x$ at the upper left and eliminating the other $x$-terms from the first column.

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Write Equation 1.} \\
  -x + 3y &= -4 & \text{Write Equation 2.} \\
  y + 3z &= 5 & \text{Add Equation 1 to Equation 2.}
\end{align*}
\]

Adding the first equation to the second equation produces a new second equation.

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Adding first equation to second equation produces new second equation.} \\
  y + 3z &= 5
\end{align*}
\]

Multiplying Equation 1 by $-2$.

\[
\begin{align*}
  2x - 5y + 5z &= 17 & \text{Write Equation 3.} \\
  -y - z &= -1 & \text{Add revised Equation 1 to Equation 3.}
\end{align*}
\]

Adding $-2$ times the first equation to the third equation produces a new third equation.

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Adding } -2 \text{ times the first equation to third equation produces new third equation.} \\
  y + 3z &= 5 \\
  -y - z &= -1
\end{align*}
\]

Now that all but the first $x$ have been eliminated from the first column, go to work on the second column. (You need to eliminate $y$ from the third equation.)

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Adding the second equation to the third equation produces a new third equation.} \\
  y + 3z &= 5 \\
  2z &= 4
\end{align*}
\]

Finally, you need a coefficient of 1 for $z$ in the third equation.

\[
\begin{align*}
  x - 2y + 3z &= 9 & \text{Multiplying third equation by } \frac{1}{2} \text{ produces a new third equation.} \\
  y + 3z &= 5 \\
  z &= 2
\end{align*}
\]

This is the same system that was solved in Example 1, and, as in that example, you can conclude that the solution is

\[
x = 1, \quad y = -1, \quad \text{and} \quad z = 2.
\]

**Check Point**

Now try Exercise 21.
The next example involves an inconsistent system—one that has no solution. The key to recognizing an inconsistent system is that at some stage in the elimination process you obtain a false statement such as $0 = -2$.

### Example 4  An Inconsistent System

Solve the system of linear equations.

\[
\begin{align*}
  x - 3y + z &= 1 \\
  2x - y - 2z &= 2 \\
  x + 2y - 3z &= -1
\end{align*}
\]

**Solution**

Adding $-2$ times the first equation to the second equation produces a new second equation.

\[
\begin{align*}
  x - 3y + z &= 1 \\
  5y - 4z &= 0 \\
  x + 2y - 3z &= -1
\end{align*}
\]

Adding $-1$ times the first equation to the third equation produces a new third equation.

\[
\begin{align*}
  x - 3y + z &= 1 \\
  5y - 4z &= 0 \\
  5y - 4z &= -2
\end{align*}
\]

Adding $-1$ times the second equation to the third equation produces a new third equation.

\[
\begin{align*}
  x - 3y + z &= 1 \\
  5y - 4z &= 0 \\
  0 &= -2
\end{align*}
\]

Because $0 = -2$ is a false statement, you can conclude that this system is inconsistent and has no solution. Moreover, because this system is equivalent to the original system, you can conclude that the original system also has no solution.

**CHECKPOINT** Now try Exercise 25.

As with a system of linear equations in two variables, the solution(s) of a system of linear equations in more than two variables must fall into one of three categories.

### The Number of Solutions of a Linear System

For a system of linear equations, exactly one of the following is true.

1. There is exactly one solution.
2. There are infinitely many solutions.
3. There is no solution.

In Section 7.2, you learned that a system of two linear equations in two variables can be represented graphically as a pair of lines that are intersecting, coincident, or parallel. A system of three linear equations in three variables has a similar graphical representation—it can be represented as three planes in space that intersect in one point (exactly one solution) [see Figure 7.12], intersect in a line or a plane (infinitely many solutions) [see Figures 7.13 and 7.14], or have no points common to all three planes (no solution) [see Figures 7.15 and 7.16].
**Example 5** A System with Infinitely Many Solutions

Solve the system of linear equations.

\[
\begin{align*}
\begin{cases}
x + y - 3z &= -1 \\ y - z &= 0 \\ -x + 2y &= 1
\end{cases}
& \quad \text{Equation 1} \\
\begin{cases}
x + y - 3z &= -1 \\ 3y - 3z &= 0 \\
x + y - 3z &= -1 \\ y - z &= 0 \quad \text{Equation 2} \\
0 &= 0
\end{cases}
& \quad \text{Equation 3}
\end{align*}
\]

**Solution**

\[
\begin{align*}
\begin{cases}
x + y - 3z &= -1 \\
y - z &= 0 \\
3y - 3z &= 0
\end{cases}
& \quad \text{Adding the first equation to the third equation produces a new third equation.} \\
\begin{cases}
x + y - 3z &= -1 \\
y - z &= 0 \\
0 &= 0
\end{cases}
& \quad \text{Adding } -3 \text{ times the second equation to the third equation produces a new third equation.}
\end{align*}
\]

This result means that Equation 3 depends on Equations 1 and 2 in the sense that it gives no additional information about the variables. Because 0 = 0 is a true statement, you can conclude that this system will have infinitely many solutions. However, it is incorrect to say simply that the solution is “infinite.” You must also specify the correct form of the solution. So, the original system is equivalent to the system

\[
\begin{align*}
\begin{cases}
x + y - 3z &= -1 \\
y - z &= 0
\end{cases}
& \quad \text{Equation 1} \\
0 &= 0
\end{align*}
\]

In the last equation, solve for \( y \) in terms of \( z \) to obtain \( y = z \). Back-substituting \( y = z \) in the first equation produces \( x = 2z - 1 \). Finally, letting \( z = a \), where \( a \) is a real number, the solutions to the given system are all of the form \( x = 2a - 1, y = a, \) and \( z = a \). So, every ordered triple of the form

\[
(2a - 1, a, a)
\]

is a solution of the system.

Now try Exercise 29.

In Example 5, there are other ways to write the same infinite set of solutions. For instance, letting \( x = b \), the solutions could have been written as

\[
(b, \frac{1}{2}(b + 1), \frac{1}{2}(b + 1)).
\]

\( b \) is a real number.

To convince yourself that this description produces the same set of solutions, consider the following.

<table>
<thead>
<tr>
<th>Substitution</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>( a = 0 )</td>
<td>((2(0) - 1, 0, 0) = (-1, 0, 0))</td>
</tr>
<tr>
<td>( b = -1 )</td>
<td>((-1, \frac{1}{2}(-1 + 1), \frac{1}{2}(-1 + 1)) = (-1, 0, 0))</td>
</tr>
<tr>
<td>( a = 1 )</td>
<td>((2(1) - 1, 1, 1) = (1, 1, 1))</td>
</tr>
<tr>
<td>( b = 1 )</td>
<td>((1, \frac{1}{2}(1 + 1), \frac{1}{2}(1 + 1)) = (1, 1, 1))</td>
</tr>
<tr>
<td>( a = 2 )</td>
<td>((2(2) - 1, 2, 2) = (3, 2, 2))</td>
</tr>
<tr>
<td>( b = 3 )</td>
<td>((3, \frac{1}{2}(3 + 1), \frac{1}{2}(3 + 1)) = (3, 2, 2))</td>
</tr>
</tbody>
</table>

**Study Tip**

When comparing descriptions of an infinite solution set, keep in mind that there is more than one way to describe the set.
Nonsquare Systems

So far, each system of linear equations you have looked at has been *square*, which means that the number of equations is equal to the number of variables. In a *nonsquare* system, the number of equations differs from the number of variables. A system of linear equations cannot have a unique solution unless there are at least as many equations as there are variables in the system.

Example 6  A System with Fewer Equations than Variables

Solve the system of linear equations.

\[
\begin{align*}
x - 2y + z &= 2 & \text{Equation 1} \\
2x - y - z &= 1 & \text{Equation 2}
\end{align*}
\]

Solution

Begin by rewriting the system in row-echelon form.

\[
\begin{align*}
x - 2y + z &= 2 \\
3y - 3z &= -3
\end{align*}
\]

Adding \(-2\) times the first equation to the second equation produces a new second equation.

\[
\begin{align*}
x - 2y + z &= 2 \\
y - z &= -1
\end{align*}
\]

Multiplying the second equation by \(\frac{1}{3}\) produces a new second equation.

Solve for \(y\) in terms of \(z\), to obtain

\(y = z - 1\).

By back-substituting \(y = z - 1\) into Equation 1, you can solve for \(x\), as follows.

\[
\begin{align*}
x - 2y + z &= 2 & \text{Write Equation 1.} \\
x - 2(z - 1) + z &= 2 & \text{Substitute } z - 1 \text{ for } y \text{ in Equation 1.} \\
x - 2z + 2 + z &= 2 & \text{Distributive Property} \\
x &= z & \text{Solve for } x.
\end{align*}
\]

Finally, by letting \(z = a\), where \(a\) is a real number, you have the solution

\(x = a, \ y = a - 1, \ \text{and} \ z = a.\)

So, every ordered triple of the form

\((a, a - 1, a)\)

is a solution of the system. Because there were originally three variables and only two equations, the system cannot have a unique solution.

CHECKPOINT  Now try Exercise 33.

In Example 6, try choosing some values of \(a\) to obtain different solutions of the system, such as \((1, 0, 1), (2, 1, 2),\) and \((3, 2, 3)\). Then check each of the solutions in the original system to verify that they are solutions of the original system.
Applications

Example 7  Vertical Motion

The height at time $t$ of an object that is moving in a (vertical) line with constant acceleration $a$ is given by the position equation

$$s = \frac{1}{2}at^2 + v_0t + s_0.$$

The height $s$ is measured in feet, the acceleration $a$ is measured in feet per second squared, $t$ is measured in seconds, $v_0$ is the initial velocity (at $t = 0$), and $s_0$ is the initial height. Find the values of $a$, $v_0$, and $s_0$ if $s = 52$ at $t = 1$, $s = 52$ at $t = 2$, and $s = 20$ at $t = 3$, and interpret the result. (See Figure 7.17.)

Solution

By substituting the three values of $t$ and $s$ into the position equation, you can obtain three linear equations in $a$, $v_0$, and $s_0$.

When $t = 1$: \[ \frac{1}{2}a(1)^2 + v_0(1) + s_0 = 52 \quad \Rightarrow \quad a + 2v_0 + 2s_0 = 104 \]

When $t = 2$: \[ \frac{1}{2}a(2)^2 + v_0(2) + s_0 = 52 \quad \Rightarrow \quad 2a + 2v_0 + s_0 = 52 \]

When $t = 3$: \[ \frac{1}{2}a(3)^2 + v_0(3) + s_0 = 20 \quad \Rightarrow \quad 9a + 6v_0 + 2s_0 = 40 \]

This produces the following system of linear equations.

\[
\begin{align*}
    a + 2v_0 + 2s_0 &= 104 \\
    2a + 2v_0 + s_0 &= 52 \\
    9a + 6v_0 + 2s_0 &= 40
\end{align*}
\]

Now solve the system using Gaussian elimination.

\[
\begin{align*}
    a + 2v_0 + 2s_0 &= 104 \\
    -2v_0 - 3s_0 &= -156 \\
    9a + 6v_0 + 2s_0 &= 40 \\
    a + 2v_0 + 2s_0 &= 104 \\
    -2v_0 - 3s_0 &= -156 \\
    -12v_0 - 16s_0 &= -896 \\
    a + 2v_0 + 2s_0 &= 104 \\
    -2v_0 - 3s_0 &= -156 \\
    2s_0 &= 40 \\
    a + 2v_0 + 2s_0 &= 104 \\
    v_0 + \frac{2}{3}s_0 &= 78 \\
    s_0 &= 20
\end{align*}
\]

Adding $-2$ times the first equation to the second equation produces a new second equation.

Adding $-9$ times the first equation to the third equation produces a new third equation.

Adding $-6$ times the second equation to the third equation produces a new third equation.

Multiplying the second equation by $\frac{1}{2}$ produces a new second equation and multiplying the third equation by $\frac{1}{3}$ produces a new third equation.

So, the solution of this system is $a = -32$, $v_0 = 48$, and $s_0 = 20$, which can be written as $(-32, 48, 20)$. This solution results in a position equation of $s = -16t^2 + 48t + 20$ and implies that the object was thrown upward at a velocity of 48 feet per second from a height of 20 feet.

CHECK POINT  Now try Exercise 45.
Example 8  Data Analysis: Curve-Fitting

Find a quadratic equation
\[ y = ax^2 + bx + c \]
whose graph passes through the points \((-1, 3), (1, 1),\) and \((2, 6)\).

Solution

Because the graph of \( y = ax^2 + bx + c \) passes through the points \((-1, 3), (1, 1),\) and \((2, 6)\), you can write the following.

When \( x = -1, \ y = 3 \): \[ a(-1)^2 + b(-1) + c = 3 \]
When \( x = 1, \ y = 1 \): \[ a(1)^2 + b(1) + c = 1 \]
When \( x = 2, \ y = 6 \): \[ a(2)^2 + b(2) + c = 6 \]

This produces the following system of linear equations.

\[
\begin{align*}
2a - b + c &= 3 \\
2a + b + c &= 1 \\
4a + 2b + c &= 6
\end{align*}
\]

The solution of this system is \( a = 2, \ b = -1, \) and \( c = 0. \) So, the equation of the parabola is \( y = 2x^2 - x, \) as shown in Figure 7.18.

Now try Exercise 49.

Example 9  Investment Analysis

An inheritance of $12,000 was invested among three funds: a money-market fund that paid 3% annually, municipal bonds that paid 4% annually, and mutual funds that paid 7% annually. The amount invested in mutual funds was $4000 more than the amount invested in municipal bonds. The total interest earned during the first year was $670. How much was invested in each type of fund?

Solution

Let \( x, \ y, \) and \( z \) represent the amounts invested in the money-market fund, municipal bonds, and mutual funds, respectively. From the given information, you can write the following equations.

\[
\begin{align*}
x + y + z &= 12,000 \quad \text{Equation 1} \\
z &= y + 4000 \quad \text{Equation 2} \\
0.03x + 0.04y + 0.07z &= 670 \quad \text{Equation 3}
\end{align*}
\]

Rewriting this system in standard form without decimals produces the following.

\[
\begin{align*}
x + y + z &= 12,000 \quad \text{Equation 1} \\
-y + z &= 4,000 \quad \text{Equation 2} \\
3x + 4y + 7z &= 67,000 \quad \text{Equation 3}
\end{align*}
\]

Using Gaussian elimination to solve this system yields \( x = 2000, \ y = 3000, \) and \( z = 7000. \) So, $2000 was invested in the money-market fund, $3000 was invested in municipal bonds, and $7000 was invested in mutual funds.

Now try Exercise 61.
7.3 EXERCISES

VOCABULARY: Fill in the blanks.

1. A system of equations that is in ________ form has a “stair-step” pattern with leading coefficients of 1.

2. A solution to a system of three linear equations in three unknowns can be written as an ________ ________ which has the form \((x, y, z)\).

3. The process used to write a system of linear equations in row-echelon form is called ________ elimination.

4. Interchanging two equations of a system of linear equations is a ________ ________ that produces an equivalent system.

5. A system of equations is called ________ if the number of equations differs from the number of variables in the system.

6. The equation \(s = \frac{1}{2}at^2 + v_0t + s_0\) is called the ________ equation, and it models the height \(s\) of an object at time \(t\) that is moving in a vertical line with a constant acceleration \(a\).

SKILLS AND APPLICATIONS

In Exercises 7–10, determine whether each ordered triple is a solution of the system of equations.

7. \[
\begin{align*}
6x - y + z &= -1 \\
4x - 3z &= -19 \\
2y + 5z &= 25
\end{align*}
\]  
(a) \((2, 0, -2)\)  
(b) \((-3, 0, 5)\)  
(c) \((0, -1, 4)\)  
(d) \((-1, 0, 5)\)

8. \[
\begin{align*}
3x + 4y - z &= 17 \\
5x - y + 2z &= -2 \\
2x - 3y + 7z &= -21
\end{align*}
\]  
(a) \((3, -1, 2)\)  
(b) \((1, 3, -2)\)  
(c) \((4, 1, -3)\)  
(d) \((1, -2, 2)\)

9. \[
\begin{align*}
4x + y - z &= 0 \\
-8x - 6y + z &= -\frac{3}{4} \\
3x - y &= -\frac{9}{4}
\end{align*}
\]  
(a) \(\left(\frac{1}{4}, -\frac{3}{4}, -\frac{7}{4}\right)\)  
(b) \(\left(-\frac{3}{2}, \frac{5}{2}, -\frac{5}{4}\right)\)  
(c) \(\left(-\frac{1}{2}, \frac{1}{2}, -\frac{3}{2}\right)\)  
(d) \(\left(-\frac{1}{2}, -\frac{3}{2}, -\frac{3}{2}\right)\)

10. \[
\begin{align*}
-4x - y - 8z &= -6 \\
y + z &= 0 \\
4x - 7y &= 6
\end{align*}
\]  
(a) \((-2, -2, 2)\)  
(b) \(\left(-\frac{33}{2}, -10, 10\right)\)  
(c) \(\left(\frac{1}{2}, -\frac{1}{2}, \frac{1}{2}\right)\)  
(d) \(\left(-\frac{1}{2}, -4, 4\right)\)

In Exercises 11–16, use back-substitution to solve the system of linear equations.

11. \[
\begin{align*}
2x - y + 5z &= 24 \\
y + 2z &= 6 \\
z &= 8
\end{align*}
\]

12. \[
\begin{align*}
4x - 3y - 2z &= 21 \\
6y - 5z &= -8 \\
z &= -2
\end{align*}
\]

13. \[
\begin{align*}
2x + y - 3z &= 10 \\
y + z &= 12 \\
z &= 2
\end{align*}
\]

14. \[
\begin{align*}
x - y + 2z &= 22 \\
3y - 8z &= -9 \\
z &= -3
\end{align*}
\]

15. \[
\begin{align*}
4x - 2y + z &= 8 \\
y + z &= 4 \\
z &= 11
\end{align*}
\]

16. \[
\begin{align*}
5x - 8y &= 22 \\
y + z &= 10 \\
z &= -4
\end{align*}
\]

In Exercises 17 and 18, perform the row operation and write the equivalent system.

17. Add Equation 1 to Equation 2.
\[
\begin{align*}
x - 2y + 3z &= 5 \\
-2x - 3y &= 4 \\
x + 3y &= 0
\end{align*}
\]
What did this operation accomplish?

18. Add \(-2\) times Equation 1 to Equation 3.
\[
\begin{align*}
x - 2y + 3z &= 5 \\
-2x + 3y &= 4 \\
x + 3y &= 0
\end{align*}
\]
What did this operation accomplish?

In Exercises 19–44, solve the system of linear equations and check any solution algebraically.

19. \[
\begin{align*}
x + y + z &= 7 \\
2x - y + z &= 9 \\
3x - z &= 10
\end{align*}
\]

20. \[
\begin{align*}
x + y + z &= 5 \\
x - 2y + 4z &= 13 \\
3y + 4z &= 13
\end{align*}
\]

21. \[
\begin{align*}
2x + 3y &= 4 \\
x - 2y - 3z &= 2 \\
3y - 4z &= 4
\end{align*}
\]

22. \[
\begin{align*}
2x + 4y + z &= 1 \\
x - 2y - 3z &= 2 \\
x + y - z &= -1
\end{align*}
\]

23. \[
\begin{align*}
6y + 4z &= -12 \\
3x + 3y &= 9 \\
2x - 3z &= 10
\end{align*}
\]

24. \[
\begin{align*}
2x + 4y - z &= 7 \\
2x - 4y + 2z &= -6 \\
x + 4y + z &= 0
\end{align*}
\]

25. \[
\begin{align*}
2x + y - z &= 7 \\
x - 2y + 2z &= -9 \\
3x - y + z &= 5
\end{align*}
\]

26. \[
\begin{align*}
5x - 3y + 2z &= 3 \\
x - 11y + 4z &= 7 \\
x + 4y - z &= 3
\end{align*}
\]
27. \[
\begin{align*}
3x - 5y + 5z &= 1 \\
5x - 2y + 3z &= 0 \\
7x - y + 3z &= 0 \\
\end{align*}
\]
28. \[
\begin{align*}
2x + y + 3z &= 1 \\
2x + 6y + 8z &= 3 \\
6x + 8y + 18z &= 5 \\
\end{align*}
\]
29. \[
\begin{align*}
x + 2y - 7z &= -4 \\
2x + y + z &= 13 \\
x + 9y - 36z &= -33 \\
\end{align*}
\]
30. \[
\begin{align*}
2x + y - 3z &= 4 \\
4x + 2z &= 10 \\
-2x + 3y - 13z &= -8 \\
\end{align*}
\]
31. \[
\begin{align*}
3x - 3y + 6z &= 6 \\
x + 2y - z &= 5 \\
x - 8y + 13z &= 7 \\
\end{align*}
\]
32. \[
\begin{align*}
x + 2z &= 5 \\
3x - y - z &= 1 \\
6x - y + 5z &= 16 \\
\end{align*}
\]
33. \[
\begin{align*}
x - 2y + 5z &= 2 \\
4x - z &= 0 \\
5x - 13y + 12z &= 80 \\
\end{align*}
\]
34. \[
\begin{align*}
x - 3y + 2z &= 18 \\
5x - 13y + 12z &= 80 \\
\end{align*}
\]
35. \[
\begin{align*}
2x - 3y + z &= -2 \\
-4x + 9y &= 7 \\
\end{align*}
\]
36. \[
\begin{align*}
2x + 3y + 3z &= 7 \\
4x + 18y + 15z &= 44 \\
\end{align*}
\]
37. \[
\begin{align*}
x + 3w &= 4 \\
2y - z - w &= 0 \\
3y - 2w &= 1 \\
2x - y + 4z &= 5 \\
\end{align*}
\]
38. \[
\begin{align*}
x + y + z + w &= 6 \\
2x + 3y - w &= 0 \\
-3x + 4y + z + 2w &= 4 \\
x + 2y - z + w &= 0 \\
\end{align*}
\]
39. \[
\begin{align*}
x + 4z &= 1 \\
x + y + 10z &= 10 \\
x - y + 2z &= -5 \\
\end{align*}
\]
40. \[
\begin{align*}
2x - 2y - 6z &= -4 \\
-3x + 2y + 6z &= 1 \\
x - y - 5z &= -3 \\
\end{align*}
\]
41. \[
\begin{align*}
2x + 3y &= 0 \\
4x + 3y - z &= 0 \\
8x + 3y + 3z &= 0 \\
\end{align*}
\]
42. \[
\begin{align*}
4x + 3y + 17z &= 0 \\
5x + 4y + 22z &= 0 \\
4x + 2y + 19z &= 0 \\
\end{align*}
\]
43. \[
\begin{align*}
12x + 5y + z &= 0 \\
23x + 4y - z &= 0 \\
\end{align*}
\]
44. \[
\begin{align*}
2x - y - z &= 0 \\
-2x + 6y + 4z &= 2 \\
\end{align*}
\]
45. At \( t = 1 \) second, \( s = 128 \) feet
At \( t = 2 \) seconds, \( s = 80 \) feet
At \( t = 3 \) seconds, \( s = 0 \) feet
46. At \( t = 1 \) second, \( s = 32 \) feet
At \( t = 2 \) seconds, \( s = 32 \) feet
At \( t = 3 \) seconds, \( s = 0 \) feet

**In Exercises 49–54, find the equation of the parabola**

\[ y = ax^2 + bx + c \]

that passes through the points. To verify your result, use a graphing utility to plot the points and graph the parabola.

49. \((0, 0), (2, -2), (4, 0)\)
50. \((0, 3), (1, 4), (2, 3)\)
51. \((2, 0), (3, -1), (4, 0)\)
52. \((1, 3), (2, 2), (3, -3)\)
53. \((\frac{1}{2}, 1), (1, 3), (2, 13)\)
54. \((-2, -3), (-1, 0), (\frac{1}{2}, -3)\)

**In Exercises 55–58, find the equation of the circle**

\[ x^2 + y^2 + Dx + Ey + F = 0 \]

that passes through the points. To verify your result, use a graphing utility to plot the points and graph the circle.

55. \((0, 0), (5, 5), (10, 0)\)
56. \((0, 0), (0, 6), (3, 3)\)
57. \((-3, -1), (2, 4), (-6, 8)\)
58. \((0, 0), (0, -2), (3, 0)\)

**SPORTS** In Super Bowl I, on January 15, 1967, the Green Bay Packers defeated the Kansas City Chiefs by a score of 35 to 10. The total points scored came from 13 different scoring plays, which were a combination of touchdowns, extra-point kicks, and field goals, worth 6, 1, and 3 points respectively. The same number of touchdowns and extra-point kicks were scored. There were six times as many touchdowns as field goals. How many touchdowns, extra-point kicks, and field goals were scored during the game? (Source: Super Bowl.com)

**SPORTS** In the 2008 Women’s NCAA Final Four Championship game, the University of Tennessee Lady Volunteers defeated the University of Stanford Cardinal by a score of 64 to 48. The Lady Volunteers won by scoring a combination of two-point baskets, three-point baskets, and one-point free throws. The number of two-point baskets was two more than the number of free throws. The number of free throws was two more than five times the number of three-point baskets. What combination of scoring accounted for the Lady Volunteers’ 64 points? (Source: National Collegiate Athletic Association)
61. **FINANCE** A small corporation borrowed $775,000 to expand its clothing line. Some of the money was borrowed at 8%, some at 9%, and some at 10%. How much was borrowed at each rate if the annual interest owed was $67,500 and the amount borrowed at 8% was four times the amount borrowed at 10%?

62. **FINANCE** A small corporation borrowed $800,000 to expand its line of toys. Some of the money was borrowed at 8%, some at 9%, and some at 10%. How much was borrowed at each rate if the annual interest owed was $67,000 and the amount borrowed at 8% was five times the amount borrowed at 10%?

**INVESTMENT PORTFOLIO** In Exercises 63 and 64, consider an investor with a portfolio totaling $500,000 that is invested in certificates of deposit, municipal bonds, blue-chip stocks, and growth or speculative stocks. How much is invested in each type of investment?

63. The certificates of deposit pay 3% annually, and the municipal bonds pay 5% annually. Over a five-year period, the investor expects the blue-chip stocks to return 8% annually and the growth stocks to return 10% annually. The investor wants a combined annual return of 5% and also wants to have only one-fourth of the portfolio invested in stocks.

64. The certificates of deposit pay 2% annually, and the municipal bonds pay 4% annually. Over a five-year period, the investor expects the blue-chip stocks to return 10% annually and the growth stocks to return 14% annually. The investor wants a combined annual return of 6% and also wants to have only one-fourth of the portfolio invested in stocks.

65. **AGRICULTURE** A mixture of 5 pounds of fertilizer A, 13 pounds of fertilizer B, and 4 pounds of fertilizer C provides the optimal nutrients for a plant. Commercial brand X contains equal parts of fertilizer B and fertilizer C. Commercial brand Y contains one part of fertilizer A and two parts of fertilizer B. Commercial brand Z contains two parts of fertilizer A, five parts of fertilizer B, and two parts of fertilizer C. How much of each fertilizer brand is needed to obtain the desired mixture?

66. **AGRICULTURE** A mixture of 12 liters of chemical A, 16 liters of chemical B, and 26 liters of chemical C is required to kill a destructive crop insect. Commercial spray X contains 1, 2, and 2 parts, respectively, of these chemicals. Commercial spray Y contains only chemical C. Commercial spray Z contains only chemicals A and B in equal amounts. How much of each type of commercial spray is needed to get the desired mixture?

67. **GEOMETRY** The perimeter of a triangle is 110 feet. The longest side of the triangle is 21 feet longer than the shortest side. The sum of the lengths of the two shorter sides is 14 feet more than the length of the longest side. Find the lengths of the sides of the triangle.

68. **GEOMETRY** The perimeter of a triangle is 180 feet. The longest side of the triangle is 9 feet shorter than twice the shortest side. The sum of the lengths of the two shorter sides is 30 feet more than the length of the longest side. Find the lengths of the sides of the triangle.

In Exercises 69 and 70, find the values of $x$, $y$, and $z$ in the figure.

69. 70.  

71. **ADVERTISING** A health insurance company advertises on television, on radio, and in the local newspaper. The marketing department has an advertising budget of $42,000 per month. A television ad costs $1000, a radio ad costs $200, and a newspaper ad costs $500. The department wants to run 60 ads per month, and have as many television ads as radio and newspaper ads combined. How many of each type of ad can the department run each month?

72. **RADIO** You work as a disc jockey at your college radio station. You are supposed to play 32 songs within two hours. You are to choose the songs from the latest rock, dance, and pop albums. You want to play twice as many rock songs as pop songs and four more pop songs than dance songs. How many of each type of song will you play?

73. **ACID MIXTURE** A chemist needs 10 liters of a 25% acid solution. The solution is to be mixed from three solutions whose concentrations are 10%, 20%, and 50%. How many liters of each solution will satisfy each condition?

(a) Use 2 liters of the 50% solution.

(b) Use as little as possible of the 50% solution.

(c) Use as much as possible of the 50% solution.

74. **ACID MIXTURE** A chemist needs 12 gallons of a 20% acid solution. The solution is to be mixed from three solutions whose concentrations are 10%, 15%, and 25%. How many gallons of each solution will satisfy each condition?

(a) Use 4 gallons of the 25% solution.

(b) Use as little as possible of the 25% solution.

(c) Use as much as possible of the 25% solution.
75. **ELECTRICAL NETWORK** Applying Kirchhoff’s Laws to the electrical network in the figure, the currents \( I_1, I_2, \) and \( I_3 \) are the solution of the system
\[
\begin{align*}
I_1 - I_2 + I_3 &= 0 \\
3I_1 + 2I_2 &= 7 \\
2I_2 + 4I_3 &= 8
\end{align*}
\]
find the currents.

76. **PULLEY SYSTEM** A system of pulleys is loaded with 128-pound and 32-pound weights (see figure). The tensions \( t_1 \) and \( t_2 \) in the ropes and the acceleration \( a \) of the 32-pound weight are found by solving the system of equations
\[
\begin{align*}
t_1 - 2t_2 &= 0 \\
t_1 - 2a &= 128 \\
t_2 + a &= 32
\end{align*}
\]
where \( t_1 \) and \( t_2 \) are measured in pounds and \( a \) is measured in feet per second squared.

**Fitting a Parabola** In Exercises 77–80, find the least squares regression parabola \( y = ax^2 + bx + c \) for the points \((x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)\) by solving the following system of linear equations for \( a, b, \) and \( c \). Then use the regression feature of a graphing utility to confirm the result. (If you are unfamiliar with summation notation, look at the discussion in Section 9.1 or in Appendix B at the website for this text at academic.cengage.com.)

\[
\begin{align*}
nc + \left( \sum_{i=1}^{n} x_i \right) b + \left( \sum_{i=1}^{n} x_i^2 \right) a &= \sum_{i=1}^{n} y_i \\
\left( \sum_{i=1}^{n} x_i \right) c + \left( \sum_{i=1}^{n} x_i^2 \right) b + \left( \sum_{i=1}^{n} x_i^3 \right) a &= \sum_{i=1}^{n} x_i y_i \\
\left( \sum_{i=1}^{n} x_i^2 \right) c + \left( \sum_{i=1}^{n} x_i^3 \right) b + \left( \sum_{i=1}^{n} x_i^4 \right) a &= \sum_{i=1}^{n} x_i^2 y_i
\end{align*}
\]

77. 78.

79. 80.

81. **DATA ANALYSIS: WILDLIFE** A wildlife management team studied the reproduction rates of deer in three tracts of a wildlife preserve. Each tract contained 5 acres. In each tract, the number of females \( x \), and the percent of females \( y \) that had offspring the following year, were recorded. The results are shown in the table.

<table>
<thead>
<tr>
<th>Number, ( x )</th>
<th>Percent, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>75</td>
</tr>
<tr>
<td>120</td>
<td>68</td>
</tr>
<tr>
<td>140</td>
<td>55</td>
</tr>
</tbody>
</table>

(a) Use the technique demonstrated in Exercises 77–80 to set up a system of equations for the data and to find a least squares regression parabola that models the data.

(b) Use a graphing utility to graph the parabola and the data in the same viewing window.
(c) Use the model to create a table of estimated values of $y$. Compare the estimated values with the actual data.

(d) Use the model to estimate the percent of females that had offspring when there were 170 females.

(e) Use the model to estimate the number of females when 40% of the females had offspring.

DATA ANALYSIS: STOPPING DISTANCE

In testing a new automobile braking system, the speed $x$ (in miles per hour) and the stopping distance $y$ (in feet) were recorded in the table.

<table>
<thead>
<tr>
<th>Speed, $x$</th>
<th>Stopping distance, $y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>55</td>
</tr>
<tr>
<td>40</td>
<td>105</td>
</tr>
<tr>
<td>50</td>
<td>188</td>
</tr>
</tbody>
</table>

(a) Use the technique demonstrated in Exercises 77–80 to set up a system of equations for the data and to find a least squares regression parabola that models the data.

(b) Graph the parabola and the data on the same set of axes.

(c) Use the model to estimate the stopping distance when the speed is 70 miles per hour.

SPORTS

In Super Bowl XLIII, on February 1, 2009, the Pittsburgh Steelers defeated the Arizona Cardinals by a score of 27 to 23. The total points scored came from 15 different scoring plays, which were a combination of touchdowns, extra-point kicks, field goals, and safeties, worth 6, 1, 3, and 2 points, respectively. There were three times as many touchdowns as field goals, and the number of extra-point kicks was equal to the number of touchdowns. How many touchdowns, extra-point kicks, field goals, and safeties were scored during the game? (Source: National Football League)

SPORTS

In the 2008 Armed Forces Bowl, the University of Houston defeated the Air Force Academy by a score of 34 to 28. The total points scored came from 18 different scoring plays, which were a combination of touchdowns, extra-point kicks, field goals, and two-point conversions, worth 6, 1, 3, and 2 points, respectively. The number of touchdowns was one more than the number of extra-point kicks, and there were four times as many field goals as two-point conversions. How many touchdowns, extra-point kicks, field goals, and two-point conversions were scored during the game? (Source: ESPN.com)

ADVANCED APPLICATIONS

In Exercises 85–88, find values of $x$, $y$, and $\lambda$ that satisfy the system. These systems arise in certain optimization problems in calculus, and $\lambda$ is called a Lagrange multiplier.

85. \[
\begin{align*}
 y + \lambda &= 0 \\
 x + \lambda &= 0 \\
 x + y - 10 &= 0 \\
 2x + \lambda &= 0 \\
 2y + \lambda &= 0 \\
 x + y - 4 &= 0
\end{align*}
\]

86. \[
\begin{align*}
 2x - 2x\lambda &= 0 \\
 -2y + \lambda &= 0 \\
 y - x^2 &= 0 \\
 2x + 1 + \lambda &= 0 \\
 2x + y - 100 &= 0
\end{align*}
\]

EXPLORATION

TRUE OR FALSE? In Exercises 89 and 90, determine whether the statement is true or false. Justify your answer.

89. The system
\[
\begin{align*}
 x + 3y - 6z &= -16 \\
 -2y - z &= -1 \\
 z &= 3
\end{align*}
\]
is in row-echelon form.

90. If a system of three linear equations is inconsistent, then its graph has no points common to all three equations.

91. THINK ABOUT IT Are the following two systems of equations equivalent? Give reasons for your answer.

\[
\begin{align*}
 x + 3y - z &= 6 \\
 2x - y + 2z &= 1 \\
 3x + 2y - z &= 2
\end{align*}
\]

\[
\begin{align*}
 x + 3y - z &= 6 \\
 -7y + 4z &= 1 \\
 -7y - 4z &= -16
\end{align*}
\]

CAPSTONE Find values of $a$, $b$, and $c$ (if possible) such that the system of linear equations has (a) a unique solution, (b) no solution, and (c) an infinite number of solutions.

\[
\begin{align*}
 x + y &= 2 \\
 y + z &= 2 \\
 ax + by + cz &= 0
\end{align*}
\]

In Exercises 93–96, find two systems of linear equations that have the ordered triple as a solution. (There are many correct answers.)

93. $(3, -4, 2)$
94. $(-5, -2, 1)$
95. $(-6, -\frac{1}{3}, -\frac{2}{3})$
96. $(-\frac{3}{4}, 4, -7)$

EARNINGS PER SHARE To work an extended application analyzing the earnings per share for Wal-Mart Stores, Inc. from 1992 through 2007, visit this text’s website at academic.cengage.com. (Data Source: Wal-Mart Stores, Inc.)
What you should learn

• Recognize partial fraction decompositions of rational expressions.
• Find partial fraction decompositions of rational expressions.

Why you should learn it

Partial fractions can help you analyze the behavior of a rational function. For instance, in Exercise 62 on page 537, you can analyze the exhaust temperatures of a diesel engine using partial fractions.

What you should learn

• Find partial fraction decompositions
• Recognize partial fraction decompositions of rational expressions

Introduction

In this section, you will learn to write a rational expression as the sum of two or more simpler rational expressions. For example, the rational expression

\[
\frac{x + 7}{x^2 - x - 6}
\]

can be written as the sum of two fractions with first-degree denominators. That is,

\[
\frac{x + 7}{x^2 - x - 6} = \frac{2}{x - 3} + \frac{-1}{x + 2}
\]

Each fraction on the right side of the equation is a partial fraction, and together they make up the partial fraction decomposition of the left side.

Decomposition of \(N(x)/D(x)\) into Partial Fractions

1. **Divide if improper:** If \(N(x)/D(x)\) is an improper fraction [degree of \(N(x)\) ≥ degree of \(D(x)\)], divide the denominator into the numerator to obtain

\[
\frac{N(x)}{D(x)} = (\text{polynomial}) + \frac{N_1(x)}{D(x)}
\]

and apply Steps 2, 3, and 4 below to the proper rational expression \(N_1(x)/D(x)\). Note that \(N_1(x)\) is the remainder from the division of \(N(x)\) by \(D(x)\).

2. **Factor the denominator:** Completely factor the denominator into factors of the form

\[(px + q)^m \quad \text{and} \quad (ax^2 + bx + c)^n\]

where \((ax^2 + bx + c)\) is irreducible.

3. **Linear factors:** For each factor of the form \((px + q)^m\), the partial fraction decomposition must include the following sum of \(m\) fractions.

\[
\frac{A_1}{(px + q)} + \frac{A_2}{(px + q)^2} + \ldots + \frac{A_m}{(px + q)^m}
\]

4. **Quadratic factors:** For each factor of the form \((ax^2 + bx + c)^n\), the partial fraction decomposition must include the following sum of \(n\) fractions.

\[
\frac{B_1x + C_1}{ax^2 + bx + c} + \frac{B_2x + C_2}{(ax^2 + bx + c)^2} + \ldots + \frac{B_nx + C_n}{(ax^2 + bx + c)^n}
\]
Partial Fraction Decomposition

Algebraic techniques for determining the constants in the numerators of partial fractions are demonstrated in the examples that follow. Note that the techniques vary slightly, depending on the type of factors of the denominator: linear or quadratic, distinct or repeated.

### Example 1  Distinct Linear Factors

Write the partial fraction decomposition of \( \frac{x + 7}{x^2 - x - 6} \).

**Solution**

The expression is proper, so be sure to factor the denominator. Because \( x^2 - x - 6 = (x - 3)(x + 2) \), you should include one partial fraction with a constant numerator for each linear factor of the denominator. Write the form of the decomposition as follows.

\[
\frac{x + 7}{x^2 - x - 6} = \frac{A}{x - 3} + \frac{B}{x + 2}
\]

Write form of decomposition.

Multiplying each side of this equation by the least common denominator, \((x - 3)(x + 2)\), leads to the **basic equation**

\[
x + 7 = A(x + 2) + B(x - 3)
\]

Basic equation

Because this equation is true for all \( x \), you can substitute any convenient values of \( x \) that will help determine the constants \( A \) and \( B \). Values of \( x \) that are especially convenient are ones that make the factors \((x + 2)\) and \((x - 3)\) equal to zero. For instance, let \( x = -2 \).

Then

\[
-2 + 7 = A(-2 + 2) + B(-2 - 3)
\]

Substitute \(-2\) for \( x \).

\[
5 = 0 + B(-5)
\]

\[
5 = -5B
\]

\[
-1 = B.
\]

To solve for \( A \), let \( x = 3 \) and obtain

\[
3 + 7 = A(3 + 2) + B(3 - 3)
\]

Substitute 3 for \( x \).

\[
10 = A(5) + B(0)
\]

\[
10 = 5A
\]

\[
2 = A.
\]

So, the partial fraction decomposition is

\[
\frac{x + 7}{x^2 - x - 6} = \frac{2}{x - 3} + \frac{-1}{x + 2}
\]

Check this result by combining the two partial fractions on the right side of the equation, or by using your graphing utility.

**CHECK POINT**  Now try Exercise 23.
The next example shows how to find the partial fraction decomposition of a rational expression whose denominator has a repeated linear factor.

### Example 2 Repeated Linear Factors

Write the partial fraction decomposition of \( \frac{x^4 + 2x^3 + 6x^2 + 20x + 6}{x^3 + 2x^2 + x} \).

#### Solution

This rational expression is improper, so you should begin by dividing the numerator by the denominator to obtain

\[
x + \frac{5x^2 + 20x + 6}{x^3 + 2x^2 + x}.
\]

Because the denominator of the remainder factors as \( x^3 + 2x^2 + x = x(x^2 + 2x + 1) = x(x + 1)^2 \), you should include one partial fraction with a constant numerator for each power of \( x \) and \( (x + 1) \) and write the form of the decomposition as follows.

\[
\frac{5x^2 + 20x + 6}{x(x + 1)^2} = \frac{A}{x} + \frac{B}{x + 1} + \frac{C}{(x + 1)^2}.
\]

Write form of decomposition.

Multiplying by the LCD, \( x(x + 1)^2 \), leads to the basic equation

\[
5x^2 + 20x + 6 = A(x + 1)^2 + Bx(x + 1) + Cx.
\]

Basic equation

Letting \( x = -1 \) eliminates the \( A \)- and \( B \)-terms and yields

\[
5(-1)^2 + 20(-1) + 6 = A(-1 + 1)^2 + B(-1)(-1 + 1) + C(-1)
\]

\[
5 - 20 + 6 = 0 + 0 - C
\]

\[
C = 9.
\]

Letting \( x = 0 \) eliminates the \( B \)- and \( C \)-terms and yields

\[
5(0)^2 + 20(0) + 6 = A(0 + 1)^2 + B(0)(0 + 1) + C(0)
\]

\[
6 = A(1) + 0 + 0
\]

\[
6 = A.
\]

At this point, you have exhausted the most convenient choices for \( x \), so to find the value of \( B \), use any other value for \( x \) along with the known values of \( A \) and \( C \). So, using \( x = 1 \), \( A = 6 \), and \( C = 9 \),

\[
5(1)^2 + 20(1) + 6 = 6(1 + 1)^2 + B(1)(1 + 1) + 9(1)
\]

\[
31 = 6(4) + 2B + 9
\]

\[
-2 = 2B
\]

\[
-1 = B.
\]

So, the partial fraction decomposition is

\[
\frac{x^4 + 2x^3 + 6x^2 + 20x + 6}{x^3 + 2x^2 + x} = x + \frac{6}{x} + \frac{-1}{x + 1} + \frac{9}{(x + 1)^2}.
\]

Now try Exercise 49.
The procedure used to solve for the constants in Examples 1 and 2 works well when the factors of the denominator are linear. However, when the denominator contains irreducible quadratic factors, you should use a different procedure, which involves writing the right side of the basic equation in polynomial form and equating the coefficients of like terms. Then you can use a system of equations to solve for the coefficients.

### Example 3  Distinct Linear and Quadratic Factors

Write the partial fraction decomposition of

\[
\frac{3x^2 + 4x + 4}{x^3 + 4x}.
\]

#### Solution

This expression is proper, so factor the denominator. Because the denominator factors as

\[x^3 + 4x = x(x^2 + 4)\]

you should include one partial fraction with a constant numerator and one partial fraction with a linear numerator and write the form of the decomposition as follows.

\[
\frac{3x^2 + 4x + 4}{x^3 + 4x} = \frac{A}{x} + \frac{Bx + C}{x^2 + 4}
\]

Write form of decomposition.

Multiplying by the LCD, \(x(x^2 + 4)\), yields the basic equation

\[
3x^2 + 4x + 4 = A(x^2 + 4) + (Bx + C)x.
\]

Basic equation

Expanding this basic equation and collecting like terms produces

\[
3x^2 + 4x + 4 = Ax^2 + 4A + Bx^2 + Cx
\]

\[
= (A + B)x^2 + Cx + 4A.
\]

Polynomial form

Finally, because two polynomials are equal if and only if the coefficients of like terms are equal, you can equate the coefficients of like terms on opposite sides of the equation.

\[3x^2 + 4x + 4 = (A + B)x^2 + Cx + 4A\]

Equate coefficients of like terms.

You can now write the following system of linear equations.

\[
\begin{align*}
A + B &= 3 \\
C &= 4 \\
4A &= 4
\end{align*}
\]

Equation 1  
Equation 2  
Equation 3

From this system you can see that \(A = 1\) and \(C = 4\). Moreover, substituting \(A = 1\) into Equation 1 yields

\[1 + B = 3 \implies B = 2.\]

So, the partial fraction decomposition is

\[
\frac{3x^2 + 4x + 4}{x^3 + 4x} = \frac{1}{x} + \frac{2x + 4}{x^2 + 4}.
\]

**CHECK Point**  Now try Exercise 33.
The next example shows how to find the partial fraction decomposition of a rational expression whose denominator has a repeated quadratic factor.

Example 4  Repeated Quadratic Factors

Write the partial fraction decomposition of \( \frac{8x^3 + 13x}{(x^2 + 2)^2} \).

Solution

Include one partial fraction with a linear numerator for each power of \( (x^2 + 2) \).

\[
\frac{8x^3 + 13x}{(x^2 + 2)^2} = \frac{Ax + B}{x^2 + 2} + \frac{Cx + D}{(x^2 + 2)^2} \quad \text{Write form of decomposition.}
\]

Multiplying by the LCD, \((x^2 + 2)^2\), yields the basic equation

\[
8x^3 + 13x = (Ax + B)(x^2 + 2) + Cx + D \quad \text{Basic equation}
\]

\[
= Ax^3 + 2Ax + Bx^2 + 2B + Cx + D
\]

\[
= Ax^3 + Bx^2 + (2A + C)x + (2B + D). \quad \text{Polynomial form}
\]

Equating coefficients of like terms on opposite sides of the equation

\[
8x^3 + 0x^2 + 13x + 0 = Ax^3 + Bx^2 + (2A + C)x + (2B + D)
\]

produces the following system of linear equations.

\[
\begin{align*}
A &= 8 \quad \text{Equation 1} \\
B &= 0 \quad \text{Equation 2} \\
2A + C &= 13 \quad \text{Equation 3} \\
2B + D &= 0 \quad \text{Equation 4}
\end{align*}
\]

Finally, use the values \( A = 8 \) and \( B = 0 \) to obtain the following.

\[
2(8) + C = 13 \quad \text{Substitute 8 for } A \text{ in Equation 3.}
\]

\[
C = -3
\]

\[
2(0) + D = 0 \quad \text{Substitute 0 for } B \text{ in Equation 4.}
\]

\[
D = 0
\]

So, using \( A = 8, B = 0, C = -3, \) and \( D = 0 \), the partial fraction decomposition is

\[
\frac{8x^3 + 13x}{(x^2 + 2)^2} = \frac{8x}{x^2 + 2} + \frac{-3x}{(x^2 + 2)^2}.
\]

Check this result by combining the two partial fractions on the right side of the equation, or by using your graphing utility.

CHECKPOINT  Now try Exercise 55.
Guidelines for Solving the Basic Equation

Linear Factors
1. Substitute the zeros of the distinct linear factors into the basic equation.
2. For repeated linear factors, use the coefficients determined in Step 1 to rewrite the basic equation. Then substitute other convenient values of \( x \) and solve for the remaining coefficients.

Quadratic Factors
1. Expand the basic equation.
2. Collect terms according to powers of \( x \).
3. Equate the coefficients of like terms to obtain equations involving \( A, B, C \), and so on.
4. Use a system of linear equations to solve for \( A, B, C, \ldots \).

Keep in mind that for improper rational expressions such as

\[
\frac{N(x)}{D(x)} = \frac{2x^3 + x^2 - 7x + 7}{x^2 + x - 2}
\]

you must first divide before applying partial fraction decomposition.

CLASSROOM DISCUSSION

Error Analysis You are tutoring a student in algebra. In trying to find a partial fraction decomposition, the student writes the following.

\[
\frac{x^2 + 1}{x(x - 1)} = \frac{A}{x} + \frac{B}{x - 1}
\]

\[
\frac{x^2 + 1}{x(x - 1)} = \frac{A(x - 1)}{x(x - 1)} + \frac{Bx}{x(x - 1)}
\]

\[
x^2 + 1 = A(x - 1) + Bx \quad \text{Basic equation}
\]

By substituting \( x = 0 \) and \( x = 1 \) into the basic equation, the student concludes that \( A = -1 \) and \( B = 2 \). However, in checking this solution, the student obtains the following.

\[
\frac{-1}{x} + \frac{2}{x - 1} = \frac{(-1)(x - 1) + 2(x)}{x(x - 1)}
\]

\[
= \frac{x + 1}{x(x - 1)}
\]

\[
\neq \frac{x^2 + 1}{x(x - 1)}
\]

What is wrong?
VOCABULARY: Fill in the blanks.

1. The process of writing a rational expression as the sum or difference of two or more simpler rational expressions is called _______ _______ _______.
2. If the degree of the numerator of a rational expression is greater than or equal to the degree of the denominator, then the fraction is called _______.
3. Each fraction on the right side of the equation \( \frac{x - 1}{x^2 - 8x + 15} = \frac{-1}{x - 3} + \frac{2}{x - 5} \) is a _______.
4. The _______ _______ is obtained after multiplying each side of the partial fraction decomposition form by the least common denominator.

SKILLS AND APPLICATIONS

In Exercises 5–8, match the rational expression with the form of its decomposition. [The decompositions are labeled (a), (b), (c), and (d).]

(a) \( \frac{A}{x} + \frac{B}{x + 2} + \frac{C}{x - 2} \)
(b) \( \frac{A}{x} + \frac{B}{x - 4} \)
(c) \( \frac{A}{x} + \frac{B}{x + 2} + \frac{C}{x - 4} \)
(d) \( \frac{A}{x} + \frac{Bx + C}{x^2 + 4} \)

5. \( \frac{3x - 1}{x(x - 4)} \)
6. \( \frac{3x - 1}{x^2(x - 4)} \)
7. \( \frac{3x - 1}{x(x^2 + 4)} \)

In Exercises 9–18, write the form of the partial fraction decomposition of the rational expression. Do not solve for the constants.

9. \( \frac{3}{x^2 - 2x} \)
10. \( \frac{x - 2}{x^2 + 4x + 3} \)
11. \( \frac{9}{x^3 - 7x^2} \)
12. \( \frac{x^2 - 3x + 2}{4x^3 + 11x^2} \)
13. \( \frac{4x^2 + 3}{(x - 5)^3} \)
14. \( \frac{6x + 5}{(x + 2)^2} \)
15. \( \frac{2x - 3}{x^3 + 10x} \)
16. \( \frac{x - 6}{2x^3 + 8x} \)
17. \( \frac{x - 1}{x(x^2 + 1)^2} \)
18. \( \frac{x + 4}{x^2(3x - 1)^2} \)

In Exercises 19–42, write the partial fraction decomposition of the rational expression. Check your result algebraically.

19. \( \frac{1}{x^2 + x} \)
20. \( \frac{3}{x^2 - 3x} \)
21. \( \frac{1}{2x^2 + x} \)
22. \( \frac{5}{x^2 + x - 6} \)
23. \( \frac{3}{x^2 + x - 2} \)
24. \( \frac{x + 1}{x^2 - x - 6} \)
25. \( \frac{1}{x^2 - 1} \)
26. \( \frac{1}{4x^2 - 9} \)
27. \( \frac{x^2 + 12x + 12}{x^3 - 4x} \)
28. \( \frac{x + 2}{x(x^2 - 9)} \)
29. \( \frac{3x}{(x - 3)^2} \)
30. \( \frac{2x - 3}{(x - 1)^2} \)
31. \( \frac{4x^2 + 2x - 1}{x^2(x + 1)} \)
32. \( \frac{6x^2 + 1}{x^2(x - 1)^2} \)
33. \( \frac{x^2 + 2x + 3}{x^3 + x} \)
34. \( \frac{2x}{x^3 - 1} \)
35. \( \frac{x}{x^3 - x^2 - 2x + 2} \)
36. \( \frac{x + 6}{x^3 - 3x^2 - 4x + 12} \)
37. \( \frac{2x^2 + x + 8}{(x^2 + 4)^2} \)
38. \( \frac{x}{x^2 - 2x^2 - 8} \)
39. \( \frac{x}{16x^4 - 1} \)
40. \( \frac{3}{x^3 + x} \)
41. \( \frac{x^2 + 5}{(x + 1)(x^2 - 2x + 3)} \)
42. \( \frac{x^2 - 4x + 7}{(x + 1)(x^2 - 2x + 3)} \)

In Exercises 43–50, write the partial fraction decomposition of the improper rational expression.

43. \( \frac{x^2 - x}{x^2 + x + 1} \)
44. \( \frac{x^2 - 4x}{x^2 + x + 6} \)
45. \( \frac{2x^3 - x^2 + x + 5}{x^2 + 3x + 2} \)
46. \( \frac{x^3 + 2x^2 - x + 1}{x^2 + 3x - 4} \)
47. \( \frac{x^4}{(x - 1)^3} \)
48. \( \frac{16x^4}{(2x - 1)^3} \)
49. \( \frac{x^4 + 2x^3 + 4x^2 + 8x + 2}{x^3 + 2x^2 + x} \)
50. \( \frac{2x^4 + 8x^3 + 7x^2 - 7x - 12}{x^3 + 4x^2 + 4x} \)
Section 7.4  Partial Fractions  537

In Exercises 51–58, write the partial fraction decomposition of the rational expression. Use a graphing utility to check your result.

51. \( \frac{5 - x}{2x^2 + x - 1} \)  
52. \( \frac{3x^2 - 7x - 2}{x^3 - x} \)  
53. \( \frac{4x^2 - 1}{2x(x + 1)^2} \)  
54. \( \frac{3x + 1}{2x^3 + 3x^2} \)  
55. \( \frac{x^2 + x + 2}{(x^2 + 2)^2} \)  
56. \( \frac{x^3}{(x + 2)(x - 2)^2} \)  
57. \( \frac{2x^3 - 4x^2 - 15x + 5}{x^2 - 2x - 8} \)  
58. \( \frac{x^3 - x + 3}{x^2 + x - 2} \)

(b) The decomposition in part (a) is the difference of two fractions. The absolute values of the terms give the expected maximum and minimum temperatures of the exhaust gases for different loads.

\[ Y_{\text{max}} = |1\text{st term}| \quad Y_{\text{min}} = |2\text{nd term}| \]

Write the equations for \( Y_{\text{max}} \) and \( Y_{\text{min}} \).

(c) Use a graphing utility to graph each equation from part (b) in the same viewing window.

(d) Determine the expected maximum and minimum temperatures for a relative load of 0.5.

EXPLORATION

TRUE OR FALSE?  In Exercises 63–65, determine whether the statement is true or false. Justify your answer.

63. For the rational expression \( \frac{x}{(x + 10)(x - 10)^2} \), the partial fraction decomposition is of the form \( \frac{A}{x + 10} + \frac{B}{(x - 10)^2} \).

64. For the rational expression \( \frac{2x + 3}{x^2(x + 2)^2} \), the partial fraction decomposition is of the form \( \frac{Ax + B}{x^2} + \frac{Cx + D}{(x + 2)^2} \).

65. When writing the partial fraction decomposition of the expression \( \frac{x^3 + x - 2}{x^2 - 5x - 14} \), the first step is to divide the numerator by the denominator.

66. CAPSTONE  Explain the similarities and differences in finding the partial fraction decompositions of proper rational expressions whose denominators factor into (a) distinct linear factors, (b) distinct quadratic factors, (c) repeated factors, and (d) linear and quadratic factors.

In Exercises 67–70, write the partial fraction decomposition of the rational expression. Check your result algebraically. Then assign a value to the constant \( a \) to check the result graphically.

67. \( \frac{1}{a^2 - x^2} \)  
68. \( \frac{1}{x(x + a)} \)  
69. \( \frac{1}{y(a - y)} \)  
70. \( \frac{1}{(x + 1)(a - x)} \)

71. WRITING  Describe two ways of solving for the constants in a partial fraction decomposition.
What you should learn

- Sketch the graphs of inequalities in two variables.
- Solve systems of inequalities.
- Use systems of inequalities in two variables to model and solve real-life problems.

Why you should learn it

You can use systems of inequalities in two variables to model and solve real-life problems. For instance, in Exercise 83 on page 547, you will use a system of inequalities to analyze the retail sales of prescription drugs.

The Graph of an Inequality

The statements $3x - 2y < 6$ and $2x^2 + 3y^2 \geq 6$ are inequalities in two variables. An ordered pair $(a, b)$ is a solution of an inequality in $x$ and $y$ if the inequality is true when $a$ and $b$ are substituted for $x$ and $y$, respectively. The graph of an inequality is the collection of all solutions of the inequality. To sketch the graph of an inequality, begin by sketching the graph of the corresponding equation. The graph of the equation will normally separate the plane into two or more regions. In each such region, one of the following must be true.

1. All points in the region are solutions of the inequality.
2. No point in the region is a solution of the inequality.

So, you can determine whether the points in an entire region satisfy the inequality by simply testing one point in the region.

Sketching the Graph of an Inequality in Two Variables

1. Replace the inequality sign by an equal sign, and sketch the graph of the resulting equation. (Use a dashed line for $<$ or $>$ and a solid line for $\leq$ or $\geq$.)

2. Test one point in each of the regions formed by the graph in Step 1. If the point satisfies the inequality, shade the entire region to denote that every point in the region satisfies the inequality.

Example 1 Sketching the Graph of an Inequality

Sketch the graph of $y \geq x^2 - 1$.

Solution

Begin by graphing the corresponding equation $y = x^2 - 1$, which is a parabola, as shown in Figure 7.19. By testing a point above the parabola $(0, 0)$ and a point below the parabola $(0, -2)$, you can see that the points that satisfy the inequality are those lying above (or on) the parabola.

WARNING / CAUTION

Be careful when you are sketching the graph of an inequality in two variables. A dashed line means that all points on the line or curve are not solutions of the inequality. A solid line means that all points on the line or curve are solutions of the inequality.

CHECKPOINT Now try Exercise 7.
The inequality in Example 1 is a nonlinear inequality in two variables. Most of the following examples involve \textbf{linear inequalities} such as \( ax + by < c \) (\( a \) and \( b \) are not both zero). The graph of a linear inequality is a half-plane lying on one side of the line \( ax + by = c \).

### Example 2  
**Sketching the Graph of a Linear Inequality**

Sketch the graph of each linear inequality.

a. \( x > -2 \)  
b. \( y \leq 3 \)

**Solution**

a. The graph of the corresponding equation \( x = -2 \) is a vertical line. The points that satisfy the inequality \( x > -2 \) are those lying to the right of this line, as shown in Figure 7.20.

b. The graph of the corresponding equation \( y = 3 \) is a horizontal line. The points that satisfy the inequality \( y \leq 3 \) are those lying below (or on) this line, as shown in Figure 7.21.

### Example 3  
**Sketching the Graph of a Linear Inequality**

Sketch the graph of \( x - y < 2 \).

**Solution**

The graph of the corresponding equation \( x - y = 2 \) is a line, as shown in Figure 7.22. Because the origin \((0, 0)\) satisfies the inequality, the graph consists of the half-plane lying above the line. (Try checking a point below the line. Regardless of which point you choose, you will see that it does not satisfy the inequality.)

To graph a linear inequality, it can help to write the inequality in slope-intercept form. For instance, by writing \( x - y < 2 \) in the form

\[ y > x - 2 \]

you can see that the solution points lie \textit{above} the line \( x - y = 2 \) (or \( y = x - 2 \)), as shown in Figure 7.22.
Systems of Inequalities

Many practical problems in business, science, and engineering involve systems of linear inequalities. A solution of a system of inequalities in \( x \) and \( y \) is a point \( (x, y) \) that satisfies each inequality in the system.

To sketch the graph of a system of inequalities in two variables, first sketch the graph of each individual inequality (on the same coordinate system) and then find the region that is common to every graph in the system. This region represents the solution set of the system. For systems of linear inequalities, it is helpful to find the vertices of the solution region.

### Example 4  Solving a System of Inequalities

Sketch the graph (and label the vertices) of the solution set of the system.

\[
\begin{align*}
    x - y &< 2 & \text{Inequality 1} \\
    x &> -2 & \text{Inequality 2} \\
    y &\leq 3 & \text{Inequality 3}
\end{align*}
\]

**Solution**

The graphs of these inequalities are shown in Figures 7.22, 7.20, and 7.21, respectively, on page 539. The triangular region common to all three graphs can be found by superimposing the graphs on the same coordinate system, as shown in Figure 7.23. To find the vertices of the region, solve the three systems of corresponding equations obtained by taking pairs of equations representing the boundaries of the individual regions.

<table>
<thead>
<tr>
<th>Vertex A: ((-2, -4))</th>
<th>Vertex B: ((5, 3))</th>
<th>Vertex C: ((-2, 3))</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x - y = 2) (x = -2) (y = 3)</td>
<td>(x - y = 2) (y = 3)</td>
<td>(x = -2) (y = 3)</td>
</tr>
</tbody>
</table>

![Figure 7.23](image_url)

Note in Figure 7.23 that the vertices of the region are represented by open dots. This means that the vertices are not solutions of the system of inequalities.

**Check Point**  Now try Exercise 41.
For the triangular region shown in Figure 7.23, each point of intersection of a pair of boundary lines corresponds to a vertex. With more complicated regions, two border lines can sometimes intersect at a point that is not a vertex of the region, as shown in Figure 7.24. To keep track of which points of intersection are actually vertices of the region, you should sketch the region and refer to your sketch as you find each point of intersection.

Example 5 Solving a System of Inequalities

Sketch the region containing all points that satisfy the system of inequalities.

\[
\begin{align*}
\text{Inequality 1: } & \quad x^2 - y \leq 1 \\
\text{Inequality 2: } & \quad -x + y \leq 1
\end{align*}
\]

Solution

As shown in Figure 7.25, the points that satisfy the inequality

\[x^2 - y \leq 1 \quad \text{Inequality 1}\]

are the points lying above (or on) the parabola given by

\[y = x^2 - 1. \quad \text{Parabola}\]

The points satisfying the inequality

\[-x + y \leq 1 \quad \text{Inequality 2}\]

are the points lying below (or on) the line given by

\[y = x + 1. \quad \text{Line}\]

To find the points of intersection of the parabola and the line, solve the system of corresponding equations.

\[
\begin{align*}
x^2 - y &= 1 \\
-x + y &= 1
\end{align*}
\]

Using the method of substitution, you can find the solutions to be \((-1, 0)\) and \((2, 3)\). So, the region containing all points that satisfy the system is indicated by the shaded region in Figure 7.25.

CHECK POINT Now try Exercise 43.
When solving a system of inequalities, you should be aware that the system might have no solution or it might be represented by an unbounded region in the plane. These two possibilities are shown in Examples 6 and 7.

**Example 6  A System with No Solution**

Sketch the solution set of the system of inequalities.

\[
\begin{align*}
\text{Inequality 1} & : x + y > 3 \\
\text{Inequality 2} & : x + y < -1
\end{align*}
\]

**Solution**

From the way the system is written, it is clear that the system has no solution, because the quantity \((x + y)\) cannot be both less than \(-1\) and greater than \(3\). Graphically, the inequality \(x + y > 3\) is represented by the half-plane lying above the line \(x + y = 3\), and the inequality \(x + y < -1\) is represented by the half-plane lying below the line \(x + y = -1\), as shown in Figure 7.26. These two half-planes have no points in common. So, the system of inequalities has no solution.

![Figure 7.26](image)

**CHECK POINT**  Now try Exercise 45.

**Example 7  An Unbounded Solution Set**

Sketch the solution set of the system of inequalities.

\[
\begin{align*}
\text{Inequality 1} & : x + y < 3 \\
\text{Inequality 2} & : x + 2y > 3
\end{align*}
\]

**Solution**

The graph of the inequality \(x + y < 3\) is the half-plane that lies below the line \(x + y = 3\), as shown in Figure 7.27. The graph of the inequality \(x + 2y > 3\) is the half-plane that lies above the line \(x + 2y = 3\). The intersection of these two half-planes is an *infinite wedge* that has a vertex at \((3, 0)\). So, the solution set of the system of inequalities is unbounded.

**CHECK POINT**  Now try Exercise 47.
Applications

Example 9 in Section 7.2 discussed the equilibrium point for a system of demand and supply equations. The next example discusses two related concepts that economists call consumer surplus and producer surplus. As shown in Figure 7.28, the consumer surplus is defined as the area of the region that lies below the demand curve, above the horizontal line passing through the equilibrium point, and to the right of the \( p \)-axis. Similarly, the producer surplus is defined as the area of the region that lies above the supply curve, below the horizontal line passing through the equilibrium point, and to the right of the \( p \)-axis. The consumer surplus is a measure of the amount that consumers would have been willing to pay above what they actually paid, whereas the producer surplus is a measure of the amount that producers would have been willing to receive above what they actually received.

Example 8 Consumer Surplus and Producer Surplus

The demand and supply equations for a new type of personal digital assistant are given by

\[
\begin{align*}
\text{Demand equation} & : p = 150 - 0.00001x \\
\text{Supply equation} & : p = 60 + 0.00002x
\end{align*}
\]

where \( p \) is the price (in dollars) and \( x \) represents the number of units. Find the consumer surplus and producer surplus for these two equations.

Solution

Begin by finding the equilibrium point (when supply and demand are equal) by solving the equation

\[60 + 0.00002x = 150 - 0.00001x.\]

In Example 9 in Section 7.2, you saw that the solution is \( x = 3,000,000 \) units, which corresponds to an equilibrium price of \( p = 120 \). So, the consumer surplus and producer surplus are the areas of the following triangular regions.

\[
\begin{align*}
\text{Consumer Surplus} & : \begin{cases} 
 p \leq 150 - 0.00001x \\
 p \geq 120 \\
 x \geq 0
\end{cases} \\
\text{Producer Surplus} & : \begin{cases} 
 p \geq 60 + 0.00002x \\
 p \leq 120 \\
 x \geq 0
\end{cases}
\end{align*}
\]

In Figure 7.29, you can see that the consumer and producer surpluses are defined as the areas of the shaded triangles.

\[
\begin{align*}
\text{Consumer surplus} & = \frac{1}{2} \text{(base})(\text{height)} \\
& = \frac{1}{2} (3,000,000)(30) = 45,000,000 \\
\text{Producer surplus} & = \frac{1}{2} \text{(base})(\text{height)} \\
& = \frac{1}{2} (3,000,000)(60) = 90,000,000
\end{align*}
\]

Now try Exercise 71.
Example 9 Nutrition

The liquid portion of a diet is to provide at least 300 calories, 36 units of vitamin A, and 90 units of vitamin C. A cup of dietary drink X provides 60 calories, 12 units of vitamin A, and 10 units of vitamin C. A cup of dietary drink Y provides 60 calories, 6 units of vitamin A, and 30 units of vitamin C. Set up a system of linear inequalities that describes how many cups of each drink should be consumed each day to meet or exceed the minimum daily requirements for calories and vitamins.

Solution

Begin by letting \( x \) and \( y \) represent the following.

\[
\begin{align*}
    x &= \text{number of cups of dietary drink X} \\
    y &= \text{number of cups of dietary drink Y}
\end{align*}
\]

To meet or exceed the minimum daily requirements, the following inequalities must be satisfied.

\[
\begin{align*}
    60x + 60y &\geq 300 & \text{Calories} \\
    12x + 6y &\geq 36 & \text{Vitamin A} \\
    10x + 30y &\geq 90 & \text{Vitamin C} \\
    x &\geq 0 \\
    y &\geq 0
\end{align*}
\]

The last two inequalities are included because \( x \) and \( y \) cannot be negative. The graph of this system of inequalities is shown in Figure 7.30. (More is said about this application in Example 6 in Section 7.6.)

**CHECKPOINT** Now try Exercise 75.

### Classroom Discussion

**Creating a System of Inequalities** Plot the points \((0, 0)\), \((4, 0)\), \((3, 2)\), and \((0, 2)\) in a coordinate plane. Draw the quadrilateral that has these four points as its vertices. Write a system of linear inequalities that has the quadrilateral as its solution. Explain how you found the system of inequalities.
7.5 Systems of Inequalities

EXERCISES

VOCABULARY: Fill in the blanks.

1. An ordered pair \((a, b)\) is a ________ of an inequality in \(x\) and \(y\) if the inequality is true when \(a\) and \(b\) are substituted for \(x\) and \(y\), respectively.

2. The ________ of an inequality is the collection of all solutions of the inequality.

3. The graph of a ________ inequality is a half-plane lying on one side of the line \(ax + by = c\).

4. A ________ of a system of inequalities in two variables is a point \((x, y)\) that satisfies each inequality in the system.

5. A ________ ________ of a system of inequalities in two variables is the region common to the graphs of every inequality in the system.

6. The area of the region that lies below the demand curve, above the horizontal line passing through the equilibrium point, to the right of the \(p\)-axis is called the ________ ________.

SKILLS AND APPLICATIONS

In Exercises 7–20, sketch the graph of the inequality.

7. \(y < 5 - x^2\)  
8. \(y^2 - x < 0\)
9. \(x \geq 6\)  
10. \(x < -4\)
11. \(y > -7\)  
12. \(10 \geq y\)
13. \(y < 2 - x\)  
14. \(y > 4x - 3\)
15. \(2y - x \geq 4\)  
16. \(5x + 3y \geq -15\)
17. \((x + 1)^2 + (y - 2)^2 < 9\)  
18. \((x - 1)^2 + (y - 4)^2 > 9\)
19. \(y \leq \frac{1}{1 + x^2}\)  
20. \(y > \frac{-15}{x^2 + x + 4}\)

In Exercises 21–32, use a graphing utility to graph the inequality.

21. \(y < \ln x\)  
22. \(y \geq -2 - \ln(x + 3)\)
23. \(y < 4^{-x} - 5\)  
24. \(y \leq 2^{2x - 0.5} - 7\)
25. \(y \geq \frac{2}{x} - 2\)  
26. \(y \leq 6 - \frac{3}{x}\)
27. \(y < -3.8x + 1.1\)  
28. \(y \geq -20.74 + 2.66x\)
29. \(x^2 + 5y - 10 \leq 0\)  
30. \(2x^2 - y - 3 > 0\)
31. \(\frac{7}{2}y - 3x^2 - 6 \geq 0\)
32. \(-\frac{1}{10}x^2 - \frac{3}{8}y < -\frac{1}{4}\)

In Exercises 33–36, write an inequality for the shaded region shown in the figure.

33.  
34.
35.  
36.

In Exercises 37–40, determine whether each ordered pair is a solution of the system of linear inequalities.

37. \[\begin{align*} x &\geq -4 \\ y &> -3 \\ y &> -8x - 3 \end{align*}\]  
(a) (0, 0)  
(b) (−1, −3)  
(c) (−4, 0)  
(d) (−3, 11)
38. \[\begin{align*} -2x + 5y &\geq 3 \\ y &< 4 \\ -4x + 2y &< 7 \end{align*}\]  
(a) (0, 2)  
(b) (−6, 4)  
(c) (−8, −2)  
(d) (−3, 2)
39. \[\begin{align*} 3x + y &\geq 1 \\ y &< \frac{1}{2}x^2 - 4 \\ -15x + 4y &\geq 0 \end{align*}\]  
(a) (0, 10)  
(b) (0, −1)  
(c) (2, 9)  
(d) (−1, 6)
40. \[\begin{align*} x^2 + y^2 &\geq 36 \\ -3x + y &\leq 10 \\ \frac{3}{2}x - y &\geq 5 \end{align*}\]  
(a) (−1, 7)  
(b) (−5, 1)  
(c) (6, 0)  
(d) (4, −8)

In Exercises 41–54, sketch the graph and label the vertices of the solution set of the system of inequalities.

41. \[\begin{align*} x + y &\leq 1 \\ -x + y &\leq 1 \\ y &\geq 0 \end{align*}\]  
(a) \((x, y) = (1, 0)\)  
(b) \((x, y) = (0, 1)\)
42. \[\begin{align*} 3x + 4y &< 12 \\ x &> 0 \\ y &> 0 \end{align*}\]
43. \[\begin{align*} x^2 + y &\leq 7 \\ x &\geq 2 \\ y &\geq 0 \end{align*}\]  
(a) \((x, y) = (2, 0)\)  
(b) \((x, y) = (0, 7)\)
44. \[\begin{align*} 4x^2 + y &\geq 2 \\ x &\leq 1 \\ y &\leq 1 \end{align*}\]  
(a) \((x, y) = (1, 0)\)  
(b) \((x, y) = (0, 1)\)
45. \[ \begin{align*} 2x + y & > 2 \\
6x + 3y & < 2 \\
\end{align*} \]
46. \[ \begin{align*} x - 7y & > -36 \\
5x + 2y & > 5 \\
6x - 5y & > 6 \\
\end{align*} \]
47. \[ \begin{align*} -3x + 2y & < 6 \\
x - 4y & > -2 \\
2x + y & < 3 \\
\end{align*} \]
48. \[ \begin{align*} x - 2y & < -6 \\
5x - 3y & > 9 \\
\end{align*} \]
49. \[ \begin{align*} x & > y^2 \\
x & < y + 2 \\
\end{align*} \]
50. \[ \begin{align*} x - y^2 & > 0 \\
x - y & > 2 \\
\end{align*} \]
51. \[ \begin{align*} x^2 + y^2 & \leq 36 \\
x^2 + y^2 & \geq 9 \\
\end{align*} \]
52. \[ \begin{align*} x^2 + y^2 & \leq 25 \\
4x - 3y & \leq 0 \\
\end{align*} \]
53. \[ \begin{align*} 3x + 4 & \geq y^2 \\
x - y & < 0 \\
\end{align*} \]
54. \[ \begin{align*} x & < 2y - y^2 \\
0 & < x + y \\
\end{align*} \]

In Exercises 55–60, use a graphing utility to graph the solution set of the system of inequalities.

55. \[ \begin{align*} y & \leq \sqrt{3}x + 1 \\
y & \geq x^2 + 1 \\
\end{align*} \]
56. \[ \begin{align*} y & \leq -x^2 + 2x + 3 \\
y & > x^2 - 4x + 3 \\
\end{align*} \]
57. \[ \begin{align*} y & < x^3 - 2x + 1 \\
y & > -2x \\
x & \leq 1 \\
\end{align*} \]
58. \[ \begin{align*} y & \geq x^4 - 2x^2 + 1 \\
y & \leq 1 - x^2 \\
\end{align*} \]
59. \[ \begin{align*} x^2y & \geq 1 \\
0 & < x \leq 4 \\
y & \leq 4 \\
\end{align*} \]
60. \[ \begin{align*} y & \leq e^{-x^2/2} \\
y & \geq 0 \\
-2 & \leq x \leq 2 \\
\end{align*} \]

In Exercises 61–70, derive a set of inequalities to describe the region.

61. \[ \begin{align*} y & \leq 0 \\
2 & \leq x \leq 6 \\
\end{align*} \]
62. \[ \begin{align*} y & \leq 0 \\
6 & \leq x \leq 3 \\
\end{align*} \]
63. \[ \begin{align*} y & \geq 0 \\
2 & \leq x \leq 8 \\
\end{align*} \]
64. \[ \begin{align*} y & \leq 0 \\
1 & \leq x \leq 2 \\
\end{align*} \]
65. \[ \begin{align*} y & \leq 0 \\
-2 & \leq x \leq 2 \\
\end{align*} \]
66. \[ \begin{align*} y & \leq 0 \\
-2 & \leq x \leq 2 \\
\end{align*} \]

67. Rectangle: vertices at (4, 3), (9, 3), (9, 9), (4, 9)
68. Parallelogram: vertices at (0, 0), (4, 0), (1, 4), (5, 4)
69. Triangle: vertices at (0, 0), (6, 0), (1, 5)
70. Triangle: vertices at (−1, 0), (1, 0), (0, 1)

**SUPPLY AND DEMAND** In Exercises 71–74, (a) graph the systems representing the consumer surplus and producer surplus for the supply and demand equations and (b) find the consumer surplus and producer surplus.

<table>
<thead>
<tr>
<th>Demand</th>
<th>Supply</th>
</tr>
</thead>
<tbody>
<tr>
<td>( p = 50 - 0.5x )</td>
<td>( p = 0.125x )</td>
</tr>
<tr>

<tr>
<td>( p = 140 - 0.00002x )</td>
<td>( p = 80 + 0.00001x )</td>
</tr>
<tr>
<td>( p = 400 - 0.00002x )</td>
<td>( p = 225 + 0.0005x )</td>
</tr>
</tbody>
</table>

75. **PRODUCTION** A furniture company can sell all the tables and chairs it produces. Each table requires 1 hour in the assembly center and \( \frac{1}{2} \) hours in the finishing center. Each chair requires \( \frac{1}{2} \) hours in the assembly center and \( \frac{1}{2} \) hours in the finishing center. The company’s assembly center is available 12 hours per day, and its finishing center is available 15 hours per day. Find and graph a system of inequalities describing all possible production levels.

76. **INVENTORY** A store sells two models of laptop computers. Because of the demand, the store stocks at least twice as many units of model A as of model B. The costs to the store for the two models are $800 and $1200, respectively. The management does not want more than $20,000 in computer inventory at any one time, and it wants at least four model A laptop computers and two model B laptop computers in inventory at all times. Find and graph a system of inequalities describing all possible inventory levels.

77. **INVESTMENT ANALYSIS** A person plans to invest up to $20,000 in two different interest-bearing accounts. Each account is to contain at least $5000. Moreover, the amount in one account should be at least twice the amount in the other account. Find and graph a system of inequalities to describe the various amounts that can be deposited in each account.

78. **TICKET SALES** For a concert event, there are $30 reserved seat tickets and $20 general admission tickets. There are 2000 reserved seats available, and fire regulations limit the number of paid ticket holders to 3000. The promoter must take in at least $75,000 in ticket sales. Find and graph a system of inequalities describing the different numbers of tickets that can be sold.
79. **SHIPPING** A warehouse supervisor is told to ship at least 50 packages of gravel that weigh 55 pounds each and at least 40 bags of stone that weigh 70 pounds each. The maximum weight capacity of the truck to be used is 7500 pounds. Find and graph a system of inequalities describing the numbers of bags of stone and gravel that can be shipped.

80. **TRUCK SCHEDULING** A small company that manufactures two models of exercise machines has an order for 15 units of the standard model and 16 units of the deluxe model. The company has trucks of two different sizes that can haul the products, as shown in the table.

<table>
<thead>
<tr>
<th>Truck</th>
<th>Standard</th>
<th>Deluxe</th>
</tr>
</thead>
<tbody>
<tr>
<td>Large</td>
<td>6</td>
<td>3</td>
</tr>
<tr>
<td>Medium</td>
<td>4</td>
<td>6</td>
</tr>
</tbody>
</table>

Find and graph a system of inequalities describing the numbers of trucks of each size that are needed to deliver the order.

81. **NUTRITION** A dietitian is asked to design a special dietary supplement using two different foods. Each ounce of food X contains 20 units of calcium, 15 units of iron, and 10 units of vitamin B. Each ounce of food Y contains 10 units of calcium, 10 units of iron, and 20 units of vitamin B. The minimum daily requirements of the diet are 300 units of calcium, 150 units of iron, and 200 units of vitamin B.

(a) Write a system of inequalities describing the different amounts of food X and food Y that can be used.

(b) Sketch a graph of the region corresponding to the system in part (a).

(c) Find two solutions of the system and interpret their meanings in the context of the problem.

82. **HEALTH** A person’s maximum heart rate is $220 - x$, where $x$ is the person’s age in years for $20 \leq x \leq 70$. When a person exercises, it is recommended that the person strive for a heart rate that is at least 50% of the maximum and at most 75% of the maximum. (Source: American Heart Association)

(a) Write a system of inequalities that describes the exercise target heart rate region.

(b) Sketch a graph of the region in part (a).

(c) Find two solutions to the system and interpret their meanings in the context of the problem.

83. **DATA ANALYSIS: PRESCRIPTION DRUGS** The table shows the retail sales $y$ (in billions of dollars) of prescription drugs in the United States from 2000 through 2007. (Source: National Association of Chain Drug Stores)

<table>
<thead>
<tr>
<th>Year</th>
<th>Retail sales, $y$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>145.6</td>

</tr>
<tr>
<td>2007</td>
<td>259.4</td>
</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a linear model for the data. Let $t$ represent the year, with $t = 0$ corresponding to 2000.

(b) The total retail sales of prescription drugs in the United States during this eight-year period can be approximated by finding the area of the trapezoid bounded by the linear model you found in part (a) and the lines $y = 0$, $t = -0.5$, and $t = 7.5$. Use a graphing utility to graph this region.

(c) Use the formula for the area of a trapezoid to approximate the total retail sales of prescription drugs.

84. **DATA ANALYSIS: MERCHANDISE** The table shows the retail sales $y$ (in millions of dollars) for Aeropostale, Inc. from 2000 through 2007. (Source: Aeropostale, Inc.)

<table>
<thead>
<tr>
<th>Year</th>
<th>Retail sales, $y$</th>

</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a linear model for the data. Let $t$ represent the year, with $t = 0$ corresponding to 2000.

(b) The total retail sales for Aeropostale during this eight-year period can be approximated by finding the area of the trapezoid bounded by the linear model you found in part (a) and the lines $y = 0$, $t = -0.5$, and $t = 7.5$. Use a graphing utility to graph this region.

(c) Use the formula for the area of a trapezoid to approximate the total retail sales for Aeropostale.
85. **PHYSICAL FITNESS FACILITY** An indoor running track is to be constructed with a space for exercise equipment inside the track (see figure). The track must be at least 125 meters long, and the exercise space must have an area of at least 500 square meters.

(a) Find a system of inequalities describing the requirements of the facility.
(b) Graph the system from part (a).

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 86 and 87, determine whether the statement is true or false. Justify your answer.

86. The area of the figure defined by the system
\[
\begin{align*}
x & \geq -3 \\
x & \leq 6 \\
y & \leq 5 \\
y & \geq -6
\end{align*}
\]
is 99 square units.

87. The graph below shows the solution of the system
\[
\begin{align*}
y & \leq 6 \\
-4x - 9y & > 6 \\
3x + y^2 & \geq 2
\end{align*}
\]

88. **CAPSTONE**
(a) Explain the difference between the graphs of the inequality \(x \leq -5\) on the real number line and on the rectangular coordinate system.
(b) After graphing the boundary of the inequality \(x + y < 3\), explain how you decide on which side of the boundary the solution set of the inequality lies.

89. **GRAPHICAL REASONING** Two concentric circles have radii \(x\) and \(y\), where \(y > x\). The area between the circles must be at least 10 square units.

(a) Find a system of inequalities describing the constraints on the circles.
(b) Use a graphing utility to graph the system of inequalities in part (a). Graph the line \(y = x\) in the same viewing window.
(c) Identify the graph of the line in relation to the boundary of the inequality. Explain its meaning in the context of the problem.

90. The graph of the solution of the inequality \(x + 2y < 6\) is shown in the figure. Describe how the solution set would change for each of the following.
(a) \(x + 2y \leq 6\)
(b) \(x + 2y > 6\)

In Exercises 91–94, match the system of inequalities with the graph of its solution. [The graphs are labeled (a), (b), (c), and (d).]

91. \[
\begin{align*}
x^2 + y^2 & \leq 16 \\
x + y & \geq 4
\end{align*}
\]
92. \[
\begin{align*}
x^2 + y^2 & \leq 16 \\
x + y & \leq 4
\end{align*}
\]
93. \[
\begin{align*}
x^2 + y^2 & \geq 16 \\
x + y & \geq 4
\end{align*}
\]
94. \[
\begin{align*}
x^2 + y^2 & \geq 16 \\
x + y & \leq 4
\end{align*}
\]
Linear Programming: A Graphical Approach

Many applications in business and economics involve a process called optimization, in which you are asked to find the minimum or maximum value of a quantity. In this section, you will study an optimization strategy called linear programming.

A two-dimensional linear programming problem consists of a linear objective function and a system of linear inequalities called constraints. The objective function gives the quantity that is to be maximized (or minimized), and the constraints determine the set of feasible solutions. For example, suppose you are asked to maximize the value of

\[ z = ax + by \]

subject to a set of constraints that determines the shaded region in Figure 7.31.

![Figure 7.31](Feasible solutions)

Because every point in the shaded region satisfies each constraint, it is not clear how you should find the point that yields a maximum value of \( z \). Fortunately, it can be shown that if there is an optimal solution, it must occur at one of the vertices. This means that you can find the maximum value of \( z \) by testing \( z \) at each of the vertices.

Optimal Solution of a Linear Programming Problem

If a linear programming problem has a solution, it must occur at a vertex of the set of feasible solutions. If there is more than one solution, at least one of them must occur at such a vertex. In either case, the value of the objective function is unique.

Some guidelines for solving a linear programming problem in two variables are listed at the top of the next page.
Chapter 7 Systems of Equations and Inequalities

Solving a Linear Programming Problem

1. Sketch the region corresponding to the system of constraints. (The points inside or on the boundary of the region are feasible solutions.)

2. Find the vertices of the region.

3. Test the objective function at each of the vertices and select the values of the variables that optimize the objective function. For a bounded region, both a minimum and a maximum value will exist. (For an unbounded region, if an optimal solution exists, it will occur at a vertex.)

Example 1 Solving a Linear Programming Problem

Find the maximum value of

\[ z = 3x + 2y \]

subject to the following constraints.

\[
\begin{align*}
x & \geq 0 \\
y & \geq 0 \\
x + 2y & \leq 4 \\
x - y & \leq 1
\end{align*}
\]

Solution

The constraints form the region shown in Figure 7.32. At the four vertices of this region, the objective function has the following values.

At (0, 0): \[ z = 3(0) + 2(0) = 0 \]
At (0, 2): \[ z = 3(0) + 2(2) = 4 \]
At (2, 1): \[ z = 3(2) + 2(1) = 8 \]
At (1, 0): \[ z = 3(1) + 2(0) = 3 \]

So, the maximum value of \( z \) is 8, and this occurs when \( x = 2 \) and \( y = 1 \).

In Example 1, try testing some of the interior points in the region. You will see that the corresponding values of \( z \) are less than 8. Here are some examples.

At (1, 1): \[ z = 3(1) + 2(1) = 5 \]
At \( \left( \frac{1}{2}, \frac{3}{2} \right) \): \[ z = 3 \left( \frac{1}{2} \right) + 2 \left( \frac{3}{2} \right) = \frac{9}{2} \]

To see why the maximum value of the objective function in Example 1 must occur at a vertex, consider writing the objective function in slope-intercept form

\[ y = -\frac{3}{2}x + \frac{z}{2} \]

where \( \frac{z}{2} \) is the \( y \)-intercept of the objective function. This equation represents a family of lines, each of slope \( -\frac{3}{2} \). Of these infinitely many lines, you want the one that has the largest \( y \)-intercept \( \frac{z}{2} \) and intersects the region determined by the constraints. In other words, of all the lines whose slope is \( -\frac{3}{2} \), you want the one that has the largest \( y \)-intercept and intersects the given region, as shown in Figure 7.33. From the graph, you can see that such a line will pass through one (or more) of the vertices of the region.
The next example shows that the same basic procedure can be used to solve a problem in which the objective function is to be minimized.

**Example 2**  
Minimizing an Objective Function

Find the minimum value of

\[ z = 5x + 7y \]

where \( x \geq 0 \) and \( y \geq 0 \), subject to the following constraints.

\[
\begin{align*}
2x + 3y &\geq 6 \\
3x - y &\leq 15 \\
-x + y &\leq 4 \\
2x + 5y &\leq 27
\end{align*}
\]

**Solution**

The region bounded by the constraints is shown in Figure 7.34. By testing the objective function at each vertex, you obtain the following.

- At \((0, 2)\): \( z = 5(0) + 7(2) = 14 \)  
- At \((0, 4)\): \( z = 5(0) + 7(4) = 28 \)  
- At \((1, 5)\): \( z = 5(1) + 7(5) = 40 \)  
- At \((6, 3)\): \( z = 5(6) + 7(3) = 51 \)  
- At \((5, 0)\): \( z = 5(5) + 7(0) = 25 \)  
- At \((3, 0)\): \( z = 5(3) + 7(0) = 15 \)

So, the minimum value of \( z \) is 14, and this occurs when \( x = 0 \) and \( y = 2 \).

**CHECK POINT**  
Now try Exercise 11.

**Example 3**  
Maximizing an Objective Function

Find the maximum value of

\[ z = 5x + 7y \]

where \( x \geq 0 \) and \( y \geq 0 \), subject to the following constraints.

\[
\begin{align*}
2x + 3y &\geq 6 \\
3x - y &\leq 15 \\
-x + y &\leq 4 \\
2x + 5y &\leq 27
\end{align*}
\]

**Solution**

This linear programming problem is identical to that given in Example 2 above, *except* that the objective function is maximized instead of minimized. Using the values of \( z \) at the vertices shown above, you can conclude that the maximum value of \( z \) is

\[ z = 5(6) + 7(3) = 51 \]

and occurs when \( x = 6 \) and \( y = 3 \).

**CHECK POINT**  
Now try Exercise 13.
It is possible for the maximum (or minimum) value in a linear programming problem to occur at two different vertices. For instance, at the vertices of the region shown in Figure 7.35, the objective function
\[ z = 2x + 2y \]
has the following values.
- At (0, 0): \[ z = 2(0) + 2(0) = 0 \]
- At (0, 4): \[ z = 2(0) + 2(4) = 8 \]
- At (2, 4): \[ z = 2(2) + 2(4) = 12 \]
- At (5, 1): \[ z = 2(5) + 2(1) = 12 \]
- At (5, 0): \[ z = 2(5) + 2(0) = 10 \]

In this case, you can conclude that the objective function has a maximum value not only at the vertices (2, 4) and (5, 1); it also has a maximum value (of 12) at any point on the line segment connecting these two vertices. Note that the objective function in slope-intercept form \( y = -x + \frac{1}{2}z \) has the same slope as the line through the vertices (2, 4) and (5, 1).

Some linear programming problems have no optimal solutions. This can occur if the region determined by the constraints is unbounded. Example 4 illustrates such a problem.

**Example 4 An Unbounded Region**

Find the maximum value of
\[ z = 4x + 2y \]
where \( x \geq 0 \) and \( y \geq 0 \), subject to the following constraints.
\[
\begin{align*}
 x + 2y & \geq 4 \\
 3x + y & \geq 7 \\
 -x + 2y & \leq 7
\end{align*}
\]

**Solution**

The region determined by the constraints is shown in Figure 7.36. For this unbounded region, there is no maximum value of \( z \). To see this, note that the point (\( x, 0 \)) lies in the region for all values of \( x \geq 4 \). Substituting this point into the objective function, you get
\[ z = 4(x) + 2(0) = 4x \]

By choosing \( x \) to be large, you can obtain values of \( z \) that are as large as you want. So, there is no maximum value of \( z \). However, there is a minimum value of \( z \).

- At (1, 4): \[ z = 4(1) + 2(4) = 12 \] Minimum value of \( z \)
- At (2, 1): \[ z = 4(2) + 2(1) = 10 \]
- At (4, 0): \[ z = 4(4) + 2(0) = 16 \]

So, the minimum value of \( z \) is 10, and this occurs when \( x = 2 \) and \( y = 1 \).
Applications

Example 5 shows how linear programming can be used to find the maximum profit in a business application.

**Example 5** Optimal Profit

A candy manufacturer wants to maximize the combined profit for two types of boxed chocolates. A box of chocolate covered creams yields a profit of $1.50 per box, and a box of chocolate covered nuts yields a profit of $2.00 per box. Market tests and available resources have indicated the following constraints.

1. The combined production level should not exceed 1200 boxes per month.
2. The demand for a box of chocolate covered nuts is no more than half the demand for a box of chocolate covered creams.
3. The production level for chocolate covered creams should be less than or equal to 600 boxes plus three times the production level for chocolate covered nuts.

What is the maximum monthly profit? How many boxes of each type should be produced per month to yield the maximum profit?

**Solution**

Let \( x \) be the number of boxes of chocolate covered creams and let \( y \) be the number of boxes of chocolate covered nuts. So, the objective function (for the combined profit) is given by

\[
P = 1.5x + 2y.\]

The three constraints translate into the following linear inequalities.

1. \( x + y \leq 1200 \)
2. \( y \leq \frac{1}{2}x \)
3. \( x \leq 600 + 3y \)

Because neither \( x \) nor \( y \) can be negative, you also have the two additional constraints of \( x \geq 0 \) and \( y \geq 0 \). Figure 7.37 shows the region determined by the constraints. To find the maximum monthly profit, test the values of \( P \) at the vertices of the region.

- At \((0, 0)\): \( P = 1.5(0) + 2(0) = 0 \)
- At \((800, 400)\): \( P = 1.5(800) + 2(400) = 2000 \)
- At \((1050, 150)\): \( P = 1.5(1050) + 2(150) = 1875 \)
- At \((600, 0)\): \( P = 1.5(600) + 2(0) = 900 \)

So, the maximum monthly profit is $2000, and it occurs when the monthly production consists of 800 boxes of chocolate covered creams and 400 boxes of chocolate covered nuts.

**CHECK POINT** Now try Exercise 35.

In Example 5, if the manufacturer improved the production of chocolate covered creams so that they yielded a profit of $2.50 per unit, the maximum monthly profit could then be found using the objective function \( P = 2.5x + 2y \). By testing the values of \( P \) at the vertices of the region, you would find that the maximum monthly profit was $2925 and that it occurred when \( x = 1050 \) and \( y = 150 \).
Example 6  Optimal Cost

The liquid portion of a diet is to provide at least 300 calories, 36 units of vitamin A, and 90 units of vitamin C. A cup of dietary drink X costs $0.12 and provides 60 calories, 12 units of vitamin A, and 10 units of vitamin C. A cup of dietary drink Y costs $0.15 and provides 60 calories, 6 units of vitamin A, and 30 units of vitamin C. How many cups of each drink should be consumed each day to obtain an optimal cost and still meet the daily requirements?

Solution

As in Example 9 in Section 7.5, let \( x \) be the number of cups of dietary drink X and let \( y \) be the number of cups of dietary drink Y.

For calories: \[
60x + 60y \geq 300
\]
For vitamin A: \[
12x + 6y \geq 36
\]
For vitamin C: \[
10x + 30y \geq 90
\]
Constraints

The cost \( C \) is given by \( C = 0.12x + 0.15y \).  

Objective function

The graph of the region corresponding to the constraints is shown in Figure 7.38. Because you want to incur as little cost as possible, you want to determine the minimum cost. To determine the minimum cost, test \( C \) at each vertex of the region.

At \((0, 6)\): \[
C = 0.12(0) + 0.15(6) = 0.90
\]
At \((1, 4)\): \[
C = 0.12(1) + 0.15(4) = 0.72
\]
At \((3, 2)\): \[
C = 0.12(3) + 0.15(2) = 0.66
\]
Minimum value of \( C \)
At \((9, 0)\): \[
C = 0.12(9) + 0.15(0) = 1.08
\]

So, the minimum cost is $0.66 per day, and this occurs when 3 cups of drink X and 2 cups of drink Y are consumed each day.

CHECKPOINT Now try Exercise 37.

Classroom Discussion

Creating a Linear Programming Problem  Sketch the region determined by the following constraints.

\[
x + 2y \leq 8
\]
\[
x + y \leq 5
\]
\[
x \geq 0
\]
\[
y \geq 0
\]
Constraints

Find, if possible, an objective function of the form \( z = ax + by \) that has a maximum at each indicated vertex of the region.

a. \((0, 4)\)  b. \((2, 3)\)  c. \((5, 0)\)  d. \((0, 0)\)

Explain how you found each objective function.
7.6 EXERCISES

VOCABULARY: Fill in the blanks.

1. In the process called ________, you are asked to find the maximum or minimum value of a quantity.
2. One type of optimization strategy is called ________, ________.
3. The ________ function of a linear programming problem gives the quantity that is to be maximized or minimized.
4. The ________ of a linear programming problem determine the set of ________ ________.
5. The feasible solutions are ________ or ________ the boundary of the region corresponding to a system of constraints.
6. If a linear programming problem has a solution, it must occur at a ________ of the set of feasible solutions.

SKILLS AND APPLICATIONS

In Exercises 7–12, find the minimum and maximum values of the objective function and where they occur, subject to the indicated constraints. (For each exercise, the graph of the region determined by the constraints is provided.)

7. Objective function: 
   \[ z = 4x + 3y \]
   Constraints:
   \[ x \geq 0 \]
   \[ y \geq 0 \]
   \[ x + y \leq 5 \]

8. Objective function: 
   \[ z = 2x + 8y \]
   Constraints:
   \[ x \geq 0 \]
   \[ y \geq 0 \]
   \[ 2x + y \leq 4 \]

9. Objective function: 
   \[ z = 2x + 5y \]
   Constraints:
   \[ x \geq 0 \]
   \[ y \geq 0 \]
   \[ x + 3y \leq 15 \]
   \[ 4x + y \leq 16 \]

10. Objective function: 
    \[ z = 4x + 5y \]
    Constraints:
    \[ x \geq 0 \]
    \[ 2x + 3y \geq 6 \]
    \[ 3x - y \leq 9 \]
    \[ x + 4y \leq 16 \]

11. Objective function: 
    \[ z = 10x + 7y \]
    Constraints:
    \[ 0 \leq x \leq 60 \]
    \[ 0 \leq y \leq 45 \]
    \[ 5x + 6y \leq 420 \]

12. Objective function: 
    \[ z = 40x + 45y \]
    Constraints:
    \[ x \geq 0 \]
    \[ y \geq 0 \]
    \[ 8x + 9y \leq 7200 \]
    \[ 8x + 9y \geq 3600 \]

In Exercises 13–16, sketch the region determined by the constraints. Then find the minimum and maximum values of the objective function (if possible) and where they occur, subject to the indicated constraints.

13. Objective function: 
    \[ z = 3x + 2y \]
    Constraints:
    \[ x \geq 0 \]
    \[ 5x + 2y \leq 20 \]
    \[ 5x + y \geq 10 \]

14. Objective function: 
    \[ z = 5x + \frac{1}{2}y \]
    Constraints:
    \[ x \geq 0 \]
    \[ y \geq 0 \]
    \[ \frac{1}{2}x + y \leq 8 \]
    \[ x + \frac{1}{2}y \geq 4 \]

15. Objective function: 
    \[ z = 4x + 5y \]
    Constraints:
    \[ x \geq 0 \]
    \[ y \geq 0 \]
    \[ x + y \geq 8 \]
    \[ 3x + 5y \geq 30 \]

16. Objective function: 
    \[ z = 5x + 4y \]
    Constraints:
    \[ x \geq 0 \]
    \[ y \geq 0 \]
    \[ 2x + 2y \geq 10 \]
    \[ x + 2y \geq 6 \]
In Exercises 17–20, use a graphing utility to graph the region determined by the constraints. Then find the minimum and maximum values of the objective function and where they occur, subject to the constraints.

17. Objective function: \( z = 3x + y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( x + 4y \leq 60 \)
   \( 3x + 2y \geq 48 \)

18. Objective function: \( z = x \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( 2x + 3y \leq 60 \)
   \( 2x + y \leq 28 \)
   \( 4x + y \leq 48 \)

19. Objective function: \( z = x + 4y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( x + 4y \leq 20 \)
   \( x + y \leq 18 \)

20. Objective function: \( z = y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( 2x + 4y \leq 20 \)
   \( 2x + y \leq 4 \)

In Exercises 21–24, find the minimum and maximum values of the objective function and where they occur, subject to the constraints \( x \geq 0, y \geq 0, 3x + y \leq 15, \) and \( 4x + 3y \leq 30. \)

21. \( z = 2x + y \)
22. \( z = 5x + y \)
23. \( z = x + y \)
24. \( z = 3x + y \)

In Exercises 25–28, find the minimum and maximum values of the objective function and where they occur, subject to the constraints \( x \geq 0, y \geq 0, x + 4y \leq 20, x + y \leq 18, \) and \( 2x + 2y \leq 21. \)

25. \( z = x + 5y \)
26. \( z = 2x + 4y \)
27. \( z = 4x + 5y \)
28. \( z = 4x + y \)

In Exercises 29–34, the linear programming problem has an unusual characteristic. Sketch a graph of the solution region for the problem and describe the unusual characteristic. Find the minimum and maximum values of the objective function (if possible) and where they occur.

29. Objective function: \( z = 2.5x + y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( 3x + 5y \leq 15 \)
   \( 5x + 2y \leq 10 \)

30. Objective function: \( z = x + y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( -x + y \leq 1 \)
   \( -x + 2y \leq 4 \)

31. Objective function: \( z = -x + 2y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( x \leq 10 \)
   \( x + y \leq 7 \)

32. Objective function: \( z = x + y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( -x + y \leq 0 \)
   \( -3x + y \geq 3 \)

33. Objective function: \( z = 3x + 4y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( x + y \leq 1 \)
   \( 2x + y \leq 4 \)

34. Objective function: \( z = x + 2y \)
   Constraints: \( x \geq 0 \)
   \( y \geq 0 \)
   \( x \leq 2y \)
   \( 2x + y \leq 4 \)

35. OPTIMAL PROFIT A merchant plans to sell two models of MP3 players at prices of $225 and $250. The $225 model yields a profit of $30 per unit and the $250 model yields a profit of $31 per unit. The merchant estimates that the total monthly demand will not exceed 275 units. The merchant does not want to invest more than $63,000 in inventory for these products. What is the optimal inventory level for each model? What is the optimal profit?

36. OPTIMAL PROFIT A manufacturer produces two models of elliptical cross-training exercise machines. The times for assembling, finishing, and packaging model X are 3 hours, 3 hours, and 0.8 hour, respectively. The times for model Y are 4 hours, 2.5 hours, and 0.4 hour. The total times available for assembling, finishing, and packaging are 6000 hours, 4200 hours, and 950 hours, respectively. The profits per unit are $300 for model X and $375 for model Y. What is the optimal production level for each model? What is the optimal profit?

37. OPTIMAL COST An animal shelter mixes two brands of dog food. Brand X costs $25 per bag and contains two units of nutritional element A, two units of element B, and two units of element C. Brand Y costs $20 per bag and contains one unit of nutritional element A, nine units of element B, and three units of element C. The minimum required amounts of nutrients A, B, and C are 12 units, 36 units, and 24 units, respectively. What is the optimal number of bags of each brand that should be mixed? What is the optimal cost?

38. OPTIMAL COST A humanitarian agency can use two models of vehicles for a refugee rescue mission. Each model A vehicle costs $1000 and each model B vehicle costs $1500. Mission strategies and objectives indicate the following constraints.
• A total of at least 20 vehicles must be used.
• A model A vehicle can hold 45 boxes of supplies. A model B vehicle can hold 30 boxes of supplies. The agency must deliver at least 690 boxes of supplies to the refugee camp.
• A model A vehicle can hold 20 refugees. A model B vehicle can hold 32 refugees. The agency must rescue at least 520 refugees.

What is the optimal number of vehicles of each model that should be used? What is the optimal cost?

39. OPTIMAL REVENUE An accounting firm has 780 hours of staff time and 272 hours of reviewing time available each week. The firm charges $1600 for an audit and $250 for a tax return. Each audit requires 60 hours of staff time and 16 hours of review time. Each tax return requires 10 hours of staff time and 4 hours of review time. What numbers of audits and tax returns will yield an optimal revenue? What is the optimal revenue?

40. OPTIMAL REVENUE. The accounting firm in Exercise 39 lowers its charge for an audit to $1400. What numbers of audits and tax returns will yield an optimal revenue? What is the optimal revenue?

41. MEDIA SELECTION A company has budgeted a maximum of $1,000,000 for national advertising of an allergy medication. Each minute of television time costs $100,000 and each one-page newspaper ad costs $20,000. Each television ad is expected to be viewed by 20 million viewers, and each newspaper ad is expected to be seen by 5 million readers. The company’s market research department recommends that at most 80% of the advertising budget be spent on television ads. What is the optimal amount that should be spent on each type of ad? What is the optimal total audience?

42. OPTIMAL COST According to AAA (Automobile Association of America), on March 27, 2009, the national average price per gallon of regular unleaded (87-octane) gasoline was $2.03, and the price of premium unleaded (93-octane) gasoline was $2.23.
(a) Write an objective function that models the cost of the blend of mid-grade unleaded gasoline (89-octane).
(b) Determine the constraints for the objective function in part (a).
(c) Sketch a graph of the region determined by the constraints from part (b).
(d) Determine the blend of regular and premium unleaded gasoline that results in an optimal cost of mid-grade unleaded gasoline.
(e) What is the optimal cost?
(f) Is the cost lower than the national average of $2.15 per gallon for mid-grade unleaded gasoline?

43. INVESTMENT PORTFOLIO An investor has up to $250,000 to invest in two types of investments. Type A pays 8% annually and type B pays 10% annually. To have a well-balanced portfolio, the investor imposes the following conditions. At least one-fourth of the total portfolio is to be allocated to type A investments and at least one-fourth of the portfolio is to be allocated to type B investments. What is the optimal amount that should be invested in each type of investment? What is the optimal return?

44. INVESTMENT PORTFOLIO An investor has up to $450,000 to invest in two types of investments. Type A pays 6% annually and type B pays 10% annually. To have a well-balanced portfolio, the investor imposes the following conditions. At least one-half of the total portfolio is to be allocated to type A investments and at least one-fourth of the portfolio is to be allocated to type B investments. What is the optimal amount that should be invested in each type of investment? What is the optimal return?

EXPLORATION

TRUE OR FALSE? In Exercises 45–47, determine whether the statement is true or false. Justify your answer.

45. If an objective function has a maximum value at the vertices (4, 7) and (8, 3), you can conclude that it also has a maximum value at the points (4.5, 6.5) and (7.8, 3.2).
46. If an objective function has a minimum value at the vertex (20, 0), you can conclude that it also has a minimum value at the point (0, 0).
47. When solving a linear programming problem, if the objective function has a maximum value at more than one vertex, you can assume that there are an infinite number of points that will produce the maximum value.

48. CAPSTONE Using the constraint region shown below, determine which of the following objective functions has (a) a maximum at vertex A, (b) a maximum at vertex B, (c) a maximum at vertex C, and (d) a minimum at vertex C.
(i) $z = 2x + y$
(ii) $z = 2x - y$
(iii) $z = -x + 2y$

</table>
| Use the method of substitution to solve systems of linear equations in two variables (p. 494). | **Method of Substitution**  
1. Solve one of the equations for one variable in terms of the other.  
2. Substitute the expression found in Step 1 into the other equation to obtain an equation in one variable.  
3. Solve the equation obtained in Step 2.  
4. Back-substitute the value obtained in Step 3 into the expression obtained in Step 1 to find the value of the other variable.  
5. Check that the solution satisfies each of the original equations. | 1–6 |
| Use the method of substitution to solve systems of nonlinear equations in two variables (p. 497). | The method of substitution (see steps above) can be used to solve systems in which one or both of the equations are nonlinear. (See Examples 3 and 4.) | 7–10 |
| Use a graphical approach to solve systems of equations in two variables (p. 498). |  
| ![Graphical Approach](image) | 11–18 |
| Use systems of equations to model and solve real-life problems (p. 499). | A system of equations can be used to find the break-even point for a company. (See Example 6.) | 19–24 |
| Use the method of elimination to solve systems of linear equations in two variables (p. 505). | **Method of Elimination**  
1. Obtain coefficients for x (or y) that differ only in sign.  
2. Add the equations to eliminate one variable.  
3. Solve the equation obtained in Step 2.  
4. Back-substitute the value obtained in Step 3 into either of the original equations and solve for the other variable.  
5. Check that the solution satisfies each of the original equations. | 25–32 |
| Interpret graphically the numbers of solutions of systems of linear equations in two variables (p. 508). |  
| ![Graphical Interpretation](image) | 33–36 |
| Use systems of linear equations in two variables to model and solve real-life problems (p. 511). | A system of linear equations in two variables can be used to find the equilibrium point for a particular market. (See Example 9.) | 37, 38 |
| Section 7.3 | Use back-substitution to solve linear systems in row-echelon form (p. 517). | Use Gaussian elimination to solve systems of linear equations (p. 518). | To produce an equivalent system of linear equations, use row operations by (1) interchanging two equations, (2) multiplying one equation by a nonzero constant, or (3) adding a multiple of one of the equations to another equation to replace the latter equation. |
| Section 7.4 | Solve nonsquare systems of linear equations (p. 522). | Recognize partial fraction decompositions of rational expressions (p. 530). | In a nonsquare system, the number of equations differs from the number of variables. A system of linear equations cannot have a unique solution unless there are at least as many equations as there are variables. |
| Section 7.5 | Use systems of linear equations in three or more variables to model and solve real-life problems (p. 523). | Find partial fraction decompositions of rational expressions (p. 531). | A system of linear equations in three variables can be used to find the position equation of an object that is moving in a (vertical) line with constant acceleration. (See Example 7.) |
| | Sketch the graphs of inequalities in two variables (p. 538). | Sketch the graphs of inequalities in two variables (p. 538). | The techniques used for determining constants in the numerators of partial fractions vary slightly, depending on the type of factors of the denominator: linear or quadratic, distinct or repeated. |
| Section 7.6 | Solve systems of inequalities (p. 540). | Use systems of inequalities in two variables to model and solve real-life problems (p. 543). | A system of inequalities in two variables can be used to find the consumer surplus and producer surplus for given demand and supply functions. (See Example 8.) |
| | Solve linear programming problems (p. 549). | Solve linear programming problems (p. 549). | To solve a linear programming problem, (1) sketch the region corresponding to the system of constraints, (2) find the vertices of the region, and (3) test the objective function at each of the vertices and select the values of the variables that optimize the objective function. |
| | Use linear programming to model and solve real-life problems (p. 553). | Use linear programming to model and solve real-life problems (p. 553). | Linear programming can be used to find the maximum profit in business applications. (See Example 5.) |
In Exercises 1–10, solve the system by the method of substitution.

1. \[ \begin{align*}
    x + y &= 2 \\
    x - y &= 0
\end{align*} \]

2. \[ \begin{align*}
    2x - 3y &= 3 \\
    x - y &= 0
\end{align*} \]

3. \[ \begin{align*}
    4x - y - 1 &= 0 \\
    8x + y - 17 &= 0
\end{align*} \]

4. \[ \begin{align*}
    10x + 6y + 14 &= 0 \\
    x + 9y + 7 &= 0
\end{align*} \]

5. \[ \begin{align*}
    0.5x + y &= 0.75 \\
    1.25x - 4.5y &= -2.5
\end{align*} \]

6. \[ \begin{align*}
    -x + \frac{2}{3}y &= \frac{3}{5} \\
    -x + \frac{1}{3}y &= -\frac{4}{5}
\end{align*} \]

7. \[ \begin{align*}
    x^2 - y^2 &= 9 \\
    x - y &= 1
\end{align*} \]

8. \[ \begin{align*}
    x^2 + y^2 &= 169 \\
    3x + 2y &= 39
\end{align*} \]

9. \[ \begin{align*}
    y &= 2x \\
    y &= x^4 - 2x^2
\end{align*} \]

10. \[ \begin{align*}
    x &= y + 3 \\
    x &= y^2 + 1
\end{align*} \]

In Exercises 11–14, solve the system graphically.

11. \[ \begin{align*}
    2x - y &= 10 \\
    x + 5y &= -6
\end{align*} \]

12. \[ \begin{align*}
    8x - 3y &= -3 \\
    2x + 5y &= 28
\end{align*} \]

13. \[ \begin{align*}
    y &= 2x^2 - 4x + 1 \\
    y &= x^2 - 4x + 3
\end{align*} \]

14. \[ \begin{align*}
    y^2 - 2y + x &= 0 \\
    x + y &= 0
\end{align*} \]

In Exercises 15–18, use a graphing utility to solve the system of equations. Find the solution accurate to two decimal places.

15. \[ \begin{align*}
    y &= -2e^{-x} \\
    2e^x + y &= 0
\end{align*} \]

16. \[ \begin{align*}
    x^2 + y^2 &= 100 \\
    2x - 3y &= -12
\end{align*} \]

17. \[ \begin{align*}
    y &= 2 + \log x \\
    y &= \frac{3}{4}x + 5
\end{align*} \]

18. \[ \begin{align*}
    y &= \ln(x - 1) - 3 \\
    y &= 4 - \frac{1}{2}x
\end{align*} \]

19. **BREAK-EVEN ANALYSIS** You set up a scrapbook business and make an initial investment of $50,000. The unit cost of a scrapbook kit is $12 and the selling price is $25. How many kits must you sell to break even?

20. **CHOICE OF TWO JOBS** You are offered two sales jobs at a pharmaceutical company. One company offers an annual salary of $55,000 plus a year-end bonus of 1.5% of your total sales. The other company offers an annual salary of $52,000 plus a year-end bonus of 2% of your total sales. What amount of sales will make the second offer better? Explain.

21. **GEOMETRY** The perimeter of a rectangle is 480 meters and its length is 150% of its width. Find the dimensions of the rectangle.

22. **GEOMETRY** The perimeter of a rectangle is 68 feet and its width is \( \frac{3}{5} \) times its length. Find the dimensions of the rectangle.

23. **GEOMETRY** The perimeter of a rectangle is 40 inches. The area of the rectangle is 96 square inches. Find the dimensions of the rectangle.

24. **BODY MASS INDEX** Body Mass Index (BMI) is a measure of body fat based on height and weight. The 75th percentile BMI for females, ages 9 to 20, is growing more slowly than that for males of the same age range. Models that represent the 75th percentile BMI for males and females, ages 9 to 20, are given by

\[ B = 0.73a + 11 \quad \text{Males} \]

\[ B = 0.61a + 12.8 \quad \text{Females} \]

where \( B \) is the BMI (kg/m²) and \( a \) represents the age, with \( a = 9 \) corresponding to 9 years of age. Use a graphing utility to determine whether the BMI for males ever exceeds the BMI for females. (Source: National Center for Health Statistics)

In Exercises 25–32, solve the system by the method of elimination.

25. \[ \begin{align*}
    2x - y &= 2 \\
    6x + 8y &= 39
\end{align*} \]

26. \[ \begin{align*}
    40x + 30y &= 24 \\
    20x - 50y &= -14
\end{align*} \]

27. \[ \begin{align*}
    0.2x + 0.3y &= 0.14 \\
    0.4x + 0.5y &= 0.20
\end{align*} \]

28. \[ \begin{align*}
    12x + 42y &= -17 \\
    30x - 18y &= 19
\end{align*} \]

29. \[ \begin{align*}
    3x - 2y &= 0 \\
    3x + 2(y + 5) &= 10
\end{align*} \]

30. \[ \begin{align*}
    7x + 12y &= 63 \\
    2x + 3(y + 2) &= 21
\end{align*} \]

31. \[ \begin{align*}
    1.25x - 2y &= 3.5 \\
    5x - 8y &= 14
\end{align*} \]

32. \[ \begin{align*}
    1.5x + 2.5y &= 8.5 \\
    6x + 10y &= 24
\end{align*} \]

In Exercises 33–36, match the system of linear equations with its graph. Describe the number of solutions and state whether the system is consistent or inconsistent. [The graphs are labeled (a), (b), (c), and (d).]
In Exercises 37 and 38, find the equilibrium point of the demand and supply equations.

**Demand**

\[ p = 37 - 0.0002x \]

**Supply**

\[ p = 22 + 0.00001x \]

**SUPPLY AND DEMAND** In Exercises 37 and 38, find the equilibrium point of the demand and supply equations.

\[
\begin{align*}
33. \quad & \begin{cases}
\text{Demand} \\
\text{Supply}
\end{cases} \\
& \begin{cases}
x + 5y = 4 \\
x - 3y = 6
\end{cases} \\
\begin{cases}
x - 3y = 7 \\
-6x + 2y = 8
\end{cases}
\] \\
34. \quad & \begin{cases}
-3x + y = -7 \\
9x - 3y = 21
\end{cases} \\
35. \quad & \begin{cases}
2x - y = -3 \\
x + 5y = 4
\end{cases}
\]

**7.3** In Exercises 39–42, use back-substitution to solve the system of linear equations.

39. \[ \begin{cases}
x - 4y + 3z = 3 \\
y + z = -1 \\
z = 5
\end{cases} \]

40. \[ \begin{cases}
x - 7y + 8z = 85 \\
y - 9z = -35 \\
z = 3
\end{cases} \]

41. \[ \begin{cases}
4x - 3y - 2z = -65 \\
8y - 7z = -14 \\
z = 10
\end{cases} \]

42. \[ \begin{cases}
5x - 7z = 9 \\
3y - 8z = -4 \\
z = 7
\end{cases} \]

In Exercises 43–48, use Gaussian elimination to solve the system of equations.

43. \[ \begin{cases}
x + 2y + 6z = 4 \\
-3x + 2y - z = -4 \\
4x + 2z = 16
\end{cases} \]

44. \[ \begin{cases}
x + 3y - z = 13 \\
2x - 5z = 23 \\
4x - y - 2z = 14
\end{cases} \]

45. \[ \begin{cases}
x - 2y + z = -6 \\
2x - 3y = -7 \\
x + 3y - 3z = 11
\end{cases} \]

46. \[ \begin{cases}
x + 6z = -9 \\
3x - 2y + 11z = -16 \\
3x - y + 7z = -11
\end{cases} \]

47. \[ \begin{cases}
x + 4w = 1 \\
3y + z - w = 4 \\
2y - 3w = 2 \\
4x - y + 2z = 5
\end{cases} \]

48. \[ \begin{cases}
x + y + z + w = 6 \\
3x + 4y - w = 3 \\
-2x + 3y + z + 3w = 6 \\
x + 4y - z + 2w = 7
\end{cases} \]

In Exercises 49 and 50, solve the nonsquare system of equations.

49. \[ \begin{cases}
x - 12y + 7z = 16 \\
x - 7y + 4z = 9 \\
x + 8y - 31z = 54
\end{cases} \]

50. \[ \begin{cases}
x + 5y - 19z = 34 \\
x + 8y - 31z = 54
\end{cases} \]

In Exercises 51 and 52, find the equation of the parabola \( y = ax^2 + bx + c \) that passes through the points. To verify your result, use a graphing utility to plot the points and graph the parabola.

51. \[ \begin{cases}
0 \quad 2 \quad 4 \\
1 \quad 0 \quad -2
\end{cases} \]

52. \[ \begin{cases}
0 \quad 2 \quad 4 \\
1 \quad 0 \quad -2
\end{cases} \]

In Exercises 53 and 54, find the equation of the circle \( x^2 + y^2 + Dx + Ey + F = 0 \) that passes through the points. To verify your result, use a graphing utility to plot the points and graph the circle.

53. \[ \begin{cases}
0 \quad 2 \quad 4 \\
1 \quad 0 \quad -2
\end{cases} \]

54. \[ \begin{cases}
0 \quad 2 \quad 4 \\
1 \quad 0 \quad -2
\end{cases} \]

55. **DATA ANALYSIS: ONLINE SHOPPING** The table shows the projected online retail sales \( y \) (in billions of dollars) in the United States from 2010 through 2012. (Source: Forrester Research, Inc.)

<table>
<thead>
<tr>
<th>Year</th>
<th>Online retail sales, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2010</td>
<td>267.8</td>
</tr>
<tr>
<td>2011</td>
<td>301.0</td>
</tr>
<tr>
<td>2012</td>
<td>334.7</td>
</tr>
</tbody>
</table>

(a) Use the technique demonstrated in Exercises 77–80 in Section 7.3 to set up a system of equations for the data and to find a least squares regression parabola that models the data. Let \( x \) represent the year, with \( x = 10 \) corresponding to 2010.

(b) Use a graphing utility to graph the parabola and the data in the same viewing window. How well does the model fit the data?

(c) Use the model to estimate the online retail sales in the United States in 2015. Does your answer seem reasonable?
56. **AGRICULTURE** A mixture of 6 gallons of chemical A, 8 gallons of chemical B, and 13 gallons of chemical C is required to kill a destructive crop insect. Commercial spray X contains 1, 2, and 2 parts, respectively, of these chemicals. Commercial spray Y contains only chemical C. Commercial spray Z contains chemicals A, B, and C in equal amounts. How much of each type of commercial spray is needed to get the desired mixture?

57. **INVESTMENT ANALYSIS** An inheritance of $40,000 was divided among three investments yielding $3500 in interest per year. The interest rates for the three investments were 7%, 9%, and 11%. Find the amount placed in each investment if the second and third were $3000 and $5000 less than the first, respectively.

58. **VERTICAL MOTION** An object moving vertically is at the given heights at the specified times. Find the position equation

\[ s = \frac{1}{2}at^2 + v_0t + s_0 \]

for the object.

(a) At \( t = 1 \) second, \( s = 134 \) feet

At \( t = 2 \) seconds, \( s = 86 \) feet

At \( t = 3 \) seconds, \( s = 6 \) feet

(b) At \( t = 1 \) second, \( s = 184 \) feet

At \( t = 2 \) seconds, \( s = 116 \) feet

At \( t = 3 \) seconds, \( s = 16 \) feet

59. **SPORTS** Pebble Beach Golf Links in Pebble Beach, California is an 18-hole course that consists of par-3 holes, par-4 holes, and par-5 holes. There are two more par-4 holes than twice the number of par-5 holes, and the number of par-3 holes is equal to the number of par-5 holes. Find the numbers of par-3, par-4, and par-5 holes on the course. *(Source: Pebble Beach Resorts)*

60. **SPORTS** St Andrews Golf Course in St Andrews, Scotland is one of the oldest golf courses in the world. It is an 18-hole course that consists of par-3 holes, par-4 holes, and par-5 holes. There are seven times as many par-4 holes as par-5 holes, and the sum of the numbers of par-3 and par-5 holes is four. Find the numbers of par-3, par-4, and par-5 holes on the course. *(Source: St Andrews Links Trust)*

74. In Exercises 61–64, write the form of the partial fraction decomposition for the rational expression. Do not solve for the constants.

61. \[ \frac{3}{x^2 + 20x} \]

62. \[ \frac{x - 8}{x^2 - 3x - 28} \]

63. \[ \frac{3x - 4}{x^3 - 5x^2} \]

64. \[ \frac{x - 2}{x(x^2 + 2)^2} \]

In Exercises 65–72, write the partial fraction decomposition of the rational expression.

65. \[ \frac{4 - x}{x^3 + 6x + 8} \]

66. \[ \frac{-x}{x^2 + 3x + 2} \]

67. \[ \frac{x^2}{x^2 + 2x - 15} \]

68. \[ \frac{9}{x^2 - 9} \]

69. \[ \frac{x^2 + 2x}{x^3 - x^2 + x - 1} \]

70. \[ \frac{4x}{3(x - 1)^2} \]

71. \[ \frac{3x^2 + 4x}{(x^2 + 1)^2} \]

72. \[ \frac{4x^2}{(x - 1)(x^2 + 1)} \]

75. In Exercises 73–78, sketch the graph of the inequality.

73. \[ y \leq 5 - \frac{1}{2}x \]

74. \[ 3y - x \geq 7 \]

75. \[ y - 4x^2 > -1 \]

76. \[ y \leq \frac{3}{x^2 + 2} \]

77. \[ (x - 1)^2 + (y - 3)^2 < 16 \]

78. \[ x^2 + (y + 5)^2 > 1 \]

In Exercises 79–86, sketch the graph and label the vertices of the solution set of the system of inequalities.

79. \[ \begin{cases} x + 2y \leq 160 \\ 3x + y \leq 180 \\ x \geq 0 \\ y \geq 0 \end{cases} \]

80. \[ \begin{cases} 2x + 3y \leq 24 \\ 2x + y \leq 16 \\ x \geq 0 \\ y \geq 0 \end{cases} \]

81. \[ \begin{cases} 3x + 2y \geq 24 \\ x + 2y \geq 12 \\ 2 \leq x \leq 15 \\ y \leq 15 \end{cases} \]

82. \[ \begin{cases} 2x + y \geq 16 \\ x + 3y \geq 18 \\ 0 \leq x \leq 25 \\ 0 \leq y \leq 25 \end{cases} \]

83. \[ \begin{cases} y < x + 1 \\ y > x^2 - 1 \end{cases} \]

84. \[ \begin{cases} y \leq 6 - 2x - x^2 \\ y \geq x + 6 \end{cases} \]

85. \[ \begin{cases} 2x - 3y \geq 0 \\ 2x - y \leq 8 \\ y \geq 0 \end{cases} \]

86. \[ \begin{cases} x^2 + y^2 \leq 9 \\ (x - 3)^2 + y^2 \leq 9 \end{cases} \]
87. **INVENTORY COSTS** A warehouse operator has 24,000 square feet of floor space in which to store two products. Each unit of product I requires 20 square feet of floor space and costs $12 per day to store. Each unit of product II requires 30 square feet of floor space and costs $8 per day to store. The total storage cost per day cannot exceed $12,400. Find and graph a system of inequalities describing all possible inventory levels.

88. **NUTRITION** A dietitian is asked to design a special dietary supplement using two different foods. Each ounce of food X contains 12 units of calcium, 10 units of iron, and 20 units of vitamin B. Each ounce of food Y contains 15 units of calcium, 20 units of iron, and 12 units of vitamin B. The minimum daily requirements of the diet are 300 units of calcium, 280 units of iron, and 300 units of vitamin B.

(a) Write a system of inequalities describing the different amounts of food X and food Y that can be used.

(b) Sketch a graph of the region in part (a).

(c) Find two solutions to the system and interpret their meanings in the context of the problem.

**SUPPLY AND DEMAND** In Exercises 89 and 90, (a) graph the systems representing the consumer surplus and producer surplus for the supply and demand equations and (b) find the consumer surplus and producer surplus.

<table>
<thead>
<tr>
<th>Demand</th>
<th>Supply</th>

93. **Objective function:** \( z = 3x + 4y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ 2x + 5y \leq 50 \]
\[ 4x + y \leq 28 \]

94. **Objective function:** \( z = 10x + 7y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ 2x + y \geq 100 \]
\[ x + y \geq 75 \]

95. **Objective function:** \( z = 1.75x + 2.25y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ 2x + y \geq 25 \]
\[ 3x + 2y \geq 45 \]

96. **Objective function:** \( z = 50x + 70y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ x + 2y \leq 1500 \]
\[ 5x + 2y \leq 3500 \]

97. **Objective function:** \( z = 5x + 11y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ x + 3y \leq 12 \]
\[ 3x + 2y \leq 15 \]

98. **Objective function:** \( z = -2x + y \)

**Constraints:**

\[ x \geq 0 \]
\[ y \geq 0 \]
\[ x + y \geq 7 \]
\[ 5x + 2y \geq 20 \]

99. **OPTIMAL REVENUE** A student is working part time as a hairdresser to pay college expenses. The student may work no more than 24 hours per week. Haircuts cost $25 and require an average of 20 minutes, and permanents cost $70 and require an average of 1 hour and 10 minutes. What combination of haircuts and/or permanents will yield an optimal revenue? What is the optimal revenue?
100. **OPTIMAL PROFIT** A shoe manufacturer produces a walking shoe and a running shoe yielding profits of $18 and $24, respectively. Each shoe must go through three processes, for which the required times per unit are shown in the table.

<table>
<thead>
<tr>
<th>Process</th>
<th>Process I</th>
<th>Process II</th>
<th>Process III</th>
</tr>
</thead>
<tbody>
<tr>
<td>Walking shoe hours</td>
<td>4</td>
<td>1</td>

</tr>
<tr>
<td>Running shoe hours</td>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>Hours available per day</td>
<td>24</td>
<td>9</td>
<td>8</td>
</tr>
</tbody>
</table>

What is the optimal production level for each type of shoe? What is the optimal profit?

101. **OPTIMAL PROFIT** A manufacturer produces two models of bicycles. The times (in hours) required for assembling, painting, and packaging each model are shown in the table.

<table>
<thead>
<tr>
<th>Process</th>
<th>Hours, model A</th>
<th>Hours, model B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assembling</td>
<td>2</td>
<td>2.5</td>
</tr>
<tr>
<td>Painting</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>Packaging</td>
<td>1</td>
<td>0.75</td>
</tr>
</tbody>
</table>

The total times available for assembling, painting, and packaging are 4000 hours, 4800 hours, and 1500 hours, respectively. The profits per unit are $45 for model A and $50 for model B. What is the optimal production level for each model? What is the optimal profit?

102. **OPTIMAL COST** A pet supply company mixes two brands of dry dog food. Brand X costs $15 per bag and contains eight units of nutritional element A, one unit of nutritional element B, and two units of nutritional element C. Brand Y costs $30 per bag and contains two units of nutritional element A, one unit of nutritional element B, and seven units of nutritional element C. Each bag of mixed dog food must contain at least 16 units of A, 5 units, and 20 units of nutritional elements A, B, and C, respectively. Find the numbers of bags of brands X and Y that should be mixed to produce a mixture meeting the minimum nutritional requirements and having an optimal cost. What is the optimal cost?

103. **OPTIMAL COST** Regular unleaded gasoline and premium unleaded gasoline have octane ratings of 87 and 93, respectively. For the week of March 23, 2009, regular unleaded gasoline in Houston, Texas averaged $1.85 per gallon. For the same week, premium unleaded gasoline averaged $2.10 per gallon. Determine the blend of regular and premium unleaded gasoline that results in an optimal cost of mid-grade unleaded (89-octane) gasoline. What is the optimal cost?

(Source: Energy Information Administration)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 104–106, determine whether the statement is true or false. Justify your answer.

104. If a system of equations consists of a circle and a parabola, it is possible for the system to have three solutions.

105. The system

\[
\begin{align*}
  y &\leq 5 \\
  y &\geq -2 \\
  y &\geq \frac{2}{3}x - 9 \\
  y &\geq -\frac{2}{5}x + 26
\end{align*}
\]

represents the region covered by an isosceles trapezoid.

106. It is possible for an objective function of a linear programming problem to have exactly 10 maximum value points.

In Exercises 107–110, find a system of linear equations having the ordered pair as a solution. (There are many correct answers.)

107. (−8, 10) 108. (5, −4)

109. \(\left(\frac{4}{3}, 3\right)\) 110. \(\left(−2, \frac{11}{3}\right)\)

In Exercises 111–114, find a system of linear equations having the ordered triple as a solution. (There are many correct answers.)

111. (4, −1, 3)

112. (−3, 5, 6)

113. \(\left(\frac{5}{2}, 2\right)\)

114. \(\left(−\frac{3}{2}, −2, −\frac{3}{4}\right)\)

115. **WRITING** Explain what is meant by an inconsistent system of linear equations.

116. How can you tell graphically that a system of linear equations in two variables has no solution? Give an example.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1–3, solve the system by the method of substitution.

1. \[
\begin{aligned}
    x + y &= -9 \\
    5x - 8y &= 20
\end{aligned}
\]

2. \[
\begin{aligned}
    y &= x - 1 \\
    y &= (x - 1)^3
\end{aligned}
\]

3. \[
\begin{aligned}
    2x - y^2 &= 0 \\
    x - y &= 4
\end{aligned}
\]

In Exercises 4–6, solve the system graphically.

4. \[
\begin{aligned}
    3x - 6y &= 0 \\
    3x + 6y &= 18
\end{aligned}
\]

5. \[
\begin{aligned}
    y &= 9 - x^2 \\
    y &= x + 3
\end{aligned}
\]

6. \[
\begin{aligned}
    y - \ln x &= 12 \\
    7x - 2y + 11 &= -6
\end{aligned}
\]

In Exercises 7–10, solve the linear system by the method of elimination.

7. \[
\begin{aligned}
    3x + 4y &= -26 \\
    7x - 5y &= 11
\end{aligned}
\]

8. \[
\begin{aligned}
    1.4x - y &= 17 \\
    0.8x + 6y &= -10
\end{aligned}
\]

9. \[
\begin{aligned}
    x - 2y + 3z &= 11 \\
    2x - z &= 3 \\
    3y + z &= -8
\end{aligned}
\]

10. \[
\begin{aligned}
    3x + 2y + z &= 17 \\
    -x + y + z &= 4 \\
    x - y - z &= 3
\end{aligned}
\]

In Exercises 11–14, write the partial fraction decomposition of the rational expression.

11. \[
\frac{2x + 5}{x^2 - x - 2}
\]

12. \[
\frac{3x^2 - 2x + 4}{x^2(2 - x)}
\]

13. \[
\frac{x^2 + 5}{x^3 - x}
\]

14. \[
\frac{x^2 - 4}{x^3 + 2x}
\]

In Exercises 15–17, sketch the graph and label the vertices of the solution of the system of inequalities.

15. \[
\begin{aligned}
    2x + y &\leq 4 \\
    2x - y &\geq 0 \\
    x &\geq 0
\end{aligned}
\]

16. \[
\begin{aligned}
    y &< -x^2 + x + 4 \\
    y &> 4x
\end{aligned}
\]

17. \[
\begin{aligned}
    x^2 + y^2 &\leq 36 \\
    x &\geq 2 \\
    y &\geq -4
\end{aligned}
\]

18. Find the maximum and minimum values of the objective function \(z = 20x + 12y\), and where they occur, subject to the following constraints.

\[
\begin{aligned}
    x &\geq 0 \\
    y &\geq 0 \\
    x + 4y &\leq 32 \\
    3x + 2y &\leq 36
\end{aligned}
\]

Constraints

19. A total of $50,000 is invested in two funds paying 4% and 5.5% simple interest. The yearly interest is $2390. How much is invested at each rate?

20. Find the equation of the parabola \(y = ax^2 + bx + c\) passing through the points \((0, 6), (-2, 2),\) and \((3, \frac{1}{2})\).

21. A manufacturer produces two types of television stands. The amounts (in hours) of time for assembling, staining, and packaging the two models are shown in the table at the left. The total amounts of time available for assembling, staining, and packaging are 4000, 8950, and 2650 hours, respectively. The profits per unit are $30 (model I) and $40 (model II). What is the optimal inventory level for each model? What is the optimal profit?

<table>

TABLE FOR 21
PROOFS IN MATHEMATICS

An indirect proof can be useful in proving statements of the form “p implies q.” Recall that the conditional statement \( p \implies q \) is false only when \( p \) is true and \( q \) is false. To prove a conditional statement indirectly, assume that \( p \) is true and \( q \) is false. If this assumption leads to an impossibility, then you have proved that the conditional statement is true. An indirect proof is also called a proof by contradiction.

You can use an indirect proof to prove the following conditional statement, “If \( a \) is a positive integer and \( a^2 \) is divisible by 2, then \( a \) is divisible by 2,” as follows. First, assume that \( a \) is a positive integer and \( a^2 \) is divisible by 2, is true and \( a \) is divisible by 2, is false. This means that \( a \) is not divisible by 2. If so, \( a \) is odd and can be written as \( a = 2n + 1 \), where \( n \) is an integer.

\[
a = 2n + 1 \\
a^2 = 4n^2 + 4n + 1 \\
a^2 = 2(2n^2 + 2n) + 1
\]

So, by the definition of an odd integer, \( a^2 \) is odd. This contradicts the assumption, and you can conclude that \( a \) is divisible by 2.

Example  Using an Indirect Proof

Use an indirect proof to prove that \( \sqrt{2} \) is an irrational number.

Solution

Begin by assuming that \( \sqrt{2} \) is not an irrational number. Then \( \sqrt{2} \) can be written as the quotient of two integers \( a \) and \( b \) (\( b \neq 0 \)) that have no common factors.

\[
\sqrt{2} = \frac{a}{b} \quad \text{Assume that } \sqrt{2} \text{ is a rational number.}
\]

\[
2 = \frac{a^2}{b^2} \quad \text{Square each side.}
\]

2. This implies that 2 is a factor of \( a^2 \). So, 2 is also a factor of \( a \), and \( a \) can be written as \( 2c \), where \( c \) is an integer.

\[
2b^2 = (2c)^2 \quad \text{Substitute } 2c \text{ for } a.
\]

\[
2b^2 = 4c^2 \quad \text{Simplify.}
\]

\[
b^2 = 2c^2 \quad \text{Divide each side by 2.}
\]

This implies that 2 is a factor of \( b^2 \) and also a factor of \( b \). So, 2 is a factor of both \( a \) and \( b \). This contradicts the assumption that \( a \) and \( b \) have no common factors. So, you can conclude that \( \sqrt{2} \) is an irrational number.
1. A theorem from geometry states that if a triangle is inscribed in a circle such that one side of the triangle is a diameter of the circle, then the triangle is a right triangle. Show that this theorem is true for the circle and the triangle formed by the lines
   \[ y = 0, \quad y = -\frac{1}{2}x + 5, \text{ and } y = -2x + 20. \]
2. Find \( k_1 \) and \( k_2 \) such that the system of equations has an infinite number of solutions.
   \[
   \begin{cases}
   3x - 5y = 8 \\
   2x + ky = k_2
   \end{cases}
   \]
3. Consider the following system of linear equations in \( x \) and \( y \).
   \[
   \begin{cases}
   ax + by = e \\
   cx + dy = f
   \end{cases}
   \]
   Under what conditions will the system have exactly one solution?
4. Graph the lines determined by each system of linear equations. Then use Gaussian elimination to solve each system. At each step of the elimination process, graph the corresponding lines. What do you observe?
   (a) \[
   \begin{cases}
   x - 4y = -3 \\
   5x - 6y = 13
   \end{cases}
   \]
   (b) \[
   \begin{cases}
   2x - 3y = 7 \\
   -4x + 6y = -14
   \end{cases}
   \]
5. A system of two equations in two unknowns is solved and has a finite number of solutions. Determine the maximum number of solutions of the system satisfying each condition.
   (a) Both equations are linear.
   (b) One equation is linear and the other is quadratic.
   (c) Both equations are quadratic.
6. In the 2008 presidential election, approximately 125.2 million voters divided their votes between Barack Obama and John McCain. Obama received approximately 8.5 million more votes than McCain. Write and solve a system of equations to find the total number of votes cast for each candidate. Let \( D \) represent the number of votes cast for Obama, and let \( R \) represent the number of votes cast for McCain. (Source: CNN.com)
7. The Vietnam Veterans Memorial (or “The Wall”) in Washington, D.C. was designed by Maya Ying Lin when she was a student at Yale University. This monument has two vertical, triangular sections of black granite with a common side (see figure). The bottom of each section is level with the ground. The tops of the two sections can be approximately modeled by the equations
   \[
   \begin{align*}
   -2x + 50y &= 505 \\
   2x + 50y &= 505
   \end{align*}
   \]
   when the \( x \)-axis is superimposed at the base of the wall. Each unit in the coordinate system represents 1 foot. How high is the memorial at the point where the two sections meet? How long is each section?
8. Weights of atoms and molecules are measured in atomic mass units (u). A molecule of \( \text{C}_2\text{H}_6 \) (ethane) is made up of two carbon atoms and six hydrogen atoms and weighs 30.070 u. A molecule of \( \text{C}_3\text{H}_8 \) (propane) is made up of three carbon atoms and eight hydrogen atoms and weighs 44.097 u. Find the weights of a carbon atom and a hydrogen atom.
9. Connecting a DVD player to a television set requires a cable with special connectors at both ends. You buy a six-foot cable for $15.50 and a three-foot cable for $10.25. Assuming that the cost of a cable is the sum of the cost of the two connectors and the cost of the cable itself, what is the cost of a four-foot cable? Explain your reasoning.
10. A hotel 35 miles from an airport runs a shuttle service to and from the airport. The 9:00 A.M. bus leaves for the airport traveling at 30 miles per hour. The 9:15 A.M. bus leaves for the airport traveling at 40 miles per hour. Write a system of linear equations that represents distance as a function of time for each bus. Graph and solve the system. How far from the airport will the 9:15 A.M. bus catch up to the 9:00 A.M. bus?
11. Solve each system of equations by letting \( X = 1/x, \ Y = 1/y, \) and \( Z = 1/z. \)

(a) \[
\begin{align*}
x + 2y - 3z &= a \\
-x - y + z &= 0 \\
2x + 3y - 2z &= c
\end{align*}
\]

Equation 1
(b) \[
\begin{align*}
x + 2y - 3z &= 7 \\
3x + 4y &= 0
\end{align*}
\]

(a) \[
\begin{align*}
x - y + z &= 4 \\
x + 3y - 2z &= 10 \\
2x + 3y - 13z &= -8
\end{align*}
\]

Equation 2
Equation 3

(b) \[
\begin{align*}
x - y &= 1 \\
y + z &= 2
\end{align*}
\]

Equation 1
(c) \[
\begin{align*}
x + y &= 0 \\
-x - 3y + 2z &= 6
\end{align*}
\]

Equation 2
Equation 3

12. What values should be given to \( a, b, \) and \( c \) so that the linear system shown has \((-1, 2, -3)\) as its only solution?

\[
\begin{align*}
x + 2y - 3z &= a \quad \text{Equation 1} \\
-x - y + z &= b \\
2x + 3y - 2z &= c \quad \text{Equation 3}
\end{align*}
\]

13. The following system has one solution: \( x = 1, \ y = -1, \) and \( z = 2. \)

\[
\begin{align*}
4x - 2y + 5z &= 16 \\
x + y &= 0 \\
-x - 3y + 2z &= 6
\end{align*}
\]

Solve the system given by (a) Equation 1 and Equation 2, (b) Equation 1 and Equation 3, and (c) Equation 2 and Equation 3. (d) How many solutions does each of these systems have?

14. Solve the system of linear equations algebraically.

\[
\begin{align*}
x_1 - x_2 + 2x_3 + 2x_4 + 6x_5 &= 6 \\
3x_1 - 2x_2 + 4x_3 + 4x_4 + 12x_5 &= 14 \\
-x_2 - x_3 - x_4 - 3x_5 &= -3 \\
2x_1 - 2x_2 + 4x_3 + 5x_4 + 15x_5 &= 10 \\
2x_1 - 2x_2 + 4x_3 + 4x_5 + 13x_5 &= 13
\end{align*}
\]

15. Each day, an average adult moose can process about 32 kilograms of terrestrial vegetation (twigs and leaves) and aquatic vegetation. From this food, it needs to obtain about 1.9 grams of sodium and 11,000 calories of energy. Aquatic vegetation has about 0.15 gram of sodium per kilogram and about 193 calories of energy per kilogram, whereas terrestrial vegetation has minimal sodium and about four times as much energy as aquatic vegetation. Write and graph a system of inequalities that describes the amounts \( t \) and \( a \) of terrestrial and aquatic vegetation, respectively, for the daily diet of an average adult moose. (Source: Biology by Numbers)

16. For a healthy person who is 4 feet 10 inches tall, the recommended minimum weight is about 91 pounds and increases by about 3.65 pounds for each additional inch of height. The recommended maximum weight is about 119 pounds and increases by about 4.85 pounds for each additional inch of height. (Source: U.S. Department of Agriculture)

(a) Let \( x \) be the number of inches by which a person’s height exceeds 4 feet 10 inches and let \( y \) be the person’s weight in pounds. Write a system of inequalities that describes the possible values of \( x \) and \( y \) for a healthy person.

(b) Use a graphing utility to graph the system of inequalities from part (a).

(c) What is the recommended weight range for someone 6 feet tall?

17. The cholesterol in human blood is necessary, but too much cholesterol can lead to health problems. A blood cholesterol test gives three readings: LDL ("bad") cholesterol, HDL ("good") cholesterol, and total cholesterol (LDL + HDL). It is recommended that your LDL cholesterol level be less than 130 milligrams per deciliter, your HDL cholesterol level be at least 60 milligrams per deciliter, and your total cholesterol level be no more than 200 milligrams per deciliter. (Source: American Heart Association)

(a) Write a system of linear inequalities for the recommended cholesterol levels. Let \( x \) represent HDL cholesterol and let \( y \) represent LDL cholesterol.

(b) Graph the system of inequalities from part (a). Label any vertices of the solution region.

(c) Are the following cholesterol levels within recommendations? Explain your reasoning.

- LDL: 120 milligrams per deciliter
- HDL: 90 milligrams per deciliter
- Total: 210 milligrams per deciliter

(d) Give an example of cholesterol levels in which the LDL cholesterol level is too high but the HDL and total cholesterol levels are acceptable.

(e) Another recommendation is that the ratio of total cholesterol to HDL cholesterol be less than 5. Find a point in your solution region from part (b) that meets this recommendation, and explain why it meets the recommendation.
In Mathematics
Matrices are used to model and solve a variety of problems. For instance, you can use matrices to solve systems of linear equations.

In Real Life
Matrices are used to model inventory levels, electrical networks, investment portfolios, and other real-life situations. For instance, you can use a matrix to model the number of people in the United States who participate in snowboarding. (See Exercise 114, page 583.)

IN CAREERS
There are many careers that use matrices. Several are listed below.

• Bank Teller
  Exercise 110, page 582

• Political Analyst
  Exercise 70, page 597

• Small Business Owner
  Exercises 69–72, pages 606 and 607

• Florist
  Exercise 74, page 607
What you should learn

- Write matrices and identify their orders.
- Perform elementary row operations on matrices.
- Use matrices and Gaussian elimination to solve systems of linear equations.
- Use matrices and Gauss-Jordan elimination to solve systems of linear equations.

Why you should learn it

You can use matrices to solve systems of linear equations in two or more variables. For instance, in Exercise 113 on page 582, you will use a matrix to find a model for the path of a ball thrown by a baseball player.

Definition of Matrix

If \( m \) and \( n \) are positive integers, an \( m \times n \) (read “\( m \) by \( n \)”) matrix is a rectangular array in which each entry, \( a_{ij} \), of the matrix is a number. An \( m \times n \) matrix has \( m \) rows and \( n \) columns. Matrices are usually denoted by capital letters.

The entry in the \( i \)th row and \( j \)th column is denoted by the double subscript notation \( a_{ij} \). For instance, \( a_{32} \) refers to the entry in the second row, third column. A matrix having \( m \) rows and \( n \) columns is said to be of order \( m \times n \). If \( m = n \), the matrix is square of order \( m \times m \) (or \( n \times n \)). For a square matrix, the entries \( a_{11}, a_{22}, a_{33}, \ldots \) are the main diagonal entries.

Example 1  
Order of Matrices

Determine the order of each matrix.

a. \[
\begin{bmatrix} 2 \\
\end{bmatrix}
\]
b. \[
\begin{bmatrix} 1 & -3 & 0 & \frac{1}{2} \\
\end{bmatrix}
\]
c. \[
\begin{bmatrix} 0 & 0 \\ 0 & 0 \\
\end{bmatrix}
\]
d. \[
\begin{bmatrix} 5 & 0 \\ 2 & -2 \\ -7 & 4 \\
\end{bmatrix}
\]

Solution

a. This matrix has one row and one column. The order of the matrix is \( 1 \times 1 \).
b. This matrix has one row and four columns. The order of the matrix is \( 1 \times 4 \).
c. This matrix has two rows and two columns. The order of the matrix is \( 2 \times 2 \).
d. This matrix has three rows and two columns. The order of the matrix is \( 3 \times 2 \).

Now try Exercise 9.

A matrix that has only one row is called a \textbf{row matrix}, and a matrix that has only one column is called a \textbf{column matrix}.
A matrix derived from a system of linear equations (each written in standard form with the constant term on the right) is the augmented matrix of the system. Moreover, the matrix derived from the coefficients of the system (but not including the constant terms) is the coefficient matrix of the system.

Add Equation: 

$$\begin{align*}
\begin{bmatrix}
1 & -4 & 3 & : & 5 \\
-1 & 3 & -1 & : & -3 \\
2 & 0 & -4 & : & 6
\end{bmatrix}
\end{align*}$$

The vertical dots in an augmented matrix separate the coefficients of the linear system from the constant terms.

Add Example 2: Writing an Augmented Matrix

Write the augmented matrix for the system of linear equations.

$$\begin{align*}
\begin{bmatrix}
x + 3y - w &= 9 \\
- y + 4z + 2w &= -2 \\
x - 5z - 6w &= 0 \\
2x + 4y - 3z &= 4
\end{bmatrix}
\end{align*}$$

What is the order of the augmented matrix?

Solution

Begin by rewriting the linear system and aligning the variables.

$$\begin{align*}
\begin{bmatrix}
x + 3y & - w &= 9 \\
- y + 4z & + 2w &= -2 \\
x & - 5z & - 6w &= 0 \\
2x & + 4y & - 3z &= 4
\end{bmatrix}
\end{align*}$$

Next, use the coefficients and constant terms as the matrix entries. Include zeros for the coefficients of the missing variables.

$$\begin{align*}
R_1: 
1 & 3 & 0 & -1 : 9 \\
R_2: 
0 & -1 & 4 & 2 : -2 \\
R_3: 
1 & 0 & -5 & -6 : 0 \\
R_4: 
2 & 4 & -3 & 0 : 4
\end{align*}$$

The augmented matrix has four rows and five columns, so it is a $4 \times 5$ matrix. The notation $R_i$ is used to designate each row in the matrix. For example, Row 1 is represented by $R_1$.

Check Point: Now try Exercise 17.
Elementary Row Operations

In Section 7.3, you studied three operations that can be used on a system of linear equations to produce an equivalent system.

1. Interchange two equations.
2. Multiply an equation by a nonzero constant.
3. Add a multiple of an equation to another equation.

In matrix terminology, these three operations correspond to elementary row operations. An elementary row operation on an augmented matrix of a given system of linear equations produces a new augmented matrix corresponding to a new (but equivalent) system of linear equations. Two matrices are row-equivalent if one can be obtained from the other by a sequence of elementary row operations.

Although elementary row operations are simple to perform, they involve a lot of arithmetic. Because it is easy to make a mistake, you should get in the habit of noting the elementary row operations performed in each step so that you can go back and check your work.

Example 3

Elementary Row Operations

a. Interchange the first and second rows.

\[
\begin{bmatrix}
0 & 1 & 3 & 4 \\
-1 & 2 & 0 & 3 \\
2 & -3 & 4 & 1 \\
\end{bmatrix}
\rightarrow 
\begin{bmatrix}
-1 & 2 & 0 & 3 \\
0 & 1 & 3 & 4 \\
2 & -3 & 4 & 1 \\
\end{bmatrix}
\]

b. Multiply the first row of the original matrix by \( \frac{1}{2} \).

\[
\begin{bmatrix}
2 & -4 & 6 & -2 \\
1 & 3 & -3 & 0 \\
5 & -2 & 1 & 2 \\
\end{bmatrix}
\rightarrow 
\begin{bmatrix}
1 & -2 & 3 & -1 \\
1 & 3 & -3 & 0 \\
5 & -2 & 1 & 2 \\
\end{bmatrix}
\]

c. Add \(-2\) times the first row of the original matrix to the third row.

\[
\begin{bmatrix}
1 & 2 & -4 & 3 \\
0 & 3 & -2 & -1 \\
2 & 1 & 5 & -2 \\
\end{bmatrix}
\rightarrow 
\begin{bmatrix}
1 & 2 & -4 & 3 \\
0 & 3 & -2 & -1 \\
0 & -3 & 13 & -8 \\
\end{bmatrix}
\]

Note that the elementary row operation is written beside the row that is changed.

Checkpoint

Now try Exercise 37.
In Example 3 in Section 7.3, you used Gaussian elimination with back-substitution to solve a system of linear equations. The next example demonstrates the matrix version of Gaussian elimination. The two methods are essentially the same. The basic difference is that with matrices you do not need to keep writing the variables.

### Example 4  Comparing Linear Systems and Matrix Operations

#### Linear System

{ 
  \begin{align*}
  x - 2y + 3z &= 9 \\
  -x + 3y &= -4 \\
  2x - 5y + 5z &= 17 
  \end{align*}

#### Associated Augmented Matrix

\[
\begin{bmatrix}
1 & -2 & 3 & \vdots & 9 \\
-1 & 3 & 0 & \vdots & -4 \\
2 & -5 & 5 & \vdots & 17 
\end{bmatrix}
\]

Add the first equation to the second equation.

\[
\begin{bmatrix}
1 & -2 & 3 & \vdots & 9 \\
0 & 1 & 3 & \vdots & 5 \\
2 & -5 & 5 & \vdots & 17 
\end{bmatrix}
\]

Add \(-2\) times the first equation to the third equation.

\[
\begin{bmatrix}
1 & -2 & 3 & \vdots & 9 \\
0 & 1 & 3 & \vdots & 5 \\
0 & -1 & -1 & \vdots & -1 
\end{bmatrix}
\]

Add the second equation to the third equation.

\[
\begin{bmatrix}
1 & -2 & 3 & \vdots & 9 \\
0 & 1 & 3 & \vdots & 5 \\
0 & 0 & 2 & \vdots & 4 
\end{bmatrix}
\]

Multiply the third equation by \(\frac{1}{2}\).

\[
\begin{bmatrix}
1 & -2 & 3 & \vdots & 9 \\
0 & 1 & 3 & \vdots & 5 \\
0 & 0 & 1 & \vdots & 2 
\end{bmatrix}
\]

At this point, you can use back-substitution to find \(x\) and \(y\).

\[
\begin{align*}
y + 3(2) &= 5 & \text{Substitute 2 for } z. \\
y &= -1 & \text{Solve for } y. \\
x - 2(-1) + 3(2) &= 9 & \text{Substitute } -1 \text{ for } y \text{ and } 2 \text{ for } z. \\
x &= 1 & \text{Solve for } x. 
\end{align*}
\]

The solution is \(x = 1, y = -1,\) and \(z = 2\).

#### Study Tip

Remember that you should check a solution by substituting the values of \(x, y,\) and \(z\) into each equation of the original system. For example, you can check the solution to Example 4 as follows.

- **Equation 1:** \(1 - 2(-1) + 3(2) = 9 \; \checkmark\)
- **Equation 2:** \(-1 + 3(-1) = -4 \; \checkmark\)
- **Equation 3:** \(2(1) - 5(-1) + 5(2) = 17 \; \checkmark\)

#### Checkpoint

Now try Exercise 39.
The last matrix in Example 4 is said to be in **row-echelon form**. The term *echelon* refers to the stair-step pattern formed by the nonzero elements of the matrix. To be in this form, a matrix must have the following properties.

### Row-Echelon Form and Reduced Row-Echelon Form

A matrix in **row-echelon form** has the following properties.

1. Any rows consisting entirely of zeros occur at the bottom of the matrix.
2. For each row that does not consist entirely of zeros, the first nonzero entry is 1 (called a *leading 1*).
3. For two successive (nonzero) rows, the leading 1 in the higher row is farther to the left than the leading 1 in the lower row.

A matrix in row-echelon form is in **reduced row-echelon form** if every column that has a leading 1 has zeros in every position above and below its leading 1.

It is worth noting that the row-echelon form of a matrix is not unique. That is, two different sequences of elementary row operations may yield different row-echelon forms. However, the reduced row-echelon form of a given matrix is unique.

### Example 5  Row-Echelon Form

Determine whether each matrix is in row-echelon form. If it is, determine whether the matrix is in reduced row-echelon form.

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>-1</td>
<td>4</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>-2</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>-3</td>
</tr>
<tr>
<td>0</td>
<td>2</td>
<td>1</td>
<td>-1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>-3</td>
</tr>
</tbody>
</table>

**Solution**

The matrices in (a), (c), (d), and (f) are in row-echelon form. The matrices in (d) and (f) are in reduced row-echelon form because every column that has a leading 1 has zeros in every position above and below its leading 1. The matrix in (b) is not in row-echelon form because a row of all zeros does not occur at the bottom of the matrix. The matrix in (e) is not in row-echelon form because the first nonzero entry in Row 2 is not a leading 1.

**CHECKPOINT** Now try Exercise 41.

Every matrix is row-equivalent to a matrix in row-echelon form. For instance, in Example 5, you can change the matrix in part (e) to row-echelon form by multiplying its second row by \( \frac{1}{2} \).
Gaussian Elimination with Back-Substitution

Gaussian elimination with back-substitution works well for solving systems of linear equations by hand or with a computer. For this algorithm, the order in which the elementary row operations are performed is important. You should operate from left to right by columns, using elementary row operations to obtain zeros in all entries directly below the leading 1’s.

**Example 6**  Gaussian Elimination with Back-Substitution

Solve the system
\[
\begin{aligned}
    y + z - 2w &= -3 \\
    x + 2y - z &= 2 \\
    2x + 4y + z - 3w &= -2 \\
    x - 4y - 7z - w &= -19
\end{aligned}
\]

**Solution**

\[
\begin{bmatrix}
0 & 1 & 1 & -2 & \vdots & -3 \\
1 & 2 & -1 & 0 & \vdots & 2 \\
2 & 4 & 1 & -3 & \vdots & -2 \\
1 & -4 & -7 & -1 & \vdots & -19
\end{bmatrix}
\]

Write augmented matrix.

Interchange \(R_1\) and \(R_2\) so first column has leading 1 in upper left corner.

Perform operations on \(R_3\) and \(R_4\) so first column has zeros below its leading 1.

Perform operations on \(R_4\) so second column has zeros below its leading 1.

Perform operations on \(R_1\) and \(R_3\) so third and fourth columns have leading 1’s.

The matrix is now in row-echelon form, and the corresponding system is
\[
\begin{aligned}
    x + 2y - z &= 2 \\
    y + z - 2w &= -3 \\
    z - w &= -2 \\
    w &= 3
\end{aligned}
\]

Using back-substitution, you can determine that the solution is \(x = -1, y = 2, z = 1,\) and \(w = 3.\)

**CHECK Point**  Now try Exercise 63.
The procedure for using Gaussian elimination with back-substitution is summarized below.

### Gaussian Elimination with Back-Substitution
1. Write the augmented matrix of the system of linear equations.
2. Use elementary row operations to rewrite the augmented matrix in row-echelon form.
3. Write the system of linear equations corresponding to the matrix in row-echelon form, and use back-substitution to find the solution.

When solving a system of linear equations, remember that it is possible for the system to have no solution. If, in the elimination process, you obtain a row of all zeros except for the last entry, it is unnecessary to continue the elimination process. You can simply conclude that the system has no solution, or is inconsistent.

#### Example 7  A System with No Solution

Solve the system

\[
\begin{align*}
  x - y + 2z &= 4 \\
  x + z &= 6 \\
  2x - 3y + 5z &= 4 \\
  3x + 2y - z &= 1
\end{align*}
\]

**Solution**

\[
\begin{bmatrix}
  1 & -1 & 2 & : & 4 \\
  1 & 0 & 1 & : & 6 \\
  2 & -3 & 5 & : & 4 \\
  3 & 2 & -1 & : & 1
\end{bmatrix}
\]

Write augmented matrix.

\[
\begin{bmatrix}
  1 & -1 & 2 & : & 4 \\
  0 & 1 & -1 & : & 2 \\
  0 & -1 & 1 & : & -4 \\
  0 & 5 & -7 & : & -11
\end{bmatrix}
\]

Perform row operations.

Note that the third row of this matrix consists entirely of zeros except for the last entry. This means that the original system of linear equations is inconsistent. You can see why this is true by converting back to a system of linear equations.

\[
\begin{align*}
  x - y + 2z &= 4 \\
  y - z &= 2 \\
  0 &= -2 \\
  5y - 7z &= -11
\end{align*}
\]

Because the third equation is not possible, the system has no solution.

**CHECK Point** Now try Exercise 81.
Gauss-Jordan Elimination

With Gaussian elimination, elementary row operations are applied to a matrix to obtain a (row-equivalent) row-echelon form of the matrix. A second method of elimination, called Gauss-Jordan elimination, after Carl Friedrich Gauss and Wilhelm Jordan (1842–1899), continues the reduction process until a reduced row-echelon form is obtained. This procedure is demonstrated in Example 8.

Example 8  Gauss-Jordan Elimination

Use Gauss-Jordan elimination to solve the system

\[
\begin{align*}
2x - 5y + 5z &= 17 \\
3x - 2y + 3z &= 11 \\
-3x + 3y &= -6
\end{align*}
\]

The elimination procedures described in this section sometimes result in fractional coefficients. For instance, in the elimination procedure for the system

\[
\begin{align*}
2x - 5y + 5z &= 17 \\
3x - 2y + 3z &= 11 \\
-3x + 3y &= -6
\end{align*}
\]

you may be inclined to multiply the first row by \( \frac{1}{2} \) to produce a leading 1, which will result in working with fractional coefficients. You can sometimes avoid fractions by judiciously choosing the order in which you apply elementary row operations.

Example 8  Gauss-Jordan Elimination

Use Gauss-Jordan elimination to solve the system

\[
\begin{align*}
x - 2y + 3z &= 9 \\
-x + 3y &= -4 \\
2x - 5y + 5z &= 17
\end{align*}
\]

Solution

In Example 4, Gaussian elimination was used to obtain the row-echelon form of the linear system above.

\[
\begin{pmatrix}
1 & -2 & 3 & : & 9 \\
0 & 1 & 3 & : & 5 \\
0 & 0 & 1 & : & 2
\end{pmatrix}
\]

Now, apply elementary row operations until you obtain zeros above each of the leading 1’s, as follows.

\[
\begin{align*}
2R_2 + R_1 &\rightarrow \begin{pmatrix}
1 & 0 & 9 & : & 19 \\
0 & 1 & 3 & : & 5 \\
0 & 0 & 1 & : & 2
\end{pmatrix} & \text{Perform operations on } R_1 \\
-9R_3 + R_1 &\rightarrow \begin{pmatrix}
1 & 0 & 0 & : & 1 \\
0 & 1 & 0 & : & -1 \\
0 & 0 & 1 & : & 2
\end{pmatrix} & \text{so second column has a zero above its leading 1.} \\
-3R_3 + R_2 &\rightarrow \begin{pmatrix}
1 & 0 & 0 & : & 1 \\
0 & 1 & 0 & : & -1 \\
0 & 0 & 1 & : & 2
\end{pmatrix} & \text{Perform operations on } R_1 \text{ and } R_2, \text{ so third column has zeros above its leading 1.}
\end{align*}
\]

The matrix is now in reduced row-echelon form. Converting back to a system of linear equations, you have

\[
\begin{align*}
x &= 1 \\
y &= -1 \\
z &= 2
\end{align*}
\]

Now you can simply read the solution, \( x = 1, y = -1, \) and \( z = 2, \) which can be written as the ordered triple \( (1, -1, 2) \).

Study Tip  The advantage of using Gauss-Jordan elimination to solve a system of linear equations is that the solution of the system is easily found without using back-substitution, as illustrated in Example 8.
Recall from Chapter 7 that when there are fewer equations than variables in a system of equations, then the system has either no solution or infinitely many solutions.

### Example 9  A System with an Infinite Number of Solutions

Solve the system.

\[
\begin{align*}
2x + 4y - 2z &= 0 \\
3x + 5y &= 1
\end{align*}
\]

**Solution**

\[
\begin{bmatrix}
2 & 4 & -2 & \vdots & 0 \\
3 & 5 & 0 & \vdots & 1
\end{bmatrix}
\]

\[
\frac{1}{2}R_1 \rightarrow \begin{bmatrix}
1 & 2 & -1 & \vdots & 0 \\
3 & 5 & 0 & \vdots & 1
\end{bmatrix}
\]

\[
-3R_1 + R_2 \rightarrow \begin{bmatrix}
1 & 2 & -1 & \vdots & 0 \\
0 & -1 & 0 & \vdots & 1
\end{bmatrix}
\]

\[
-R_2 \rightarrow \begin{bmatrix}
1 & 2 & -1 & \vdots & 0 \\
0 & 1 & -3 & \vdots & -1
\end{bmatrix}
\]

\[
-2R_2 + R_1 \rightarrow \begin{bmatrix}
1 & 0 & 5 & \vdots & 2 \\
0 & 1 & -3 & \vdots & -1
\end{bmatrix}
\]

The corresponding system of equations is

\[
\begin{align*}
x + 5z &= 2 \\
y - 3z &= -1
\end{align*}
\]

Solving for \(x\) and \(y\) in terms of \(z\), you have

\[
x = -5z + 2 \quad \text{and} \quad y = 3z - 1.
\]

To write a solution of the system that does not use any of the three variables of the system, let \(a\) represent any real number and let

\[
z = a.
\]

Now substitute \(a\) for \(z\) in the equations for \(x\) and \(y\).

\[
x = -5z + 2 = -5a + 2 \\
y = 3z - 1 = 3a - 1
\]

So, the solution set can be written as an ordered triple with the form

\[
(-5a + 2, 3a - 1, a)
\]

where \(a\) is any real number. Remember that a solution set of this form represents an infinite number of solutions. Try substituting values for \(a\) to obtain a few solutions. Then check each solution in the original system of equations.

**Study Tip** In Example 9, \(x\) and \(y\) are solved for in terms of the third variable \(z\). To write a solution of the system that does not use any of the three variables of the system, let \(a\) represent any real number and let \(z = a\). Then solve for \(x\) and \(y\). The solution can then be written in terms of \(a\), which is not one of the variables of the system.

**Checkpoint** Now try Exercise 79.
8.1 EXERCISES

VOCABULARY: Fill in the blanks.
1. A rectangular array of real numbers that can be used to solve a system of linear equations is called a ________.
2. A matrix is ________ if the number of rows equals the number of columns.
3. For a square matrix, the entries $a_{11}, a_{22}, a_{33}, \ldots, a_{nn}$ are the ________ ________ entries.
4. A matrix with only one row is called a ________ matrix, and a matrix with only one column is called a ________ matrix.
5. The matrix derived from a system of linear equations is called the ________ matrix of the system.
6. The matrix derived from the coefficients of a system of linear equations is called the ________ matrix of the system.
7. Two matrices are called ________ if one of the matrices can be obtained from the other by a sequence of elementary row operations.
8. A matrix in row-echelon form is in ________ ________ ________ if every column that has a leading 1 has zeros in every position above and below its leading 1.

SKILLS AND APPLICATIONS

In Exercises 9–14, determine the order of the matrix.
9. $[ 7 \ 0 ]$
10. $[ 5 \ -3 \ 8 \ 7 ]$
11. $\begin{pmatrix} 2 \\ 36 \\ 3 \end{pmatrix}$
12. $\begin{pmatrix} -3 & 7 & 15 \\ 0 & 0 & 3 \\ 1 & 1 & 6 \end{pmatrix}$
13. $\begin{pmatrix} 33 & 45 \\ -9 & 20 \end{pmatrix}$
14. $\begin{pmatrix} -7 & 6 & 4 \\ 0 & -5 & 1 \end{pmatrix}$

In Exercises 15–20, write the augmented matrix for the system of linear equations.
15. \[ \begin{align*}
4x - 3y & = -5 \\
-x + 3y & = 12
\end{align*} \]
16. \[ \begin{align*}
7x + 4y & = 22 \\
5x - 9y & = 15
\end{align*} \]
17. \[ \begin{align*}
x + 10y - 2z & = 2 \\
5x - 3y + 4z & = 0 \\
2x + y & = 6
\end{align*} \]
18. \[ \begin{align*}
x - 8y + 5z & = 8 \\
-x & - 15z = -38
\end{align*} \]
19. \[ \begin{align*}
7x - 5y + z & = 13 \\
9x + 2y - 3z & = 20 \\
19x - 8z & = 10
\end{align*} \]
20. \[ \begin{align*}
-25y + 11z & = -5
\end{align*} \]

In Exercises 21–26, write the system of linear equations represented by the augmented matrix. (Use variables $x, y, z,$ and $w$, if applicable.)
21. $\begin{pmatrix} 1 & 2 & : & 7 \\ 2 & 3 & : & 4 \end{pmatrix}$
22. $\begin{pmatrix} 7 & -5 & : & 0 \\ 8 & 3 & : & -2 \\ 2 & 0 & : & 5 \\ 0 & 1 & : & -2 \\ 6 & 3 & : & 0 \\ 4 & -5 & : & -1 \end{pmatrix}$
24. $\begin{pmatrix} -11 & 0 & 6 & : & 25 \\ 3 & 8 & 0 & : & -29 \end{pmatrix}$

In Exercises 27–34, fill in the blank(s) using elementary row operations to form a row-equivalent matrix.
27. $\begin{pmatrix} 1 & 4 & 3 \\ 2 & 10 & 5 \end{pmatrix}$
28. $\begin{pmatrix} 3 & 6 & 8 \\ 4 & -3 & 6 \end{pmatrix}$
29. $\begin{pmatrix} 1 & 1 & 1 \\ 5 & -2 & 4 \end{pmatrix}$
30. $\begin{pmatrix} -3 & 3 & 12 \\ 18 & -8 & 4 \end{pmatrix}$
31. $\begin{pmatrix} 1 & 0 & 6 \\ 0 & -1 & 0 \\ 0 & 0 & -1 \end{pmatrix}$
32. $\begin{pmatrix} 1 & 0 & 6 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$
Perform the sequence of row operations on the matrix.

33.
\[
\begin{bmatrix}
1 & 1 & 4 & -1 \\
3 & 8 & 10 & 3 \\
-2 & 1 & 12 & 6
\end{bmatrix}
\]

34.
\[
\begin{bmatrix}
2 & 4 & 8 & 3 \\
1 & -1 & -3 & 2 \\
2 & 6 & 4 & 9
\end{bmatrix}
\]

35. Add times to
36. Multiply by
37. Add times to
38. Add times to
39. Add times to
40. Interchange \( R_1 \) and \( R_3 \).

In Exercises 35–38, identify the elementary row operation(s) being performed to obtain the new row-equivalent matrix.

<table>
<thead>
<tr>
<th>Original Matrix</th>
<th>New Row-Equivalent Matrix</th>
</tr>
</thead>
</table>
| \[
\begin{bmatrix}
-2 & 5 & 1 \\
3 & -1 & -8
\end{bmatrix}
\] | \[
\begin{bmatrix}
13 & 0 & -39 \\
3 & -1 & -8
\end{bmatrix}
\] |

In Exercises 39–40, perform the sequence of row operations on the matrix. What did the operations accomplish?

<table>
<thead>
<tr>
<th>Matrix</th>
<th>Operation</th>
</tr>
</thead>
</table>
| \[
\begin{bmatrix}
1 & 2 & 3 \\
2 & -1 & -4 \\
3 & 1 & -1
\end{bmatrix}
\] | (a) Add \(-2\) times \( R_1 \) to \( R_2 \). |

In Exercises 41–44, determine whether the matrix is in row-echelon form. If it is, determine if it is also in reduced row-echelon form.

41.
\[
\begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 1 & 5 \\
0 & 0 & 0 & 0
\end{bmatrix}
\]

42.
\[
\begin{bmatrix}
1 & 3 & 0 & 0 \\
0 & 1 & 1 & 5 \\
0 & 0 & 0 & 0
\end{bmatrix}
\]

43.
\[
\begin{bmatrix}
1 & 0 & 1 & 0 \\
0 & 1 & 0 & -1 \\
0 & 0 & 0 & 2
\end{bmatrix}
\]

44.
\[
\begin{bmatrix}
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 2 \\
0 & 0 & 0 & 1
\end{bmatrix}
\]

In Exercises 45–48, write the matrix in row-echelon form. (Remember that the row-echelon form of a matrix is not unique.)

45.
\[
\begin{bmatrix}
1 & 1 & 0 & 5 \\
-2 & -1 & 2 & -10 \\
3 & 6 & 7 & 14
\end{bmatrix}
\]

46.
\[
\begin{bmatrix}
1 & 2 & -1 & 3 \\
3 & 7 & -5 & 14 \\
-2 & -1 & 3 & 8
\end{bmatrix}
\]

47.
\[
\begin{bmatrix}
1 & -1 & -1 & 1 \\
5 & -4 & 1 & 8 \\
-6 & 8 & 18 & 0
\end{bmatrix}
\]

48.
\[
\begin{bmatrix}
1 & -3 & 0 & -7 \\
-3 & 10 & 1 & 23 \\
4 & -10 & 2 & -24
\end{bmatrix}
\]

In Exercises 49–54, use the matrix capabilities of a graphing utility to write the matrix in reduced row-echelon form.

49.
\[
\begin{bmatrix}
3 & 3 & 3 \\
-1 & 0 & -4 \\
2 & 4 & -2
\end{bmatrix}
\]

50.
\[
\begin{bmatrix}
1 & 3 & 2 \\
5 & 15 & 9 \\
2 & 6 & 10
\end{bmatrix}
\]

51.
\[
\begin{bmatrix}
1 & 2 & 3 & -5 \\
1 & 2 & 4 & -9 \\
-2 & -4 & -4 & 3 \\
4 & 8 & 11 & -14
\end{bmatrix}
\]

52.
\[
\begin{bmatrix}
-2 & 3 & -1 & -2 \\
4 & -2 & 5 & 8 \\
1 & 5 & -2 & 0 \\
3 & 8 & -10 & -30
\end{bmatrix}
\]

53.
\[
\begin{bmatrix}
-3 & 5 & 1 & 12 \\
1 & -1 & 1 & 4 \\
5 & 1 & 2 & 4
\end{bmatrix}
\]

54.
\[
\begin{bmatrix}
-1 & 5 & 10 & -32 \\
5 & 1 & 2 & 4 \\
-1 & 5 & 10 & -32
\end{bmatrix}
\]

In Exercises 55–58, write the system of linear equations represented by the augmented matrix. Then use back-substitution to solve. (Use variables \( x, y \), and \( z \), if applicable.)

55.
\[
\begin{bmatrix}
1 & -2 & 4 \\
0 & 1 & -3
\end{bmatrix}
\]

56.
\[
\begin{bmatrix}
1 & 5 & 0 \\
0 & 1 & -1
\end{bmatrix}
\]
In Exercises 59–62, an augmented matrix that represents a system of linear equations (in variables $x$, $y$, and $z$, if applicable) has been reduced using Gaussian-Jordan elimination. Write the solution represented by the augmented matrix.

59. \[
\begin{bmatrix}
1 & 0 & 0 & : & 3 \\
0 & 1 & 0 & : & 1 \\
1 & 0 & 1 & : & -4 \\
0 & 0 & 1 & : & -10 \\
\end{bmatrix}
\]

60. \[
\begin{bmatrix}
1 & 0 & : & -6 \\
0 & 1 & : & 10 \\
0 & 1 & 0 & : & 5 \\
0 & 0 & 1 & : & 0 \\
\end{bmatrix}
\]

In Exercises 63–84, use matrices to solve the system of equations (if possible). Use Gaussian elimination with back-substitution or Gauss-Jordan elimination.

63. \[
\begin{aligned}
x + 2y &= 7 \\
2x + y &= 8 \\
3x - 2y &= -27 \\
x + 3y &= 13 \\
-2x + 6y &= -22 \\
x + 2y &= 1 \\
8x - 4y &= 7 \\
5x + 2y &= 1 \\
\end{aligned}
\]

64. \[
\begin{aligned}
2x + 6y &= 16 \\
2x + 3y &= 7 \\
-x + y &= 4 \\
2x - 4y &= -34 \\
5x - 5y &= -5 \\
-2x - 3y &= 7 \\
x - 3y &= 5 \\
-2x + 6y &= -10 \\
\end{aligned}
\]

65. \[
\begin{aligned}
x + y + 2z &= 5 \\
x + 3x + y + z &= 4 \\
-x + y - z &= -14 \\
2x - y + z &= 21 \\
x + 2y - z &= 19 \\
x + 2y - 3z &= 28 \\
4y + 2z &= 0 \\
x - y + z &= -5 \\
x + 2y &= 0 \\
-x - y &= 0 \\
x + 2y + z &= 8 \\
3x + 7y + 6z &= 26 \\
x - y &= -22 \\
3x + 4y &= 4 \\
4x - 8y &= 32 \\
3x + 2y - z &= 0 \\
x - y + 4z + 2w &= 25 \\
-2x + y + 2z - w &= 2 \\
x + y + z + w &= 6 \\
\end{aligned}
\]

66. \[
\begin{aligned}
x - 2y + 3z &= -2 \\
2y - y + 3z &= 5 \\
2x + 2y + z &= 4 \\
x - y - z &= -14 \\
2x + 2y - z &= 2 \\
2x - y + z &= 21 \\
x + 2y + z &= 19 \\
4x + 2z &= 0 \\
-x + y + 2z &= 10 \\
x + 2y &= 0 \\
-x - y &= 0 \\
x + 2y + z &= 8 \\
3x + 7y + 6z &= 26 \\
x - y &= -22 \\
x + 2y &= 0 \\
3x + 4y &= 4 \\
4x - 8y &= 32 \\
3x + 2y - z &= 0 \\
-x + y + 4z + 2w &= 25 \\
-2x + y + 2z - w &= 2 \\
x + y + z + w &= 6 \\
\end{aligned}
\]
97. \( f(-2) = -15, f(-1) = 7, f(1) = -3 \)  
98. \( f(-2) = -3, f(1) = -3, f(2) = -11 \)

In Exercises 99–102, use a system of equations to find the cubic function \( f(x) = ax^3 + bx^2 + cx + d \) that satisfies the equations. Solve the system using matrices.

99. \( f(-1) = -5 \)
   \[
   \begin{align*}
   f(1) &= -1 \\
   f(2) &= 1 \\
   f(3) &= 11 \\
   f(4) &= 44
   \end{align*}
   \]

100. \( f(-1) = 4 \)
    \[
    \begin{align*}
    f(1) &= 1 \\
    f(2) &= 16 \\
    f(3) &= 44 \\
    f(4) &= 7
    \end{align*}
    \]

101. \( f(-2) = -7 \)
   \[
   \begin{align*}
   f(-1) &= 2 \\
   f(1) &= -4 \\
   f(2) &= -7 \\
   f(3) &= 1
   \end{align*}
   \]

102. \( f(-2) = -17 \)
    \[
    \begin{align*}
    f(-1) &= 2 \\
    f(1) &= -1 \\
    f(2) &= 1 \\
    f(3) &= 7
    \end{align*}
    \]

103. Use the system
    \[
    \begin{align*}
    x + 3y + z &= 3 \\
    x + 5y + 5z &= 1 \\
    2x + 6y + 3z &= 8
    \end{align*}
    \]
to write two different matrices in row-echelon form that yield the same solution.

104. ELECTRICAL NETWORK The currents in an electrical network are given by the solution of the system
    \[
    \begin{align*}
    I_1 - I_2 + I_3 &= 0 \\
    3I_1 + 4I_2 &= 18 \\
    I_2 + 3I_3 &= 6
    \end{align*}
    \]
    where \( I_1, I_2, \) and \( I_3 \) are measured in amperes. Solve the system of equations using matrices.

105. PARTIAL FRACTIONS Use a system of equations to write the partial fraction decomposition of the rational expression. Solve the system using matrices.
    \[
    \frac{4x^2}{(x + 1)^2(x - 1)} = \frac{A}{x - 1} + \frac{B}{x + 1} + \frac{C}{(x + 1)^2}
    \]

106. PARTIAL FRACTIONS Use a system of equations to write the partial fraction decomposition of the rational expression. Solve the system using matrices.
    \[
    \frac{8x^2}{(x - 1)^2(x + 1)} = \frac{A}{x + 1} + \frac{B}{x - 1} + \frac{C}{(x - 1)^2}
    \]

107. FINANCE A small shoe corporation borrowed $1,500,000 to expand its line of shoes. Some of the money was borrowed at 7%, some at 8%, and some at 10%. Use a system of equations to determine how much was borrowed at each rate if the annual interest was $130,500 and the amount borrowed at 10% was 4 times the amount borrowed at 7%. Solve the system using matrices.

108. FINANCE A small software corporation borrowed $500,000 to expand its software line. Some of the money was borrowed at 9%, some at 10%, and some at 12%. Use a system of equations to determine how much was borrowed at each rate if the annual interest was $52,000 and the amount borrowed at 10% was \( \frac{7}{2} \) times the amount borrowed at 9%. Solve the system using matrices.

109. TIPS A food server examines the amount of money earned in tips after working an 8-hour shift. The server has a total of $95 in denominations of $1, $5, $10, and $20 bills. The total number of paper bills is 26. The number of $5 bills is 4 times the number of $10 bills, and the number of $1 bills is 1 less than twice the number of $5 bills. Write a system of linear equations to represent the situation. Then use matrices to find the number of each denomination.

110. BANKING A bank teller is counting the total amount of money in a cash drawer at the end of a shift. There is a total of $2600 in denominations of $1, $5, $10, and $20 bills. The total number of paper bills is 235. The number of $20 bills is twice the number of $1 bills, and the number of $5 bills is 10 more than the number of $1 bills. Write a system of linear equations to represent the situation. Then use matrices to find the number of each denomination.

In Exercises 111 and 112, use a system of equations to find the equation of the parabola \( y = ax^2 + bx + c \) that passes through the points. Solve the system using matrices. Use a graphing utility to verify your results.

111. \[
\begin{align*}
(1, 9) & \quad (2, 13) \\
(3, 5) & \quad (3, 20)
\end{align*}
\]

112. \[
\begin{align*}
(1, 19) & \quad (2, 8) \\
(3, 5) & \quad (3, 5)
\end{align*}
\]

113. MATHEMATICAL MODELING A video of the path of a ball thrown by a baseball player was analyzed with a grid covering the TV screen. The tape was paused three times, and the position of the ball was measured each time. The coordinates obtained are shown in the table. (\( x \) and \( y \) are measured in feet.)

<table>
<thead>
<tr>
<th>Horizontal distance, ( x )</th>
<th>Height, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5.0</td>
</tr>
<tr>
<td>15</td>
<td>9.6</td>
</tr>
<tr>
<td>30</td>
<td>12.4</td>
</tr>
</tbody>
</table>
(a) Use a system of equations to find the equation of the parabola \( y = ax^2 + bx + c \) that passes through the three points. Solve the system using matrices.

(b) Use a graphing utility to graph the parabola.

(c) Graphically approximate the maximum height of the ball and the point at which the ball struck the ground.

(d) Analytically find the maximum height of the ball and the point at which the ball struck the ground.

(e) Compare your results from parts (c) and (d).

114. DATA ANALYSIS: SNOWBOARDERS

The table shows the numbers of people (in millions) in the United States who participated in snowboarding in selected years from 2003 to 2007. (Source: National Sporting Goods Association)

<table>
<thead>
<tr>
<th>Year</th>
<th>Number, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2003</td>
<td>6.3</td>
</tr>
<tr>
<td>2005</td>
<td>6.0</td>
</tr>
<tr>
<td>2007</td>
<td>5.1</td>
</tr>
</tbody>
</table>

(a) Use a system of equations to find the equation of the parabola \( y = at^2 + bt + c \) that passes through the points. Let \( t \) represent the year, with \( t = 3 \) corresponding to 2003. Solve the system using matrices.

(b) Use a graphing utility to graph the parabola.

(c) Use the equation in part (a) to estimate the number of people who participated in snowboarding in 2009. Does your answer seem reasonable? Explain.

(d) Do you believe that the equation can be used for years far beyond 2007? Explain.

NETWORK ANALYSIS

In Exercises 115 and 116, answer the questions about the specified network. (In a network it is assumed that the total flow into each junction is equal to the total flow out of each junction.)

115. Water flowing through a network of pipes (in thousands of cubic meters per hour) is shown in the figure.

(a) Solve this system using matrices for the water flow represented by \( x_i, i = 1, 2, \ldots, 7 \).

(b) Find the network flow pattern when \( x_6 = 0 \) and \( x_7 = 0 \).

(c) Find the network flow pattern when \( x_5 = 400 \) and \( x_6 = 500 \).

116. The flow of traffic (in vehicles per hour) through a network of streets is shown in the figure.

(a) Solve this system using matrices for the traffic flow represented by \( x_i, i = 1, 2, \ldots, 5 \).

(b) Find the traffic flow when \( x_2 = 200 \) and \( x_3 = 50 \).

(c) Find the traffic flow when \( x_2 = 150 \) and \( x_3 = 0 \).

EXPLORATION

TRUE OR FALSE? In Exercises 117 and 118, determine whether the statement is true or false. Justify your answer.

117. \[
\begin{bmatrix}
5 & 0 & -2 & 7 \\
-1 & 3 & -6 & 0
\end{bmatrix}
\] is a \( 4 \times 2 \) matrix.

118. The method of Gaussian elimination reduces a matrix until a reduced row-echelon form is obtained.

119. THINK ABOUT IT

The augmented matrix below represents system of linear equations (in variables \( x, y, \) and \( z \)) that has been reduced using Gaussian-Jordan elimination. Write a system of equations with nonzero coefficients that is represented by the reduced matrix. (There are many correct answers.)

\[
\begin{bmatrix}
1 & 0 & 3 & \vdots & -2 \\
0 & 1 & 4 & \vdots & 1 \\
0 & 0 & 0 & \vdots & 0
\end{bmatrix}
\]

120. THINK ABOUT IT

(a) Describe the row-echelon form of an augmented matrix that corresponds to a system of linear equations that is inconsistent.

(b) Describe the row-echelon form of an augmented matrix that corresponds to a system of linear equations that has an infinite number of solutions.

121. Describe the three elementary row operations that can be performed on an augmented matrix.

122. CAPSTONE

In your own words, describe the difference between a matrix in row-echelon form and a matrix in reduced row-echelon form. Include an example of each to support your explanation.

123. What is the relationship between the three elementary row operations performed on an augmented matrix and the operations that lead to equivalent systems of equations?
What you should learn
• Decide whether two matrices are equal.
• Add and subtract matrices and multiply matrices by scalars.
• Multiply two matrices.
• Use matrix operations to model and solve real-life problems.

Why you should learn it
Matrix operations can be used to model and solve real-life problems. For instance, in Exercise 76 on page 598, matrix operations are used to analyze annual health care costs.

Equality of Matrices
In Section 8.1, you used matrices to solve systems of linear equations. There is a rich mathematical theory of matrices, and its applications are numerous. This section and the next two introduce some fundamentals of matrix theory. It is standard mathematical convention to represent matrices in any of the following three ways.

Example 1
Equality of Matrices
Solve for $a_{11}$, $a_{12}$, $a_{21}$, and $a_{22}$ in the following matrix equation.

$$
\begin{bmatrix}
  a_{11} & a_{12} \\
  a_{21} & a_{22}
\end{bmatrix}
= 
\begin{bmatrix}
  2 & -1 \\
  -3 & 0
\end{bmatrix}
$$

Solution
Because two matrices are equal only if their corresponding entries are equal, you can conclude that

$$
a_{11} = 2, \quad a_{12} = -1, \quad a_{21} = -3, \quad \text{and} \quad a_{22} = 0.
$$

CHECKPOINT
Now try Exercise 7.

Be sure you see that for two matrices to be equal, they must have the same order and their corresponding entries must be equal. For instance,

$$
\begin{bmatrix}
  2 & -1 \\
  \sqrt{4} & -\frac{1}{2}
\end{bmatrix}
= 
\begin{bmatrix}
  2 & -1 \\
  2 & 0.5
\end{bmatrix}
\quad \text{but} \quad
\begin{bmatrix}
  2 & -1 \\
  3 & 4
\end{bmatrix}
\neq 
\begin{bmatrix}
  2 & -1 \\
  3 & 4
\end{bmatrix}
$$
Matrix Addition and Scalar Multiplication

In this section, three basic matrix operations will be covered. The first two are matrix addition and scalar multiplication. With matrix addition, you can add two matrices (of the same order) by adding their corresponding entries.

### Definition of Matrix Addition

If \( A = [a_{ij}] \) and \( B = [b_{ij}] \) are matrices of order \( m \times n \), their sum is the \( m \times n \) matrix given by

\[
A + B = [a_{ij} + b_{ij}].
\]

The sum of two matrices of different orders is undefined.

### Example 2

Addition of Matrices

\[
\begin{align*}
a. \quad & \begin{bmatrix} -1 & 2 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 1 & 3 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} -1 + 1 & 2 + 3 \\ 0 + (-1) & 1 + 2 \end{bmatrix} \\
& = \begin{bmatrix} 0 & 5 \\ -1 & 3 \end{bmatrix} \\
b. \quad & \begin{bmatrix} 0 & 1 & -2 \\ 1 & 2 & 3 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 1 & -2 \\ 1 & 2 & 3 \end{bmatrix} \\
c. \quad & \begin{bmatrix} 1 \\ -3 \\ -2 \end{bmatrix} + \begin{bmatrix} -1 \\ 3 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \\
d. \quad & \begin{bmatrix} 2 & 1 & 0 \\ 4 & 0 & -1 \\ 3 & -2 & 2 \end{bmatrix} \quad \text{and} \quad \begin{bmatrix} 0 & 1 \\ -1 & 3 \\ 2 & 4 \end{bmatrix}
\end{align*}
\]

is undefined because \( A \) is of order \( 3 \times 3 \) and \( B \) is of order \( 3 \times 2 \).

#### CHECK POINT

Now try Exercise 13(a).

In operations with matrices, numbers are usually referred to as **scalars**. In this text, scalars will always be real numbers. You can multiply a matrix \( A \) by a scalar \( c \) by multiplying each entry in \( A \) by \( c \).

### Definition of Scalar Multiplication

If \( A = [a_{ij}] \) is an \( m \times n \) matrix and \( c \) is a scalar, the **scalar multiple** of \( A \) by \( c \) is the \( m \times n \) matrix given by

\[
cA = [ca_{ij}].
\]
The symbol \(-A\) represents the negation of \(A\), which is the scalar product \((-1)A\). Moreover, if \(A\) and \(B\) are of the same order, then \(A - B\) represents the sum of \(A\) and \((-1)B\). That is,

\[ A - B = A + (-1)B. \]

Subtraction of matrices

The order of operations for matrix expressions is similar to that for real numbers. In particular, you perform scalar multiplication before matrix addition and subtraction, as shown in Example 3(c).

**Example 3**  
Scalar Multiplication and Matrix Subtraction

For the following matrices, find (a) \(3A\), (b) \(-B\), and (c) \(3A - B\).

\[ A = \begin{bmatrix} 2 & 2 & 4 \\ -3 & 0 & -1 \\ 2 & 1 & 2 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix} \]

**Solution**

a. \(3A = 3\begin{bmatrix} 2 & 2 & 4 \\ -3 & 0 & -1 \\ 2 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 3(2) & 3(2) & 3(4) \\ 3(-3) & 3(0) & 3(-1) \\ 3(2) & 3(1) & 3(2) \end{bmatrix} = \begin{bmatrix} 6 & 6 & 12 \\ -9 & 0 & -3 \\ 6 & 3 & 6 \end{bmatrix} \)

Multiply each entry by 3.

b. \(-B = (-1)\begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 & 0 \\ -1 & 4 & -3 \\ 1 & -3 & -2 \end{bmatrix} \)

Multiply each entry by \(-1\).

c. \(3A - B = \begin{bmatrix} 6 & 6 & 12 \\ -9 & 0 & -3 \\ 6 & 3 & 6 \end{bmatrix} - \begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix} = \begin{bmatrix} 4 & 6 & 12 \\ -10 & 4 & -6 \\ 7 & 0 & 4 \end{bmatrix} \)

Subtract corresponding entries.

Now try Exercise 13(b), (c), and (d).

It is often convenient to rewrite the scalar multiple \(cA\) by factoring \(c\) out of every entry in the matrix. For instance, in the following example, the scalar \(\frac{1}{2}\) has been factored out of the matrix.

\[ \begin{bmatrix} \frac{1}{2} & -\frac{3}{2} \\ \frac{5}{2} & 1 \end{bmatrix} = \begin{bmatrix} \frac{1}{2}(1) & \frac{1}{2}(-3) \\ \frac{1}{2}(5) & \frac{1}{2}(1) \end{bmatrix} = \begin{bmatrix} \frac{1}{2} & -3 \\ \frac{5}{2} & 1 \end{bmatrix} \]
The properties of matrix addition and scalar multiplication are similar to those of addition and multiplication of real numbers.

### Properties of Matrix Addition and Scalar Multiplication

Let $A$, $B$, and $C$ be $m \times n$ matrices and let $c$ and $d$ be scalars.

1. $A + B = B + A$  **Commutative Property of Matrix Addition**
2. $A + (B + C) = (A + B) + C$  **Associative Property of Matrix Addition**
3. $(cd)A = c(dA)$  **Associative Property of Scalar Multiplication**
4. $1A = A$  **Scalar Identity Property**
5. $c(A + B) = cA + cB$  **Distributive Property**
6. $(c + d)A = cA + dA$  **Distributive Property**

Note that the Associative Property of Matrix Addition allows you to write expressions such as $A + B + C$ without ambiguity because the same sum occurs no matter how the matrices are grouped. This same reasoning applies to sums of four or more matrices.

### Example 4  Addition of More than Two Matrices

By adding corresponding entries, you obtain the following sum of four matrices.

$$
\begin{bmatrix}
1 & -1 \\
2 & 0 \\
-3 & 2
\end{bmatrix}
\begin{bmatrix}
2 & -3 \\
1 & -1 \\
4 & -2
\end{bmatrix}
= 
\begin{bmatrix}
2 \\
-1 \\
1
\end{bmatrix}
$$

**CHECK**  Now try Exercise 19.

### Example 5  Using the Distributive Property

Perform the indicated matrix operations.

$$
3\left(\begin{bmatrix}
-2 & 0 \\
4 & 1
\end{bmatrix}
+ \begin{bmatrix}
4 & -2 \\
3 & 7
\end{bmatrix}\right)
$$

**Solution**

$$
3\left(\begin{bmatrix}
-2 & 0 \\
4 & 1
\end{bmatrix}
+ \begin{bmatrix}
4 & -2 \\
3 & 7
\end{bmatrix}\right) = 3\begin{bmatrix}
-2 & 0 \\
4 & 1
\end{bmatrix} + 3\begin{bmatrix}
4 & -2 \\
3 & 7
\end{bmatrix}
= \begin{bmatrix}
-6 & 0 \\
12 & 3
\end{bmatrix} + \begin{bmatrix}
12 & -6 \\
9 & 21
\end{bmatrix}
= \begin{bmatrix}
6 & -6 \\
21 & 24
\end{bmatrix}
$$

**CHECK**  Now try Exercise 21.

In Example 5, you could add the two matrices first and then multiply the matrix by 3, as follows. Notice that you obtain the same result.

$$
3\left(\begin{bmatrix}
-2 & 0 \\
4 & 1
\end{bmatrix}
+ \begin{bmatrix}
4 & -2 \\
3 & 7
\end{bmatrix}\right) = \begin{bmatrix}
2 & -2 \\
7 & 8
\end{bmatrix} = \begin{bmatrix}
6 & -6 \\
21 & 24
\end{bmatrix}
$$
One important property of addition of real numbers is that the number 0 is the additive identity. That is, for any real number \( c \), \( c + 0 = c \). For matrices, a similar property holds. That is, if \( A \) is an \( m \times n \) matrix and \( O \) is the \( m \times n \) zero matrix consisting entirely of zeros, then \( A + O = A \).

In other words, \( O \) is the additive identity for the set of all \( m \times n \) matrices. For example, the following matrices are the additive identities for the sets of all \( 2 \times 3 \) and \( 2 \times 2 \) matrices.

\[
O = \begin{bmatrix}
0 & 0 & 0 \\
0 & 0 & 0 \\
\end{bmatrix} \quad \text{and} \quad O = \begin{bmatrix}
0 & 0 \\
\end{bmatrix}
\]

The algebra of real numbers and the algebra of matrices have many similarities. For example, compare the following solutions.

**Real Numbers**  
\( (\text{Solve for } x) \)  
\( x + a = b \)  
\( x + a + (-a) = b + (-a) \)  
\( x + 0 = b - a \)  
\( x = b - a \)

**\( m \times n \) Matrices**  
\( (\text{Solve for } X) \)  
\( X + A = B \)  
\( X + A + (-A) = B + (-A) \)  
\( X + O = B - A \)  
\( X = B - A \)

The algebra of real numbers and the algebra of matrices also have important differences, which will be discussed later.

**Example 6**  
**Solving a Matrix Equation**

Solve for \( X \) in the equation \( 3X + A = B \), where

\[
A = \begin{bmatrix}
1 & -2 \\
0 & 3 \\
\end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix}
-3 & 4 \\
2 & 1 \\
\end{bmatrix}.
\]

**Solution**

Begin by solving the matrix equation for \( X \) to obtain

\[ 3X = B - A \]

\[ X = \frac{1}{3}(B - A). \]

Now, using the matrices \( A \) and \( B \), you have

\[
X = \frac{1}{3} \left( \begin{bmatrix}
-3 & 4 \\
2 & 1 \\
\end{bmatrix} - \begin{bmatrix}
1 & -2 \\
0 & 3 \\
\end{bmatrix} \right) \quad \text{Substitute the matrices.}
\]

\[
= \frac{1}{3} \begin{bmatrix}
-4 & 6 \\
2 & -2 \\
\end{bmatrix} \quad \text{Subtract matrix } A \text{ from matrix } B.
\]

\[
= \begin{bmatrix}
-\frac{4}{3} & 2 \\
\frac{2}{3} & -\frac{2}{3} \\
\end{bmatrix} \quad \text{Multiply the matrix by } \frac{1}{3}.
\]

**CHECKPOINT**  
Now try Exercise 31.
Matrix Multiplication

Another basic matrix operation is **matrix multiplication**. At first glance, the definition may seem unusual. You will see later, however, that this definition of the product of two matrices has many practical applications.

**Definition of Matrix Multiplication**

If \( A = [a_{ij}] \) is an \( m \times n \) matrix and \( B = [b_{ij}] \) is an \( n \times p \) matrix, the product \( AB \) is an \( m \times p \) matrix

\[
AB = [c_{ij}]
\]

where \( c_{ij} = a_{i1}b_{1j} + a_{i2}b_{2j} + a_{i3}b_{3j} + \cdots + a_{in}b_{nj}. \)

The definition of matrix multiplication indicates a **row-by-column** multiplication, where the entry in the \( i \)th row and \( j \)th column of the product \( AB \) is obtained by multiplying the entries in the \( i \)th row of \( A \) by the corresponding entries in the \( j \)th column of \( B \) and then adding the results. So for the product of two matrices to be defined, the number of columns of the first matrix must equal the number of rows of the second matrix. The general pattern for matrix multiplication is as follows.

\[
\begin{bmatrix}
  a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\
  a_{21} & a_{22} & a_{23} & \cdots & a_{2n} \\
  a_{31} & a_{32} & a_{33} & \cdots & a_{3n} \\
  \vdots & \vdots & \vdots & \ddots & \vdots \\
  a_{m1} & a_{m2} & a_{m3} & \cdots & a_{mn}
\end{bmatrix}
\begin{bmatrix}
  b_{11} & b_{12} & \cdots & b_{1p} \\
  b_{21} & b_{22} & \cdots & b_{2p} \\
  b_{31} & b_{32} & \cdots & b_{3p} \\
  \vdots & \vdots & \ddots & \vdots \\
  b_{n1} & b_{n2} & \cdots & b_{np}
\end{bmatrix}
= 
\begin{bmatrix}
  c_{11} & c_{12} & \cdots & c_{1p} \\
  c_{21} & c_{22} & \cdots & c_{2p} \\
  \vdots & \vdots & \ddots & \vdots \\
  c_{m1} & c_{m2} & \cdots & c_{mp}
\end{bmatrix}
\]

\[a_{1j}b_{1j} + a_{2j}b_{2j} + a_{3j}b_{3j} + \cdots + a_{nj}b_{nj} = c_{ij}\]

**Example 7** Finding the Product of Two Matrices

Find the product \( AB \) using \( A = \begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \) and \( B = \begin{bmatrix} -3 & 2 \\ -4 & 1 \end{bmatrix} \).

**Solution**

To find the entries of the product, multiply each row of \( A \) by each column of \( B \).

\[
AB = \begin{bmatrix}
  -1 & 3 \\
  4 & -2 \\
  5 & 0
\end{bmatrix}
\begin{bmatrix}
  -3 & 2 \\
  -4 & 1
\end{bmatrix} = \begin{bmatrix}
  ( - 1)(- 3) + (3)(- 4) & (- 1)(2) + (3)(1) \\
  (4)(- 3) + (- 2)(- 4) & (4)(2) + (- 2)(1) \\
  (5)(- 3) + (0)(- 4) & (5)(2) + (0)(1)
\end{bmatrix} = \begin{bmatrix}
  -9 & 1 \\
  -4 & 6 \\
  -15 & 10
\end{bmatrix}
\]

In Example 7, the product \( AB \) is defined because the number of columns of \( A \) is equal to the number of rows of \( B \). Also, note that the product \( AB \) has order \( 3 \times 2 \).

**Check Point** Now try Exercise 35.
Be sure you understand that for the product of two matrices to be defined, the number of columns of the first matrix must equal the number of rows of the second matrix. That is, the middle two indices must be the same. The outside two indices give the order of the product, as shown below.

\[
\begin{align*}
\text{Order of } AB & \downarrow \\
A & \times B = AB \\
m \times n & n \times p \\
\end{align*}
\]

**Example 8** Finding the Product of Two Matrices

Find the product where

\[
A = \begin{bmatrix} 1 & 0 & 3 \\ 2 & -1 & -2 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} -2 & 4 \\ 1 & 0 \\ -1 & 1 \end{bmatrix}
\]

**Solution**

Note that the order of \( A \) is \( 2 \times 3 \) and the order of \( B \) is \( 3 \times 2 \). So, the product \( AB \) has order \( 2 \times 2 \).

\[
AB = \begin{bmatrix} 1 & 0 & 3 \\ 2 & -1 & -2 \end{bmatrix} \begin{bmatrix} -2 & 4 \\ 1 & 0 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 1(-2) + 0(1) + 3(-1) & 1(4) + 0(0) + 3(1) \\ 2(-2) + (-1)(1) + (-2)(-1) & 2(4) + (-1)(0) + (-2)(1) \end{bmatrix} = \begin{bmatrix} -5 & 7 \\ -3 & 6 \end{bmatrix}
\]

**Example 9** Patterns in Matrix Multiplication

**a.** \[
\begin{bmatrix} 3 & 4 \\ -2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 4 \\ -2 & 5 \end{bmatrix}
\]

**b.** \[
\begin{bmatrix} 6 & 2 & 0 \\ 3 & -1 & 2 \\ 1 & 4 & 6 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ -3 \end{bmatrix} = \begin{bmatrix} 10 \\ -5 \\ -9 \end{bmatrix}
\]

**c.** The product \( AB \) for the following matrices is not defined.

\[
A = \begin{bmatrix} -2 & 1 \\ 1 & -3 \\ 1 & 4 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} -2 & 3 & 1 & 4 \\ 0 & 1 & -1 & 2 \\ 2 & -1 & 0 & 1 \end{bmatrix}.
\]

**CHECK POINT** Now try Exercise 33.
Patterns in Matrix Multiplication

Example 10

a. \[
\begin{bmatrix}
1 & -2 & -3 \\
-1 & & 1 \\
& & \\
\end{bmatrix}
\begin{bmatrix}
2 \\
& \\
\end{bmatrix}
= \begin{bmatrix}
1 \\
& \\
\end{bmatrix}
\]

b. \[
\begin{bmatrix}
2 \\
& \\
\end{bmatrix}
\begin{bmatrix}
-1 & -2 & -3 \\
1 & & 1 \\
& & \\
\end{bmatrix}
= \begin{bmatrix}
-1 & 2 & 3 \\
1 & -2 & -3 \\
& & \\
\end{bmatrix}
\]

In Example 10, note that the two products are different. Even if both \(AB\) and \(BA\) are defined, matrix multiplication is not, in general, commutative. That is, for most matrices, \(AB \neq BA\). This is one way in which the algebra of real numbers and the algebra of matrices differ.

Properties of Matrix Multiplication

Let \(A\), \(B\), and \(C\) be matrices and let \(c\) be a scalar.

1. \(A(BC) = (AB)C\)  
   Associative Property of Matrix Multiplication

2. \(A(B + C) = AB + AC\)  
   Distributive Property

3. \((A + B)C = AC + BC\)  
   Distributive Property

4. \(c(AB) = (cA)B = A(cB)\)  
   Associative Property of Scalar Multiplication

Definition of Identity Matrix

The \(n \times n\) matrix that consists of 1’s on its main diagonal and 0’s elsewhere is called the identity matrix of order \(n \times n\) and is denoted by

\[
I_n = \begin{bmatrix}
1 & 0 & 0 & \ldots & 0 \\
0 & 1 & 0 & \ldots & 0 \\
0 & 0 & 1 & \ldots & 0 \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
0 & 0 & 0 & \ldots & 1 \\
\end{bmatrix}
\]

Identity matrix

Note that an identity matrix must be square. When the order is understood to be \(n \times n\), you can denote \(I_n\) simply by \(I\).

If \(A\) is an \(n \times n\) matrix, the identity matrix has the property that \(AI_n = A\) and \(I_nA = A\). For example,

\[
\begin{bmatrix}
3 & -2 & 5 \\
1 & 0 & 4 \\
-1 & 2 & -3 \\
\end{bmatrix}
\begin{bmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1 \\
\end{bmatrix}
= \begin{bmatrix}
3 & -2 & 5 \\
1 & 0 & 4 \\
-1 & 2 & -3 \\
\end{bmatrix}
\]

\(AI = A\)

and

\[
\begin{bmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1 \\
\end{bmatrix}
\begin{bmatrix}
3 & -2 & 5 \\
1 & 0 & 4 \\
-1 & 2 & -3 \\
\end{bmatrix}
= \begin{bmatrix}
3 & -2 & 5 \\
1 & 0 & 4 \\
-1 & 2 & -3 \\
\end{bmatrix}
\]

\(IA = A\)
Applications

Matrix multiplication can be used to represent a system of linear equations. Note how the system

\[\begin{align*}
    a_{11}x_1 + a_{12}x_2 + a_{13}x_3 &= b_1 \\
    a_{21}x_1 + a_{22}x_2 + a_{23}x_3 &= b_2 \\
    a_{31}x_1 + a_{32}x_2 + a_{33}x_3 &= b_3
\end{align*}\]

can be written as the matrix equation \(AX = B\), where \(A\) is the coefficient matrix of the system, and \(X\) and \(B\) are column matrices.

### Example 11  Solving a System of Linear Equations

Consider the following system of linear equations.

\[\begin{align*}
    x_1 - 2x_2 + x_3 &= -4 \\
    x_2 + 2x_3 &= 4 \\
    2x_1 + 3x_2 - 2x_3 &= 2
\end{align*}\]

a. Write this system as a matrix equation, \(AX = B\).

b. Use Gauss-Jordan elimination on the augmented matrix \([A : B]\) to solve for the matrix \(X\).

#### Solution

a. In matrix form, \(AX = B\), the system can be written as follows.

\[
\begin{bmatrix}
    1 & -2 & 1 \\
    0 & 1 & 2 \\
    2 & 3 & -2
\end{bmatrix}
\begin{bmatrix}
    x_1 \\
    x_2 \\
    x_3
\end{bmatrix}
= 
\begin{bmatrix}
    -4 \\
    4 \\
    2
\end{bmatrix}
\]

b. The augmented matrix is formed by adjoining matrix \(B\) to matrix \(A\).

\[
[A : B] = 
\begin{bmatrix}
    1 & -2 & 1 & -4 \\
    0 & 1 & 2 & 4 \\
    2 & 3 & -2 & 2
\end{bmatrix}
\]

Using Gauss-Jordan elimination, you can rewrite this equation as

\[
[I : X] = 
\begin{bmatrix}
    1 & 0 & 0 & -1 \\
    0 & 1 & 0 & 2 \\
    0 & 0 & 1 & 1
\end{bmatrix}
\]

So, the solution of the system of linear equations is \(x_1 = -1\), \(x_2 = 2\), and \(x_3 = 1\), and the solution of the matrix equation is

\[
X = \begin{bmatrix}
    x_1 \\
    x_2 \\
    x_3
\end{bmatrix} = \begin{bmatrix}
    -1 \\
    2 \\
    1
\end{bmatrix}
\]

Now try Exercise 61.
Section 8.2 Operations with Matrices

Example 12 Softball Team Expenses

Two softball teams submit equipment lists to their sponsors. 

<table>
<thead>
<tr>
<th>Women's Team</th>
<th>Men's Team</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bats</td>
<td>12</td>
</tr>
<tr>
<td></td>
<td>15</td>
</tr>
<tr>
<td>Balls</td>
<td>45</td>
</tr>
<tr>
<td></td>
<td>38</td>
</tr>
<tr>
<td>Gloves</td>
<td>15</td>
</tr>
<tr>
<td></td>
<td>17</td>
</tr>
</tbody>
</table>

Each bat costs $80, each ball costs $6, and each glove costs $60. Use matrices to find the total cost of equipment for each team.

Solution

The equipment lists $E$ and the costs per item $C$ can be written in matrix form as

\[
E = \begin{bmatrix}
12 & 15 \\
45 & 38 \\
15 & 17 \\
\end{bmatrix}
\]

and

\[
C = \begin{bmatrix}
80 & 6 & 60 \\
\end{bmatrix}
\]

The total cost of equipment for each team is given by the product

\[
CE = \begin{bmatrix}
80 & 6 & 60 \\
\end{bmatrix} \begin{bmatrix}
12 & 15 \\
45 & 38 \\
15 & 17 \\
\end{bmatrix}
= \begin{bmatrix}
80(12) + 6(45) + 60(15) & 80(15) + 6(38) + 60(17) \\
\end{bmatrix}
= \begin{bmatrix}
2130 & 2448 \\
\end{bmatrix}
\]

So, the total cost of equipment for the women’s team is $2130 and the total cost of equipment for the men’s team is $2448.

Check Point Now try Exercise 69.

Classroom Discussion

Problem Posing Write a matrix multiplication application problem that uses the matrix

\[
A = \begin{bmatrix}
20 & 42 & 33 \\
17 & 30 & 50 \\
\end{bmatrix}
\]

Exchange problems with another student in your class. Form the matrices that represent the problem, and solve the problem. Interpret your solution in the context of the problem. Check with the creator of the problem to see if you are correct. Discuss other ways to represent and/or approach the problem.
In Exercises 11–18, if possible, find (a) \( A + B \), (b) \( A - B \), (c) \( 3A - 2B \).

11. \[ A = \begin{bmatrix} 1 & -1 \\ 2 & -1 \end{bmatrix}, \quad B = \begin{bmatrix} 2 \\ -1 \end{bmatrix} \]

12. \[ A = \begin{bmatrix} 2 & 1 \\ 1 & 2 \end{bmatrix}, \quad B = \begin{bmatrix} -3 \\ -2 \end{bmatrix} \]

13. \[ A = \begin{bmatrix} 8 & -1 \\ 2 & 3 \\ -4 & 5 \end{bmatrix}, \quad B = \begin{bmatrix} 1 \\ -1 \\ 10 \end{bmatrix} \]

14. \[ A = \begin{bmatrix} 1 & -1 & 3 \\ 0 & 6 & 9 \end{bmatrix}, \quad B = \begin{bmatrix} -2 & 0 & -5 \\ -3 & 4 & -7 \end{bmatrix} \]

In Exercises 19–24, evaluate the expression.

19. \[ \begin{bmatrix} -5 \\ 3 \end{bmatrix} + \begin{bmatrix} 7 \\ -6 \end{bmatrix} + \begin{bmatrix} -10 \\ 14 \end{bmatrix} \]

20. \[ \begin{bmatrix} 6 \\ -8 \\ -1 \end{bmatrix} + \begin{bmatrix} 0 \\ 5 \\ -3 \end{bmatrix} + \begin{bmatrix} -11 \\ -7 \\ 2 \end{bmatrix} \]

21. \[ 4 \left( \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} - \begin{bmatrix} 2 \\ 1 \\ -2 \end{bmatrix} \right) \]
In Exercises 29–32, if possible, find and state the order of the result.

22. \(
\frac{1}{2}[\begin{bmatrix} 5 & -2 & 4 & 0 \\ 0 & 4 & -3 & 0 \\ 7 & 2 & 5 \end{bmatrix}] + \begin{bmatrix} 14 & 6 & -18 & 9 \\ 0 & 1 & 2 & 0 \\ 9 & 3 & 7 \\ 9 & 3 & 1 \end{bmatrix}\)

23. \(-3\left(\begin{bmatrix} 0 & -3 \\ 2 & 6 \\ 7 & -9 \end{bmatrix} + \begin{bmatrix} 6 & 3 \\ 8 & 1 \end{bmatrix}\right) - 2\left(\begin{bmatrix} 4 & -4 \\ 9 & 0 \\ 7 & -9 \end{bmatrix}\right)\)

24. \(-\left(\begin{bmatrix} 4 & 11 \\ -2 & -1 \\ 9 & 3 \end{bmatrix} + \frac{1}{6}\left(\begin{bmatrix} -5 & -1 \\ 3 & 4 \\ 7 & 5 \end{bmatrix} + \begin{bmatrix} 7 & -5 \\ 0 & 13 \end{bmatrix}\right)\right)\)

In Exercises 25–28, use the matrix capabilities of a graphing utility to evaluate the expression. Round your results to three decimal places, if necessary.

25. \(
\frac{3}{7}\left[\begin{bmatrix} 2 & 5 \\ 1 & -4 \end{bmatrix} + \begin{bmatrix} -3 & 0 \\ 2 & 2 \end{bmatrix}\right]\)

26. \(55\left(\begin{bmatrix} 14 & -11 \\ -22 & 20 \end{bmatrix}\right) + \left(\begin{bmatrix} 15 \end{bmatrix}\right)\)

27. \(-1.004\left(\begin{bmatrix} 0.55 \end{bmatrix}\right) + \left(\begin{bmatrix} 22 \end{bmatrix}\right)\)

28. \(-20\left(\begin{bmatrix} 1 \\ 2 \end{bmatrix}\right) + \frac{1}{8}\left(\begin{bmatrix} -13 \\ 7 \end{bmatrix}\right) + \left(\begin{bmatrix} -14 \end{bmatrix}\right)\)

In Exercises 29–32, solve for \(X\) in the equation, given

\[
\begin{bmatrix} -2 & 1 \\ 1 & 0 \\ 3 & -4 \end{bmatrix}X = \begin{bmatrix} 0 & 3 \\ 2 & -4 \\ 1 \end{bmatrix}
\]

29. \(X = 3A - 2B\)

30. \(2X = 2A - B\)

31. \(2X + 3A = B\)

32. \(2A + 4B = -2X\)

In Exercises 33–40, if possible, find \(AB\) and state the order of the result.

33. \(A = \begin{bmatrix} 2 & 1 \\ -3 & 4 \\ 1 & 6 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & -1 \\ 4 & 0 \\ 8 & 2 \end{bmatrix}\)

34. \(A = \begin{bmatrix} 6 & 0 & 3 \\ 7 & -1 & 8 \\ -1 & 6 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & -1 \\ 4 & -5 \\ 1 & 6 \end{bmatrix}\)

35. \(A = \begin{bmatrix} -1 & 6 \\ -4 & 5 \\ 0 & 3 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & 3 \\ 1 & 9 \end{bmatrix}\)

36. \(A = \begin{bmatrix} 1 & 0 \\ 0 & 4 \\ 0 & -2 \end{bmatrix}, \quad B = \begin{bmatrix} 3 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & -1 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 0 \end{bmatrix}\)

37. \(A = \begin{bmatrix} 5 & 0 \\ 0 & -8 \\ 0 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 0 \end{bmatrix}, \quad B = \begin{bmatrix} -\frac{1}{5} & 0 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 0 \end{bmatrix}\)

38. \(A = \begin{bmatrix} 0 & 0 & 5 \\ 0 & 0 & -3 \\ 1 & 1 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 6 & -11 & 4 \\ 8 & 16 & 4 \\ 0 & 0 & 0 \end{bmatrix}\)

39. \(A = \begin{bmatrix} 10 \\ 12 \end{bmatrix}, \quad B = \begin{bmatrix} 6 & -2 & 1 \\ 6 & 5 & 8 \end{bmatrix}\)

40. \(A = \begin{bmatrix} 1 & 0 & 3 & -2 \\ 6 & 13 & 8 & -17 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 6 \\ 4 & 2 \end{bmatrix}\)

In Exercises 41–46, use the matrix capabilities of a graphing utility to find \(AB\), if possible.

41. \(A = \begin{bmatrix} 7 & 5 & -4 \\ 2 & 5 & 1 \\ 10 & 4 & -7 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & -2 & 3 \\ 8 & 1 & 4 \\ -4 & 2 & -8 \end{bmatrix}\)

42. \(A = \begin{bmatrix} 11 & 12 & 4 \\ 12 & 10 & 7 \end{bmatrix}, \quad B = \begin{bmatrix} 15 & 16 \end{bmatrix}\)

43. \(A = \begin{bmatrix} -3 & 8 & -6 & 8 \\ -12 & 15 & 9 & 6 \end{bmatrix}, \quad B = \begin{bmatrix} 3 & 1 & 6 \\ 24 & 15 & 14 \end{bmatrix}\)

44. \(A = \begin{bmatrix} -2 & 4 & 8 \\ 21 & 5 & 6 \end{bmatrix}, \quad B = \begin{bmatrix} 20 & -1 \\ 15 & 26 \end{bmatrix}\)

45. \(A = \begin{bmatrix} 9 & 10 & -38 \\ 100 & -50 & 250 \end{bmatrix}, \quad B = \begin{bmatrix} 18 \\ 75 \end{bmatrix}\)

46. \(A = \begin{bmatrix} 16 & -18 \\ -4 & 13 \\ -9 & 21 \end{bmatrix}, \quad B = \begin{bmatrix} -7 & 0 \\ 20 & -1 \\ 15 & 26 \end{bmatrix}\)

In Exercises 47–52, if possible, find (a) \(AB\), (b) \(BA\), and (c) \(A^3\). (Note: \(A^2 = AA\)).

47. \(A = \begin{bmatrix} 1 & 2 \\ 4 & 2 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & -1 \\ -1 & 8 \end{bmatrix}\)

48. \(A = \begin{bmatrix} 6 & 3 \\ 2 & 4 \\ -2 & -4 \end{bmatrix}, \quad B = \begin{bmatrix} -2 & 0 \\ 2 & 4 \end{bmatrix}\)

49. \(A = \begin{bmatrix} 3 & -1 \\ 1 & 3 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 3 \\ -3 & 1 \end{bmatrix}\)

50. \(A = \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 3 \\ -3 & 1 \end{bmatrix}\)

51. \(A = \begin{bmatrix} 7 \\ 8 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}\)

52. \(A = \begin{bmatrix} 3 & 2 \\ 1 \end{bmatrix}, \quad B = \begin{bmatrix} 3 \\ 0 \end{bmatrix}\)
In Exercises 53–56, evaluate the expression. Use the matrix capabilities of a graphing utility to verify your answer.

53. \[A = \begin{bmatrix} 3 & 1 \\ 0 & -2 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 0 \\ 2 & 4 \end{bmatrix}\]

54. \[-3 \begin{bmatrix} 6 & 5 & -1 \\ 1 & -2 & 0 \end{bmatrix} \begin{bmatrix} 0 & 3 \\ -1 & -3 \end{bmatrix} \begin{bmatrix} 4 & 0 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} -2 & 3 \\ 0 & -3 \end{bmatrix}\]

55. \[\begin{bmatrix} 3 \\ 1 \\ -1 \end{bmatrix} (\begin{bmatrix} 5 \\ -6 \end{bmatrix} + \begin{bmatrix} 7 \\ -1 \end{bmatrix} + \begin{bmatrix} -8 \\ 9 \end{bmatrix})\]

56. \[\begin{bmatrix} 3 \\ -1 \\ 5 \end{bmatrix}\]

In Exercises 57–64, (a) write the system of linear equations as a matrix equation, \(AX = B\), and (b) use Gauss-Jordan elimination on the augmented matrix \([A : B]\) to solve for the matrix \(X\).

57. \[-x_1 + x_2 = 4, \quad -2x_1 + x_3 = 0 \]

58. \[\begin{bmatrix} 2x_1 + 3x_2 = 5 \\ x_1 + 4x_2 = 10 \end{bmatrix}\]

59. \[-2x_1 - 3x_2 = -4, \quad 6x_1 + x_3 = -36 \]

60. \[\begin{bmatrix} -4x_1 + 9x_2 = -13 \\ x_1 - 3x_2 = 12 \end{bmatrix}\]

61. \[\begin{bmatrix} x_1 - 2x_2 + 3x_3 = 9 \\ -x_1 + 3x_2 - x_3 = -6 \\ 2x_1 - 5x_2 + 5x_3 = 17 \end{bmatrix}\]

62. \[\begin{bmatrix} x_1 + x_2 - 3x_3 = -1 \\ -x_1 + 2x_2 = 1 \\ x_1 - x_2 + x_3 = 2 \end{bmatrix}\]

63. \[\begin{bmatrix} x_1 - 5x_2 + 2x_3 = -20 \\ -3x_1 + x_2 - x_3 = 8 \\ -2x_2 + 5x_3 = -16 \end{bmatrix}\]

64. \[\begin{bmatrix} x_1 - x_2 + 4x_3 = 17 \\ x_1 + 3x_2 = -11 \\ -6x_2 + 5x_3 = 40 \end{bmatrix}\]

65. MANUFACTURING A corporation has three factories, each of which manufactures acoustic guitars and electric guitars. The number of units of guitars produced at factory \(j\) in one day is represented by \(a_{ij}\) in the matrix \(A\).

\[A = \begin{bmatrix} 70 & 50 & 25 \\ 35 & 100 & 70 \end{bmatrix}\]

Find the production levels if production is increased by 20%.

66. MANUFACTURING A corporation has four factories, each of which manufactures sport utility vehicles and pickup trucks. The number of units of vehicle \(i\) produced at factory \(j\) in one day is represented by \(a_{ij}\) in the matrix \(A\).

\[A = \begin{bmatrix} 100 & 90 & 70 & 30 \\ 40 & 20 & 60 & 60 \end{bmatrix}\]

Find the production levels if production is increased by 10%.

67. AGRICULTURE A fruit grower raises two crops, apples and peaches. Each of these crops is sent to three different outlets for sale. These outlets are The Farmer’s Market, The Fruit Stand, and The Fruit Farm. The numbers of bushels of apples sent to the three outlets are 125, 100, and 75, respectively. The numbers of bushels of peaches sent to the three outlets are 100, 175, and 125, respectively. The profit per bushel for apples is $3.50 and the profit per bushel for peaches is $6.00.

(a) Write a matrix \(A\) that represents the number of bushels of each crop \(i\) that are shipped to each outlet \(j\). State what each entry \(a_{ij}\) of the matrix represents.

(b) Write a matrix \(B\) that represents the profit per bushel of each fruit. State what each entry \(b_{ij}\) of the matrix represents.

(c) Find the product \(BA\) and state what each entry of the matrix represents.

68. REVENUE An electronics manufacturer produces three models of LCD televisions, which are shipped to two warehouses. The numbers of units of model \(i\) that are shipped to warehouse \(j\) are represented by \(a_{ij}\) in the matrix \(A\).

\[A = \begin{bmatrix} 5,000 & 4,000 \\ 6,000 & 10,000 \\ 8,000 & 5,000 \end{bmatrix}\]

The prices per unit are represented by the matrix \(B\).

\[B = \begin{bmatrix} \$699.95 \\ \$899.95 \\ \$1099.95 \end{bmatrix}\]

Compute \(BA\) and interpret the result.

69. INVENTORY A company sells five models of computers through three retail outlets. The inventories are represented by \(S\).

\[S = \begin{bmatrix} 3 & 2 & 2 & 3 & 0 \\ 2 & 0 & 3 & 4 & 3 \\ 4 & 2 & 1 & 3 & 2 \end{bmatrix}\]

The wholesale and retail prices are represented by \(T\).

\[T = \begin{bmatrix} \$840 & \$1100 \\ \$1200 & \$1350 \\ \$1450 & \$1650 \\ \$2650 & \$3000 \\ \$3050 & \$3200 \end{bmatrix}\]

Compute \(ST\) and interpret the result.
70. VOTING PREFERENCES The matrix

\[ P = \begin{bmatrix}
0.6 & 0.1 & 0.1 \\
0.2 & 0.7 & 0.1 \\
0.2 & 0.2 & 0.8
\end{bmatrix} \]

is called a stochastic matrix. Each entry \( p_{ij} \) represents the proportion of the voting population that changes from party \( i \) to party \( j \), and \( p_{ii} \) represents the proportion that remains loyal to the party from one election to the next. Compute and interpret \( P^2 \).

71. VOTING PREFERENCES Use a graphing utility to find \( P^3, P^4, P^5, P^6, P^7, \) and \( P^8 \) for the matrix given in Exercise 70. Can you detect a pattern as \( P \) is raised to higher powers?

72. LABOR/WAGE REQUIREMENTS A company that manufactures boats has the following labor-hour and wage requirements.

<table>
<thead>
<tr>
<th>Labor per boat Department</th>
<th>Cutting</th>
<th>Assembly</th>
<th>Packaging</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>1.0 h</td>
<td>0.5 h</td>
<td>0.2 h</td>
</tr>
<tr>
<td>Medium</td>
<td>1.6 h</td>
<td>1.0 h</td>
<td>0.2 h</td>
</tr>
<tr>
<td>Large</td>
<td>2.5 h</td>
<td>2.0 h</td>
<td>1.4 h</td>
</tr>
</tbody>
</table>

Wages per hour

<table>
<thead>
<tr>
<th>Plant</th>
<th>A</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>$15</td>
<td>$13</td>
<td>Cutting</td>
</tr>
<tr>
<td>$12</td>
<td>$11</td>
<td>Assembly</td>
</tr>
<tr>
<td>$11</td>
<td>$10</td>
<td>Packaging</td>
</tr>
</tbody>
</table>

Compute \( ST \) and interpret the result.

73. PROFIT At a local dairy mart, the numbers of gallons of skim milk, 2% milk, and whole milk sold over the weekend are represented by \( A \).

<table>
<thead>
<tr>
<th>Selling price</th>
<th>Profit</th>
</tr>
</thead>
<tbody>
<tr>
<td>$3.45</td>
<td>$1.20</td>
</tr>
<tr>
<td>$3.65</td>
<td>$1.30</td>
</tr>
<tr>
<td>$3.85</td>
<td>$1.45</td>
</tr>
</tbody>
</table>

Skim milk

\[ B = \begin{bmatrix}
\text{Skim milk} \\
\text{2% milk} \\
\text{Whole milk}
\end{bmatrix} \]

(a) Compute \( AB \) and interpret the result.
(b) Find the dairy mart’s total profit from milk sales for the weekend.

74. PROFIT At a convenience store, the numbers of gallons of 87-octane, 89-octane, and 93-octane gasoline sold over the weekend are represented by \( A \).

<table>
<thead>
<tr>
<th>Selling price</th>
<th>Profit</th>
</tr>
</thead>
<tbody>
<tr>
<td>$2.00</td>
<td>$0.08</td>
</tr>
<tr>
<td>$2.10</td>
<td>$0.09</td>
</tr>
<tr>
<td>$2.20</td>
<td>$0.10</td>
</tr>
</tbody>
</table>

87 89 93

<table>
<thead>
<tr>
<th>Octane</th>
<th>Friday</th>
<th>Saturday</th>
<th>Sunday</th>

<td>87</td>
<td>580 420 1020</td>
<td></td>
<td></td>
</tr>
<tr>
<td>89</td>
<td>840 420 540</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(a) Compute \( AB \) and interpret the result.
(b) Find the convenience store’s profit from gasoline sales for the weekend.

75. EXERCISE The numbers of calories burned by individuals of different body weights performing different types of aerobic exercises for a 20-minute time period are shown in matrix \( A \).

<table>
<thead>
<tr>
<th>Calories burned</th>
</tr>
</thead>
<tbody>
<tr>
<td>120-lb person</td>
</tr>
<tr>
<td>150-lb person</td>
</tr>
<tr>
<td>Bicycling</td>
</tr>
<tr>
<td>109 136</td>
</tr>
<tr>
<td>Jogging</td>
</tr>
<tr>
<td>127 159</td>
</tr>
<tr>
<td>Walking</td>
</tr>
<tr>
<td>64 79</td>
</tr>
</tbody>
</table>

Friday Saturday Sunday

(a) A 120-pound person and a 150-pound person bicycled for 40 minutes, jogged for 10 minutes, and walked for 60 minutes. Organize the time they spent exercising in a matrix \( B \).
(b) Compute \( BA \) and interpret the result.
76. **HEALTH CARE** The health care plans offered this year by a local manufacturing plant are as follows. For individuals, the comprehensive plan costs $694.32, the HMO standard plan costs $451.80, and the HMO Plus plan costs $489.48. For families, the comprehensive plan costs $1725.36, the HMO standard plan costs $1187.76, and the HMO Plus plan costs $1248.12. The plant expects the costs of the plans to change next year as follows. For individuals, the costs for the comprehensive, HMO standard, and HMO Plus plans will be $683.91, $463.10, and $499.27, respectively. For families, the costs for the comprehensive, HMO standard, and HMO Plus plans will be $1699.48, $1217.45, and $1273.08, respectively.

(a) Organize the information using two matrices and 
where represents the health care plan costs for this year and represents the health care plan costs for next year. State what each entry of each matrix represents.

(b) Compute and interpret the result.

(c) The employees receive monthly paychecks from which the health care plan costs are deducted. Use the matrices from part (a) to write matrices that show how much will be deducted from each employees’ paycheck this year and next year. State what each entry of each matrix represents.

(d) Suppose instead that the costs of the health care plans increase by 4% next year. Write a matrix that shows the new monthly payments.

---

### EXPLORATION

#### TRUE OR FALSE?

In Exercises 77 and 78, determine whether the statement is true or false. Justify your answer.

77. Two matrices can be added only if they have the same order.

78. Matrix multiplication is commutative.

**THINK ABOUT IT** In Exercises 79–86, let matrices , , , and be of orders 2 × 3, 2 × 3, 3 × 2, and 2 × 2, respectively. Determine whether the matrices are of proper order to perform the operation(s). If so, give the order of the answer.

79.  
80.  
81.  
82.  
83.  
84.  
85.  
86. 

87. Consider matrices , , and below. Perform the indicated operations and compare the results.

\[ A = \begin{bmatrix} 3 & -1 \\ 4 & 7 \end{bmatrix}, \quad B = \begin{bmatrix} -2 & 0 \\ 8 & 1 \end{bmatrix}, \quad C = \begin{bmatrix} 5 & 2 \\ 2 & -6 \end{bmatrix} \]

(a) Find  and 
(b) Find , then add to the resulting matrix.
Find , then add to the resulting matrix.
(c) Find  and , then add the two resulting matrices.
Find , then multiply the resulting matrix by 2.

88. Use the following matrices to find , , , and . What do your results tell you about matrix multiplication, commutativity, and associativity?

\[ A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \quad B = \begin{bmatrix} 0 & 1 \\ 2 & 3 \end{bmatrix}, \quad C = \begin{bmatrix} 3 & 0 \\ 0 & 1 \end{bmatrix} \]

89. **THINK ABOUT IT** If , , and are real numbers such that , then . However, if , , and are nonzero matrices such that , then is not necessarily equal to . Illustrate this using the following matrices.

\[ A = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix}, \quad C = \begin{bmatrix} 2 & 3 \\ 2 & 3 \end{bmatrix} \]

90. **THINK ABOUT IT** If , and are real numbers such that , then . However, if and are matrices such that , it is not necessarily true that or . Illustrate this using the following matrices.

\[ A = \begin{bmatrix} 3 & 3 \\ 4 & 4 \end{bmatrix}, \quad B = \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \]

91. Let and be unequal diagonal matrices of the same order. (A **diagonal matrix** is a square matrix in which each entry not on the main diagonal is zero.) Determine the products for several pairs of such matrices. Make a conjecture about a quick rule for such products.

92. Let and let

\[ A = \begin{bmatrix} i & 0 \\ 0 & i \end{bmatrix}, \quad B = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix} \]

(a) Find , , and . Identify any similarities with , , and .
(b) Find and identify .

93. Find two matrices and such that .

94. **CAPSTONE** Let matrices and be of orders 3 × 2 and 2 × 2, respectively. Answer the following questions and explain your reasoning.

(a) Is it possible that ?
(b) Is defined?
(c) Is defined? If so, is it possible that ?
8.3 The Inverse of a Square Matrix

The Inverse of a Matrix

This section further develops the algebra of matrices. To begin, consider the real number equation \( ax = b \). To solve this equation for \( x \), multiply each side of the equation by \( a^{-1} \) (provided that \( a \neq 0 \)).

\[
ax = b \\
(a^{-1}a)x = a^{-1}b \\
(1)x = a^{-1}b \\
x = a^{-1}b
\]

The number \( a^{-1} \) is called the multiplicative inverse of \( a \) because \( a^{-1}a = 1 \). The definition of the multiplicative inverse of a matrix is similar.

Definition of the Inverse of a Square Matrix

Let \( A \) be an \( n \times n \) matrix and let \( I_n \) be the \( n \times n \) identity matrix. If there exists a matrix \( A^{-1} \) such that

\[ AA^{-1} = I_n = A^{-1}A \]

then \( A^{-1} \) is called the inverse of \( A \). The symbol \( A^{-1} \) is read “A inverse.”

Example 1 The Inverse of a Matrix

Show that \( B \) is the inverse of \( A \), where

\[
A = \begin{bmatrix} -1 & 2 \\ -1 & 1 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 1 & -2 \\ 1 & -1 \end{bmatrix}
\]

Solution

To show that \( B \) is the inverse of \( A \), show that \( AB = I = BA \), as follows.

\[
AB = \begin{bmatrix} -1 & 2 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ 1 & -1 \end{bmatrix} = \begin{bmatrix} -1+2 & 2-2 \\ -1+1 & 2-1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}
\]

\[
BA = \begin{bmatrix} 1 & -2 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} -1+2 & 2-2 \\ -1+1 & 2-1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}
\]

As you can see, \( AB = I = BA \). This is an example of a square matrix that has an inverse. Note that not all square matrices have inverses.

CHECK Point Now try Exercise 5.

Recall that it is not always true that \( AB = BA \), even if both products are defined. However, if \( A \) and \( B \) are both square matrices and \( AB = I_n \), it can be shown that \( BA = I_n \). So, in Example 1, you need only to check that \( AB = I_2 \).
Finding Inverse Matrices

If a matrix $A$ has an inverse, $A$ is called invertible (or nonsingular); otherwise, $A$ is called singular. A nonsquare matrix cannot have an inverse. To see this, note that if $A$ is of order $m \times n$ and $B$ is of order $n \times m$ (where $m \neq n$), the products $AB$ and $BA$ are of different orders and so cannot be equal to each other. Not all square matrices have inverses (see the matrix at the bottom of page 602). If, however, a matrix does have an inverse, that inverse is unique. Example 2 shows how to use a system of equations to find the inverse of a matrix.

### Example 2 Finding the Inverse of a Matrix

Find the inverse of

$$A = \begin{bmatrix} 1 & 4 \\ -1 & -3 \end{bmatrix}.$$  

**Solution**

To find the inverse of $A$, try to solve the matrix equation $AX = I$ for $X$.

$$A \begin{bmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Equating corresponding entries, you obtain two systems of linear equations.

$$\begin{align*}
x_{11} + 4x_{21} &= 1 \\
x_{11} - 3x_{21} &= 0
\end{align*}$$  

Linear system with two variables, $x_{11}$ and $x_{21}$.

$$\begin{align*}
x_{12} + 4x_{22} &= 0 \\
x_{12} - 3x_{22} &= 1
\end{align*}$$  

Linear system with two variables, $x_{12}$ and $x_{22}$.

Solve the first system using elementary row operations to determine that $x_{11} = -3$ and $x_{21} = 1$. From the second system you can determine that $x_{12} = -4$ and $x_{22} = 1$. Therefore, the inverse of $A$ is

$$X = A^{-1} = \begin{bmatrix} -3 & -4 \\ 1 & 1 \end{bmatrix}.$$  

You can use matrix multiplication to check this result.

**Check**

$$AA^{-1} = \begin{bmatrix} 1 & 4 \\ -1 & -3 \end{bmatrix} \begin{bmatrix} -3 & -4 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \checkmark$$

$$A^{-1}A = \begin{bmatrix} -3 & -4 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 4 \\ -1 & -3 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \checkmark$$

**CHECK Point** Now try Exercise 15.
In Example 2, note that the two systems of linear equations have the same coefficient matrix \( A \). Rather than solve the two systems represented by

\[
\begin{bmatrix}
1 & 4 & \vdots & 1 \\
-1 & -3 & \vdots & 0 \\
\end{bmatrix}
\]

and

\[
\begin{bmatrix}
1 & 4 & \vdots & 0 \\
-1 & -3 & \vdots & 1 \\
\end{bmatrix}
\]

separately, you can solve them simultaneously by adjoining the identity matrix to the coefficient matrix to obtain

\[
\begin{bmatrix}
A & I \\
\end{bmatrix}
\]

This “doubly augmented” matrix can be represented as \([A : I]\). By applying Gauss-Jordan elimination to this matrix, you can solve both systems with a single elimination process.

So, from the “doubly augmented” matrix \([A : I]\), you obtain the matrix \([I : A^{-1}]\).

**Finding an Inverse Matrix**

Let \( A \) be a square matrix of order \( n \).

1. Write the \( n \times 2n \) matrix that consists of the given matrix \( A \) on the left and the \( n \times n \) identity matrix \( I \) on the right to obtain \([A : I]\).

2. If possible, row reduce \( A \) to \( I \) using elementary row operations on the entire matrix \([A : I]\). The result will be the matrix \([I : A^{-1}]\). If this is not possible, \( A \) is not invertible.

3. Check your work by multiplying to see that \( AA^{-1} = I = A^{-1}A \).
**Example 3  Finding the Inverse of a Matrix**

Find the inverse of \( A = \begin{bmatrix} 1 & -1 & 0 \\ 1 & 0 & -1 \\ 6 & -2 & -3 \end{bmatrix} \).

**Solution**

Begin by adjoining the identity matrix to form the matrix

\[
[A : I] = \begin{bmatrix} 1 & -1 & 0 & 1 & 0 & 0 \\ 1 & 0 & -1 & 0 & 1 & 0 \\ 6 & -2 & -3 & 0 & 0 & 1 \end{bmatrix}.
\]

Use elementary row operations to obtain the form \([I : A^{-1}]\), as follows.

\[
\begin{align*}
-R_1 + R_2 & \rightarrow 0 1 -1 : -1 1 0 \\
-6R_1 + R_3 & \rightarrow 0 4 -3 : -6 0 1 \\
R_2 + R_1 & \rightarrow 1 0 -1 : 0 1 0 \\
0 1 -1 & \rightarrow -1 1 0 \\
-4R_2 + R_3 & \rightarrow 0 0 1 : -2 -4 1 \\
R_3 + R_1 & \rightarrow 1 0 0 : -2 -3 1 \\
R_3 + R_2 & \rightarrow 0 1 0 : -3 -3 1 \\
0 0 1 & \rightarrow -2 -4 1 
\end{align*}
\]

So, the matrix \( A \) is invertible and its inverse is

\[
A^{-1} = \begin{bmatrix} -2 & -3 & 1 \\ -3 & -3 & 1 \\ -2 & -4 & 1 \end{bmatrix}.
\]

Confirm this result by multiplying \( A \) and \( A^{-1} \) to obtain \( I \), as follows.

**Check**

\[
AA^{-1} = \begin{bmatrix} 1 & -1 & 0 \\ 1 & 0 & -1 \\ 6 & -2 & -3 \end{bmatrix} \begin{bmatrix} -2 & -3 & 1 \\ -3 & -3 & 1 \\ -2 & -4 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = I
\]

**CHECKPOINT**  Now try Exercise 19.

The process shown in Example 3 applies to any \( n \times n \) matrix \( A \). When using this algorithm, if the matrix \( A \) does not reduce to the identity matrix, then \( A \) does not have an inverse. For instance, the following matrix has no inverse.

\[
A = \begin{bmatrix} 1 & 2 & 0 \\ 3 & -1 & 2 \\ -2 & 3 & -2 \end{bmatrix}
\]

To confirm that matrix \( A \) above has no inverse, adjoin the identity matrix to \( A \) to form \([A : I]\) and perform elementary row operations on the matrix. After doing so, you will see that it is impossible to obtain the identity matrix \( I \) on the left. Therefore, \( A \) is not invertible.
The Inverse of a 2 × 2 Matrix

Using Gauss-Jordan elimination to find the inverse of a matrix works well (even as a computer technique) for matrices of order 3 × 3 or greater. For 2 × 2 matrices, however, many people prefer to use a formula for the inverse rather than Gauss-Jordan elimination. This simple formula, which works only for 2 × 2 matrices, is explained as follows. If A is a 2 × 2 matrix given by

\[
A = \begin{bmatrix}
a & b \\
c & d
\end{bmatrix}
\]

then A is invertible if and only if \(ad - bc \neq 0\). Moreover, if \(ad - bc \neq 0\), the inverse is given by

\[
A^{-1} = \frac{1}{ad - bc} \begin{bmatrix}
d & -b \\
-c & a
\end{bmatrix}
\]

Formula for inverse of matrix A

The denominator \(ad - bc\) is called the determinant of the 2 × 2 matrix \(A\). You will study determinants in the next section.

Example 4 Finding the Inverse of a 2 × 2 Matrix

If possible, find the inverse of each matrix.

a. \(A = \begin{bmatrix}3 & -1 \\ -2 & 2\end{bmatrix}\)

b. \(B = \begin{bmatrix}3 & -1 \\ -6 & 2\end{bmatrix}\)

Solution

a. For the matrix \(A\), apply the formula for the inverse of a 2 × 2 matrix to obtain

\[
ad - bc = (3)(2) - (-1)(-2)
\]

\[
= 4.
\]

Because this quantity is not zero, the inverse is formed by interchanging the entries on the main diagonal, changing the signs of the other two entries, and multiplying by the scalar \(\frac{1}{4}\), as follows.

\[
A^{-1} = \frac{1}{4} \begin{bmatrix}2 & 1 \\ -2 & 3\end{bmatrix}
\]

Substitute for \(a, b, c,\) and the determinant.

\[
= \frac{1}{4} \begin{bmatrix}2 & 1 \\ -2 & 3\end{bmatrix}
\]

Multiply by the scalar \(\frac{1}{4}\).

b. For the matrix \(B\), you have

\[
ad - bc = (3)(2) - (-1)(-6)
\]

\[
= 0
\]

which means that \(B\) is not invertible.

CHECK POINT Now try Exercise 35.
Systems of Linear Equations

You know that a system of linear equations can have exactly one solution, infinitely many solutions, or no solution. If the coefficient matrix $A$ of a square system (a system that has the same number of equations as variables) is invertible, the system has a unique solution, which is defined as follows.

**A System of Equations with a Unique Solution**

If $A$ is an invertible matrix, the system of linear equations represented by $AX = B$ has a unique solution given by

$$ X = A^{-1}B. $$

**Example 5** Solving a System Using an Inverse Matrix

You are going to invest $10,000 in AAA-rated bonds, AA-rated bonds, and B-rated bonds and want an annual return of $730. The average yields are 6% on AAA bonds, 7.5% on AA bonds, and 9.5% on B bonds. You will invest twice as much in AAA bonds as in B bonds. Your investment can be represented as

$$ \begin{align*}
&x + y + z = 10,000 \\
&0.06x + 0.075y + 0.095z = 730 \\
&x - 2z = 0
\end{align*} $$

where $x$, $y$, and $z$ represent the amounts invested in AAA, AA, and B bonds, respectively. Use an inverse matrix to solve the system.

**Solution**

Begin by writing the system in the matrix form $AX = B$.

$$ \begin{bmatrix} 1 & 1 & 1 \\ 0.06 & 0.075 & 0.095 \\ 1 & 0 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 10,000 \\ 730 \\ 0 \end{bmatrix} $$

Then, use Gauss-Jordan elimination to find $A^{-1}$.

$$ A^{-1} = \begin{bmatrix} 15 & -200 & -2 \\ -21.5 & 300 & 3.5 \\ 7.5 & -100 & -1.5 \end{bmatrix} $$

Finally, multiply $B$ by $A^{-1}$ on the left to obtain the solution.

$$ X = A^{-1}B $$

$$ \begin{bmatrix} 15 & -200 & -2 \\ -21.5 & 300 & 3.5 \\ 7.5 & -100 & -1.5 \end{bmatrix} \begin{bmatrix} 10,000 \\ 730 \\ 0 \end{bmatrix} = \begin{bmatrix} 4000 \\ 4000 \\ 2000 \end{bmatrix} $$

The solution of the system is $x = 4000$, $y = 4000$, and $z = 2000$. So, you will invest $4000 in AAA bonds, $4000 in AA bonds, and $2000 in B bonds.

**Checkpoint** Now try Exercise 65.
VOCABULARY: Fill in the blanks.

1. In a _______ matrix, the number of rows equals the number of columns.

2. If there exists an \( n \times n \) matrix \( A^{-1} \) such that \( AA^{-1} = I_n \), then \( A^{-1} \) is called the _______ of \( A \).

3. If a matrix \( A \) has an inverse, it is called invertible or _______; if it does not have an inverse, it is called ________.

4. If \( A \) is an invertible matrix, the system of linear equations represented by \( AX = B \) has a unique solution given by \( X = \) ________.

SKILLS AND APPLICATIONS

In Exercises 5–12, show that \( B \) is the inverse of \( A \).

5. \( A = \begin{bmatrix} 2 & 1 \\ 5 & 3 \end{bmatrix}, \ B = \begin{bmatrix} 3 & 1 \\ -5 & 2 \end{bmatrix} \)

6. \( A = \begin{bmatrix} 1 & -1 \\ -1 & 2 \end{bmatrix}, \ B = \begin{bmatrix} 2 & 1 \\ 1 & 1 \end{bmatrix} \)

7. \( A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \ B = \begin{bmatrix} -2 & 1 \\ \frac{5}{2} & -\frac{1}{2} \end{bmatrix} \)

8. \( A = \begin{bmatrix} 1 & -1 \\ 2 & 3 \end{bmatrix}, \ B = \begin{bmatrix} \frac{2}{3} & \frac{1}{3} \\ \frac{2}{3} & \frac{1}{3} \end{bmatrix} \)

9. \( A = \begin{bmatrix} 2 & -11 & 11 \\ -1 & 11 & -7 \\ 0 & 3 & -2 \end{bmatrix}, \ B = \begin{bmatrix} 1 & 1 & 2 \\ 2 & 4 & -3 \\ 3 & 6 & -5 \end{bmatrix} \)

10. \( A = \begin{bmatrix} -4 & 1 & 5 \\ 0 & -1 & -1 \end{bmatrix}, \ B = \begin{bmatrix} -\frac{1}{3} & 1 & \frac{1}{2} \\ -\frac{1}{4} & -1 & \frac{1}{2} \end{bmatrix} \)

11. \( A = \begin{bmatrix} -2 & 2 & 3 \\ 1 & -1 & 0 \\ 0 & 1 & 4 \end{bmatrix}, \ B = \begin{bmatrix} -4 & -5 & 3 \\ -4 & -8 & 3 \\ 1 & 2 & 0 \end{bmatrix} \)

12. \( A = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 1 & 0 \\ -1 & 1 & 2 \\ 0 & -1 & 1 \end{bmatrix}, \ B = \begin{bmatrix} -3 & 1 & -3 \\ -3 & -1 & 2 \\ -3 & 1 & 1 \\ 0 & 1 & 0 \end{bmatrix} \)

In Exercises 13–24, find the inverse of the matrix (if it exists).

13. \( \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix} \)

14. \( \begin{bmatrix} 1 & 2 \\ 3 & 7 \end{bmatrix} \)

15. \( \begin{bmatrix} 1 & -2 \\ 2 & -3 \end{bmatrix} \)

16. \( \begin{bmatrix} -7 & 33 \\ 4 & -19 \end{bmatrix} \)

17. \( \begin{bmatrix} 3 & 1 \\ 4 & 2 \end{bmatrix} \)

18. \( \begin{bmatrix} 4 & -1 \\ -3 & 1 \end{bmatrix} \)

19. \( \begin{bmatrix} 1 & 1 \\ 3 & 5 \\ 4 \end{bmatrix} \)

20. \( \begin{bmatrix} 1 & 2 & 2 \\ 3 & 7 & 9 \\ 6 & 5 & -1 \\ -4 & 7 & \end{bmatrix} \)

21. \( \begin{bmatrix} -5 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \)

22. \( \begin{bmatrix} 1 & 0 & 0 \\ 2 & 0 & 0 \\ -1 & 5 & 7 \end{bmatrix} \)

23. \( \begin{bmatrix} -8 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 4 & 0 \\ 0 & 0 & 0 & -5 \end{bmatrix} \)

24. \( \begin{bmatrix} 1 & 3 & -2 \\ 1 & 3 & -2 \\ 0 & 2 & 4 \\ 6 & 0 & 2 \end{bmatrix} \)

In Exercises 25–34, use the matrix capabilities of a graphing utility to find the inverse of the matrix (if it exists).

25. \( \begin{bmatrix} 1 & 2 & -1 \\ 3 & 7 & -10 \end{bmatrix} \)

26. \( \begin{bmatrix} 10 & 5 & -7 \\ 3 & 7 & -10 \end{bmatrix} \)

27. \( \begin{bmatrix} 1 & 1 & 2 \\ 3 & 1 & 0 \\ -2 & 0 & 3 \end{bmatrix} \)

28. \( \begin{bmatrix} 1 & 2 \\ 3 & 2 \end{bmatrix} \)

29. \( \begin{bmatrix} 1 & 0 & -\frac{3}{2} \\ 0 & -1 & \frac{1}{2} \end{bmatrix} \)

30. \( \begin{bmatrix} -\frac{5}{6} & \frac{1}{3} & \frac{11}{6} \\ 0 & \frac{1}{2} & 2 \end{bmatrix} \)

31. \( \begin{bmatrix} 0.1 & 0.2 & 0.3 \\ -0.3 & 0.2 & 0.2 \\ 0.5 & 0.4 & 0.4 \end{bmatrix} \)

32. \( \begin{bmatrix} 0.6 & 0 & -0.3 \\ 0.7 & -1 & 0.2 \\ 1 & 0 & -0.9 \end{bmatrix} \)

33. \( \begin{bmatrix} -1 & 0 & 1 \\ 0 & 2 & 0 \\ 2 & 0 & -1 \\ 0 & -1 & 0 \end{bmatrix} \)

34. \( \begin{bmatrix} 1 & -2 & -1 \\ 3 & -2 & -3 \\ -2 & -2 & -5 \\ 4 & 4 & 11 \end{bmatrix} \)

In Exercises 35–40, use the formula on page 603 to find the inverse of the \( 2 \times 2 \) matrix (if it exists).

35. \( \begin{bmatrix} 2 & 3 \\ -1 & 5 \end{bmatrix} \)

36. \( \begin{bmatrix} 1 & -2 \\ -3 & 2 \end{bmatrix} \)

37. \( \begin{bmatrix} -4 & -6 \\ 2 & 3 \end{bmatrix} \)

38. \( \begin{bmatrix} -12 & 3 \\ 5 & 2 \end{bmatrix} \)
39. \[
\begin{bmatrix}
\frac{7}{5} & -\frac{1}{5} \\
\frac{1}{5} & \frac{4}{5}
\end{bmatrix}
\]  
40. \[
\begin{bmatrix}
-\frac{1}{5} & \frac{9}{5} \\
\frac{5}{5} & \frac{8}{5}
\end{bmatrix}
\]

In Exercises 41–44, use the inverse matrix found in Exercise 15 to solve the system of linear equations.

41. \[
\begin{align*}
3x - 2y &= 5 \\
2x - 3y &= 10
\end{align*}
\]
42. \[
\begin{align*}
x - 2y &= 0 \\
2x - 3y &= 3
\end{align*}
\]
43. \[
\begin{align*}
x - 2y &= 4 \\
2x - 3y &= 2
\end{align*}
\]
44. \[
\begin{align*}
x - 2y &= 1 \\
2x - 3y &= -2
\end{align*}
\]

In Exercises 45 and 46, use the inverse matrix found in Exercise 19 to solve the system of linear equations.

45. \[
\begin{align*}
x + y + z &= 0 \\
3x + 5y + 4z &= 5 \\
3x + 6y + 5z &= 2
\end{align*}
\]
46. \[
\begin{align*}
x + y + z &= -1 \\
3x + 5y + 4z &= 2 \\
3x + 6y + 5z &= 0
\end{align*}
\]

In Exercises 47 and 48, use the inverse matrix found in Exercise 34 to solve the system of linear equations.

47. \[
\begin{align*}
x_1 - 2x_2 - x_3 - 2x_4 &= 0 \\
3x_1 - 5x_2 - 2x_3 - 3x_4 &= 1 \\
2x_1 - 5x_2 - 2x_3 - 5x_4 &= -1 \\
-x_1 + 4x_2 + 3x_3 + 11x_4 &= 2
\end{align*}
\]
48. \[
\begin{align*}
x_1 - 2x_2 - x_3 - 2x_4 &= 1 \\
3x_1 - 5x_2 - 2x_3 - 3x_4 &= -2 \\
2x_1 - 5x_2 - 2x_3 - 5x_4 &= 0 \\
-x_1 + 4x_2 + 4x_3 + 11x_4 &= -3
\end{align*}
\]

In Exercises 49 and 50, use a graphing utility to solve the system of linear equations using an inverse matrix.

49. \[
\begin{align*}
x_1 + 2x_2 - x_3 + 3x_4 - x_5 &= -3 \\
x_1 - 3x_2 + x_3 + 2x_4 - x_5 &= -3 \\
x_1 + x_2 + x_3 + 3x_4 - x_5 &= 6 \\
x_1 - x_2 + 2x_3 + x_4 - x_5 &= 2 \\
x_1 + x_2 - x_3 + 3x_4 + 3x_5 &= -3
\end{align*}
\]
50. \[
\begin{align*}
x_1 + x_2 - x_3 + 3x_4 - x_5 &= 3 \\
x_1 + x_2 + x_3 - x_4 + x_5 &= 4 \\
x_1 + x_2 - x_3 + 2x_4 - x_5 &= 3 \\
x_1 + x_2 + x_3 + 3x_4 - x_5 &= -1 \\
x_1 + x_2 + x_3 - 3x_4 + x_5 &= 5
\end{align*}
\]

In Exercises 51–58, use an inverse matrix to solve (if possible) the system of linear equations.

51. \[
\begin{align*}
3x + 4y &= -2 \\
5x + 3y &= 4
\end{align*}
\]
52. \[
\begin{align*}
18x + 12y &= 13 \\
30x + 24y &= 23
\end{align*}
\]
53. \[
\begin{align*}
-0.4x + 0.8y &= 1.6 \\
2x + 4y &= 5
\end{align*}
\]
54. \[
\begin{align*}
0.2x - 0.6y &= 2.4 \\
x + 1.4y &= -8.8
\end{align*}
\]
55. \[
\begin{align*}
-\frac{1}{2}x + \frac{3}{2}y &= -2 \\
\frac{3}{2}x + \frac{1}{2}y &= -12
\end{align*}
\]
56. \[
\begin{align*}
\frac{5}{4}x - y &= -20 \\
\frac{3}{4}x + \frac{7}{2}y &= -51
\end{align*}
\]
57. \[
\begin{align*}
4x - y + z &= -5 \\
x + 2y + z &= 10 \\
5x - 2y + 6z &= 1
\end{align*}
\]
58. \[
\begin{align*}
4x - 2y + 3z &= -2 \\
2x + 2y + 5z &= 16 \\
8x - 5y - 2z &= 4
\end{align*}
\]

In Exercises 59–62, use the matrix capabilities of a graphing utility to solve (if possible) the system of linear equations.

59. \[
\begin{align*}
5x - 3y + 2z &= 2 \\
x + 3y + 5z &= 6 \\
x - 7y + 8z &= -1
\end{align*}
\]
60. \[
\begin{align*}
2x + 3y + 5z &= 4 \\
3x + 5y + 9z &= 7 \\
5x + 9y + 17z &= 13
\end{align*}
\]
61. \[
\begin{align*}
3x - 2y + z &= -29 \\
4x + y - 3z &= 37 \\
x - 5y + z &= -24
\end{align*}
\]
62. \[
\begin{align*}
-8x + 7y - 10z &= -151 \\
12x + 3y + 5z &= 86 \\
15x - 9y + 2z &= 187
\end{align*}
\]

In Exercises 63 and 64, show that the matrix is invertible and find its inverse.

63. \[
A = \begin{bmatrix}
\sin \theta & \cos \theta \\
-\cos \theta & \sin \theta
\end{bmatrix}
\]
64. \[
A = \begin{bmatrix}
\sec \theta & \tan \theta \\
\tan \theta & \sec \theta
\end{bmatrix}
\]

INVESTMENT PORTFOLIO In Exercises 65–68, consider a person who invests in AAA-rated bonds, A-rated bonds, and B-rated bonds. The average yields are 6.5% on AAA bonds, 7% on A bonds, and 9% on B bonds. The person invests twice as much in B bonds as in A bonds. Let \( x, y, \) and \( z \) represent the amounts invested in AAA, A, and B bonds, respectively. Find the amount invested in each type of bond.

\[
\begin{align*}
x + y + z &= \text{(total investment)} \\
0.065x + 0.07y + 0.09z &= \text{(annual return)} \\
2y - z &= 0
\end{align*}
\]

Use the inverse of the coefficient matrix of this system to find the amount invested in each type of bond.

<table>

PRODUCTION In Exercises 69–72, a small home business creates muffins, bones, and cookies for dogs. In addition to other ingredients, each muffin requires 2 units of beef, 3 units of chicken, and 2 units of liver. Each bone requires 1 unit of beef, 1 unit of chicken, and 1 unit of liver. Each cookie requires 2 units of beef, 1 unit of chicken, and 1.5 units of liver. Find the numbers of muffins, bones, and cookies that the company can create with the given amounts of ingredients.
Section 8.3  The Inverse of a Square Matrix  607

69. 700 units of beef  
70. 525 units of beef 
500 units of chicken  
680 units of chicken  
600 units of liver 
500 units of liver

71. 800 units of beef  
72. 1000 units of beef 
750 units of chicken  
950 units of chicken  
725 units of liver  
900 units of liver

73. COFFEE A coffee manufacturer sells a 10-pound package that contains three flavors of coffee for $26. French vanilla coffee costs $2 per pound, hazelnut flavored coffee costs $2.50 per pound, and Swiss chocolate flavored coffee costs $3 per pound. The package contains the same amount of hazelnut as Swiss chocolate. Let \( f \) represent the number of pounds of French vanilla, \( h \) represent the number of pounds of hazelnut, and \( s \) represent the number of pounds of Swiss chocolate.

(a) Write a system of linear equations that represents the situation.
(b) Write a matrix equation that corresponds to your system.
(c) Solve your system of linear equations using an inverse matrix. Find the number of pounds of each flavor of coffee in the 10-pound package.

74. FLOWERS A florist is creating 10 centerpieces for the tables at a wedding reception. Roses cost $2.50 each, lilies cost $4 each, and irises cost $2 each. The customer has a budget of $300 allocated for the centerpieces and wants each centerpiece to contain 12 flowers, with twice as many roses as the number of irises and lilies combined.

(a) Write a system of linear equations that represents the situation.
(b) Write a matrix equation that corresponds to your system.
(c) Solve your system of linear equations using an inverse matrix. Find the number of flowers of each type that the florist can use to create the 10 centerpieces.

75. ENROLLMENT The table shows the enrollment projections (in millions) for public universities in the United States for the years 2010 through 2012. (Source: U.S. National Center for Education Statistics, Digest of Education Statistics)

<table>

<tr>
<td>2012</td>
<td>14.20</td>
</tr>
</tbody>
</table>

(a) The data can be modeled by the quadratic function \( y = at^2 + bt + c \). Create a system of linear equations for the data. Let \( t \) represent the year, with \( t = 10 \) corresponding to 2010.

(b) Use the matrix capabilities of a graphing utility to find the inverse matrix to solve the system from part (a) and find the least squares regression parabola \( y = at^2 + bt + c \).

(c) Use the graphing utility to graph the parabola with the data.

(d) Do you believe the model is a reasonable predictor of future enrollments? Explain.

EXPLORATION

76. CAPSTONE If \( A \) is a \( 2 \times 2 \) matrix \( A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \), then \( A \) is invertible if and only if \( ad - bc \neq 0 \). If \( ad - bc \neq 0 \), verify that the inverse is

\[
A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}.
\]

TRUE OR FALSE? In Exercises 77 and 78, determine whether the statement is true or false. Justify your answer.

77. Multiplication of an invertible matrix and its inverse is commutative.
78. If you multiply two square matrices and obtain the identity matrix, you can assume that the matrices are inverses of one another.

79. WRITING Explain how to determine whether the inverse of a \( 2 \times 2 \) matrix exists. If so, explain how to find the inverse.

80. WRITING Explain in your own words how to write a system of three linear equations in three variables as a matrix equation, \( AX = B \), as well as how to solve the system using an inverse matrix.

81. Consider matrices of the form

\[
A = \begin{bmatrix}
2
3
\vdots
n
\end{bmatrix}
\]

(a) Write a \( 2 \times 2 \) matrix and a \( 3 \times 3 \) matrix in the form of \( A \). Find the inverse of each.

(b) Use the result of part (a) to make a conjecture about the inverses of matrices in the form of \( A \).

PROJECT: VIEWING TELEVISION To work an extended application analyzing the average amounts of time spent viewing television in the United States, visit this text’s website at academic.cengage.com. (Data Source: The Nielsen Company)
The Determinant of a 2 × 2 Matrix

Every square matrix can be associated with a real number called its determinant. Determinants have many uses, and several will be discussed in this and the next section. Historically, the use of determinants arose from special number patterns that occur when systems of linear equations are solved. For instance, the system

\[
\begin{align*}
  a_1x + b_1y &= c_1 \\
  a_2x + b_2y &= c_2
\end{align*}
\]

has a solution

\[
x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1} \quad \text{and} \quad y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}
\]

provided that \(a_1b_2 - a_2b_1 \neq 0\). Note that the denominators of the two fractions are the same. This denominator is called the determinant of the coefficient matrix of the system.

The determinant of the matrix \(A\) can also be denoted by vertical bars on both sides of the matrix, as indicated in the following definition.

**Definition of the Determinant of a 2 × 2 Matrix**

The determinant of the matrix

\[
A = \begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix}
\]

is given by

\[
\det(A) = |A| = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1.
\]

In this text, \(\det(A)\) and \(|A|\) are used interchangeably to represent the determinant of \(A\). Although vertical bars are also used to denote the absolute value of a real number, the context will show which use is intended.

A convenient method for remembering the formula for the determinant of a 2 × 2 matrix is shown in the following diagram.

\[
\det(A) = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1
\]

Note that the determinant is the difference of the products of the two diagonals of the matrix.
Example 1  The Determinant of a \(2 \times 2\) Matrix

Find the determinant of each matrix.

a. \(A = \begin{bmatrix} 2 & -3 \\ 1 & 2 \end{bmatrix}\)

b. \(B = \begin{bmatrix} 2 & 1 \\ 4 & 2 \end{bmatrix}\)

c. \(C = \begin{bmatrix} 0 & \frac{3}{2} \\ 2 & 4 \end{bmatrix}\)

Solution

a. \(\text{det}(A) = \begin{vmatrix} 2 & -3 \\ 1 & 2 \end{vmatrix} = 2(2) - 1(-3) = 4 + 3 = 7\)

b. \(\text{det}(B) = \begin{vmatrix} 2 & 1 \\ 4 & 2 \end{vmatrix} = 2(2) - 4(1) = 4 - 4 = 0\)

c. \(\text{det}(C) = \begin{vmatrix} 0 & \frac{3}{2} \\ 2 & 4 \end{vmatrix} = 0(4) - 2(\frac{3}{2}) = 0 - 3 = -3\)

Notice in Example 1 that the determinant of a matrix can be positive, zero, or negative.

The determinant of a matrix of order \(1 \times 1\) is defined simply as the entry of the matrix. For instance, if \(A = \begin{bmatrix} -2 \end{bmatrix}\), then \(\text{det}(A) = -2\).

**Technology**

Most graphing utilities can evaluate the determinant of a matrix. For instance, you can evaluate the determinant of

\[ A = \begin{bmatrix} 2 & -3 \\ 1 & 2 \end{bmatrix} \]

by entering the matrix as \([A]\) and then choosing the determinant feature. The result should be 7, as in Example 1(a). Try evaluating the determinants of other matrices. Consult the user’s guide for your graphing utility for specific keystrokes.
Minors and Cofactors

To define the determinant of a square matrix of order $3 \times 3$ or higher, it is convenient to introduce the concepts of minors and cofactors.

Minors and Cofactors of a Square Matrix

If $A$ is a square matrix, the minor $M_{ij}$ of the entry $a_{ij}$ is the determinant of the matrix obtained by deleting the $i$th row and $j$th column of $A$. The cofactor $C_{ij}$ of the entry $a_{ij}$ is

$$C_{ij} = (-1)^{i+j}M_{ij}.$$

In the sign pattern for cofactors at the left, notice that odd positions (where $i + j$ is odd) have negative signs and even positions (where $i + j$ is even) have positive signs.

Example 2
Finding the Minors and Cofactors of a Matrix

Find all the minors and cofactors of

$$A = \begin{bmatrix} 0 & 2 & 1 \\ 3 & -1 & 2 \\ 4 & 0 & 1 \end{bmatrix}.$$

Solution

To find the minor $M_{11}$, delete the first row and first column of $A$ and evaluate the determinant of the resulting matrix.

$$M_{11} = \begin{vmatrix} 2 & 1 \\ -1 & 2 \end{vmatrix} = (-1)(2) - (2)(-1) = -1.$$

Similarly, to find $M_{12}$, delete the first row and second column.

$$M_{12} = \begin{vmatrix} 0 & 2 \\ 3 & -1 \end{vmatrix} = (-1)(0) - (2)(3) = -6.$$

Continuing this pattern, you obtain the minors.

$$M_{11} = -1 \quad M_{12} = -5 \quad M_{13} = 4 \quad M_{21} = 2 \quad M_{22} = -4 \quad M_{23} = -8 \quad M_{31} = 5 \quad M_{32} = -3 \quad M_{33} = -6.$$

Now, to find the cofactors, combine these minors with the checkerboard pattern of signs for a $3 \times 3$ matrix shown at the upper left.

$$C_{11} = -1 \quad C_{12} = 5 \quad C_{13} = 4 \quad C_{21} = -2 \quad C_{22} = -4 \quad C_{23} = 8 \quad C_{31} = 5 \quad C_{32} = 3 \quad C_{33} = -6.$$

Now try Exercise 29.
The Determinant of a Square Matrix

The definition below is called *inductive* because it uses determinants of matrices of order \( n - 1 \) to define determinants of matrices of order \( n \).

**Determinant of a Square Matrix**

If \( A \) is a square matrix (of order \( 2 \times 2 \) or greater), the determinant of \( A \) is the sum of the entries in any row (or column) of \( A \) multiplied by their respective cofactors. For instance, expanding along the first row yields

\[
|A| = a_{11}C_{11} + a_{12}C_{12} + \cdots + a_{1n}C_{1n}.
\]

Applying this definition to find a determinant is called **expanding by cofactors**.

Try checking that for a \( 2 \times 2 \) matrix

\[
A = \begin{bmatrix}
    a_1 & b_1 \\
    a_2 & b_2
\end{bmatrix}
\]

this definition of the determinant yields \( |A| = a_1b_2 - a_2b_1 \), as previously defined.

**Example 3**  The Determinant of a Matrix of Order \( 3 \times 3 \)

Find the determinant of

\[
A = \begin{bmatrix}
    0 & 2 & 1 \\
    3 & -1 & 2 \\
    4 & 0 & 1
\end{bmatrix}
\]

**Solution**

Note that this is the same matrix that was in Example 2. There you found the cofactors of the entries in the first row to be

\[
C_{11} = -1, \quad C_{12} = 5, \quad \text{and} \quad C_{13} = 4.
\]

So, by the definition of a determinant, you have

\[
|A| = a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13} \quad \text{First-row expansion}
\]

\[
= 0(-1) + 2(5) + 1(4)
\]

\[
= 14.
\]

**CHECK POINT** Now try Exercise 39.

In Example 3, the determinant was found by expanding by the cofactors in the first row. You could have used any row or column. For instance, you could have expanded along the second row to obtain

\[
|A| = a_{21}C_{21} + a_{22}C_{22} + a_{23}C_{23} \quad \text{Second-row expansion}
\]

\[
= 3(-2) + (-1)(-4) + 2(8)
\]

\[
= 14.
\]
When expanding by cofactors, you do not need to find cofactors of zero entries, because zero times its cofactor is zero.

\[ a_{ij} C_{ij} = (0)C_{ij} = 0 \]

So, the row (or column) containing the most zeros is usually the best choice for expansion by cofactors. This is demonstrated in the next example.

### Example 4  The Determinant of a Matrix of Order 4 \(\times 4\)

Find the determinant of

\[
A = \begin{bmatrix}
1 & -2 & 3 & 0 \\
-1 & 1 & 0 & 2 \\
0 & 2 & 0 & 3 \\
3 & 4 & 0 & 2
\end{bmatrix}
\]

**Solution**

After inspecting this matrix, you can see that three of the entries in the third column are zeros. So, you can eliminate some of the work in the expansion by using the third column.

\[
|A| = 3(C_{13}) + 0(C_{23}) + 0(C_{33}) + 0(C_{43})
\]

Because \(C_{23}, C_{33},\) and \(C_{43}\) have zero coefficients, you need only find the cofactor \(C_{13}\). To do this, delete the first row and third column of \(A\) and evaluate the determinant of the resulting matrix.

\[
C_{13} = (-1)^{1+3} \begin{vmatrix}
-1 & 1 & 2 \\
0 & 2 & 3 \\
3 & 4 & 2
\end{vmatrix}
\]

Delete 1st row and 3rd column.

\[
= \begin{vmatrix}
-1 & 1 & 2 \\
0 & 2 & 3 \\
3 & 4 & 2
\end{vmatrix}
\]

Simplify.

Expanding by cofactors in the second row yields

\[
C_{13} = 0(-1)^{3} \begin{vmatrix}
1 & 2 \\
4 & 2
\end{vmatrix}
+ 2(-1)^{4} \begin{vmatrix}
-1 & 2 \\
3 & 2
\end{vmatrix}
+ 3(-1)^{5} \begin{vmatrix}
-1 & 1 \\
3 & 4
\end{vmatrix}
\]

\[
= 0 + 2(1)(-8) + 3(-1)(-7)
\]

\[
= 5.
\]

So, you obtain

\[
|A| = 3C_{13}
\]

\[
= 3(5)
\]

\[
= 15.
\]

**Checkpoint**  Now try Exercise 49.

Try using a graphing utility to confirm the result of Example 4.
8.4 EXERCISES

VOCABULARY: Fill in the blanks.
1. Both det(A) and |A| represent the ________ of the matrix A.
2. The ________ $M_{ij}$ of the entry $a_{ij}$ is the determinant of the matrix obtained by deleting the $i$th row and $j$th column of the square matrix $A$.
3. The ________ $C_{ij}$ of the entry $a_{ij}$ of the square matrix $A$ is given by $(-1)^{i+j}M_{ij}$.
4. The method of finding the determinant of a matrix of order $2 \times 2$ or greater is called ________ by ________.

SKILLS AND APPLICATIONS

In Exercises 5–20, find the determinant of the matrix.

5. $[4]$
6. $[-10]$

7. $\begin{bmatrix} 8 & 4 \\ 2 & 3 \end{bmatrix}$
8. $\begin{bmatrix} -9 & 0 \\ 6 & 2 \end{bmatrix}$

9. $\begin{bmatrix} 6 & 2 \\ -5 & 3 \end{bmatrix}$
10. $\begin{bmatrix} 3 & -3 \\ 4 & -8 \end{bmatrix}$

11. $\begin{bmatrix} -7 & 0 \\ 3 & 0 \end{bmatrix}$
12. $\begin{bmatrix} 4 & -3 \\ 0 & 0 \end{bmatrix}$

13. $\begin{bmatrix} 2 & 6 \\ 0 & 3 \end{bmatrix}$
14. $\begin{bmatrix} 2 & -3 \\ -6 & 9 \end{bmatrix}$

15. $\begin{bmatrix} -3 & -2 \\ -6 & -1 \end{bmatrix}$
16. $\begin{bmatrix} 4 & 7 \\ -2 & 5 \end{bmatrix}$

17. $\begin{bmatrix} -7 & 6 \\ 1 & 3 \end{bmatrix}$
18. $\begin{bmatrix} 0 & 6 \\ -3 & 2 \end{bmatrix}$

19. $\begin{bmatrix} -3 & 1 \\ -6 & 1 \end{bmatrix}$
20. $\begin{bmatrix} \frac{4}{3} & \frac{1}{3} \\ -1 & -\frac{1}{3} \end{bmatrix}$

In Exercises 21–24, use the matrix capabilities of a graphing utility to find the determinant of the matrix.

21. $\begin{bmatrix} 0.3 & 0.2 & 0.2 \\ 0.2 & 0.2 & 0.2 \\ -0.4 & 0.4 & 0.3 \\ 0.9 & 0.7 & 0 \end{bmatrix}$
22. $\begin{bmatrix} 0.1 & 0.2 & 0.3 \\ -0.3 & 0.2 & 0.2 \\ 0.5 & 0.4 & 0.4 \\ 0.1 & 0.1 & -4.3 \end{bmatrix}$

23. $\begin{bmatrix} -0.1 & 0.3 & 1.3 \\ -2.2 & 4.2 & 6.1 \end{bmatrix}$
24. $\begin{bmatrix} 7.5 & 6.2 & 0.7 \\ 0.3 & 0.6 & -1.2 \end{bmatrix}$

In Exercises 25–32, find all (a) minors and (b) cofactors of the matrix.

25. $\begin{bmatrix} 4 & 5 \\ 3 & -6 \end{bmatrix}$
26. $\begin{bmatrix} 0 & 10 \\ 3 & -4 \end{bmatrix}$

27. $\begin{bmatrix} 3 & 1 \\ -2 & -4 \end{bmatrix}$
28. $\begin{bmatrix} -6 & 5 \\ 7 & -2 \end{bmatrix}$

29. $\begin{bmatrix} 4 & 0 \\ -3 & 2 \\ 1 & -1 \end{bmatrix}$
30. $\begin{bmatrix} 1 & -1 \\ 3 & 2 \\ 4 & -6 \end{bmatrix}$

31. $\begin{bmatrix} -4 & 6 & 3 \\ 7 & -2 & 8 \\ 1 & 0 & -5 \end{bmatrix}$
32. $\begin{bmatrix} -2 & 9 & 4 \\ 7 & -6 & 0 \\ 6 & 7 & -6 \end{bmatrix}$

In Exercises 33–38, find the determinant of the matrix by the method of expansion by cofactors. Expand using the indicated row or column.

33. $\begin{bmatrix} -3 & 2 & 1 \\ 4 & 5 & 6 \\ 2 & -3 & 1 \end{bmatrix}$
(a) Row 1
(b) Column 2

34. $\begin{bmatrix} -3 & 4 & 2 \\ 6 & 3 & 1 \\ 4 & -7 & -8 \end{bmatrix}$
(a) Row 2
(b) Column 3

35. $\begin{bmatrix} 5 & 0 & -3 \\ 0 & 12 & 4 \\ 1 & 6 & 3 \end{bmatrix}$
(a) Row 3
(b) Column 1

36. $\begin{bmatrix} 10 & -5 & 5 \\ 30 & 0 & 10 \\ 0 & 10 & 1 \end{bmatrix}$
(a) Row 1
(b) Column 2

In Exercises 39–54, find the determinant of the matrix. Expand by cofactors on the row or column that appears to make the computations easiest.

39. $\begin{bmatrix} 2 & -1 & 0 \\ 4 & 2 & 1 \\ 4 & 2 & 1 \end{bmatrix}$
40. $\begin{bmatrix} -2 & 2 & 3 \\ 1 & -1 & 0 \\ 0 & 1 & 4 \end{bmatrix}$

41. $\begin{bmatrix} 6 & 3 & -7 \\ 0 & 0 & 0 \\ 4 & -6 & 3 \end{bmatrix}$
42. $\begin{bmatrix} 1 & 1 & 2 \\ 3 & 1 & 0 \\ -2 & 0 & 3 \end{bmatrix}$

43. $\begin{bmatrix} -1 & 8 & -3 \\ 0 & 3 & -6 \\ 0 & 0 & 3 \end{bmatrix}$
44. $\begin{bmatrix} 1 & 0 & 0 \\ -1 & -1 & 0 \\ 4 & 11 & 5 \end{bmatrix}$
In Exercises 53–70, find (a) \( |A| \), (b) \( |B| \), (c) \( AB \), and (d) \( |AB| \).

63. \( A = \begin{bmatrix} -1 & 0 \\ 0 & 3 \end{bmatrix} \), \( B = \begin{bmatrix} 2 \\ 0 \end{bmatrix} \)

64. \( A = \begin{bmatrix} -2 & 1 \\ 4 & -2 \end{bmatrix} \), \( B = \begin{bmatrix} 1 \\ 2 \end{bmatrix} \)

65. \( A = \begin{bmatrix} 4 & 0 \\ 3 & -2 \end{bmatrix} \), \( B = \begin{bmatrix} -1 \\ 1 \end{bmatrix} \)

66. \( A = \begin{bmatrix} 5 & 4 \\ 3 & -1 \end{bmatrix} \), \( B = \begin{bmatrix} 0 \\ 6 \end{bmatrix} \)

67. \( A = \begin{bmatrix} -3 & -2 & 1 \\ 0 & 4 & 1 \end{bmatrix} \), \( B = \begin{bmatrix} 3 & -2 & 0 \\ 3 & 1 & 1 \end{bmatrix} \)

68. \( A = \begin{bmatrix} -1 & -3 & 4 \\ -2 & 0 & 1 \end{bmatrix} \), \( B = \begin{bmatrix} -3 & 0 & 1 \\ -2 & -1 & 1 \end{bmatrix} \)

69. \( A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \), \( B = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \)

70. \( A = \begin{bmatrix} 2 & 0 & 1 \\ 1 & -1 & 2 \\ 3 & 1 & 0 \end{bmatrix} \), \( B = \begin{bmatrix} 2 & -1 & 4 \\ 0 & 1 & 3 \\ 3 & -2 & 1 \end{bmatrix} \)

In Exercises 71–76, evaluate the determinant(s) to verify the equation.

71. \( \begin{vmatrix} w & x \\ y & z \end{vmatrix} = - \begin{vmatrix} y & z \\ w & x \end{vmatrix} \)

72. \( \begin{vmatrix} w & cx \\ y & cz \end{vmatrix} = c \begin{vmatrix} w & x \\ y & z \end{vmatrix} \)

73. \( \begin{vmatrix} w & x + cw \\ y & z + cy \end{vmatrix} \)

74. \( \begin{vmatrix} w & x \\ cw & cx \end{vmatrix} = 0 \)

75. \( \begin{vmatrix} 1 & x \\ 1 & y \end{vmatrix}, \begin{vmatrix} 1 & x^2 \\ 1 & y^2 \end{vmatrix} = (y - x)(z - x)(z - y) \)

76. \( \begin{vmatrix} a + b & a \\ a & a + b \end{vmatrix} = b^2(3a + b) \)

In Exercises 77–84, solve for \( x \).

77. \( \begin{vmatrix} x & 2 \\ 1 & x \end{vmatrix} = 2 \)

78. \( \begin{vmatrix} x & 4 \\ -1 & x \end{vmatrix} = 20 \)

79. \( \begin{vmatrix} x & 1 \\ 2 & x - 2 \end{vmatrix} = -1 \)

80. \( \begin{vmatrix} x + 1 & 2 \\ -1 & x \end{vmatrix} = 4 \)

81. \( \begin{vmatrix} x - 1 & 2 \\ 3 & x - 2 \end{vmatrix} = 0 \)

82. \( \begin{vmatrix} x - 2 & -1 \\ -3 & x \end{vmatrix} = 0 \)

83. \( \begin{vmatrix} x + 3 & 2 \\ 1 & x + 2 \end{vmatrix} = 0 \)

84. \( \begin{vmatrix} x + 4 & -2 \\ 7 & x - 5 \end{vmatrix} = 0 \)
In Exercises 85–90, evaluate the determinant in which the entries are functions. Determinants of this type occur when changes of variables are made in calculus.

85. \[
\begin{vmatrix}
4u & -1 \\
-1 & 2v
\end{vmatrix}
\]

86. \[
\begin{vmatrix}
3x^2 & -3y^3 \\
1 & 1
\end{vmatrix}
\]

87. \[
\begin{vmatrix}
e^{2x} & e^{3x} \\
2e^{2x} & 3e^{3x}
\end{vmatrix}
\]

88. \[
\begin{vmatrix}
e^{-x} & xe^{-x} \\
-e^{-x} & (1-x)e^{-x}
\end{vmatrix}
\]

89. \[
\begin{vmatrix} x & \ln x \\
1 & 1/x
\end{vmatrix}
\]

90. \[
\begin{vmatrix} x & x \ln x \\
1 & 1 + \ln x
\end{vmatrix}
\]

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 91 and 92, determine whether the statement is true or false. Justify your answer.

91. If a square matrix has an entire row of zeros, the determinant will always be zero.

92. If two columns of a square matrix are the same, the determinant of the matrix will be zero.

93. Find square matrices \(A\) and \(B\) to demonstrate that \(|A + B| \neq |A| + |B|\).

94. Consider square matrices in which the entries are consecutive integers. An example of such a matrix is

\[
\begin{bmatrix}
4 & 5 & 6 \\
7 & 8 & 9 \\
10 & 11 & 12
\end{bmatrix}
\]

(a) Use a graphing utility to evaluate the determinants of four matrices of this type. Make a conjecture based on the results.

(b) Verify your conjecture.

95. **WRITING** Write a brief paragraph explaining the difference between a square matrix and its determinant.

96. **THINK ABOUT IT** If \(A\) is a matrix of order \(3 \times 3\) such that \(|A| = 5\), is it possible to find \(2|A|\)? Explain.

**PROPERTIES OF DETERMINANTS** In Exercises 97–99, a property of determinants is given (\(A\) and \(B\) are square matrices). State how the property has been applied to the given determinants and use a graphing utility to verify the results.

97. If \(B\) is obtained from \(A\) by interchanging two rows of \(A\) or interchanging two columns of \(A\), then \(|B| = -|A|\).

\[
\begin{vmatrix}
1 & 3 & 4 \\
-7 & 2 & -5 \\
6 & 1 & 2
\end{vmatrix} = -\begin{vmatrix}
1 & 4 & 3 \\
-7 & -5 & 2 \\
6 & 2 & 1
\end{vmatrix}
\]

98. If \(B\) is obtained from \(A\) by adding a multiple of a row of \(A\) to another row of \(A\) or by adding a multiple of a column of \(A\) to another column of \(A\), then \(|B| = |A|\).

\[
\begin{vmatrix}
1 & -3 \\
5 & 2
\end{vmatrix} = |\begin{vmatrix}
1 & -3 \\
5 & 17
\end{vmatrix}|
\]

\[
\begin{vmatrix}
1 & 10 & -6 \\
2 & -3 & 4 \\
7 & 6 & 3
\end{vmatrix} = |\begin{vmatrix}
2 & -3 & 4 \\
5 & 4 & 2 \\
7 & 6 & 3
\end{vmatrix}|
\]

99. If \(B\) is obtained from \(A\) by multiplying a row by a nonzero constant \(c\) or by multiplying a column by a nonzero constant \(c\), then \(|B| = c|A|\).

\[
\begin{vmatrix}
5 & 10 & 2 \\
2 & -3 & -3 \\
1 & 8 & -3
\end{vmatrix} = 5 \begin{vmatrix}
1 & 2 \\
2 & -3 \\
1 & 2
\end{vmatrix}
\]

100. **CAPSTONE** If \(A\) is an \(n \times n\) matrix, explain how to find the following.

(a) The minor \(M_{ij}\) of the entry \(a_{ij}\)

(b) The cofactor \(C_{ij}\) of the entry \(a_{ij}\)

(c) The determinant of \(A\)

In Exercises 101–104, evaluate the determinant.

101. \[
\begin{vmatrix}
1 & 0 & 0 \\
0 & 5 & 0 \\
0 & 0 & 2
\end{vmatrix}
\]

102. \[
\begin{vmatrix}
-2 & 0 & 0 \\
0 & 2 & 0 \\
0 & 0 & 3
\end{vmatrix}
\]

103. \[
\begin{vmatrix}
0 & 3 & 4 \\
-1 & 2 & -5 \\
0 & 3 & 0
\end{vmatrix}
\]

104. \[
\begin{vmatrix}
-4 & -1 & 0 \\
0 & 0 & 3 \\
5 & 1 & 5
\end{vmatrix}
\]

105. **CONJECTURE** A **triangular matrix** is a square matrix with all zero entries either below or above its main diagonal. A square matrix is **upper triangular** if it has all zero entries below its main diagonal and is **lower triangular** if it has all zero entries above its main diagonal. A matrix that is both upper and lower triangular is called diagonal. That is, a **diagonal matrix** is a square matrix in which all entries above and below the main diagonal are zero. In Exercises 101–104, you evaluated the determinants of triangular matrices. Make a conjecture based on your results.

106. Use the matrix capabilities of a graphing utility to find the determinant of \(A\). What message appears on the screen? Why does the graphing utility display this message?

\[
A = \begin{bmatrix}
1 & 2 \\
-1 & 0 \\
3 & -2
\end{bmatrix}
\]
Cramer’s Rule

So far, you have studied three methods for solving a system of linear equations: substitution, elimination with equations, and elimination with matrices. In this section, you will study one more method, Cramer’s Rule, named after Gabriel Cramer (1704–1752). This rule uses determinants to write the solution of a system of linear equations. To see how Cramer’s Rule works, take another look at the solution described at the beginning of Section 8.4. There, it was pointed out that the system

\[
\begin{align*}
ax + by &= c_1 \\
ax + by &= c_2
\end{align*}
\]

has a solution

\[
x = \frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1} \quad \text{and} \quad y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}
\]

provided that \(a_1b_2 - a_2b_1 \neq 0\). Each numerator and denominator in this solution can be expressed as a determinant, as follows.

\[
x = \frac{\begin{vmatrix} c_1 & b_1 \\ a_1 & b_1 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}} \quad \text{and} \quad y = \frac{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}
\]

Relative to the original system, the denominator for \(x\) and \(y\) is simply the determinant of the coefficient matrix of the system. This determinant is denoted by \(D\). The numerators for \(x\) and \(y\) are denoted by \(D_x\) and \(D_y\), respectively. They are formed by using the column of constants as replacements for the coefficients of \(x\) and \(y\), as follows.

\[
\begin{align*}
\text{Coefficient Matrix} & \quad D & \quad D_x & \quad D_y \\
\begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix} & \begin{bmatrix} a_1 & b_1 \\ a_2 & b_2 \end{bmatrix} & \begin{bmatrix} c_1 & b_1 \\ c_2 & b_2 \end{bmatrix} & \begin{bmatrix} a_1 & c_1 \\ a_2 & c_2 \end{bmatrix}
\end{align*}
\]

For example, given the system

\[
\begin{align*}
2x - 5y &= 3 \\
-4x + 3y &= 8
\end{align*}
\]

the coefficient matrix, \(D\), \(D_x\), and \(D_y\) are as follows.

\[
\begin{align*}
\text{Coefficient Matrix} & \quad D & \quad D_x & \quad D_y \\
\begin{bmatrix} 2 & -5 \\ -4 & 3 \end{bmatrix} & \begin{bmatrix} 2 & -5 \\ -4 & 3 \end{bmatrix} & \begin{bmatrix} 3 & -5 \\ 8 & 3 \end{bmatrix} & \begin{bmatrix} 2 & 3 \\ -4 & 8 \end{bmatrix}
\end{align*}
\]
Cramer’s Rule generalizes easily to systems of \( n \) equations in \( n \) variables. The value of each variable is given as the quotient of two determinants. The denominator is the determinant of the coefficient matrix, and the numerator is the determinant of the matrix formed by replacing the column corresponding to the variable (being solved for) with the column representing the constants. For instance, the solution for \( x_3 \) in the following system is shown.

\[
\begin{align*}
    a_{11}x_1 + a_{12}x_2 + a_{13}x_3 &= b_1 \\
    a_{21}x_1 + a_{22}x_2 + a_{23}x_3 &= b_2 \\
    a_{31}x_1 + a_{32}x_2 + a_{33}x_3 &= b_3 \\
\end{align*}
\]

\[
x_3 = \frac{\begin{vmatrix} a_{11} & a_{12} & b_1 \\ a_{21} & a_{22} & b_2 \\ a_{31} & a_{32} & b_3 \end{vmatrix}}{\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}}
\]

**Cramer’s Rule**

If a system of \( n \) linear equations in \( n \) variables has a coefficient matrix \( A \) with a nonzero determinant \( |A| \), the solution of the system is

\[
x_1 = \frac{|A_1|}{|A|}, \quad x_2 = \frac{|A_2|}{|A|}, \quad \ldots, \quad x_n = \frac{|A_n|}{|A|}
\]

where the \( i \)th column of \( A_i \) is the column of constants in the system of equations. If the determinant of the coefficient matrix is zero, the system has either no solution or infinitely many solutions.

**Example 1**  
Using Cramer’s Rule for a \( 2 \times 2 \) System

Use Cramer’s Rule to solve the system of linear equations.

\[
\begin{align*}
    4x - 2y &= 10 \\
    3x - 5y &= 11
\end{align*}
\]

**Solution**

To begin, find the determinant of the coefficient matrix.

\[
D = \begin{vmatrix} 4 & -2 \\ 3 & -5 \end{vmatrix} = -20 - (-6) = -14
\]

Because this determinant is not zero, you can apply Cramer’s Rule.

\[
x = \frac{D_x}{D} = \frac{\begin{vmatrix} 10 & -2 \\ 11 & -5 \end{vmatrix}}{-14} = \frac{-50 - (-22)}{-14} = \frac{-28}{-14} = 2
\]

\[
y = \frac{D_y}{D} = \frac{\begin{vmatrix} 4 & 10 \\ 3 & 11 \end{vmatrix}}{-14} = \frac{44 - 30}{-14} = \frac{14}{-14} = -1
\]

So, the solution is \( x = 2 \) and \( y = -1 \). Check this in the original system.

**Check Point**  
Now try Exercise 7.
Using Cramer’s Rule for a 3 × 3 System

Use Cramer’s Rule to solve the system of linear equations.

\[
\begin{align*}
-x + 2y - 3z &= 1 \\
2x + z &= 0 \\
3x - 4y + 4z &= 2
\end{align*}
\]

Solution

To find the determinant of the coefficient matrix

\[
\begin{vmatrix}
-1 & 2 & -3 \\
2 & 0 & 1 \\
3 & -4 & 4
\end{vmatrix}
\]

expand along the second row, as follows.

\[
D = 2(-1)^3 \begin{vmatrix}
2 & -3 \\
-4 & 4
\end{vmatrix} + 0(-1)^4 \begin{vmatrix}
-1 & -3 \\
3 & 4
\end{vmatrix} + 1(-1)^5 \begin{vmatrix}
-1 & 2 \\
3 & 4
\end{vmatrix}
\]

\[
= -2(-4) + 0 - 1(-2) = 10
\]

Because this determinant is not zero, you can apply Cramer’s Rule.

\[
x = \frac{D_x}{D} = \frac{\begin{vmatrix}
1 & 2 & -3 \\
0 & 0 & 1 \\
2 & -4 & 4
\end{vmatrix}}{10} = \frac{8}{10} = \frac{4}{5}
\]

\[
y = \frac{D_y}{D} = \frac{\begin{vmatrix}
-1 & 1 & -3 \\
2 & 0 & 1 \\
3 & 2 & 4
\end{vmatrix}}{10} = \frac{-15}{10} = -\frac{3}{2}
\]

\[
z = \frac{D_z}{D} = \frac{\begin{vmatrix}
-1 & 2 & 1 \\
2 & 0 & 0 \\
3 & -4 & 2
\end{vmatrix}}{10} = \frac{-16}{10} = -\frac{8}{5}
\]

The solution is \(\left(\frac{4}{5}, -\frac{3}{2}, -\frac{8}{5}\right)\). Check this in the original system as follows.

Check

\[
\begin{align*}
-x + 2y - 3z &= 1 \quad \text{Substitute into Equation 1.} \\
-\frac{4}{5} + 2\left(-\frac{3}{2}\right) - 3\left(-\frac{8}{5}\right) &= 1 \\
-\frac{4}{5} - 3 + \frac{24}{5} &= 1 \quad \text{Equation 1 checks.}\ \\
2\left(-\frac{4}{5}\right) + \left(-\frac{3}{2}\right) &= 0 \quad \text{Substitute into Equation 2.} \\
\frac{8}{5} - \frac{8}{5} &= 0 \quad \text{Equation 2 checks.}\ \\
3\left(-\frac{4}{5}\right) - 4\left(-\frac{3}{2}\right) + 4\left(-\frac{8}{5}\right) &= 2 \quad \text{Substitute into Equation 3.} \\
\frac{12}{5} + 6 - \frac{32}{5} &= 2 \quad \text{Equation 3 checks.}
\end{align*}
\]

Now try Exercise 13.

Remember that Cramer’s Rule does not apply when the determinant of the coefficient matrix is zero. This would create division by zero, which is undefined.
Another application of matrices and determinants is finding the area of a triangle whose vertices are given as points in a coordinate plane.

**Area of a Triangle**

The area of a triangle with vertices \((x_1, y_1), (x_2, y_2),\) and \((x_3, y_3)\) is

\[
\text{Area} = \pm \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}
\]

where the symbol \(\pm\) indicates that the appropriate sign should be chosen to yield a positive area.

**Example 3  Finding the Area of a Triangle**

Find the area of a triangle whose vertices are \((1, 0), (2, 2),\) and \((4, 3),\) as shown in Figure 8.1.

**Solution**

Let \((x_1, y_1) = (1, 0), (x_2, y_2) = (2, 2),\) and \((x_3, y_3) = (4, 3).\) Then, to find the area of the triangle, evaluate the determinant.

\[
\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 0 & 1 \\ 2 & 2 & 1 \\ 4 & 3 & 1 \end{vmatrix}
\]

\[
= 1(-1)^2 \begin{vmatrix} 2 & 1 \\ 4 & 1 \end{vmatrix} + 0(-1)^1 \begin{vmatrix} 2 & 1 \\ 4 & 3 \end{vmatrix} + 1(-1)^4 \begin{vmatrix} 2 & 2 \\ 4 & 3 \end{vmatrix}
\]

\[
= 1(-1) + 0 + 1(-2)
\]

\[
= -3.
\]

Using this value, you can conclude that the area of the triangle is

\[
\text{Area} = -\frac{1}{2} \begin{vmatrix} 1 & 0 & 1 \\ 2 & 2 & 1 \\ 4 & 3 & 1 \end{vmatrix} \quad \text{Choose \((-\)}\) so that the area is positive.
\]

\[
= -\frac{1}{2}(-3)
\]

\[
= \frac{3}{2} \text{ square units.}
\]

**CHECK Point** Now try Exercise 25.
Lines in a Plane

What if the three points in Example 3 had been on the same line? What would have happened had the area formula been applied to three such points? The answer is that the determinant would have been zero. Consider, for instance, the three collinear points \((-2, -2), (1, 1),\) and \((7, 5)\), as shown in Figure 8.2. The area of the “triangle” that has these three points as vertices is

\[
\frac{1}{2} \begin{vmatrix} 0 & 1 & 1 \\ 2 & 2 & 1 \\ 4 & 3 & 1 \end{vmatrix} = \frac{1}{2} \left[ 0(-1)^2 \frac{2}{3} \frac{1}{1} + 1(-1)^2 \frac{2}{4} \frac{1}{1} + 1(-1)^2 \frac{2}{4} \frac{3}{1} \right] \\
= \frac{1}{2} \left[ 0 - 1(-2) + 1(-2) \right] \\
= 0.
\]

The result is generalized as follows.

**Test for Collinear Points**

Three points \((x_1, y_1), (x_2, y_2),\) and \((x_3, y_3)\) are **collinear** (lie on the same line) if and only if

\[
\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0.
\]

**Example 4**  Testing for Collinear Points

Determine whether the points \((-2, -2), (1, 1),\) and \((7, 5)\) are collinear. (See Figure 8.3.)

**Solution**

Letting \((x_1, y_1) = (-2, -2), (x_2, y_2) = (1, 1),\) and \((x_3, y_3) = (7, 5),\) you have

\[
\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \begin{vmatrix} -2 & -2 & 1 \\ 1 & 1 & 1 \\ 7 & 5 & 1 \end{vmatrix} \\
= -2(-1)^2 \frac{1}{5} \frac{1}{1} + (-2)(-1)^3 \frac{1}{7} \frac{1}{1} + 1(-1)^2 \frac{1}{7} \frac{5}{1} \\
= -2(-4) + 2(-6) + 1(-2) \\
= -6.
\]

Because the value of this determinant is not zero, you can conclude that the three points do not lie on the same line. Moreover, the area of the triangle with vertices at these points is \((-\frac{1}{2})(-6) = 3\) square units.

**CHECKPoint**  Now try Exercise 39.
Section 8.5  Applications of Matrices and Determinants  621

The test for collinear points can be adapted to another use. That is, if you are given two points on a rectangular coordinate system, you can find an equation of the line passing through the two points, as follows.

**Example 5  Finding an Equation of a Line**

Find an equation of the line passing through the two points \((2, 4)\) and \((-1, 3)\), as shown in Figure 8.4.

**Solution**

Let \((x_1, y_1) = (2, 4)\) and \((x_2, y_2) = (-1, 3)\). Applying the determinant formula for the equation of a line produces

\[
\begin{vmatrix}
  x & y & 1 \\
  x_1 & y_1 & 1 \\
  x_2 & y_2 & 1 \\
\end{vmatrix} = 0.
\]

To evaluate this determinant, you can expand by cofactors along the first row to obtain the following.

\[
x(-1)\left|\begin{array}{cc}
4 & 1 \\
3 & 1 \\
\end{array}\right| + y(-1)\left|\begin{array}{cc}
2 & 1 \\
-1 & 1 \\
\end{array}\right| + 1(-1)\left|\begin{array}{cc}
2 & 4 \\
-1 & 3 \\
\end{array}\right| = 0
\]

\[
x(1) + y(-1)(3) + (1)(1)(10) = 0
\]

\[
x - 3y + 10 = 0
\]

So, an equation of the line is

\[
x - 3y + 10 = 0.
\]

**Check Point** Now try Exercise 47.

Note that this method of finding the equation of a line works for all lines, including horizontal and vertical lines. For instance, the equation of the vertical line through \((2, 0)\) and \((2, 2)\) is

\[
\begin{vmatrix}
  x & y & 1 \\
  2 & 0 & 1 \\
  2 & 2 & 1 \\
\end{vmatrix} = 0
\]

\[
4 - 2x = 0
\]

\[
x = 2.
\]
Cryptography

A cryptogram is a message written according to a secret code. (The Greek word kryptos means “hidden.”) Matrix multiplication can be used to encode and decode messages. To begin, you need to assign a number to each letter in the alphabet (with 0 assigned to a blank space), as follows.

\[
\begin{align*}
0 &= _ & 9 &= I & 18 &= R \\
1 &= A & 10 &= J & 19 &= S \\
2 &= B & 11 &= K & 20 &= T \\
3 &= C & 12 &= L & 21 &= U \\
4 &= D & 13 &= M & 22 &= V \\
5 &= E & 14 &= N & 23 &= W \\
6 &= F & 15 &= O & 24 &= X \\
7 &= G & 16 &= P & 25 &= Y \\
8 &= H & 17 &= Q & 26 &= Z
\end{align*}
\]

Then the message is converted to numbers and partitioned into uncoded row matrices, each having \( n \) entries, as demonstrated in Example 6.

**Example 6** Forming Uncoded Row Matrices

Write the uncoded row matrices of order \( 1 \times 3 \) for the message

MEET ME MONDAY.

**Solution**

Partitioning the message (including blank spaces, but ignoring punctuation) into groups of three produces the following uncoded row matrices.

\[
\begin{bmatrix}
13 & 5 & 5 \\
20 & 0 & 13 \\
5 & 0 & 13 \\
15 & 14 & 4 \\
1 & 25 & 0
\end{bmatrix}
\]

\[
\text{MEET } \text{ME } \text{MONDAY}
\]

Note that a blank space is used to fill out the last uncoded row matrix.

**CHECK Point** Now try Exercise 55(a).

To encode a message, use the techniques demonstrated in Section 8.3 to choose an \( n \times n \) invertible matrix such as

\[
A = \begin{bmatrix}
1 & -2 & 2 \\
-1 & 1 & 3 \\
1 & -1 & -4
\end{bmatrix}
\]

and multiply the uncoded row matrices by \( A \) (on the right) to obtain coded row matrices. Here is an example.

**Uncoded Matrix** \hspace{1cm} **Encoding Matrix** \hspace{1cm} **Coded Matrix**

\[
\begin{bmatrix}
13 & 5 & 5 \\
-1 & 1 & 3 \\
1 & -1 & -4
\end{bmatrix}
\begin{bmatrix}
1 & -2 & 2 \\
-1 & 1 & 3 \\
1 & -1 & -4
\end{bmatrix}
= \begin{bmatrix}
13 & -26 & 21
\end{bmatrix}
\]
Encoding a Message

Use the following invertible matrix to encode the message MEET ME MONDAY.

\[ A = \begin{bmatrix} 1 & -2 & 2 \\ -1 & 1 & 3 \\ 1 & -1 & -4 \end{bmatrix} \]

Solution

The coded row matrices are obtained by multiplying each of the uncoded row matrices found in Example 6 by the matrix \( A \), as follows.

<table>
<thead>
<tr>
<th>Uncoded Matrix</th>
<th>Encoding Matrix A</th>
<th>Coded Matrix</th>
</tr>
</thead>
<tbody>
<tr>
<td>([13 \ 5 \ 5] )</td>
<td>([-1 \ 1 \ 3] )</td>
<td>([13 \ -26 \ 21] )</td>
</tr>
<tr>
<td>([20 \ 0 \ 13] )</td>
<td>([-1 \ 1 \ 3] )</td>
<td>([33 \ -53 \ -12] )</td>
</tr>
<tr>
<td>([5 \ 0 \ 13] )</td>
<td>([-1 \ 1 \ 3] )</td>
<td>([18 \ -23 \ -42] )</td>
</tr>
<tr>
<td>([15 \ 14 \ 4] )</td>
<td>([-1 \ 1 \ 3] )</td>
<td>([5 \ -20 \ 56] )</td>
</tr>
<tr>
<td>([1 \ 25 \ 0] )</td>
<td>([-1 \ 1 \ 3] )</td>
<td>([-24 \ 23 \ 77] )</td>
</tr>
</tbody>
</table>

So, the sequence of coded row matrices is

\([13 \ -26 \ 21] [33 \ -53 \ -12] [18 \ -23 \ -42] [5 \ -20 \ 56] [-24 \ 23 \ 77] \).

Finally, removing the matrix notation produces the following cryptogram.

13 26 21 33 53 12 18 23 42 5 20 56 24 23 77

CHECK Point  Now try Exercise 55(b).

For those who do not know the encoding matrix \( A \), decoding the cryptogram found in Example 7 is difficult. But for an authorized receiver who knows the encoding matrix \( A \), decoding is simple. The receiver just needs to multiply the coded row matrices by \( A^{-1} \) (on the right) to retrieve the uncoded row matrices. Here is an example.

\[ \begin{bmatrix} 13 & -26 & 21 \\ -1 & -10 & -8 \\ -1 & -6 & -5 \\ 0 & -1 & -1 \end{bmatrix} \begin{bmatrix} -1 & -10 & -8 \\ -1 & -6 & -5 \\ 0 & -1 & -1 \end{bmatrix} = \begin{bmatrix} 13 & 5 & 5 \end{bmatrix} \]
Decoding a Message

Use the inverse of the matrix

\[
A = \begin{bmatrix}
1 & -2 & 2 \\
-1 & 1 & 3 \\
1 & -1 & -4
\end{bmatrix}
\]

to decode the cryptogram

\[
13 \quad 26 \quad 21 \quad 33 \quad -53 \quad -12 \quad 18 \quad -23 \quad -42 \quad 5 \quad -20 \quad 56 \quad -24 \quad 23 \quad 77
\]

Solution

First find \(A^{-1}\) by using the techniques demonstrated in Section 8.3. \(A^{-1}\) is the decoding matrix. Then partition the message into groups of three to form the coded row matrices. Finally, multiply each coded row matrix by \(A^{-1}\) (on the right).

\[
\begin{array}{ccc}
\text{Coded Matrix} & \text{Decoding Matrix} & \text{Decoded Matrix} \\
\begin{bmatrix}
13 & 26 & 21 \\
33 & -53 & -12 \\
18 & -23 & -42 \\
5 & -20 & 56 \\
-24 & 23 & 77
\end{bmatrix} & \begin{bmatrix}
-1 & -10 & -8 \\
-1 & -6 & -5 \\
-1 & -10 & -8 \\
-1 & -6 & -5 \\
-1 & -10 & -8
\end{bmatrix} & \begin{bmatrix}
13 & 5 & 5 \\
20 & 0 & 13 \\
5 & 0 & 13 \\
15 & 14 & 4 \\
1 & 25 & 0
\end{bmatrix}
\end{array}
\]

So, the message is as follows.

\[
\begin{bmatrix}
13 & 5 & 5 \\
20 & 0 & 13 \\
5 & 0 & 13 \\
15 & 14 & 4 \\
1 & 25 & 0
\end{bmatrix}
\]

\[
\text{MEETMEMONDAY}
\]

CHECKPOINT Now try Exercise 63.

CLASSROOM DISCUSSION

Cryptography  Use your school’s library, the Internet, or some other reference source to research information about another type of cryptography. Write a short paragraph describing how mathematics is used to code and decode messages.
VOCABULARY: Fill in the blanks.

1. The method of using determinants to solve a system of linear equations is called _______ _______.
2. Three points are _______ if the points lie on the same line.
3. The area $A$ of a triangle with vertices $(x_1, y_1)$, $(x_2, y_2)$, and $(x_3, y_3)$ is given by _______.
4. A message written according to a secret code is called a _______.
5. To encode a message, choose an invertible matrix $A$ and multiply the _______ row matrices by $A$
   (on the right) to obtain _______ row matrices.
6. If a message is encoded using an invertible matrix $A$, then the message can be decoded by multiplying
   the coded row matrices by _______ (on the right).

SKILLS AND APPLICATIONS

In Exercises 7–16, use Cramer’s Rule to solve (if possible) the system of equations.

7. $\begin{cases} -7x + 11y = -1 \\ 3x - 9y = 9 \end{cases}$
8. $\begin{cases} 4x - 3y = -10 \\ 6x + 9y = 12 \end{cases}$
9. $\begin{cases} 3x + 2y = -2 \\ 6x + 4y = 4 \end{cases}$
10. $\begin{cases} 6x - 5y = 17 \\ -13x + 3y = -76 \end{cases}$
11. $\begin{cases} -0.4x + 0.8y = 1.6 \\ 0.2x + 0.3y = 2.2 \end{cases}$
12. $\begin{cases} 2.4x - 1.3y = 14.63 \\ -4.6x + 0.5y = -11.51 \end{cases}$
13. $\begin{cases} 4x - y + z = -5 \\ 2x + 2y + 3z = 10 \\ 5x - 2y + 6z = 1 \end{cases}$
14. $\begin{cases} 2x - y + z = -3 \\ -2x + y - z = 6 \\ 3x - 3y + 2z = -11 \end{cases}$
15. $\begin{cases} 5x - 4y + z = -14 \\ -x + 2y - 2z = 10 \\ 3x + y + z = 1 \end{cases}$

In Exercises 17–20, use a graphing utility and Cramer’s Rule to solve (if possible) the system of equations.

17. $\begin{cases} 3x + 3y + 5z = 1 \\ 3x + 5y + 9z = 2 \\ 5x + 9y + 17z = 4 \end{cases}$
18. $\begin{cases} x + 2y - z = -7 \\ 2x - 2y - 2z = -8 \\ -x + 3y + 4z = 8 \end{cases}$
19. $\begin{cases} 2x - y + z = 5 \\ x - 2y - z = 1 \\ 3x + y + z = 4 \end{cases}$
20. $\begin{cases} 3x - y - 3z = 1 \\ 2x + y + 2z = -4 \\ x + y - z = 5 \end{cases}$

In Exercises 21–32, use a determinant and the given vertices of a triangle to find the area of the triangle.

21. $\begin{pmatrix} 0 & 0 & 1 \\ 1 & 2 & 3 \\ 4 & 5 & \end{pmatrix}$
22. $\begin{pmatrix} 3 & 1 & 2 \\ 0 & 0 & 1 \\ 4 & 5 & \end{pmatrix}$
23. $\begin{pmatrix} 0 & 4 \\ -2 & -3 \\ 2 & -3 \end{pmatrix}$
24. $\begin{pmatrix} 1 & 6 \\ -2 & 1 \\ -3 & -1 \end{pmatrix}$
25. $\begin{pmatrix} 0 & 1 \\ 3 & 5 \\ 4 & 3 \end{pmatrix}$
26. $\begin{pmatrix} 6 & 10 \\ -4 & -5 \\ 6 & -1 \end{pmatrix}$
27. $\begin{pmatrix} -2 & 4, 2 & 3, (-1, 5) \\ 0, -2, (-1, 4, 3, 5) \\ 0, -2, (-1, 4, 3, 5) \end{pmatrix}$
28. $\begin{pmatrix} (3, 5) & (0, 2) \end{pmatrix}$
29. $\begin{pmatrix} (3, 5) & (3, -5) \end{pmatrix}$
30. $\begin{pmatrix} (3, -5) \end{pmatrix}$
31. $\begin{pmatrix} (3, -5) \end{pmatrix}$
32. $\begin{pmatrix} (0, 3, 5) \end{pmatrix}$

In Exercises 33 and 34, find a value of $y$ such that the triangle with the given vertices has an area of 4 square units.

33. $\begin{pmatrix} -5, 1, 0, 2 \end{pmatrix}$
34. $\begin{pmatrix} -2, y \end{pmatrix}$
35. $\begin{pmatrix} -2, -3, 1, -1, (-1, y) \end{pmatrix}$
36. $\begin{pmatrix} -2, -3, 1, -1, (-1, y) \end{pmatrix}$

37. AREA OF A REGION A large region of forest has been infested with gypsy moths. The region is roughly triangular, as shown in the figure on the next page. From the northernmost vertex $A$ of the region, the distances to the other vertices are 25 miles south and 10 miles east (for vertex $B$), and 20 miles south and 28 miles east (for vertex $C$). Use a graphing utility to approximate the number of square miles in this region.
In Exercises 45 and 46, find $y$ such that the points are collinear.

In Exercises 47–52, use a determinant to find an equation of the line passing through the points.

In Exercises 53 and 54, (a) write the uncoded $1 \times 2$ row matrices for the message. (b) Then encode the message using the encoding matrix.

In Exercises 55 and 56, (a) write the uncoded $1 \times 3$ row matrices for the message. (b) Then encode the message using the encoding matrix.

In Exercises 57–60, write a cryptogram for the message using the matrix $A$. 

In Exercises 61–64, use $A^{-1}$ to decode the cryptogram.

### Exercises

**38. Area of a Region** You own a triangular tract of land, as shown in the figure. To estimate the number of square feet in the tract, you start at one vertex, walk 65 feet east and 50 feet north to the second vertex, and then walk 85 feet west and 30 feet north to the third vertex. Use a graphing utility to determine how many square feet there are in the tract of land.

**39.** $(3, -1), (0, -3), (12, 5)$

70. **HAIR PRODUCTS** A hair product company sells three types of hair products for $30, $20, and $10 per unit. In one year, the total revenue for the three products was $800,000, which corresponded to the sale of 40,000 units. The company sold half as many units of the $30 product as units of the $20 product. Use Cramer’s Rule to solve a system of linear equations to find how many units of each product were sold.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 71–74, determine whether the statement is true or false. Justify your answer.

71. In Cramer’s Rule, the numerator is the determinant of the coefficient matrix.

72. You cannot use Cramer’s Rule when solving a system of linear equations if the determinant of the coefficient matrix is zero.

73. In a system of linear equations, if the determinant of the coefficient matrix is zero, the system has no solution.

74. The points \((-5, -13), (0, 2), \) and \((3, 11)\) are collinear.

75. **WRITING** Use your school’s library, the Internet, or some other reference source to research a few current real-life uses of cryptography. Write a short summary of these uses. Include a description of how messages are encoded and decoded in each case.

76. **CAPSTONE**

(a) State Cramer’s Rule for solving a system of linear equations.

(b) At this point in the text, you have learned several methods for solving systems of linear equations. Briefly describe which method(s) you find easiest to use and which method(s) you find most difficult to use.

77. Use determinants to find the area of a triangle with vertices \((3, -1), \) \((7, -1), \) and \((7, 5)\). Confirm your answer by plotting the points in a coordinate plane and using the formula

\[
\text{Area} = \frac{1}{2}(\text{base})(\text{height}).
\]
### What Did You Learn? Explanation/Examples Review Exercises

| Section 8.1 | Write matrices and identify their orders (p. 570). | \[
\begin{pmatrix}
-1 & 1 \\
4 & 7
\end{pmatrix}
\begin{pmatrix}
-2 & 3 & 0 \\
5 & 0
\end{pmatrix}
\begin{pmatrix}
4 & -3 \\
-2 & 1
\end{pmatrix}
\begin{pmatrix}
8 \\
-8
\end{pmatrix}
\] | 2 x 2 | 1 x 3 | 3 x 2 | 2 x 1 | 1–8 |
| Section 8.1 | Perform elementary row operations on matrices (p. 572). | **Elementary Row Operations** 1. Interchange two rows. 2. Multiply a row by a nonzero constant. 3. Add a multiple of a row to another row. | | | | 9, 10 |
| Section 8.2 | Use matrices and Gaussian elimination to solve systems of linear equations (p. 575). | **Gaussian Elimination with Back-Substitution** 1. Write the augmented matrix of the system of linear equations. 2. Use elementary row operations to rewrite the augmented matrix in row-echelon form. 3. Write the system of linear equations corresponding to the matrix in row-echelon form, and use back-substitution to find the solution. | | | | 11–28 |
| Section 8.2 | Use matrices and Gauss-Jordan elimination to solve systems of linear equations (p. 577). | Gauss-Jordan elimination continues the reduction process on a matrix in row-echelon form until a reduced row-echelon form is obtained. (See Example 8.) | | | | 29–36 |
| Section 8.3 | Decide whether two matrices are equal (p. 584). | Two matrices are equal if their corresponding entries are equal. | | | | 37–40 |
| Section 8.3 | Add and subtract matrices and multiply matrices by scalars (p. 585). | **Definition of Matrix Addition** If \( A = [a_{ij}] \) and \( B = [b_{ij}] \) are matrices of order \( m \times n \), their sum is the \( m \times n \) matrix given by \( A + B = [a_{ij} + b_{ij}] \).  **Definition of Scalar Multiplication** If \( A = [a_{ij}] \) is an \( m \times n \) matrix and \( c \) is a scalar, the scalar multiple of \( A \) by \( c \) is the \( m \times n \) matrix given by \( cA = [ca_{ij}] \). | | | | 41–54 |
| Section 8.3 | Multiply two matrices (p. 589). | **Matrix Multiplication** If \( A = [a_{ij}] \) is an \( m \times n \) matrix and \( B = [b_{ij}] \) is an \( n \times p \) matrix, the product \( AB \) is an \( m \times p \) matrix \( AB = [c_{ij}] \) where \( c_{ij} = a_{i1}b_{1j} + a_{i2}b_{2j} + a_{i3}b_{3j} + \cdots + a_{in}b_{nj} \). | | | | 55–68 |
| Section 8.3 | Use matrix operations to model and solve real-life problems (p. 592). | Matrix operations can be used to find the total cost of equipment for two softball teams. (See Example 12.) | | | | 69–72 |
| Section 8.3 | Verify that two matrices are inverses of each other (p. 599). | **Inverse of a Square Matrix** Let \( A \) be an \( n \times n \) matrix and let \( I_n \) be the \( n \times n \) identity matrix. If there exists a matrix \( A^{-1} \) such that \( AA^{-1} = I_n = A^{-1}A \) then \( A^{-1} \) is the inverse of \( A \). | | | | 73–76 |
### Chapter Summary

#### What Did You Learn?

- **Use Gauss-Jordan elimination to find the inverses of matrices** (p. 600).
- **Find an Inverse Matrix**
  - Let \( A \) be a square matrix of order \( n \).
  1. Write the \( n \times 2n \) matrix that consists of the given matrix \( A \) on the left and the \( n \times n \) identity matrix \( I \) on the right to obtain \([A: I]\).
  2. If possible, row reduce \( A \) to \( I \) using elementary row operations on the entire matrix \([A: I]\). The result will be the matrix \([I: A^{-1}]\). If this is not possible, \( A \) is not invertible.
  3. Check your work to see that \( AA^{-1} = I = A^{-1}A \).

- **Use a formula to find the inverses of matrices** (p. 603).
  
  \[
  A^{-1} = \frac{1}{ad-bc} \begin{bmatrix}
  d & -b \\
  -c & a
  \end{bmatrix}
  \]

- **Use inverse matrices to solve systems of linear equations** (p. 604).
  - If \( A \) is an invertible matrix, the system of linear equations represented by \( AX = B \) has a unique solution given by \( X = A^{-1}B \).

- **Find the determinants of matrices** (p. 608).
  - The determinant of the matrix \( A = \begin{bmatrix}
  a_1 & b_1 \\
  a_2 & b_2
  \end{bmatrix} \) is given by \( \det(A) = |A| = a_1b_2 - a_2b_1 \).

- **Find minors and cofactors of square matrices** (p. 610).
  - If \( A \) is a square matrix, the minor \( M_{ij} \) of the entry \( a_{ij} \) is the determinant of the matrix obtained by deleting the \( i \)th row and \( j \)th column of \( A \). The cofactor \( C_{ij} \) of the entry \( a_{ij} \) is \( C_{ij} = (-1)^{i+j}M_{ij} \).

- **Find the determinants of square matrices** (p. 611).
  - If \( A \) is a square matrix (of order \( 2 \times 2 \) or greater), the determinant of \( A \) is the sum of the entries in any row (or column) of \( A \) multiplied by their respective cofactors.

- **Use Cramer’s Rule to solve systems of linear equations** (p. 616).
  - Cramer’s Rule uses determinants to write the solution of a system of linear equations.

- **Use determinants to find the areas of triangles** (p. 619).
  - The area of a triangle with vertices \((x_1, y_1), (x_2, y_2), \) and \((x_3, y_3)\) is
    \[
    \text{Area} = \pm \frac{1}{2} \begin{vmatrix}
    x_1 & y_1 & 1 \\
    x_2 & y_2 & 1 \\
    x_3 & y_3 & 1
    \end{vmatrix}
    \]
  - where the symbol \( \pm \) indicates that the appropriate sign should be chosen to yield a positive area.

- **Use a determinant to test for collinear points and find an equation of a line passing through two points** (p. 620).
  - Three points \((x_1, y_1), (x_2, y_2), \) and \((x_3, y_3)\) are collinear (lie on the same line) if and only if
    \[
    \begin{vmatrix}
    x_1 & y_1 & 1 \\
    x_2 & y_2 & 1 \\
    x_3 & y_3 & 1
    \end{vmatrix} = 0.
    \]

- **Use matrices to encode and decode messages** (p. 622).
  - The inverse of a matrix can be used to decode a cryptogram. (See Example 8.)

---

#### Explanation/Examples

- **Finding an Inverse Matrix**
  - Let \( A \) be a square matrix of order \( n \).
  1. Write the \( n \times 2n \) matrix that consists of the given matrix \( A \) on the left and the \( n \times n \) identity matrix \( I \) on the right to obtain \([A: I]\).
  2. If possible, row reduce \( A \) to \( I \) using elementary row operations on the entire matrix \([A: I]\). The result will be the matrix \([I: A^{-1}]\). If this is not possible, \( A \) is not invertible.
  3. Check your work to see that \( AA^{-1} = I = A^{-1}A \).

---

#### Review Exercises

- **Section 8.3**
  - Use Gauss-Jordan elimination to find the inverses of matrices (p. 600).
  - Use a formula to find the inverses of matrices (p. 603).
  - Use inverse matrices to solve systems of linear equations (p. 604).
  - Find the determinants of matrices (p. 608).
  - Find minors and cofactors of square matrices (p. 610).
  - Find the determinants of square matrices (p. 611).
  - Use Cramer’s Rule to solve systems of linear equations (p. 616).
  - Use determinants to find the areas of triangles (p. 619).
  - Use a determinant to test for collinear points and find an equation of a line passing through two points (p. 620).
  - Use matrices to encode and decode messages (p. 622).

- **Section 8.4**
  - Use a formula to find the inverses of matrices (p. 603).
  - Use inverse matrices to solve systems of linear equations (p. 604).
  - Find the determinants of matrices (p. 608).
  - Find minors and cofactors of square matrices (p. 610).
  - Find the determinants of square matrices (p. 611).
  - Use Cramer’s Rule to solve systems of linear equations (p. 616).
  - Use determinants to find the areas of triangles (p. 619).
  - Use a determinant to test for collinear points and find an equation of a line passing through two points (p. 620).
  - Use matrices to encode and decode messages (p. 622).

- **Section 8.5**
  - Use Gauss-Jordan elimination to find the inverses of matrices (p. 600).
  - Use a formula to find the inverses of matrices (p. 603).
  - Use inverse matrices to solve systems of linear equations (p. 604).
  - Find the determinants of matrices (p. 608).
  - Find minors and cofactors of square matrices (p. 610).
  - Find the determinants of square matrices (p. 611).
  - Use Cramer’s Rule to solve systems of linear equations (p. 616).
  - Use determinants to find the areas of triangles (p. 619).
  - Use a determinant to test for collinear points and find an equation of a line passing through two points (p. 620).
  - Use matrices to encode and decode messages (p. 622).
8.1 In Exercises 1–4, determine the order of the matrix.

1. \[
\begin{bmatrix}
-4 \\
5
\end{bmatrix}
\]

2. \[
\begin{bmatrix}
3 & -1 & 0 & 6 \\
-2 & 7 & 1 & 4
\end{bmatrix}
\]

3. \[
\begin{bmatrix}
3
\end{bmatrix}
\]

4. \[
\begin{bmatrix}
6 & 2 & -5 & 8 & 0
\end{bmatrix}
\]

In Exercises 5 and 6, write the augmented matrix for the system of linear equations.

5. \[
\begin{aligned}
3x - 10y &= 15 \\
5x + 4y &= 22
\end{aligned}
\]

6. \[
\begin{aligned}
8x - 7y + 4z &= 12 \\
3x - 5y + 2z &= 20 \\
x + 3y + 2z &= 12
\end{aligned}
\]

In Exercises 7 and 8, write the system of linear equations represented by the augmented matrix. (Use variables \(x, y, z,\) and \(w\), if applicable.)

7. \[
\begin{bmatrix}
5 & 1 & 7 & : & -9 \\
4 & 2 & 0 & : & 10 \\
9 & 4 & 2 & : & 3
\end{bmatrix}
\]

8. \[
\begin{bmatrix}
13 & 16 & 7 & 3 & : & 2 \\
1 & 21 & 8 & 5 & : & 12 \\
4 & 10 & -4 & 3 & : & -1
\end{bmatrix}
\]

In Exercises 9 and 10, write the matrix in row-echelon form. (Remember that the row-echelon form of a matrix is not unique.)

9. \[
\begin{bmatrix}
0 & 1 & 1 \\
1 & 2 & 3 \\
2 & 2 & 2
\end{bmatrix}
\]

10. \[
\begin{bmatrix}
4 & 8 & 16 \\
3 & -1 & 2 \\
-2 & 10 & 12
\end{bmatrix}
\]

In Exercises 11–14, write the system of linear equations represented by the augmented matrix. Then use back-substitution to solve the system. (Use variables \(x, y,\) and \(z\)).

11. \[
\begin{bmatrix}
1 & 2 & 3 & : & 9 \\
0 & 1 & -2 & : & 2 \\
0 & 0 & 1 & : & 0
\end{bmatrix}
\]

12. \[
\begin{bmatrix}
1 & 3 & -9 & : & 4 \\
0 & 1 & -1 & : & 10 \\
0 & 0 & 1 & : & -2
\end{bmatrix}
\]

13. \[
\begin{bmatrix}
1 & -5 & 4 & : & 1 \\
0 & 1 & 2 & : & 3 \\
0 & 0 & 1 & : & 4
\end{bmatrix}
\]

14. \[
\begin{bmatrix}
1 & -8 & 0 & : & -2 \\
0 & 1 & -1 & : & -7 \\
0 & 0 & 1 & : & 1
\end{bmatrix}
\]

In Exercises 15–28, use matrices and Gaussian elimination with back-substitution to solve the system of equations (if possible).

15. \[
\begin{aligned}
5x + 4y &= 2 \\
x - y &= -3
\end{aligned}
\]

16. \[
\begin{aligned}
2x - 5y &= 2 \\
x - y &= -3
\end{aligned}
\]

17. \[
\begin{aligned}
0.3x - 0.1y &= -0.3 \\
0.2x - 0.3y &= -0.25
\end{aligned}
\]

18. \[
\begin{aligned}
0.2x - 0.1y &= 0.07 \\
0.4x - 0.5y &= -0.01
\end{aligned}
\]

19. \[
\begin{aligned}
x + 2y &= 3 \\
x &= 2y - 4y = 6
\end{aligned}
\]

20. \[
\begin{aligned}
x + 2y &= 3 \\
x &= 2y - 4y = 6
\end{aligned}
\]

21. \[
\begin{aligned}
x - 2y + z &= 7 \\
x - y &= 2z = 4 \\
-x + 3y + 2z &= -3
\end{aligned}
\]

22. \[
\begin{aligned}
x - 2y + z &= 4 \\
x - y &= 2z = 4 \\
-x + 3y + 2z &= -3
\end{aligned}
\]

23. \[
\begin{aligned}
x &= 2y + 6z = 1 \\
x + 3y &= 5 \\
2x - y &= 6z = 2
\end{aligned}
\]

24. \[
\begin{aligned}
x &= 2y + 6z = 1 \\
x + 3y &= 5 \\
2x - y &= 6z = 2
\end{aligned}
\]

25. \[
\begin{aligned}
x + 3y + z &= 10 \\
2x - 3y - 3z &= 22 \\
4x - 2y + 3z &= -2
\end{aligned}
\]

26. \[
\begin{aligned}
x + 3y + 3z &= 3 \\
2x + 3y + 3z &= 3 \\
6x + 6y + 12z &= 13
\end{aligned}
\]

27. \[
\begin{aligned}
x &= 2y + z = 6 \\
x &= 2y + z = 6 \\
x &= 2y + z = 6
\end{aligned}
\]

28. \[
\begin{aligned}
x + 2y + w &= 3 \\
x &= 2y + w = 3 \\
-x + 3y + 3z &= 0
\end{aligned}
\]

29. \[
\begin{aligned}
x + 2y - z &= 3 \\
x - y &= -3 \\
2x + y + 3z &= 10
\end{aligned}
\]

30. \[
\begin{aligned}
x - 3y + z &= 2 \\
x &= 3y - z = 6 \\
x &= 3y - z = 6
\end{aligned}
\]

31. \[
\begin{aligned}
-x + y + 2z &= 1 \\
2x + 3y + z &= -2 \\
5x + 4y + 2z &= 4
\end{aligned}
\]

32. \[
\begin{aligned}
4x + 4y + 4z &= 5 \\
4x - 2y - 8z &= 1 \\
5x + 3y + 8z &= 6
\end{aligned}
\]

33. \[
\begin{aligned}
2x - y + 9z &= -8 \\
-x - 3y + 4z &= -15 \\
5x + 2y - z &= 17
\end{aligned}
\]

34. \[
\begin{aligned}
-3x + y + 7z &= -20 \\
5x - 2y - z &= 34 \\
-x + y + 4z &= -8
\end{aligned}
\]
In Exercises 35 and 36, use the matrix capabilities of a graphing utility to reduce the augmented matrix corresponding to the system of equations, and solve the system.

35. \[
\begin{align*}
3x - y + 5z - 2w &= -44 \\
x + 6y + 4z - w &= 1 \\
5x - y + z + 3w &= -15 \\
4y - z - 8w &= 58
\end{align*}
\]
36. \[
\begin{align*}
4x + 12y + 2z &= 20 \\
x + 6y + 4z &= 12 \\
x + 6y + z &= 8 \\
-2x - 10y - 2z &= -10
\end{align*}
\]

In Exercises 37–40, find \(x\) and \(y\).

37. \[
[ \begin{array}{c}
-x \\
y
\end{array} ] = [ \begin{array}{c}
-1 \\
9
\end{array} ]
\]
38. \[
[ \begin{array}{c}
x \\
y
\end{array} ] = [ \begin{array}{c}
5 \\
5
\end{array} ]
\]
39. \[
[ \begin{array}{c}
x + 3 \\
y + 5 \\
-9
\end{array} ] = [ \begin{array}{c}
11 \\
4 \\
0
\end{array} ]
\]
40. \[
[ \begin{array}{c}
x + 3 \\
y + 5 \\
-9
\end{array} ] = [ \begin{array}{c}
1 \\
4 \\
0
\end{array} ]
\]

In Exercises 41–44, if possible, find (a) \(A + B\), (b) \(A - B\), (c) \(4A\), and (d) \(A + 3B\).

41. \[
A = [ \begin{array}{c}
2 \\
3
\end{array} ], \quad B = [ \begin{array}{c}
-3 \\
12
\end{array} ]
\]
42. \[
A = [ \begin{array}{c}
4 \\
-6
\end{array} ], \quad B = [ \begin{array}{c}
3 \\
15
\end{array} ]
\]
43. \[
A = [ \begin{array}{c}
5 \\
-7
\end{array} ], \quad B = [ \begin{array}{c}
0 \\
4
\end{array} ]
\]
44. \[
A = [ \begin{array}{c}
6 \\
-5
\end{array} ], \quad B = [ \begin{array}{c}
-1 \\
4
\end{array} ]
\]

In Exercises 45–48, perform the matrix operations. If it is not possible, explain why.

45. \[
[ \begin{array}{c}
7 \\
-1
\end{array} ] + [ \begin{array}{c}
10 \\
14
\end{array} ]
\]
46. \[
[ \begin{array}{c}
-11 \\
-7
\end{array} ] + [ \begin{array}{c}
16 \\
2
\end{array} ] - [ \begin{array}{c}
6 \\
8
\end{array} ]
\]

In Exercises 49 and 50, use the matrix capabilities of a graphing utility to evaluate the expression.

49. \[
3 \begin{bmatrix}
8 & -2 & 5 \\
1 & 3 & -1 \\
2 & 7 & 6
\end{bmatrix}
+ 6 \begin{bmatrix}
4 & -2 & -3 \\
2 & 7 & 6
\end{bmatrix}
\]
50. \[
-5 \begin{bmatrix}
7 & -2 \\
8 & 2
\end{bmatrix}
+ 4 \begin{bmatrix}
-4 & 2 \\
-1 & 3
\end{bmatrix}
\]

In Exercises 51–54, solve for \(X\) in the equation, given

51. \[
X = 2A - 3B
\]
52. \[
6X = 4A + 3B
\]
53. \[
3X + 2A = B
\]
54. \[
2A - 5B = 3X
\]

In Exercises 55–58, find \(AB\), if possible.

55. \[
A = \begin{bmatrix}
2 & -2 \\
3 & 5
\end{bmatrix}, \quad B = \begin{bmatrix}
-3 & 10 \\
8 & 12
\end{bmatrix}
\]
56. \[
A = \begin{bmatrix}
5 & 4 \\
11 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
4 & 12 \\
15 & 30
\end{bmatrix}
\]
57. \[
A = \begin{bmatrix}
-7 & 2 \\
11 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
4 & 12 \\
20 & 40
\end{bmatrix}
\]
58. \[
A = \begin{bmatrix}
6 & -5 \\
7 & 4
\end{bmatrix}, \quad B = \begin{bmatrix}
1 & 4 \\
8 & 10
\end{bmatrix}
\]

In Exercises 59–66, perform the matrix operations, if possible. If it is not possible, explain why.

59. \[
\begin{bmatrix}
1 & 2 \\
5 & -4
\end{bmatrix} \begin{bmatrix}
6 & 2 & 8 \\
4 & 0 & 0
\end{bmatrix}
\]
60. \[
\begin{bmatrix}
1 & 5 & 6 \\
2 & -4 & 0
\end{bmatrix} \begin{bmatrix}
6 & -2 & 8 \\
4 & 0 & 0
\end{bmatrix}
\]
61. \[
\begin{bmatrix}
1 & 5 & 6 \\
2 & -4 & 0
\end{bmatrix} \begin{bmatrix}
-2 & 0 \\
8 & 0
\end{bmatrix}
\]
62. \[
\begin{bmatrix}
1 & 3 & 2 \\
0 & 2 & -4
\end{bmatrix} \begin{bmatrix}
4 & -3 & 2 \\
0 & 3 & 1
\end{bmatrix}
\]

63. \[
\begin{bmatrix}
2 & -4 \\
0 & 2
\end{bmatrix} \begin{bmatrix}
6 & 0 & 0
\end{bmatrix}
\]
632 Chapter 8 Matrices and Determinants

71. MANUFACTURING

An electronics manufacturing company produces three different models of headphones that are shipped to two warehouses. The number of units of model \( i \) that are shipped to warehouse \( j \) is represented by \( a_{ij} \) in the matrix

\[
A = \begin{bmatrix}
8200 & 7400 \\
6500 & 9800 \\
5400 & 4800
\end{bmatrix}.
\]

The price per unit is represented by the matrix

\[
B = \begin{bmatrix}
879.99 & 109.95 & 189.99
\end{bmatrix}.
\]

Compute \( BA \) and interpret the result.

72. CELL PHONE CHARGES

The pay-as-you-go charges (in dollars per minute) of two cellular telephone companies for calls inside the coverage area, regional roaming calls, and calls outside the coverage area are represented by \( C \).

\[
C = \begin{bmatrix}
0.07 & 0.095 \\
0.10 & 0.08 \\
0.28 & 0.25
\end{bmatrix}
\]

Each month, you plan to use 120 minutes on calls inside the coverage area, 80 minutes on regional roaming calls, and 20 minutes on calls outside the coverage area.

(a) Write a matrix \( T \) that represents the times spent on the phone for each type of call.

(b) Compute \( TC \) and interpret the result.

8.3

In Exercises 73–76, show that \( B \) is the inverse of \( A \).

73. \( A = \begin{bmatrix}
-4 & -1 \\
7 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & -1 \\
7 & 4
\end{bmatrix} \)

74. \( A = \begin{bmatrix}
5 & -1 \\
11 & -2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & 1 \\
-11 & 5
\end{bmatrix} \)

75. \( A = \begin{bmatrix}
1 & 1 & 0 \\
1 & 0 & 1 \\
6 & 2 & 3
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & -3 & 1 \\
3 & 3 & -1 \\
2 & 4 & -1
\end{bmatrix} \)

76. \( A = \begin{bmatrix}
1 & -1 & 0 \\
-1 & 0 & -1 \\
8 & -4 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & 1 & \frac{1}{2} \\
-3 & 1 & \frac{1}{2} \\
2 & -2 & -\frac{1}{2}
\end{bmatrix} \)

In Exercises 77–80, find the inverse of the matrix (if it exists).

77. \( \begin{bmatrix}
-6 & 5 \\
-5 & 4
\end{bmatrix} \)

78. \( \begin{bmatrix}
-3 & -5 \\
2 & 3
\end{bmatrix} \)

79. \( \begin{bmatrix}
-1 & 1 \\
2 & -2
\end{bmatrix} \)

80. \( \begin{bmatrix}
0 & -2 \\
7 & 3
\end{bmatrix} \)

In Exercises 81–84, use the matrix capabilities of a graphing utility to find the inverse of the matrix (if it exists).

81. \( \begin{bmatrix}
-1 & -2 & -2 \\
1 & 4 & 7 \\
3 & 7 & 9
\end{bmatrix} \)

82. \( \begin{bmatrix}
1 & 4 & 6 \\
2 & -3 & 1 \\
-1 & 18 & 16
\end{bmatrix} \)

83. \( \begin{bmatrix}
1 & 3 & 1 \\
4 & 4 & 2 \\
3 & 4 & 1
\end{bmatrix} \)

84. \( \begin{bmatrix}
1 & 3 & 6 \\
8 & 0 & 2 \\
4 & -2 & 0
\end{bmatrix} \)

83. In Exercises 73–76, show that \( B \) is the inverse of \( A \).

73. \( A = \begin{bmatrix}
-4 & -1 \\
7 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & -1 \\
7 & 4
\end{bmatrix} \)

74. \( A = \begin{bmatrix}
5 & -1 \\
11 & -2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & 1 \\
-11 & 5
\end{bmatrix} \)

75. \( A = \begin{bmatrix}
1 & 1 & 0 \\
1 & 0 & 1 \\
6 & 2 & 3
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & -3 & 1 \\
3 & 3 & -1 \\
2 & 4 & -1
\end{bmatrix} \)

76. \( A = \begin{bmatrix}
1 & -1 & 0 \\
-1 & 0 & -1 \\
8 & -4 & 2
\end{bmatrix}, \quad B = \begin{bmatrix}
-2 & 1 & \frac{1}{2} \\
-3 & 1 & \frac{1}{2} \\
2 & -2 & -\frac{1}{2}
\end{bmatrix} \)

In Exercises 77–80, find the inverse of the matrix (if it exists).

77. \( \begin{bmatrix}
-6 & 5 \\
-5 & 4
\end{bmatrix} \)

78. \( \begin{bmatrix}
-3 & -5 \\
2 & 3
\end{bmatrix} \)

79. \( \begin{bmatrix}
-1 & 1 \\
2 & -2
\end{bmatrix} \)

80. \( \begin{bmatrix}
0 & -2 \\
7 & 3
\end{bmatrix} \)

In Exercises 81–84, use the matrix capabilities of a graphing utility to find the inverse of the matrix (if it exists).

81. \( \begin{bmatrix}
-1 & -2 & -2 \\
1 & 4 & 7 \\
3 & 7 & 9
\end{bmatrix} \)

82. \( \begin{bmatrix}
1 & 4 & 6 \\
2 & -3 & 1 \\
-1 & 18 & 16
\end{bmatrix} \)

83. \( \begin{bmatrix}
1 & 3 & 1 \\
4 & 4 & 2 \\
3 & 4 & 1
\end{bmatrix} \)

84. \( \begin{bmatrix}
1 & 3 & 6 \\
8 & 0 & 2 \\
4 & -2 & 0
\end{bmatrix} \)

In Exercises 77–80, find the inverse of the matrix (if it exists).

77. \( \begin{bmatrix}
-6 & 5 \\
-5 & 4
\end{bmatrix} \)

78. \( \begin{bmatrix}
-3 & -5 \\
2 & 3
\end{bmatrix} \)

79. \( \begin{bmatrix}
-1 & 1 \\
2 & -2
\end{bmatrix} \)

80. \( \begin{bmatrix}
0 & -2 \\
7 & 3
\end{bmatrix} \)

In Exercises 81–84, use the matrix capabilities of a graphing utility to find the inverse of the matrix (if it exists).

81. \( \begin{bmatrix}
1 & 4 & 6 \\
2 & -3 & 1 \\
-1 & 18 & 16
\end{bmatrix} \)

82. \( \begin{bmatrix}
1 & 3 & 6 \\
8 & 0 & 2 \\
4 & -2 & 0
\end{bmatrix} \)

83. \( \begin{bmatrix}
1 & 3 & 1 \\
4 & 4 & 2 \\
3 & 4 & 1
\end{bmatrix} \)

84. \( \begin{bmatrix}
1 & 3 & 6 \\
8 & 0 & 2 \\
4 & -2 & 0
\end{bmatrix} \)

In Exercises 77–80, find the inverse of the matrix (if it exists).

77. \( \begin{bmatrix}
-6 & 5 \\
-5 & 4
\end{bmatrix} \)

78. \( \begin{bmatrix}
-3 & -5 \\
2 & 3
\end{bmatrix} \)

79. \( \begin{bmatrix}
-1 & 1 \\
2 & -2
\end{bmatrix} \)

80. \( \begin{bmatrix}
0 & -2 \\
7 & 3
\end{bmatrix} \)
In Exercises 85–92, use the formula below to find the inverse of the matrix, if it exists.

\[ A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \]

85. \[
\begin{bmatrix}
-7 & 2 \\
-8 & 2
\end{bmatrix}
\]

86. \[
\begin{bmatrix}
10 & 4 \\
7 & 3
\end{bmatrix}
\]

87. \[
\begin{bmatrix}
-12 & 6 \\
10 & -5
\end{bmatrix}
\]

88. \[
\begin{bmatrix}
-18 & -15 \\
-6 & -5
\end{bmatrix}
\]

89. \[
\begin{bmatrix}
\frac{3}{11} & 20 \\
\frac{3}{11} & -6
\end{bmatrix}
\]

90. \[
\begin{bmatrix}
-\frac{3}{2} & \frac{5}{2} \\
-\frac{8}{5} & -\frac{3}{5}
\end{bmatrix}
\]

91. \[
\begin{bmatrix}
0.5 & 0.1 \\
-0.2 & -0.4
\end{bmatrix}
\]

92. \[
\begin{bmatrix}
1.6 & -3.2 \\
1.2 & -2.4
\end{bmatrix}
\]

In Exercises 93–104, use an inverse matrix to solve (if possible) the system of linear equations.

93. \[
\begin{aligned}
-x + 4y &= 8 \\
2x - 7y &= -5
\end{aligned}
\]

94. \[
\begin{aligned}
5x - y &= 13 \\
-9x + 2y &= -24
\end{aligned}
\]

95. \[
\begin{aligned}
-3x + 10y &= 8 \\
5x - 17y &= -13
\end{aligned}
\]

96. \[
\begin{aligned}
4x - 2y &= -10 \\
-19x + 9y &= 47
\end{aligned}
\]

97. \[
\begin{aligned}
\frac{1}{2}x + \frac{1}{3}y &= 2 \\
-3x + 2y &= 0
\end{aligned}
\]

98. \[
\begin{aligned}
\frac{5}{6}x + \frac{3}{8}y &= -2 \\
4x - 3y &= 0
\end{aligned}
\]

99. \[
\begin{aligned}
0.3x + 0.7y &= 10.2 \\
0.4x + 0.6y &= 7.6
\end{aligned}
\]

100. \[
\begin{aligned}
3.5x - 4.5y &= 8 \\
2.5x - 7.5y &= 25
\end{aligned}
\]

101. \[
\begin{aligned}
3x + 2y - z &= 6 \\
x - y + 2z &= -1 \\
5x + y + z &= 7
\end{aligned}
\]

102. \[
\begin{aligned}
-x + 4y - 2z &= 12 \\
2x - 9y + 5z &= -25 \\
x + 5y - 4z &= 10
\end{aligned}
\]

103. \[
\begin{aligned}
-2x + y + 2z &= -13 \\
x - 4y + z &= -11 \\
y - z &= 0
\end{aligned}
\]

104. \[
\begin{aligned}
3x - y + 5z &= -14 \\
x + y + 6z &= 8 \\
-8x + 4y - z &= 44
\end{aligned}
\]

In Exercises 105–110, use the matrix capabilities of a graphing utility to solve (if possible) the system of linear equations.

105. \[
\begin{aligned}
x + 2y &= -1 \\
3x + 4y &= -5
\end{aligned}
\]

106. \[
\begin{aligned}
x + 3y &= 23 \\
-6x + 2y &= -18
\end{aligned}
\]

107. \[
\begin{aligned}
\frac{6}{3}x - \frac{4}{3}y &= \frac{6}{3} \\
-\frac{2}{3}x + \frac{12}{3}y &= -\frac{17}{3}
\end{aligned}
\]

108. \[
\begin{aligned}
\frac{5}{3}x + 10y &= 7 \\
2x + y &= -98
\end{aligned}
\]

109. \[
\begin{aligned}
-3x - 3y - 4z &= 2 \\
y + z &= -1 \\
4x + 3y + 4z &= -1
\end{aligned}
\]

110. \[
\begin{aligned}
x - 3y - 2z &= 8 \\
-2x + 7y + 3z &= -19 \\
x - y - 3z &= 3
\end{aligned}
\]

In Exercises 111–114, find the determinant of the matrix.

111. \[
\begin{bmatrix}
8 & 5 \\
2 & -4
\end{bmatrix}
\]

112. \[
\begin{bmatrix}
-9 & 11 \\
7 & -4
\end{bmatrix}
\]

113. \[
\begin{bmatrix}
50 & -30 \\
10 & 5
\end{bmatrix}
\]

114. \[
\begin{bmatrix}
14 & -24 \\
12 & -15
\end{bmatrix}
\]

In Exercises 115–118, find all (a) minors and (b) cofactors of the matrix.

115. \[
\begin{bmatrix}
2 & -1 \\
7 & 4
\end{bmatrix}
\]

116. \[
\begin{bmatrix}
3 & 6 \\
5 & -4
\end{bmatrix}
\]

117. \[
\begin{bmatrix}
-2 & 5 \\
1 & 8
\end{bmatrix}
\]

118. \[
\begin{bmatrix}
8 & 3 \\
5 & 9
\end{bmatrix}
\]

In Exercises 119–128, find the determinant of the matrix. Expand by cofactors on the row or column that appears to make the computations easiest.

119. \[
\begin{bmatrix}
-2 & 0 & 0 \\
2 & -1 & 0 \\
-1 & 1 & -3
\end{bmatrix}
\]

120. \[
\begin{bmatrix}
0 & 1 & -2 \\
2 & 1 & 0 \\
-1 & -1 & 3
\end{bmatrix}
\]

121. \[
\begin{bmatrix}
4 & 1 & -1 \\
2 & 3 & 2 \\
1 & -1 & 0
\end{bmatrix}
\]

122. \[
\begin{bmatrix}
-1 & -2 & 1 \\
2 & 3 & 0 \\
-5 & 1 & 3
\end{bmatrix}
\]

123. \[
\begin{bmatrix}
-2 & 4 & 1 \\
-6 & 0 & 2 \\
5 & 3 & 4
\end{bmatrix}
\]

124. \[
\begin{bmatrix}
1 & 1 & 4 \\
-4 & 1 & 2 \\
0 & 1 & -1
\end{bmatrix}
\]

125. \[
\begin{bmatrix}
1 & 2 & -1 \\
1 & 2 & -4 \\
2 & 2 & 3
\end{bmatrix}
\]

126. \[
\begin{bmatrix}
1 & 2 & 1 \\
4 & 1 & 4 \\
2 & 3 & 3
\end{bmatrix}
\]

127. \[
\begin{bmatrix}
3 & 0 & -4 \\
0 & 8 & 1 \\
6 & 1 & 8
\end{bmatrix}
\]

128. \[
\begin{bmatrix}
-5 & 0 & 6 \\
0 & 1 & -1 \\
-3 & 4 & -5
\end{bmatrix}
\]

In Exercises 129–132, use Cramer’s Rule to solve (if possible) the system of equations.

129. \[
\begin{aligned}
5x - 2y &= 6 \\
-11x + 3y &= -23
\end{aligned}
\]

130. \[
\begin{aligned}
3x + 8y &= -7 \\
9x - 5y &= 37
\end{aligned}
\]

131. \[
\begin{aligned}
-2x + 3y - 5z &= -11 \\
4x - y + z &= -3 \\
x - 4y + 6z &= 15
\end{aligned}
\]
132. \[
\begin{align*}
5x - 2y + z &= 15 \\
3x - 3y - z &= -7 \\
2x - y - 7z &= -3
\end{align*}
\]

In Exercises 133–136, use a determinant and the given vertices of a triangle to find the area of the triangle.

133. \[
\text{Area of \((0, 5), (5, 0), (5, 8)\):}
\]

134. \[
\text{Area of \((-4, 0), (4, 0), (0, 6)\):}
\]

135. \[
\text{Area of \((-2, 3), (0, 5), (2, 3)\):}
\]

136. \[
\text{Area of \((-4, -2), (1, 4), (4, 2)\):}
\]

In Exercises 137 and 138, use a determinant to determine whether the points are collinear.

137. \((-1, 7), (3, -9), (-3, 15)\)
138. \((0, -5), (-2, -6), (8, -1)\)

In Exercises 139–142, use a determinant to find an equation of the line passing through the points.

139. \((-4, 0), (4, 4)\)
140. \((2, 5), (6, -1)\)
141. \((-\frac{5}{2}, 3), (\frac{-7}{2}, 1)\)
142. \((-0.8, 0.2), (0.7, 3.2)\)

In Exercises 143 and 144, (a) write the uncoded row matrices for the message, and (b) encode the message using the encoding matrix.

143. LOOK OUT BELOW

144. HEAD DUE WEST

In Exercises 145 and 146, decode the cryptogram by using the inverse of the matrix

\[
A = \begin{bmatrix}
-5 & 4 & -3 \\
10 & -7 & 6 \\
8 & -6 & 5
\end{bmatrix}
\]

EXPLORATION

TRUE OR FALSE? In Exercises 147 and 148, determine whether the statement is true or false. Justify your answer.

147. It is possible to find the determinant of a \(4 \times 5\) matrix.

148. \[
\begin{vmatrix}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} + c_1 & a_{32} + c_2 & a_{33} + c_3 \\
a_{41} & a_{42} & a_{43}
\end{vmatrix}
\]

149. Use the matrix capabilities of a graphing utility to find the inverse of the matrix

\[
A = \begin{bmatrix}
1 & -3 \\
-2 & 6
\end{bmatrix}
\]

What message appears on the screen? Why does the graphing utility display this message?

150. Under what conditions does a matrix have an inverse?

151. WRITING What is meant by the cofactor of an entry of a matrix? How are cofactors used to find the determinant of the matrix?

152. Three people were asked to solve a system of equations using an augmented matrix. Each person reduced the matrix to row-echelon form. The reduced matrices were

\[
\begin{bmatrix}
1 & 2 & : & 3 \\
0 & 1 & : & 1 \\
-6 & 2 & : & 3
\end{bmatrix}
\]

and

\[
\begin{bmatrix}
1 & 2 & : & 3 \\
0 & 0 & : & 0
\end{bmatrix}
\]

Can all three be right? Explain.

153. THINK ABOUT IT Describe the row-echelon form of an augmented matrix that corresponds to a system of linear equations that has a unique solution.

154. Solve the equation for \(\lambda\).

\[
\begin{vmatrix}
2 - \lambda & 5 \\
3 & -8 - \lambda
\end{vmatrix} = 0
\]
8 CHAPTER TEST

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1 and 2, write the matrix in reduced row-echelon form.

1. \[
\begin{bmatrix}
1 & -1 & 5 \\
6 & 2 & 3 \\
5 & 3 & -3
\end{bmatrix}
\]

2. \[
\begin{bmatrix}
1 & 0 & -1 & 2 \\
-1 & 1 & 1 & -3 \\
1 & 1 & -1 & 1 \\
3 & 2 & -3 & 4
\end{bmatrix}
\]

3. Write the augmented matrix corresponding to the system of equations and solve the system.

\[
\begin{align*}
4x + 3y - 2z &= 14 \\
-x - y + 2z &= -5 \\
3x + y - 4z &= 8
\end{align*}
\]

4. Find (a) \( A - B \), (b) \( 3A \), (c) \( 3A - 2B \), and (d) \( AB \) (if possible).

\[
A = \begin{bmatrix}
6 & 5 \\
-5 & -5
\end{bmatrix}, \quad B = \begin{bmatrix}
5 & 0 \\
-5 & -1
\end{bmatrix}
\]

In Exercises 5 and 6, find the inverse of the matrix (if it exists).

5. \[
\begin{bmatrix}
-4 & 3 \\
5 & -2
\end{bmatrix}
\]

6. \[
\begin{bmatrix}
-2 & 4 & -6 \\
2 & 1 & 0 \\
4 & -2 & 5
\end{bmatrix}
\]

7. Use the result of Exercise 5 to solve the system.

\[
\begin{align*}
-4x + 3y &= 6 \\
5x - 2y &= 24
\end{align*}
\]

In Exercises 8–10, evaluate the determinant of the matrix.

8. \[
\begin{bmatrix}
-6 & 4 \\
10 & 12
\end{bmatrix}
\]

9. \[
\begin{bmatrix}
\frac{5}{7} & \frac{13}{7} \\
-8 & 6
\end{bmatrix}
\]

10. \[
\begin{bmatrix}
6 & -7 & 2 \\
3 & -2 & 0 \\
1 & 5 & 1
\end{bmatrix}
\]

In Exercises 11 and 12, use Cramer’s Rule to solve (if possible) the system of equations.

11. \[
\begin{align*}
7x + 6y &= 9 \\
-2x - 11y &= -49
\end{align*}
\]

12. \[
\begin{align*}
6x - y + 2z &= -4 \\
-2x + 3y - z &= 10 \\
4x - 4y + z &= -18
\end{align*}
\]

13. Use a determinant to find the area of the triangle in the figure.

14. Find the uncoded 1 \( \times \) 3 row matrices for the message KNOCK ON WOOD. Then encode the message using the matrix \( A \) below.

\[
A = \begin{bmatrix}
1 & -1 & 0 \\
1 & 0 & -1 \\
6 & -2 & -3
\end{bmatrix}
\]

15. One hundred liters of a 50% solution is obtained by mixing a 60% solution with a 20% solution. How many liters of each solution must be used to obtain the desired mixture?
**PROOFS IN MATHEMATICS**

**Proofs without words** are pictures or diagrams that give a visual understanding of why a theorem or statement is true. They can also provide a starting point for writing a formal proof. The following proof shows that a $2 \times 2$ determinant is the area of a parallelogram.

\[
\begin{vmatrix} a & b \\ c & d \end{vmatrix} = \text{Area of parallelogram} = \text{Area of orange \triangle} + \text{Area of yellow \triangle} + \text{Area of blue \triangle} + \text{Area of pink \triangle} + \text{Area of white quadrilateral}
\]

Area of $\square = \text{Area of orange \triangle} + \text{Area of yellow \triangle} + \text{Area of blue \triangle} - \text{Area of pink \triangle} - \text{Area of white quadrilateral}$

Area of $\square = \text{Area of white quadrilateral} + \text{Area of blue \triangle} + \text{Area of yellow \triangle} - \text{Area of green quadrilateral}

= Area of $\square - \text{Area of \square}$

PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. The columns of matrix \( T \) show the coordinates of the vertices of a triangle. Matrix \( A \) is a transformation matrix.

\[
A = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}, \quad T = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 4 & 2 \end{bmatrix}
\]

(a) Find \( AT \) and \( AAT \). Then sketch the original triangle and the two transformed triangles. What transformation does \( A \) represent?

(b) Given the triangle determined by \( AAT \), describe the transformation process that produces the triangle determined by \( AT \) and then the triangle determined by \( T \).

2. The matrices show the number of people (in thousands) who lived in each region of the United States in 2000 and the number of people (in thousands) projected to live in each region in 2015. The regional populations are separated into three age categories. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Region</th>
<th>2000</th>
<th>2015</th>

</tbody>
</table>

(a) The total population in 2000 was approximately 281,422,000 and the projected total population in 2015 is 322,366,000. Rewrite the matrices to give the information as percents of the total population.

(b) Write a matrix that gives the projected change in the percent of the population in each region and age group from 2000 to 2015.

(c) Based on the result of part (b), which region(s) and age group(s) are projected to show relative growth from 2000 to 2015?

3. Determine whether the matrix is idempotent. A square matrix is **idempotent** if \( A^2 = A \).

(a) \[ \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} \]

(b) \[ \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \]

(c) \[ \begin{bmatrix} 2 & 3 \\ -1 & -2 \end{bmatrix} \]

(d) \[ \begin{bmatrix} 2 & 3 \\ 1 & 2 \end{bmatrix} \]

4. Let \( A = \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix} \).

(a) Show that \( A^2 = 2A + 5I = O \), where \( I \) is the identity matrix of order 2.

(b) Show that \( A^{-1} = \frac{1}{3}(2I - A) \).

(c) Show in general that for any square matrix satisfying \( A^2 - 2A + 5I = O \) the inverse of \( A \) is given by \( A^{-1} = \frac{1}{3}(2I - A) \).

5. Two competing companies offer satellite television to a city with 100,000 households. Gold Satellite System has 25,000 subscribers and Galaxy Satellite Network has 30,000 subscribers. (The other 45,000 households do not subscribe.) The percent changes in satellite subscriptions each year are shown in the matrix below.

\[
\begin{bmatrix}
0.10 & 0.20 & 0.15 \\
0.70 & 0.80 & 0.15 \\
0.10 & 0.05 & 0.70
\end{bmatrix}
\]

(a) Find the number of subscribers each company will have in 1 year using matrix multiplication. Explain how you obtained your answer.

(b) Find the number of subscribers each company will have in 2 years using matrix multiplication. Explain how you obtained your answer.

(c) Find the number of subscribers each company will have in 3 years using matrix multiplication. Explain how you obtained your answer.

(d) What is happening to the number of subscribers to each company? What is happening to the number of nonsubscribers?

6. Find \( x \) such that the matrix is equal to its own inverse.

\[
A = \begin{bmatrix} x & 3 \\ -2 & -3 \end{bmatrix}
\]

7. Find \( x \) such that the matrix is singular.

\[
A = \begin{bmatrix} x & 4 \\ -2 & -3 \end{bmatrix}
\]

8. Find an example of a singular \( 2 \times 2 \) matrix satisfying \( A^2 = A \).
9. Verify the following equation.
\[
\begin{vmatrix}
1 & 1 & 1 \\
a & b & c \\
a^2 & b^2 & c^2
\end{vmatrix} = (a - b)(b - c)(c - a)
\]

10. Verify the following equation.
\[
\begin{vmatrix}
1 & 1 & 1 \\
a & b & c \\
a^3 & b^3 & c^3
\end{vmatrix} = (a - b)(b - c)(c - a)(a + b + c)
\]

11. Verify the following equation.
\[
\begin{vmatrix}
x & 0 & c \\
-1 & x & b \\
0 & 1 & a
\end{vmatrix} = ax^2 + bx + c
\]

12. Use the equation given in Exercise 11 as a model to find a determinant that is equal to \(ax^3 + bx^2 + cx + d\).

13. The atomic masses of three compounds are shown in the table. Use a linear system and Cramer’s Rule to find the atomic masses of sulfur (S), nitrogen (N), and fluorine (F).

<table>
<thead>
<tr>
<th>Compound</th>

</table>

14. A walkway lighting package includes a transformer, a certain length of wire, and a certain number of lights on the wire. The price of each lighting package depends on the length of wire and the number of lights on the wire. Use the following information to find the cost of a transformer, the cost per foot of wire, and the cost of a light. Assume that the cost of each item is the same in each lighting package.

- A package that contains a transformer, 25 feet of wire, and 5 lights costs $20.
- A package that contains a transformer, 50 feet of wire, and 15 lights costs $35.
- A package that contains a transformer, 100 feet of wire, and 20 lights costs $50.

15. The transpose of a matrix, denoted \(A^T\), is formed by writing its columns as rows. Find the transpose of each matrix and verify that \((AB)^T = B^TA^T\).

\[
A = \begin{bmatrix}
-1 & 1 & 2 \\
2 & 0 & 1
\end{bmatrix},
B = \begin{bmatrix}
-3 & 0 \\
1 & 2 \\
1 & -1
\end{bmatrix}
\]

16. Use the inverse of matrix \(A\) to decode the cryptogram.
\[
A = \begin{bmatrix}
1 & -2 & 2 \\
1 & 1 & -3 \\
1 & 1 & 4
\end{bmatrix}
\]

\[
\begin{bmatrix}
23 & 13 & -34 & 31 & -34 & 63 & 25 & -17 & 61 \\
24 & 14 & -37 & 41 & -17 & -8 & 20 & -29 & 40 \\
38 & -56 & 116 & 13 & -11 & 1 & 22 & -3 & -6 \\
41 & -53 & 85 & 28 & -32 & 16
\end{bmatrix}
\]

17. A code breaker intercepted the encoded message below.
\[
45 & -35 & 38 & -30 & 18 & -18 & 35 & -30 & 81 & -60 \\
42 & -28 & 75 & -55 & 2 & -2 & 22 & -21 & 15 & -10
\]

Let
\[
A^{-1} = \begin{bmatrix}
w & x \\
y & z
\end{bmatrix}
\]

(a) You know that \([45 & -35]A^{-1} = [10 & 15]\) and that \([38 & -30]A^{-1} = [8 & 14]\), where \(A^{-1}\) is the inverse of the encoding matrix \(A\). Write and solve two systems of equations to find \(w, x, y,\) and \(z\).

(b) Decode the message.

18. Let
\[
A = \begin{bmatrix}
6 & 4 & 1 \\
0 & 2 & 3 \\
1 & 1 & 2
\end{bmatrix}
\]

Use a graphing utility to find \(A^{-1}\). Compare \(|A^{-1}|\) with \(|A|\). Make a conjecture about the determinant of the inverse of a matrix.

19. Let \(A\) be an \(n \times n\) matrix each of whose rows adds up to zero. Find \(|A|\).

20. Consider matrices of the form
\[
A = \begin{bmatrix}
0 & a_{12} & a_{13} & a_{14} & \cdots & a_{1n} \\
0 & 0 & a_{23} & a_{24} & \cdots & a_{2n} \\
0 & 0 & 0 & a_{34} & \cdots & a_{3n} \\
\vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\
0 & 0 & 0 & 0 & \cdots & a_{(n-1)n} \\
0 & 0 & 0 & 0 & \cdots & 0
\end{bmatrix}
\]

(a) Write a \(2 \times 2\) matrix and a \(3 \times 3\) matrix in the form of \(A\).

(b) Use a graphing utility to raise each of the matrices to higher powers. Describe the result.

(c) Use the result of part (b) to make a conjecture about powers of \(A\) if \(A\) is a \(4 \times 4\) matrix. Use a graphing utility to test your conjecture.

(d) Use the results of parts (b) and (c) to make a conjecture about powers of \(A\) if \(A\) is an \(n \times n\) matrix.
Sequences, Series, and Probability

9.1 Sequences and Series
9.2 Arithmetic Sequences and Partial Sums
9.3 Geometric Sequences and Series
9.4 Mathematical Induction
9.5 The Binomial Theorem
9.6 Counting Principles
9.7 Probability

In Mathematics
Sequences and series are used to describe algebraic patterns. Mathematical induction is used to prove formulas. The Binomial Theorem is used to calculate binomial coefficients. Probability theory is used to determine the likelihood of an event.

In Real Life
The concepts discussed in this chapter are used to model depreciation, sales, compound interest, population growth, and other real-life applications. For instance, the federal debt of the United States can be modeled by a sequence, which can then be used to identify patterns in the data. (See Exercise 125, page 649.)

IN CAREERS
There are many careers that use the concepts presented in this chapter. Several are listed below.

• Public Finance Economist
  Exercises 127–130, page 669
• Professional Poker Player
  Example 9, page 695

• Quality Assurance Technician
  Example 11, page 706
• Survey Researcher
  Exercise 45, page 708
9.1 SEQUENCES AND SERIES

What you should learn
• Use sequence notation to write the terms of sequences.
• Use factorial notation.
• Use summation notation to write sums.
• Find the sums of series.
• Use sequences and series to model and solve real-life problems.

Why you should learn it
Sequences and series can be used to model real-life problems. For instance, in Exercise 123 on page 649, sequences are used to model the numbers of Best Buy stores from 2002 through 2007.

Sequences
In mathematics, the word sequence is used in much the same way as in ordinary English. Saying that a collection is listed in sequence means that it is ordered so that it has a first member, a second member, a third member, and so on. Two examples are 1, 2, 3, 4, . . . and 1, 3, 5, 7, . . .

Mathematically, you can think of a sequence as a function whose domain is the set of positive integers.

Rather than using function notation, however, sequences are usually written using subscript notation, as indicated in the following definition.

Definition of Sequence
An infinite sequence is a function whose domain is the set of positive integers. The function values are the terms of the sequence. If the domain of the function consists of the first \( n \) positive integers only, the sequence is a finite sequence.

On occasion it is convenient to begin subscripting a sequence with 0 instead of 1 so that the terms of the sequence become \( a_0, a_1, a_2, a_3, \ldots \). When this is the case, the domain includes 0.

Example 1 Writing the Terms of a Sequence

Write the first four terms of the sequences given by

\[
a_n = 3n - 2 \quad \text{and} \quad a_n = 3 + (-1)^n.
\]

Solution

\(a\). The first four terms of the sequence given by \( a_n = 3n - 2 \) are

\[
\begin{align*}
a_1 &= 3(1) - 2 = 1 \\
a_2 &= 3(2) - 2 = 4 \\
a_3 &= 3(3) - 2 = 7 \\
a_4 &= 3(4) - 2 = 10.
\end{align*}
\]

\(b\). The first four terms of the sequence given by \( a_n = 3 + (-1)^n \) are

\[
\begin{align*}
a_1 &= 3 + (-1)^1 = 3 - 1 = 2 \\
a_2 &= 3 + (-1)^2 = 3 + 1 = 4 \\
a_3 &= 3 + (-1)^3 = 3 - 1 = 2 \\
a_4 &= 3 + (-1)^4 = 3 + 1 = 4.
\end{align*}
\]

Study Tip

The subscripts of a sequence make up the domain of the sequence and serve to identify the locations of terms within the sequence. For example, \( a_4 \) is the fourth term of the sequence, and \( a_n \) is the \( n \)th term of the sequence. Any variable can be used as a subscript. The most commonly used variable subscripts in sequence and series notation are \( i, j, k, \) and \( n \).
Section 9.1 Sequences and Series

Example 2  A Sequence Whose Terms Alternate in Sign

Write the first five terms of the sequence given by \( a_n = \frac{(-1)^n}{2n + 1} \).

Solution

The first five terms of the sequence are as follows.

\[
\begin{align*}
a_1 &= \frac{(-1)^1}{2(1) + 1} = -\frac{1}{3} & \text{1st term} \\
a_2 &= \frac{(-1)^2}{2(2) + 1} = \frac{1}{5} & \text{2nd term} \\
a_3 &= \frac{(-1)^3}{2(3) + 1} = -\frac{1}{7} & \text{3rd term} \\
a_4 &= \frac{(-1)^4}{2(4) + 1} = \frac{1}{9} & \text{4th term} \\
a_5 &= \frac{(-1)^5}{2(5) + 1} = -\frac{1}{11} & \text{5th term}
\end{align*}
\]

Simply listing the first few terms is not sufficient to define a unique sequence—the \( n \)th term must be given. To see this, consider the following sequences, both of which have the same first three terms.

\[
\begin{align*}
1 & \quad 1 & \quad 1 & \quad \ddots \\
2 & \quad 4 & \quad 8 & \quad 16 & \quad \ddots \\
1 & \quad 1 & \quad 1 & \quad \ddots \\
2 & \quad 4 & \quad 8 & \quad 15 & \quad \ddots \\
1 & \quad 1 & \quad 1 & \quad \ddots \\
2 & \quad 4 & \quad 8 & \quad 15 & \quad \ddots & \quad (n+1)(n^2 - n + 6) & \quad \ddots
\end{align*}
\]

Example 3  Finding the \( n \)th Term of a Sequence

Write an expression for the apparent \( n \)th term \( (a_n) \) of each sequence.

a. 1, 3, 5, 7, . . .  
   b. -5, 10, -17, . . .

Solution

a. \( n: 1 \ 2 \ 3 \ 4 \ldots n \)  
   Terms: 1 3 5 7 . . . \( a_n \)  
   Apparent pattern: Each term is 1 less than twice \( n \), which implies that  
   \[ a_n = 2n - 1 \].

b. \( n: 1 \ 2 \ 3 \ 4 \ldots n \)  
   Terms: -5 10 -17 . . . \( a_n \)  
   Apparent pattern: The terms have alternating signs with those in the even positions being negative. Each term is 1 more than the square of \( n \), which implies that  
   \[ a_n = (-1)^{n+1}(n^2 + 1) \]  

CHECK Point Now try Exercise 47.
Some sequences are defined **recursively**. To define a sequence recursively, you need to be given one or more of the first few terms. All other terms of the sequence are then defined using previous terms. A well-known recursive sequence is the Fibonacci sequence shown in Example 4.

### Example 4  The Fibonacci Sequence: A Recursive Sequence

The Fibonacci sequence is defined recursively, as follows.

\[ a_0 = 1, \ a_1 = 1, \ a_k = a_{k-2} + a_{k-1}, \text{ where } k \geq 2 \]

Write the first six terms of this sequence.

**Solution**

\[ a_0 = 1 \quad \text{(0th term is given)} \]
\[ a_1 = 1 \quad \text{(1st term is given)} \]
\[ a_2 = a_{2-2} + a_{2-1} = a_0 + a_1 = 1 + 1 = 2 \quad \text{Use recursion formula.} \]
\[ a_3 = a_{3-2} + a_{3-1} = a_1 + a_2 = 1 + 2 = 3 \quad \text{Use recursion formula.} \]
\[ a_4 = a_{4-2} + a_{4-1} = a_2 + a_3 = 2 + 3 = 5 \quad \text{Use recursion formula.} \]
\[ a_5 = a_{5-2} + a_{5-1} = a_3 + a_4 = 3 + 5 = 8 \quad \text{Use recursion formula.} \]

**CHECKPOINT**  Now try Exercise 65.

### Factorial Notation

Some very important sequences in mathematics involve terms that are defined with special types of products called **factorials**.

#### Definition of Factorial

If \( n \) is a positive integer, **\( n \) factorial** is defined as

\[ n! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \ldots \cdot (n - 1) \cdot n. \]

As a special case, zero factorial is defined as \( 0! = 1 \).

Here are some values of \( n! \) for the first several nonnegative integers. Notice that \( 0! \) is 1 by definition.

\[ 0! = 1 \]
\[ 1! = 1 \]
\[ 2! = 1 \cdot 2 = 2 \]
\[ 3! = 1 \cdot 2 \cdot 3 = 6 \]
\[ 4! = 1 \cdot 2 \cdot 3 \cdot 4 = 24 \]
\[ 5! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 = 120 \]

The value of \( n \) does not have to be very large before the value of \( n! \) becomes extremely large. For instance, \( 10! = 3,628,800 \).
Factorials follow the same conventions for order of operations as do exponents. For instance,

\[ 2n! = 2(n!) = 2(1 \cdot 2 \cdot 3 \cdot 4 \cdot \ldots \cdot n) \]

whereas \((2n)! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \ldots \cdot 2n\).

**Example 5**  
**Writing the Terms of a Sequence Involving Factorials**

Write the first five terms of the sequence given by

\[ a_n = \frac{2^n}{n!} \]

Begin with \(n = 0\).

**Algebraic Solution**

\[
\begin{align*}
 a_0 &= \frac{2^0}{0!} = \frac{1}{1} = 1 \quad & \text{0th term} \\
 a_1 &= \frac{2^1}{1!} = \frac{2}{1} = 2 \quad & \text{1st term} \\
 a_2 &= \frac{2^2}{2!} = \frac{4}{2} = 2 \quad & \text{2nd term} \\
 a_3 &= \frac{2^3}{3!} = \frac{8}{6} = \frac{4}{3} \quad & \text{3rd term} \\
 a_4 &= \frac{2^4}{4!} = \frac{16}{24} = \frac{2}{3} \quad & \text{4th term}
\end{align*}
\]

**Numerical Solution**

Set your graphing utility to sequence mode. Enter the sequence into your graphing utility, as shown in Figure 9.1. Use the table feature (in ask mode) to create a table showing the terms of the sequence \(u_n\) for \(n = 0, 1, 2, 3,\) and 4.

From Figure 9.2, you can estimate the first five terms of the sequence as follows.

\[ u_0 = 1, \ u_1 = 2, \ u_2 = 2, \ u_3 \approx 1.3333 \approx \frac{4}{3}, \ u_4 \approx 0.66667 \approx \frac{2}{3} \]

**Example 6**  
**Evaluating Factorial Expressions**

Evaluate each factorial expression.

a. \(\frac{8!}{2! \cdot 6!}\)  
   \(\frac{8!}{2! \cdot 6!} = \frac{8 \cdot 7 \cdot 6!}{2! \cdot 6!} = \frac{8 \cdot 7}{2 \cdot 1} = 28\)

b. \(\frac{2! \cdot 6!}{3! \cdot 5!}\)  
   \(\frac{2! \cdot 6!}{3! \cdot 5!} = \frac{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} = \frac{7 \cdot 8}{2} = 28\)

c. \(\frac{n!}{(n - 1)!}\)  
   \(\frac{n!}{(n - 1)!} = \frac{1 \cdot 2 \cdot 3 \cdot \ldots \cdot (n - 1) \cdot n}{1 \cdot 2 \cdot 3 \cdot \ldots \cdot (n - 1)} = n\)

**CHECK Point** Now try Exercise 81.
Summation Notation

There is a convenient notation for the sum of the terms of a finite sequence. It is called **summation notation** or **sigma notation** because it involves the use of the uppercase Greek letter sigma, written as $\Sigma$.

### Definition of Summation Notation

The sum of the first $n$ terms of a sequence is represented by

$$\sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$$

where $i$ is called the **index of summation**, $n$ is the **upper limit of summation**, and 1 is the **lower limit of summation**.

### Example 7

**Summation Notation for a Sum**

Find each sum.

a. $\sum_{i=1}^{5} 3i$

b. $\sum_{k=3}^{6} (1 + k^2)$

c. $\sum_{i=0}^{8} \frac{1}{i!}$

**Solution**

a. $\sum_{i=1}^{5} 3i = 3(1) + 3(2) + 3(3) + 3(4) + 3(5)$

$$= 3(1 + 2 + 3 + 4 + 5)$$

$$= 3(15)$$

$$= 45$$

b. $\sum_{k=3}^{6} (1 + k^2) = (1 + 3^2) + (1 + 4^2) + (1 + 5^2) + (1 + 6^2)$

$$= 10 + 17 + 26 + 37$$

$$= 90$$

c. $\sum_{i=0}^{8} \frac{1}{i!} = \frac{1}{0!} + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \frac{1}{5!} + \frac{1}{6!} + \frac{1}{7!} + \frac{1}{8!}$

$$= 1 + \frac{1}{2} + \frac{1}{6} + \frac{1}{24} + \frac{1}{120} + \frac{1}{720} + \frac{1}{5040} + \frac{1}{40320}$$

$$\approx 2.71828$$

For this summation, note that the sum is very close to the irrational number $e \approx 2.718281828$. It can be shown that as more terms of the sequence whose $n$th term is $1/n!$ are added, the sum becomes closer and closer to $e$.

**CHECKPOINT**

Now try Exercise 85.

In Example 7, note that the lower limit of a summation does not have to be 1. Also note that the index of summation does not have to be the letter $i$. For instance, in part (b), the letter $k$ is the index of summation.
Properties of Sums

1. \( \sum_{i=1}^{n} c = cn \), \( c \) is a constant.
2. \( \sum_{i=1}^{n} a_i = c \sum_{i=1}^{n} a_i \), \( c \) is a constant.
3. \( \sum_{i=1}^{n} (a_i + b_i) = \sum_{i=1}^{n} a_i + \sum_{i=1}^{n} b_i \)
4. \( \sum_{i=1}^{n} (a_i - b_i) = \sum_{i=1}^{n} a_i - \sum_{i=1}^{n} b_i \)

For proofs of these properties, see Proofs in Mathematics on page 720.

Series

Many applications involve the sum of the terms of a finite or infinite sequence. Such a sum is called a **series**.

**Definition of Series**

Consider the infinite sequence \( a_1, a_2, a_3, \ldots, a_i, \ldots \)

1. The sum of the first \( n \) terms of the sequence is called a **finite series** or the **\( n \)th partial sum** of the sequence and is denoted by
   \[ a_1 + a_2 + a_3 + \cdots + a_n = \sum_{i=1}^{n} a_i. \]
2. The sum of all the terms of the infinite sequence is called an **infinite series** and is denoted by
   \[ a_1 + a_2 + a_3 + \cdots = \sum_{i=1}^{\infty} a_i. \]

**Example 8** Finding the Sum of a Series

For the series \( \sum_{i=1}^{\infty} \frac{3}{10^i} \), find (a) the third partial sum and (b) the sum.

**Solution**

a. The third partial sum is
   \[ \sum_{i=1}^{3} \frac{3}{10^i} = \frac{3}{10^1} + \frac{3}{10^2} + \frac{3}{10^3} = 0.3 + 0.03 + 0.003 = 0.333. \]

b. The sum of the series is
   \[ \sum_{i=1}^{\infty} \frac{3}{10^i} = \frac{3}{10^1} + \frac{3}{10^2} + \frac{3}{10^3} + \frac{3}{10^4} + \frac{3}{10^5} + \cdots \]
   \[ = 0.3 + 0.03 + 0.003 + 0.0003 + 0.00003 + \cdots \]
   \[ = 0.33333. \ldots = \frac{1}{3}. \]
Applications

Sequences have many applications in business and science. Two such applications are illustrated in Examples 9 and 10.

**Example 9  Compound Interest**

A deposit of $5000 is made in an account that earns 3% interest compounded quarterly. The balance in the account after $n$ quarters is given by

$$A_n = 5000 \left(1 + \frac{0.03}{4}\right)^n, \quad n = 0, 1, 2, \ldots$$

a. Write the first three terms of the sequence.
b. Find the balance in the account after 10 years by computing the 40th term of the sequence.

**Solution**
a. The first three terms of the sequence are as follows.

- $A_0 = 5000 \left(1 + \frac{0.03}{4}\right)^0 = $5000.00  
  Original deposit
- $A_1 = 5000 \left(1 + \frac{0.03}{4}\right)^1 = $5037.50  
  First-quarter balance
- $A_2 = 5000 \left(1 + \frac{0.03}{4}\right)^2 = $5075.28  
  Second-quarter balance

b. The 40th term of the sequence is

- $A_{40} = 5000 \left(1 + \frac{0.03}{4}\right)^{40} = $6741.74.  
  Ten-year balance

**CHECKPOINT** Now try Exercise 121.

**Example 10  Population of the United States**

For the years 1980 through 2007, the resident population of the United States can be approximated by the model

$$a_n = 226.6 + 2.33n + 0.019n^2, \quad n = 0, 1, \ldots, 27$$

where $a_n$ is the population (in millions) and $n$ represents the year, with $n = 0$ corresponding to 1980. Find the last five terms of this finite sequence, which represent the U.S. population for the years 2003 through 2007.  
(Source: U.S. Census Bureau)

**Solution**
The last five terms of this finite sequence are as follows.

- $a_{23} = 226.6 + 2.33(23) + 0.019(23)^2 \approx 290.2$  
  2003 population
- $a_{24} = 226.6 + 2.33(24) + 0.019(24)^2 \approx 293.5$  
  2004 population
- $a_{25} = 226.6 + 2.33(25) + 0.019(25)^2 \approx 296.7$  
  2005 population
- $a_{26} = 226.6 + 2.33(26) + 0.019(26)^2 \approx 300.0$  
  2006 population
- $a_{27} = 226.6 + 2.33(27) + 0.019(27)^2 \approx 303.4$  
  2007 population

**CHECKPOINT** Now try Exercise 125.
9.1 Sequences and Series

VOCABULARY: Fill in the blanks.

1. An _______ _______ is a function whose domain is the set of positive integers.
2. The function values \( a_1, a_2, a_3, a_4, \ldots \) are called the _______ of a sequence.
3. A sequence is a _______ sequence if the domain of the function consists only of the first \( n \) positive integers.
4. If you are given one or more of the first few terms of a sequence, and all other terms of the sequence are defined using previous terms, then the sequence is said to be defined _______.
5. If \( n \) is a positive integer, \( n \) _______ is defined as \( n! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots (n - 1) \cdot n \).
6. The notation used to represent the sum of the terms of a finite sequence is _______ _______ or sigma notation.
7. For the sum \( \sum_{i=1}^{n} a_i \), \( i \) is called the _______ of summation, \( n \) is the _______ limit of summation, and 1 is the _______ limit of summation.
8. The sum of the terms of a finite or infinite sequence is called a _______.

SKILLS AND APPLICATIONS

In Exercises 9–32, write the first five terms of the sequence. (Assume that \( n \) begins with 1.)

9. \( a_n = 2n + 5 \)
10. \( a_n = 4n - 7 \)
11. \( a_n = 2^n \)
12. \( a_n = \left(\frac{1}{2}\right)^n \)
13. \( a_n = (-2)^n \)
14. \( a_n = (-\frac{1}{2})^n \)
15. \( a_n = \frac{n + 2}{n} \)
16. \( a_n = \frac{n}{n + 2} \)
17. \( a_n = \frac{6n}{3n^2 - 1} \)
18. \( a_n = \frac{2n}{n^2 + 1} \)
19. \( a_n = \frac{1 + (-1)^n}{n} \)
20. \( a_n = 1 + (-1)^n \)
21. \( a_n = 2 - \frac{1}{3^n} \)
22. \( a_n = \frac{2^n}{3^n} \)
23. \( a_n = \frac{1}{n^{\sqrt{2}}} \)
24. \( a_n = \frac{10}{n^{2/3}} \)
25. \( a_n = \frac{(-1)^n}{n^2} \)
26. \( a_n = (-1)^n \left(\frac{n}{n + 1}\right) \)
27. \( a_n = \frac{2}{3} \)
28. \( a_n = 0.3 \)
29. \( a_n = n(n - 1)(n - 2) \)
30. \( a_n = n(n^2 - 6) \)
31. \( a_n = \frac{(-1)^{n+1}}{n^2 + 1} \)
32. \( a_n = \frac{(-1)^{n+1}}{2n + 1} \)

In Exercises 33–36, find the indicated term of the sequence.

33. \( a_n = (-1)^n(3n - 2) \)
34. \( a_n = (-1)^n - 1[n(n - 1)] \)
35. \( a_n = \frac{4n}{2n^2 - 3} \)
36. \( a_n = \frac{4n^2 - n + 3}{n(n - 1)(n + 2)} \)

In Exercises 37–42, use a graphing utility to graph the first 10 terms of the sequence. (Assume that \( n \) begins with 1.)

37. \( a_n = \frac{2}{3n} \)
38. \( a_n = 2 - \frac{4}{n} \)
39. \( a_n = 16(-0.5)^{n-1} \)
40. \( a_n = 8(0.75)^{n-1} \)
41. \( a_n = \frac{2n}{n + 1} \)
42. \( a_n = \frac{3n^2}{n^2 + 1} \)

In Exercises 43–46, match the sequence with the graph of its first 10 terms. [The graphs are labeled (a), (b), (c), and (d).]

(a) \( a_n \)
(b) \( a_n \)
(c) \( a_n \)
(d) \( a_n \)

Exercises

In Exercises 47–62, write an expression for the apparent nth term of the sequence. (Assume that n begins with 1.)

47. 1, 4, 7, 10, 13, . . .  
48. 3, 7, 11, 15, 19, . . .
49. 0, 3, 8, 15, 24, . . .  
50. 2, −4, 6, −8, 10, . . .
51. −2, −3, −5, −7, . . .  
52. 1, −1, 3, −5, 7,  . . .
53. 4, 4, 4, 4,  . . .  
54. 1, 2, 4, 8, 16, . . .
55. 1, 3, 9, 15, 23, . . .  
56. 1, 2, 6, 24, 120, . . .
57. 1, −1, −1, 1, . . .  
58. 1, 2, 2², 2³,  . . .
59. 1, 3, 1, 3, . . .  
60. 3, 3, 3, 3, . . .
61. 1 + 1, 1 + 1 + 1, 1 + 1 + 1 + 1, . . .
62. 1 + 1 + 1, 1 + 3 + 1 + 3, 1 + 3 + 1 + 3, . . .

In Exercises 63–66, write the first five terms of the sequence defined recursively.

63. a₁ = 28, aₖ₊₁ = aₖ − 4  
64. a₁ = 15, aₖ₊₁ = aₖ + 3  
65. a₁ = 3, aₖ₊₁ = 2aₖ − 1  
66. a₁ = 32, aₖ₊₁ = 2aₖ

In Exercises 67–70, write the first five terms of the sequence defined recursively. Use the pattern to write the nth term of the sequence as a function of n. (Assume that n begins with 1.)

67. a₁ = 6, aₖ₊₁ = aₖ + 2  
68. a₁ = 25, aₖ₊₁ = aₖ − 5  
69. a₁ = 81, aₖ₊₁ = 2aₖ  
70. a₁ = 14, aₖ₊₁ = (−2)aₖ

In Exercises 71–76, write the first five terms of the sequence. (Assume that n begins with 0.)

71. aₙ = 1  
72. aₙ = n!  
73. aₙ = 1  
74. aₙ = n²  
75. aₙ = (−1)^n  
76. aₙ = (−1)^n + 1

In Exercises 77–84, simplify the factorial expression.

77. 4!  
78. 5!  
79. 12!  
80. 10!  
81. (n + 1)!  
82. (n + 2)!  
83. (2n − 1)!  
84. (3n + 1)!  

In Exercises 85–96, find the sum.

85. ∑ from i=1 to 5 (2i + 1)  
86. ∑ from i=1 to 6 (3i − 1)
87. ∑ from i=1 to 10  
88. ∑ from i=1 to 6  
89. ∑ from i=0 to 4 i²  
90. ∑ from i=0 to 5 3i²  
91. ∑ from k=0 to 5 1  
92. ∑ from j=3 to 5 j² − 3  
93. ∑ from k=2 to 5 (k + 1)²(k − 3)  
94. ∑ from i=1 to 4 [(i − 1)² + (i + 1)²]
95. ∑ from i=1 to 4 (−2)^i

In Exercises 97–102, use a calculator to find the sum.

97. ∑ from n=0 to 100 1  
98. ∑ from j=0 to 10 3  
99. ∑ from k=0 to 3  
100. ∑ from k=0 to 10  
101. ∑ from n=0 to 10  
102. ∑ from n=0 to 10

In Exercises 103–112, use sigma notation to write the sum.

103. 1/1 + 1/3 + 1/3 + 1/3 + . . . + 1/3
104. 5/1 + 5/1 + 5/1 + . . . + 5/1 + 15
105. [2/3] + [2/3] + . . . + [2/3] + [2/3] + [2/3] + [2/3]
106. [1/2] + [1/2] + . . . + [1/2] + [1/2] + [1/2]
107. 3 − 9 + 27 − 81 + 243 − 729
108. 1 − 1/2 + 1/4 − 1/8 + . . . + 1/128
109. 1/2 + 1/4 + . . . + 1/20
110. 1/6 + 1/12 + . . . + 1/20
111. 1/4 + 3/8 + . . . + 15/32 + 31/64
112. 1/2 + 1/2 + . . . + 1/8 + 1/16 + 1/32 + 1/64

In Exercises 113–116, find the indicated partial sum of the series.

113. ∑ from i=1 to 5 5i²  
114. ∑ from i=1 to 5 2i²
Fourth partial sum  
Fifth partial sum
115. ∑ from n=1 to 6 4(−1)ⁿ  
116. ∑ from n=1 to 6 8(−1)ⁿ
Third partial sum  
Fourth partial sum
In Exercises 117–120, find the sum of the infinite series.

117. \[\sum_{k=0}^{\infty} 6\left(\frac{1}{10}\right)^{k}\]

118. \[\sum_{k=1}^{\infty} \left(\frac{1}{10}\right)^{k}\]

119. \[\sum_{k=1}^{\infty} 7\left(\frac{1}{10}\right)^{k}\]

120. \[\sum_{k=1}^{\infty} 2\left(\frac{1}{10}\right)^{k}\]

121. **COMPOUND INTEREST** You deposit $25,000 in an account that earns 7% interest compounded monthly. The balance in the account after \(n\) months is given by

\[A_n = 25,000 \left(1 + \frac{0.07}{12}\right)^{n}, \quad n = 1, 2, 3, \ldots\]

(a) Write the first six terms of the sequence.
(b) Find the balance in the account after 5 years by computing the 60th term of the sequence.
(c) Is the balance after 10 years twice the balance after 5 years? Explain.

122. **COMPOUND INTEREST** A deposit of $10,000 is made in an account that earns 8.5% interest compounded quarterly. The balance in the account after \(n\) quarters is given by

\[A_n = 10,000 \left(1 + \frac{0.085}{4}\right)^{n}, \quad n = 1, 2, 3, \ldots\]

(a) Write the first eight terms of the sequence.
(b) Find the balance in the account after 10 years by computing the 40th term of the sequence.
(c) Is the balance after 20 years twice the balance after 10 years? Explain.

123. **DATA ANALYSIS: NUMBER OF STORES** The table shows the numbers \(a_n\) of Best Buy stores from 2002 through 2007. (Source: Best Buy Company, Inc.)

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of stores, (a_n)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>
<td>548</td>
</tr>
<tr>
<td>2003</td>
<td>595</td>
</tr>
<tr>
<td>2004</td>
<td>668</td>
</tr>
<tr>
<td>2005</td>
<td>786</td>
</tr>
<tr>
<td>2006</td>
<td>822</td>
</tr>
<tr>
<td>2007</td>
<td>923</td>
</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a linear sequence that models the data. Let \(n\) represent the year, with \(n = 2\) corresponding to 2002.
(b) Use the regression feature of a graphing utility to find a quadratic sequence that models the data.
(c) Evaluate the sequences from parts (a) and (b) for \(n = 2, 3, \ldots, 7\). Compare these values with those shown in the table. Which model is a better fit for the data? Explain.
(d) Which model do you think would better predict the number of Best Buy stores in the future? Use the model you chose to predict the number of Best Buy stores in 2013.

124. **MEDICINE** The numbers \(a_n\) (in thousands) of AIDS cases reported from 2000 through 2007 can be approximated by the model

\[a_n = 0.0768n^3 - 3.150n^2 + 41.56n - 136.4,\]

\[n = 10, 11, \ldots, 17\]

where \(n\) is the year, with \(n = 10\) corresponding to 2000. (Source: U.S. Centers for Disease Control and Prevention)

(a) Find the terms of this finite sequence. Use the statistical plotting feature of a graphing utility to construct a bar graph that represents the sequence.
(b) What does the graph in part (a) say about reported cases of AIDS?

125. **FEDERAL DEBT** From 1995 to 2007, the federal debt of the United States rose from almost $5 trillion to almost $9 trillion. The federal debt \(a_n\) (in billions of dollars) from 1995 through 2007 is approximated by the model

\[a_n = 1.0904n^3 - 6.348n^2 + 41.76n + 4871.3,\]

\[n = 5, 6, \ldots, 17\]

where \(n\) is the year, with \(n = 5\) corresponding to 1995. (Source: U.S. Office of Management and Budget)

(a) Find the terms of this finite sequence. Use the statistical plotting feature of a graphing utility to construct a bar graph that represents the sequence.
(b) What does the pattern in the bar graph in part (a) say about the future of the federal debt?

126. **REVENUE** The revenues \(a_n\) (in millions of dollars) of Amazon.com from 2001 through 2008 are shown in the figure on the next page. The revenues can be approximated by the model

\[a_n = 296.477n^2 - 469.11n + 3606.2,\]

\[n = 1, 2, \ldots, 8\]

where \(n\) is the year, with \(n = 1\) corresponding to 2001. Use this model to approximate the total revenue from 2001 through 2008. Compare this sum with the result of adding the revenues shown in the figure on the next page. (Source: Amazon.com)
EXPLORATION

TRUE OR FALSE? In Exercises 127 and 128, determine whether the statement is true or false. Justify your answer.

127. \[
\sum_{j=1}^{4} (2^j + 2i) = \sum_{i=1}^{4} j^2 + 2 \sum_{i=1}^{4} i
\]

128. \[
\sum_{j=1}^{4} 2^j = \sum_{j=1}^{6} 2^j - 2^{j-2}
\]

FIBONACCI SEQUENCE In Exercises 129 and 130, use the Fibonacci sequence. (See Example 4.)

129. Write the first 12 terms of the Fibonacci sequence \(a_n\) and the first 10 terms of the sequence given by

\[b_n = \frac{a_{n+1}}{a_n}, \quad n \geq 1.\]

130. Using the definition for \(b_n\) in Exercise 129, show that \(b_n\) can be defined recursively by

\[b_n = 1 + \frac{1}{b_{n-1}}.\]

ARITHMETIC MEAN In Exercises 131–134, use the following definition of the arithmetic mean \(\bar{x}\) of a set of \(n\) measurements \(x_1, x_2, x_3, \ldots, x_n\).

\[
\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i
\]

131. Find the arithmetic mean of the six checking account balances $327.15, $785.69, $433.04, $265.38, $604.12, and $590.30. Use the statistical capabilities of a graphing utility to verify your result.

132. Find the arithmetic mean of the following prices per gallon for regular unleaded gasoline at five gasoline stations in a city: $1.899, $1.959, $1.919, $1.939, and $1.999. Use the statistical capabilities of a graphing utility to verify your result.

133. PROOF Prove that \[
\sum_{j=1}^{n} (x_j - \bar{x}) = 0.
\]

134. PROOF Prove that \[
\sum_{j=1}^{n} (x_j - \bar{x})^2 = \sum_{j=1}^{n} x_j^2 - \frac{1}{n} \left( \sum_{j=1}^{n} x_j \right)^2.
\]

In Exercises 135–138, find the first five terms of the sequence.

135. \(a_n = \frac{x^n}{n!}\)

136. \(a_n = \frac{(-1)^n x^{2n+1}}{(2n+1)!}\)

137. \(a_n = \frac{(-1)^n x^{2n+1}}{(2n+1)!}\)

138. \(a_n = \frac{(-1)^n x^{2n+1}}{(2n + 1)!}\)

139. Write out the first five terms of the sequence whose \(n\)th term is \(a_n = \frac{(-1)^{n+1}}{2n + 1}\).

Are they the same as the first five terms of the sequence in Example 2? If not, how do they differ?

140. CAPSTONE In your own words, explain the difference between a sequence and a series. Provide examples of each.

141. A \(3 \times 3 \times 3\) cube is created using 27 unit cubes (a unit cube has a length, width, and height of 1 unit), and only the faces of each cube that are visible are painted blue, as shown in the figure.

(a) Complete the table to determine how many unit cubes of the \(3 \times 3 \times 3\) cube have 0 blue faces, 1 blue face, 2 blue faces, and 3 blue faces.

<table>
<thead>
<tr>
<th>Number of blue cube faces</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(3 \times 3 \times 3)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Do the same for a \(4 \times 4 \times 4\) cube, a \(5 \times 5 \times 5\) cube, and a \(6 \times 6 \times 6\) cube. Add your results to the table above.

(c) What type of pattern do you observe in the table?

(d) Write a formula you could use to determine the column values for an \(n \times n \times n\) cube.
Arithmetic Sequences

A sequence whose consecutive terms have a common difference is called an arithmetic sequence.

Examples of Arithmetic Sequences

a. The sequence whose $n$th term is $4n + 3$ is arithmetic. For this sequence, the common difference between consecutive terms is 4.

$$
\begin{align*}
7, 11, 15, 19, \ldots, 4n + 3, \ldots \\
11 - 7 &= 4
\end{align*}
$$

b. The sequence whose $n$th term is $7 - 5n$ is arithmetic. For this sequence, the common difference between consecutive terms is $-5$.

$$
\begin{align*}
2, -3, -8, -13, \ldots, 7 - 5n, \ldots \\
-3 - 2 &= -5
\end{align*}
$$

c. The sequence whose $n$th term is $\frac{1}{2}(n + 3)$ is arithmetic. For this sequence, the common difference between consecutive terms is $\frac{1}{4}$.

$$
\begin{align*}
1, \frac{3}{2}, \frac{7}{4}, \ldots, \frac{n + 3}{4}, \ldots \\
\frac{3}{2} - 1 &= \frac{1}{4}
\end{align*}
$$

Example 1
Examples of Arithmetic Sequences

a. The sequence whose $n$th term is $4n + 3$ is arithmetic. For this sequence, the common difference between consecutive terms is 4.

$$
\begin{align*}
7, 11, 15, 19, \ldots, 4n + 3, \ldots \\
\text{Begin with } n = 1.
\end{align*}
$$

b. The sequence whose $n$th term is $7 - 5n$ is arithmetic. For this sequence, the common difference between consecutive terms is $-5$.

$$
\begin{align*}
2, -3, -8, -13, \ldots, 7 - 5n, \ldots \\
\text{Begin with } n = 1.
\end{align*}
$$

c. The sequence whose $n$th term is $\frac{1}{2}(n + 3)$ is arithmetic. For this sequence, the common difference between consecutive terms is $\frac{1}{4}$.

$$
\begin{align*}
\frac{1}{2}, \frac{3}{4}, \frac{7}{4}, \ldots, \frac{n + 3}{4}, \ldots \\
\text{Begin with } n = 1.
\end{align*}
$$

CHECKPOINT Now try Exercise 5.

The sequence 1, 4, 9, 16, \ldots, whose $n$th term is $n^2$, is not arithmetic. The difference between the first two terms is

$$a_2 - a_1 = 4 - 1 = 3$$

but the difference between the second and third terms is

$$a_3 - a_2 = 9 - 4 = 5.$$
The $n$th Term of an Arithmetic Sequence

The $n$th term of an arithmetic sequence has the form

$$a_n = a_1 + (n - 1)d$$

where $d$ is the common difference between consecutive terms of the sequence and $a_1$ is the first term.

### Study Tip

The $n$th term of an arithmetic sequence can be derived from the pattern below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Formula</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st term</td>
<td>$a_1 = a_1$</td>
</tr>
<tr>
<td>2nd term</td>
<td>$a_2 = a_1 + d$</td>
</tr>
<tr>
<td>3rd term</td>
<td>$a_3 = a_1 + 2d$</td>
</tr>
<tr>
<td>4th term</td>
<td>$a_4 = a_1 + 3d$</td>
</tr>
<tr>
<td>5th term</td>
<td>$a_5 = a_1 + 4d$</td>
</tr>
</tbody>
</table>
| ...
| $a_n = a_1 + (n - 1)d$ | $n$th term |

### Example 2

Finding the $n$th Term of an Arithmetic Sequence

Find a formula for the $n$th term of the arithmetic sequence whose common difference is 3 and whose first term is 2.

**Solution**

You know that the formula for the $n$th term is of the form $a_n = a_1 + (n - 1)d$. Moreover, because the common difference is $d = 3$ and the first term is $a_1 = 2$, the formula must have the form

$$a_n = 2 + 3(n - 1).$$

Substitute 2 for $a_1$ and 3 for $d$.

So, the formula for the $n$th term is

$$a_n = 3n - 1.$$

The sequence therefore has the following form.

2, 5, 8, 11, 14, ... , $3n - 1$, ...

**CHECK Point** Now try Exercise 25.
Writing the Terms of an Arithmetic Sequence

The fourth term of an arithmetic sequence is 20, and the 13th term is 65. Write the first 11 terms of this sequence.

Solution

You know that and So, you must add the common difference nine times to the fourth term to obtain the 13th term. Therefore, the fourth and 13th terms of the sequence are related by

\[ a_{13} = a_4 + 9d. \]

Using and you can conclude that \( d = 5 \), which implies that the sequence is as follows.

\[ 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55 \ldots \]

Now try Exercise 39.

If you know the \( n \)th term of an arithmetic sequence \( a_n \) and you know the common difference of the sequence, you can find the \( (n + 1) \)th term by using the recursion formula

\[ a_{n+1} = a_n + d. \]

With this formula, you can find any term of an arithmetic sequence, provided that you know the preceding term. For instance, if you know the first term, you can find the second term. Then, knowing the second term, you can find the third term, and so on.

Example 4 Using a Recursion Formula

Find the ninth term of the arithmetic sequence that begins with 2 and 9.

Solution

For this sequence, the common difference is \( d = 9 - 2 = 7 \).

There are two ways to find the ninth term. One way is simply to write out the first nine terms (by repeatedly adding 7).

\[ 2, 9, 16, 23, 30, 37, 44, 51, 58 \]

Another way to find the ninth term is to first find a formula for the \( n \)th term. Because the common difference is \( d = 7 \) and the first term is \( a_1 = 2 \), the formula must have the form

\[ a_n = 2 + 7(n - 1). \]

Substitute 2 for \( a_1 \) and 7 for \( d \).

Therefore, a formula for the \( n \)th term is

\[ a_n = 7n - 5 \]

which implies that the ninth term is

\[ a_9 = 7(9) - 5 = 58. \]

Now try Exercise 47.
The Sum of a Finite Arithmetic Sequence

There is a simple formula for the sum of a finite arithmetic sequence.

For a proof of this formula for the sum of a finite arithmetic sequence, see Proofs in Mathematics on page 721.

Example 5 Finding the Sum of a Finite Arithmetic Sequence

Find the sum: \(1 + 3 + 5 + 7 + 9 + 11 + 13 + 15 + 17 + 19\).

Solution

To begin, notice that the sequence is arithmetic (with a common difference of 2). Moreover, the sequence has 10 terms. So, the sum of the sequence is

\[ S_n = \frac{n}{2}(a_1 + a_n). \]

Substitute 10 for \(n\), 1 for \(a_1\), and 19 for \(a_n\).

\[ S_n = \frac{10}{2}(1 + 19) \]

\[ = 5(20) = 100. \]

Simplify.

Now try Exercise 51.

Example 6 Finding the Sum of a Finite Arithmetic Sequence

Find the sum of the integers (a) from 1 to 100 and (b) from 1 to \(N\).

Solution

a. The integers from 1 to 100 form an arithmetic sequence that has 100 terms. So, you can use the formula for the sum of an arithmetic sequence, as follows.

\[ S_n = 1 + 2 + 3 + 4 + 5 + 6 + \cdots + 99 + 100 \]

\[ = \frac{n}{2}(a_1 + a_n) \]

Formula for sum of an arithmetic sequence

\[ = \frac{100}{2}(1 + 100) \]

Substitute 100 for \(n\), 1 for \(a_1\), 100 for \(a_n\).

\[ = 50(101) = 5050 \]

Simplify.

b. \(S_n = 1 + 2 + 3 + 4 + \cdots + N\)

\[ = \frac{n}{2}(a_1 + a_n) \]

Formula for sum of an arithmetic sequence

\[ = \frac{N}{2}(1 + N) \]

Substitute \(N\) for \(n\), 1 for \(a_1\), and \(N\) for \(a_n\).

Now try Exercise 55.
The sum of the first $n$ terms of an infinite sequence is the $n$th partial sum. The $n$th partial sum can be found by using the formula for the sum of a finite arithmetic sequence.

**Example 7** Finding a Partial Sum of an Arithmetic Sequence

Find the 150th partial sum of the arithmetic sequence

$5, 16, 27, 38, 49, \ldots$\ldots

**Solution**

For this arithmetic sequence, $a_1 = 5$ and $d = 16 - 5 = 11$. So,

$$a_n = 5 + 11(n - 1)$$

and the $n$th term is $a_n = 11n - 6$. Therefore, $a_{150} = 11(150) - 6 = 1644$, and the sum of the first 150 terms is

$$S_{150} = \frac{n}{2}(a_1 + a_{150}) \text{ (}n\text{th partial sum formula)}$$

$$= \frac{150}{2}(5 + 1644) \text{ (Substitute 150 for } n, 5 \text{ for } a_1, \text{ and } 1644 \text{ for } a_{150})$$

$$= 75(1649) \text{ (Simplify)}$$

$$= 123,675. \text{ (}n\text{th partial sum)}$$

**CHECK Point** Now try Exercise 69.

**Applications**

**Example 8** Prize Money

In a golf tournament, the 16 golfers with the lowest scores win cash prizes. First place receives a cash prize of $1000, second place receives $950, third place receives $900, and so on. What is the total amount of prize money?

**Solution**

The cash prizes awarded form an arithmetic sequence in which the first term is $a_1 = 1000$ and the common difference is $d = -50$. Because

$$a_n = 1000 + (-50)(n - 1)$$

you can determine that the formula for the $n$th term of the sequence is $a_n = -50n + 1050$. So, the 16th term of the sequence is $a_{16} = -50(16) + 1050 = 250$, and the total amount of prize money is

$$S_{16} = 1000 + 950 + 900 + \ldots + 250$$

$$S_{16} = \frac{n}{2}(a_1 + a_{16}) \text{ (}n\text{th partial sum formula)}$$

$$= \frac{16}{2}(1000 + 250) \text{ (Substitute 16 for } n, 1000 \text{ for } a_1, \text{ and } 250 \text{ for } a_{16})$$

$$= 8(1250) = 10,000. \text{ (Simplify)}$$

**CHECK Point** Now try Exercise 97.
### Example 9  Total Sales

A small business sells $10,000 worth of skin care products during its first year. The owner of the business has set a goal of increasing annual sales by $7500 each year for 9 years. Assuming that this goal is met, find the total sales during the first 10 years this business is in operation.

**Solution**

The annual sales form an arithmetic sequence in which \(a_1 = 10,000\) and \(d = 7500\). So,

\[
a_n = 10,000 + 7500(n - 1)
\]

and the \(n\)th term of the sequence is

\[
a_n = 7500n + 2500.
\]

This implies that the 10th term of the sequence is

\[
a_{10} = 7500(10) + 2500 = 77,500.
\]

The sum of the first 10 terms of the sequence is

\[
S_{10} = \frac{n}{2}(a_1 + a_{10}) \quad \text{nth partial sum formula}
\]

\[
= \frac{10}{2}(10,000 + 77,500) \quad \text{Substitute 10 for } n, \ 10,000 \text{ for } a_1, \text{ and } 77,500 \text{ for } a_{10}.
\]

\[
= 5(87,500) \quad \text{Simplify.}
\]

\[
= 437,500. \quad \text{Simplify.}
\]

So, the total sales for the first 10 years will be $437,500.

**Checkpoint** Now try Exercise 99.

### Classroom Discussion

**Numerical Relationships**  Decide whether it is possible to fill in the blanks in each of the sequences such that the resulting sequence is arithmetic. If so, find a recursion formula for the sequence.

- a. \(-7, \_\_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, 11\)
- b. \(17, \_\_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, 71\)
- c. \(2, 6, \_\_\_\_, \_\_\_\_, 162\)
- d. \(4, 7.5, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, \_\_\_\_, 39\)
- e. \(8, 12, \_\_\_\_, \_\_\_\_, \_\_\_\_, 60.75\)
9.2 EXERCISES

VOCABULARY: Fill in the blanks.
1. A sequence is called an ________ sequence if the differences between consecutive terms are the same.
   This difference is called the ________ difference.
2. The $n$th term of an arithmetic sequence has the form ________.
3. If you know the $n$th term of an arithmetic sequence and you know the common difference of the sequence,
   you can find the $(n + 1)$th term by using the ________ formula $a_{n+1} = a_n + d$.
4. The formula $S_n = \frac{n}{2}(a_1 + a_n)$ can be used to find the sum of the first $n$ terms of an arithmetic sequence,
   called the ________ of a ________ ________ ________ ________.

SKILLS AND APPLICATIONS

In Exercises 5–14, determine whether the sequence is arithmetic. If so, find the common difference.
5. 10, 8, 6, 4, 2, . . .
6. 4, 9, 14, 19, 24, . . .
7. 1, 2, 4, 8, 16, . . .
8. 80, 40, 20, 10, 5, . . .
9. $\frac{9}{2}, \frac{3}{2}, \frac{1}{2}, . . .$
10. $\frac{3}{2}, \frac{3}{4}, 1, . . .$
11. 3.7, 4.3, 4.9, 5.5, 6.1, . . .
12. 5.3, 5.7, 6.1, 6.5, 6.9, . . .
13. In 1, In 2, In 3, In 4, In 5, . . .
14. $1^2, 2^2, 3^2, 4^2, 5^2, . . .$

In Exercises 15–22, write the first five terms of the sequence.
Determine whether the sequence is arithmetic. If so, find the common difference. (Assume that $n$ begins with 1.)
15. $a_n = 5 + 3n$
16. $a_n = 100 - 3n$
17. $a_n = 3 - 4(n - 2)$
18. $a_n = 1 + (n - 1)4$
19. $a_n = (-1)^n$
20. $a_n = 2^{n-1}$
21. $a_n = \frac{(-1)^{n+3}}{n}$
22. $a_n = (2^n)n$

In Exercises 23–32, find a formula for $a_n$ for the arithmetic sequence.
23. $a_1 = 1, d = 3$
24. $a_1 = 15, d = 4$
25. $a_1 = 100, d = -8$
26. $a_1 = 0, d = -\frac{3}{2}$
27. $4, \frac{3}{2}, -1, -\frac{7}{2}, . . .$
28. $10, 5, 0, -5, -10, . . .$
29. $a_1 = 5, a_4 = 15$
30. $a_1 = -4, a_5 = 16$
31. $a_3 = 94, a_6 = 85$
32. $a_3 = 190, a_{10} = 115$

In Exercises 33–40, write the first five terms of the arithmetic sequence.
33. $a_1 = 5, d = 6$
34. $a_1 = 5, d = -\frac{3}{4}$
35. $a_1 = -2.6, d = -0.4$
36. $a_1 = 16.5, d = 0.25$
37. $a_1 = 2, a_{12} = 46$
38. $a_4 = 16, a_{10} = 46$
39. $a_8 = 26, a_{12} = 42$
40. $a_3 = 19, a_{15} = -1.7$

In Exercises 41–46, write the first five terms of the arithmetic sequence defined recursively.
41. $a_1 = 15, a_{n+1} = a_n + 4$
42. $a_1 = 6, a_{n+1} = a_n + 5$
43. $a_1 = 200, a_{n+1} = a_n - 10$
44. $a_1 = 72, a_{n+1} = a_n - 6$
45. $a_1 = \frac{5}{8}, a_{n+1} = a_n - \frac{1}{8}$
46. $a_1 = 0.375, a_{n+1} = a_n + 0.25$

In Exercises 47–50, the first two terms of the arithmetic sequence are given. Find the missing term.
47. $a_1 = 5, a_2 = 11, a_{10} = \square$
48. $a_1 = 3, a_2 = 13, a_9 = \square$
49. $a_1 = 4.2, a_2 = 6.6, a_7 = \square$
50. $a_1 = -0.7, a_2 = -13.8, a_8 = \square$

In Exercises 51–58, find the sum of the finite arithmetic sequence.
51. $2 + 4 + 6 + 8 + 10 + 12 + 14 + 16 + 18 + 20$
52. $1 + 4 + 7 + 10 + 13 + 16 + 19$
53. $-1 + (-3) + (-5) + (-7) + (-9)$
54. $-5 + (-3) + (-1) + 1 + 3 + 5$
55. Sum of the first 50 positive even integers
56. Sum of the first 100 positive odd integers
57. Sum of the integers from $-100$ to $30$
58. Sum of the integers from $-10$ to $50$
In Exercises 59–66, find the indicated \(n\)th partial sum of the arithmetic sequence.

59. 8, 20, 32, 44, \ldots, \ n = 10
60. –6, –2, 2, 6, \ldots, \ n = 50
61. 4.2, 3.7, 3.2, 2.7, \ldots, \ n = 12
62. 0.5, 1.3, 2.1, 2.9, \ldots, \ n = 10
63. 40, 37, 34, 31, \ldots, \ n = 10
64. 75, 70, 65, 60, \ldots, \ n = 25
65. \(a_1 = 100, \ a_{25} = 220, \ n = 25\)
66. \(a_1 = 15, \ a_{100} = 307, \ n = 100\)

In Exercises 67–74, find the partial sum.

67. \(\sum_{n=1}^{50} n\)

68. \(\sum_{n=1}^{100} 2n\)

69. \(\sum_{n=10}^{100} 6n\)

70. \(\sum_{n=1}^{50} 7n\)

71. \(\sum_{n=11}^{30} n - \sum_{n=1}^{10} n\)

72. \(\sum_{n=1}^{51} n - \sum_{n=1}^{50} n\)

73. \(\sum_{n=1}^{500} (n + 8)\)

74. \(\sum_{n=1}^{250} (1000 - n)\)

In Exercises 75–78, match the arithmetic sequence with its graph. [The graphs are labeled (a), (b), (c), and (d).]

(a) \(a_n = \frac{1}{2}n + 8\)

(b) \(a_n = 3n - 5\)

(c) \(a_n = 2 + \frac{3}{4}n\)

(d) \(a_n = 25 - 3n\)

In Exercises 79–82, use a graphing utility to graph the first 10 terms of the sequence. (Assume that \(n\) begins with 1.)

79. \(a_n = 15 - \frac{3}{2}n\)

80. \(a_n = -5 + 2n\)

81. \(a_n = 0.2n + 3\)

82. \(a_n = -0.3n + 8\)

In Exercises 83–88, use a graphing utility to find the partial sum.

83. \(\sum_{n=1}^{20} (2n + 1)\)

84. \(\sum_{n=0}^{50} (50 - 2n)\)

85. \(\sum_{n=1}^{100} \frac{n + 1}{2}\)

86. \(\sum_{n=0}^{100} \frac{4 - n}{4}\)

87. \(\sum_{j=1}^{20} (250 - \frac{3}{2}j)\)

88. \(\sum_{j=1}^{200} (10.5 + 0.025j)\)

**JOB OFFER** In Exercises 89 and 90, consider a job offer with the given starting salary and the given annual raise.

(a) Determine the salary during the sixth year of employment.

(b) Determine the total compensation from the company through six full years of employment.

Starting Salary | Annual Raise
---|---
89. $32,500 | $1500
90. $36,800 | $1750

91. **SEATING CAPACITY** Determine the seating capacity of an auditorium with 30 rows of seats if there are 20 seats in the first row, 24 seats in the second row, 28 seats in the third row, and so on.

92. **SEATING CAPACITY** Determine the seating capacity of an auditorium with 36 rows of seats if there are 15 seats in the first row, 18 seats in the second row, 21 seats in the third row, and so on.

93. **BRICK PATTERN** A brick patio has the approximate shape of a trapezoid (see figure). The patio has 18 rows of bricks. The first row has 14 bricks and the 18th row has 31 bricks. How many bricks are in the patio?
94. **BRICK PATTERN** A triangular brick wall is made by cutting some bricks in half to use in the first column of every other row (see figure on the previous page). The wall has 28 rows. The top row is one-half brick wide and the bottom row is 14 bricks wide. How many bricks are used in the finished wall?

95. **FALLING OBJECT** An object with negligible air resistance is dropped from a plane. During the first second of fall, the object falls 4.9 meters; during the second second, it falls 14.7 meters; during the third second, it falls 24.5 meters; during the fourth second, it falls 34.3 meters. If this arithmetic pattern continues, how many meters will the object fall in 10 seconds?

96. **FALLING OBJECT** An object with negligible air resistance is dropped from the top of the Sears Tower in Chicago at a height of 1454 feet. During the first second of fall, the object falls 16 feet; during the second second, it falls 48 feet; during the third second, it falls 80 feet; during the fourth second, it falls 112 feet. If this arithmetic pattern continues, how many feet will the object fall in 7 seconds?

97. **PRIZE MONEY** A county fair is holding a baked goods competition in which the top eight bakers receive cash prizes. First place receives a cash prize of $200, second place receives $175, third place receives $150, and so on.

(a) Write a sequence $a_n$ that represents the cash prize awarded in terms of the place $n$ in which the baked good places.

(b) Find the total amount of prize money awarded at the competition.

98. **PRIZE MONEY** A city bowling league is holding a tournament in which the top 12 bowlers with the highest three-game totals are awarded cash prizes. First place will receive $200, second place receives $175, third place receives $150, and so on.

(a) Write a sequence $a_n$ that represents the cash prize awarded in terms of the place $n$ in which the bowler finishes.

(b) Find the total amount of prize money awarded at the tournament.

99. **TOTAL PROFIT** A small snowplowing company makes a profit of $8000 during its first year. The owner of the company sets a goal of increasing profit by $1500 each year for 5 years. Assuming that this goal is met, find the total profit during the first 6 years of this business. What kinds of economic factors could prevent the company from meeting its profit goal? Are there any other factors that could prevent the company from meeting its goal? Explain.

100. **TOTAL SALES** An entrepreneur sells $15,000 worth of sports memorabilia during one year and sets a goal of increasing annual sales by $5000 each year for 9 years. Assuming that this goal is met, find the total sales during the first 10 years of this business. What kinds of economic factors could prevent the business from meeting its goals?

101. **BORROWING MONEY** You borrowed $2000 from a friend to purchase a new laptop computer and have agreed to pay back the loan with monthly payments of $200 plus 1% interest on the unpaid balance.

(a) Find the first six monthly payments you will make, and the unpaid balance after each month.

(b) Find the total amount of interest paid over the term of the loan.

102. **BORROWING MONEY** You borrowed $5000 from your parents to purchase a used car. The arrangements of the loan are such that you will make payments of $250 per month plus 1% interest on the unpaid balance.

(a) Find the first year’s monthly payments you will make, and the unpaid balance after each month.

(b) Find the total amount of interest paid over the term of the loan.

103. **DATA ANALYSIS: PERSONAL INCOME** The table shows the per capita personal income $a_n$ in the United States from 2002 through 2008. (Source: U.S. Bureau of Economic Analysis)

<table>
<thead>
<tr>
<th>Year</th>
<th>Per capita personal income, $a_n$</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>
<td>$30,834</td>
</tr>
<tr>
<td>2003</td>
<td>$31,519</td>
</tr>
<tr>
<td>2004</td>
<td>$33,159</td>
</tr>
<tr>
<td>2005</td>
<td>$34,691</td>

<tr>
<td>2006</td>
<td>$36,791</td>
</tr>
<tr>
<td>2007</td>
<td>$38,654</td>
</tr>
<tr>
<td>2008</td>
<td>$39,742</td>
</tr>
</tbody>
</table>

(a) Find an arithmetic sequence that models the data. Let $n$ represent the year, with $n = 2$ corresponding to 2002.

(b) Use a graphing utility to graph the terms of the finite sequence you found in part (a).

(c) Use the sequence from part (a) to estimate the per capita personal income in 2009.

(d) Use your school’s library, the Internet, or some other reference source to find the actual per capita personal income in 2009, and compare this value with the estimate from part (c).
104. **DATA ANALYSIS: SALES** The table shows the sales $a_n$ (in billions of dollars) for Coca-Cola Enterprises, Inc. from 2000 through 2007. (Source: Coca-Cola Enterprises, Inc.)

<table>
<thead>
<tr>
<th>Year</th>
<th>Sales, $a_n$</th>

</tbody>
</table>

(a) Construct a bar graph showing the annual sales from 2000 through 2007.
(b) Find an arithmetic sequence that models the data. Let $n$ represent the year, with $n = 0$ corresponding to 2000.
(c) Use a graphing utility to graph the terms of the finite sequence you found in part (b).
(d) Use summation notation to represent the total sales from 2000 through 2007. Find the total sales.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 105 and 106, determine whether the statement is true or false. Justify your answer.

105. Given an arithmetic sequence for which only the first two terms are known, it is possible to find the $n$th term.

106. If the only known information about a finite arithmetic sequence is its first term and its last term, then it is possible to find the sum of the sequence.

In Exercises 107 and 108, find the first 10 terms of the sequence.

107. $a_1 = x$, $d = 2x$

108. $a_1 = -y$, $d = 5y$

109. **WRITING** Explain how to use the first two terms of an arithmetic sequence to find the $n$th term.

110. **CAPSTONE** In your own words, describe the characteristics of an arithmetic sequence. Give an example of a sequence that is arithmetic and a sequence that is *not* arithmetic.

111. (a) Graph the first 10 terms of the arithmetic sequence $a_n = 2 + 3n$.
(b) Graph the equation of the line $y = 3x + 2$.
(c) Discuss any differences between the graph of $a_n = 2 + 3n$ and the graph of $y = 3x + 2$.
(d) Compare the slope of the line in part (b) with the common difference of the sequence in part (a). What can you conclude about the slope of a line and the common difference of an arithmetic sequence?

112. **PATTERN RECOGNITION**

(a) Compute the following sums of consecutive positive odd integers.

- $1 + 3 = $
- $1 + 3 + 5 = $
- $1 + 3 + 5 + 7 = $
- $1 + 3 + 5 + 7 + 9 = $
- $1 + 3 + 5 + 7 + 9 + 11 = $

(b) Use the sums in part (a) to make a conjecture about the sums of consecutive positive odd integers. Check your conjecture for the sum $1 + 3 + 5 + 7 + 9 + 11 + 13 = $.

(c) Verify your conjecture algebraically.

113. **THINK ABOUT IT** The sum of the first 20 terms of an arithmetic sequence with a common difference of 3 is 650. Find the first term.

114. **THINK ABOUT IT** The sum of the first $n$ terms of an arithmetic sequence with first term $a_1$ and common difference $d$ is $S_n$. Determine the sum if each term is increased by 5. Explain.

**PROJECT: HOUSING PRICES** To work an extended application analyzing the median sales prices of new, privately owned, single-family homes sold in the United States from 1991 through 2007, visit this text’s website at academic.cengage.com. (Data Source: U.S. Census Bureau)
What you should learn

• Recognize, write, and find the $n^{th}$ terms of geometric sequences.
• Find the sum of a finite geometric sequence.
• Find the sum of an infinite geometric series.
• Use geometric sequences to model and solve real-life problems.

Why you should learn it

Geometric sequences can be used to model and solve real-life problems. For instance, in Exercise 113 on page 668, you will use a geometric sequence to model the population of China.

Geometric Sequences

In Section 9.2, you learned that a sequence whose consecutive terms have a common difference is an arithmetic sequence. In this section, you will study another important type of sequence called a geometric sequence. Consecutive terms of a geometric sequence have a common ratio.

Definition of Geometric Sequence

A sequence is geometric if the ratios of consecutive terms are the same. So, the sequence $a_1, a_2, a_3, a_4, \ldots, a_n, \ldots$ is geometric if there is a number $r$ such that

$$\frac{a_2}{a_1} = \frac{a_3}{a_2} = \frac{a_4}{a_3} = \cdots = r, \quad r \neq 0.$$ 

The number $r$ is the common ratio of the sequence.

Example 1

Examples of Geometric Sequences

a. The sequence whose $n^{th}$ term is $2^n$ is geometric. For this sequence, the common ratio of consecutive terms is 2.

\[2, 4, 8, 16, \ldots, 2^n, \ldots\] 

Begin with $n = 1$.

$$\frac{4}{2} = 2$$

b. The sequence whose $n^{th}$ term is $4(3^n)$ is geometric. For this sequence, the common ratio of consecutive terms is 3.

\[12, 36, 108, 324, \ldots, 4(3^n), \ldots\] 

Begin with $n = 1$.

$$\frac{36}{12} = 3$$

c. The sequence whose $n^{th}$ term is $\left(-\frac{1}{3}\right)^n$ is geometric. For this sequence, the common ratio of consecutive terms is $-\frac{1}{3}$.

\[\ldots, \frac{1}{27}, \frac{1}{81}, \ldots, \left(-\frac{1}{3}\right)^n, \ldots\] 

Begin with $n = 1$.

$$\frac{1/9}{1/27} = -\frac{1}{3}$$

CHECK POINT Now try Exercise 5.

In Example 1, notice that each of the geometric sequences has an $n^{th}$ term that is of the form $ar^n$, where the common ratio of the sequence is $r$. A geometric sequence may be thought of as an exponential function whose domain is the set of natural numbers.
Chapter 9 Sequences, Series, and Probability

If you know the \(n\)th term of a geometric sequence, you can find the \((n+1)\)th term by multiplying by \(r\). That is,

\[a_{n+1} = a_n r\]

### Example 2 Finding the Terms of a Geometric Sequence

Write the first five terms of the geometric sequence whose first term is \(a_1 = 3\) and whose common ratio is \(r = 2\). Then graph the terms on a set of coordinate axes.

#### Solution

Starting with 3, repeatedly multiply by 2 to obtain the following.

- \(a_1 = 3\)
- \(a_2 = 3(2^1) = 6\)
- \(a_3 = 3(2^2) = 12\)
- \(a_4 = 3(2^3) = 24\)
- \(a_5 = 3(2^4) = 48\)

Figure 9.4 shows the first five terms of this geometric sequence.

### Example 3 Finding a Term of a Geometric Sequence

Find the 15th term of the geometric sequence whose first term is 20 and whose common ratio is 1.05.

#### Algebraic Solution

\[a_{15} = a_1 r^{n-1}\]

\[= 20(1.05)^{15-1}\]

\[≈ 39.60\]

#### Numerical Solution

For this sequence, \(r = 1.05\) and \(a_1 = 20\). So, \(a_n = 20(1.05)^{n-1}\).

Use the table feature of a graphing utility to create a table that shows the values of \(u_n = 20(1.05)^{n-1}\) for \(n = 1\) through \(n = 15\). From Figure 9.5, the number in the 15th row is approximately 39.60, so the 15th term of the geometric sequence is about 39.60.

### Figure 9.4

### Figure 9.5
Section 9.3  Geometric Sequences and Series

Example 4  Finding a Term of a Geometric Sequence

Find the 12th term of the geometric sequence

5, 15, 45, . . .

Solution

The common ratio of this sequence is 

\[ r = \frac{15}{5} = 3. \]

Because the first term is \( a_1 = 5 \), you can determine the 12th term \( (n = 12) \) to be

\[
a_{12} = 5(3)^{12-1} = 5(177,147)
\]

Simplify.

Now try Exercise 45.

Example 5  Finding a Term of a Geometric Sequence

The fourth term of a geometric sequence is 125, and the 10th term is \( \frac{125}{64} \). Find the 14th term. (Assume that the terms of the sequence are positive.)

Solution

The 10th term is related to the fourth term by the equation

\[ a_{10} = a_4 r^6 \]

Because \( a_{10} = \frac{125}{64} \) and \( a_4 = 125 \), you can solve for \( r \) as follows.

\[
\frac{125}{64} = 125r^6 \quad \text{Substitute} \ \frac{125}{64} \ \text{for} \ a_{10} \ \text{and} \ 125 \ \text{for} \ a_4.
\]

\[
\frac{1}{64} = r^6 \quad \text{Divide each side by 125.}
\]

\[
\frac{1}{2} = r \quad \text{Take the sixth root of each side.}
\]

You can obtain the 14th term by multiplying the 10th term by \( r^4 \).

\[
a_{14} = a_{10} r^4 \quad \text{Multiply the 10th term by} \ r^{14-10}.
\]

\[
= \frac{125}{64} \left( \frac{1}{2} \right)^4 \quad \text{Substitute} \ \frac{125}{64} \ \text{for} \ a_{10} \ \text{and} \ \frac{1}{2} \ \text{for} \ r.
\]

\[
= \frac{125}{64} \left( \frac{1}{2} \right)^4 \quad \text{Evaluate power.}
\]

\[
= \frac{125}{1024} \quad \text{Simplify.}
\]

Now try Exercise 53.
The Sum of a Finite Geometric Sequence

The formula for the sum of a finite geometric sequence is as follows.

The sum of the finite geometric sequence

\[ a_1, a_1r, a_1r^2, a_1r^3, a_1r^4, \ldots, a_1r^{n-1} \]

with common ratio \( r \neq 1 \) is given by

\[ S_n = \sum_{i=1}^{n} a_1r^{i-1} = a_1\left(\frac{1 - r^n}{1 - r}\right). \]

For a proof of this formula for the sum of a finite geometric sequence, see Proofs in Mathematics on page 721.

**Example 6** Finding the Sum of a Finite Geometric Sequence

Find the sum \( \sum_{i=1}^{12} 4(0.3)^{i-1} \).

**Solution**

By writing out a few terms, you have

\[ \sum_{i=1}^{12} 4(0.3)^{i-1} = 4(0.3)^0 + 4(0.3)^1 + 4(0.3)^2 + \cdots + 4(0.3)^{11}. \]

Now, because \( a_1 = 4, r = 0.3, \) and \( n = 12 \), you can apply the formula for the sum of a finite geometric sequence to obtain

\[ S_n = a_1\left(\frac{1 - r^n}{1 - r}\right). \]

Substitute 4 for \( a_1 \), 0.3 for \( r \), and 12 for \( n \).

\[ \sum_{i=1}^{12} 4(0.3)^{i-1} = 4\left[\frac{1 - (0.3)^{12}}{1 - 0.3}\right] \]

\[ \approx 5.714. \]

Use a calculator.

**CHECKPOINT** Now try Exercise 71.

When using the formula for the sum of a finite geometric sequence, be careful to check that the sum is of the form

\[ \sum_{i=1}^{n} a_1r^{i-1}. \]

Exponent for \( r \) is \( i - 1 \).

If the sum is not of this form, you must adjust the formula. For instance, if the sum in Example 6 were \( \sum_{i=1}^{12} 4(0.3)^i \), then you would evaluate the sum as follows.

\[ \sum_{i=1}^{12} 4(0.3)^i = 4(0.3) + 4(0.3)^2 + 4(0.3)^3 + \cdots + 4(0.3)^{12} \]

\[ = 4(0.3) + \left[4(0.3)\right](0.3) + \left[4(0.3)\right](0.3)^2 + \cdots + \left[4(0.3)\right](0.3)^{11} \]

\[ = 4(0.3)\left[\frac{1 - (0.3)^{12}}{1 - 0.3}\right] \approx 1.714 \quad a_1 = 4(0.3), r = 0.3, n = 12 \]
**Geometric Series**

The summation of the terms of an infinite geometric sequence is called an **infinite geometric series** or simply a **geometric series**.

The formula for the sum of a finite geometric sequence can, depending on the value of $r$, be extended to produce a formula for the sum of an infinite geometric series. Specifically, if the common ratio $r$ has the property that $|r| < 1$, it can be shown that $r^n$ becomes arbitrarily close to zero as $n$ increases without bound. Consequently,

$$a_1 \left( \frac{1 - r^n}{1 - r} \right) \to a_1 \left( \frac{1}{1 - r} \right) \quad \text{as} \quad n \to \infty.$$  

This result is summarized as follows.

**The Sum of an Infinite Geometric Series**

If $|r| < 1$, the infinite geometric series

$$a_1 + a_1 r + a_1 r^2 + a_1 r^3 + \cdots + a_1 r^{n-1} + \cdots$$

has the sum

$$S = \sum_{i=0}^{\infty} a_1 r^i = \frac{a_1}{1 - r}.$$

Note that if $|r| \geq 1$, the series does not have a sum.

**Example 7** Finding the Sum of an Infinite Geometric Series

Find each sum.

a. $\sum_{n=0}^{\infty} 4(0.6)^n$

b. $3 + 0.3 + 0.03 + 0.003 + \cdots$

**Solution**

a. $\sum_{n=0}^{\infty} 4(0.6)^n = 4 + 4(0.6) + 4(0.6)^2 + 4(0.6)^3 + \cdots + 4(0.6)^n + \cdots$

$$= \frac{4}{1 - 0.6} \quad \frac{a_1}{1 - r}$$

$$= \frac{4}{0.4} \quad \frac{4}{1 - 0.6}$$

$$= 10$$

b. $3 + 0.3 + 0.03 + 0.003 + \cdots = 3 + 3(0.1) + 3(0.1)^2 + 3(0.1)^3 + \cdots$

$$= \frac{3}{1 - 0.1} \quad \frac{a_1}{1 - r}$$

$$= \frac{3}{0.9} \quad \frac{3}{1 - 0.1}$$

$$= \frac{10}{3} \quad \approx 3.33$$

**CHECK Point** Now try Exercise 93.
Application

Example 8  Increasing Annuity

A deposit of $50 is made on the first day of each month in an account that pays 6% interest, compounded monthly. What is the balance at the end of 2 years? (This type of savings plan is called an increasing annuity.)

Solution

The first deposit will gain interest for 24 months, and its balance will be

$$A_{24} = 50 \left(1 + \frac{0.06}{12}\right)^{24}$$

$$= 50(1.005)^{24}.$$  

The second deposit will gain interest for 23 months, and its balance will be

$$A_{23} = 50 \left(1 + \frac{0.06}{12}\right)^{23}$$

$$= 50(1.005)^{23}.$$  

The last deposit will gain interest for only 1 month, and its balance will be

$$A_1 = 50 \left(1 + \frac{0.06}{12}\right)^{1}$$

$$= 50(1.005).$$  

The total balance in the annuity will be the sum of the balances of the 24 deposits. Using the formula for the sum of a finite geometric sequence, with $A_1 = 50(1.005)$ and $r = 1.005$, you have

$$S_{24} = 50(1.005) \left[ \frac{1 - (1.005)^{24}}{1 - 1.005} \right]$$

Substitute 50(1.005) for $A_1$, 1.005 for $r$, and 24 for $n$.

Simplify.

$= 50 \cdot \frac{1 - (1.005)^{24}}{1 - 1.005}$

$= 50 \cdot \frac{1 - (1.005)^{24}}{-0.005}$

$= 50 \cdot \frac{1 - (1.005)^{24}}{-0.005}$

$= 1277.96.$

Now try Exercise 121.

Classroom Discussion

An Experiment You will need a piece of string or yarn, a pair of scissors, and a tape measure. Measure out any length of string at least 5 feet long. Double over the string and cut it in half. Take one of the resulting halves, double it over, and cut it in half. Continue this process until you are no longer able to cut a length of string in half. How many cuts were you able to make? Construct a sequence of the resulting string lengths after each cut, starting with the original length of the string. Find a formula for the $n$th term of this sequence. How many cuts could you theoretically make? Discuss why you were not able to make that many cuts.
9.3 EXERCISES

VOCABULARY: Fill in the blanks.

1. A sequence is called a ________ sequence if the ratios between consecutive terms are the same.
   This ratio is called the ________ ratio.

44. \( a_1 = 1000, r = 1.005, n = 60 \)

In Exercises 45–56, find the indicated \( n \)th term of the geometric sequence.

45. 9th term: 11, 33, 99, . . .

47. 10th term: 5, 30, 180, . . .

49. 8th term: \( \frac{1}{2}, \frac{1}{3}, \frac{1}{6}, \frac{1}{12}, \ldots \)

In Exercises 29–34, write an expression for the \( n \)th term of the geometric sequence. Then find the indicated term.

35. \( a_1 = 4, r = \frac{5}{4}, n = 10 \)

36. \( a_1 = 5, r = \frac{7}{2}, n = 8 \)

37. \( a_1 = 6, r = -\frac{3}{2}, n = 12 \)

38. \( a_1 = 64, r = -\frac{1}{2}, n = 10 \)

39. \( a_1 = 100, r = e^x, n = 9 \)

40. \( a_1 = 1, r = e^{x^2}, n = 4 \)

41. \( a_1 = 2, r = \sqrt{2}, n = 12 \)

42. \( a_1 = 1, r = \sqrt{3}, n = 8 \)

43. \( a_1 = 500, r = 1.02, n = 40 \)

57. \( a_n = 18(\frac{1}{3})^{n-1} \)

58. \( a_n = 18(-\frac{2}{3})^{n-1} \)

59. \( a_n = 18(\frac{1}{3})^{n-1} \)

60. \( a_n = 18(-\frac{3}{2})^{n-1} \)
In Exercises 61–66, use a graphing utility to graph the first 10 terms of the sequence.

61. \( a_n = 12(-0.75)^{n-1} \)
62. \( a_n = 10(1.5)^{n-1} \)
63. \( a_n = 12(-0.4)^{n-1} \)
64. \( a_n = 20(-1.25)^{n-1} \)
65. \( a_n = 2(1.3)^{n-1} \)
66. \( a_n = 10(1.2)^{n-1} \)

In Exercises 67–86, find the sum of the finite geometric sequence.

67. \( \sum_{n=1}^{7} 4^n \)
68. \( \sum_{n=1}^{10} \left(\frac{1}{2}\right)^{n-1} \)
69. \( \sum_{n=1}^{6} (-7)^{n-1} \)
70. \( \sum_{n=1}^{8} 5\left(-\frac{1}{2}\right)^{n-1} \)
71. \( \sum_{j=1}^{6} 64(-\frac{1}{2})^{j-1} \)
72. \( \sum_{i=1}^{12} 2\left(\frac{1}{3}\right)^{i-1} \)
73. \( \sum_{i=1}^{6} 32\left(\frac{1}{3}\right)^{i-1} \)
74. \( \sum_{i=1}^{10} 16\left(\frac{1}{3}\right)^{i-1} \)
75. \( \sum_{n=0}^{20} 3\left(\frac{1}{3}\right)^{n} \)
76. \( \sum_{n=0}^{10} 5\left(\frac{1}{3}\right)^{n} \)
77. \( \sum_{n=0}^{15} 2\left(\frac{1}{3}\right)^{n} \)
78. \( \sum_{n=0}^{20} 10\left(\frac{1}{3}\right)^{n} \)
79. \( \sum_{n=0}^{5} 300(1.06)^{n} \)
80. \( \sum_{n=0}^{6} 500(1.04)^{n} \)
81. \( \sum_{n=0}^{10} 2\left(-\frac{1}{2}\right)^{n} \)
82. \( \sum_{n=0}^{20} 10\left(\frac{3}{5}\right)^{n-1} \)
83. \( \sum_{j=1}^{10} 8\left(-\frac{1}{3}\right)^{j-1} \)
84. \( \sum_{i=1}^{25} 8\left(-\frac{1}{3}\right)^{i-1} \)
85. \( \sum_{j=1}^{10} 5\left(-\frac{1}{3}\right)^{j-1} \)
86. \( \sum_{i=1}^{15} 15\left(\frac{1}{3}\right)^{i-1} \)

In Exercises 87–92, use summation notation to write the sum.

87. \( 10 + 30 + 90 + \ldots + 7290 \)
88. \( 9 + 18 + 36 + \ldots + 1152 \)
89. \( 2 - \frac{1}{2} + \frac{1}{8} - \cdots + \frac{1}{2048} \)
90. \( 15 - 3 + \frac{3}{3} - \cdots - \frac{1}{625} \)
91. \( 0.1 + 0.4 + 1.6 + \cdots + 102.4 \)
92. \( 32 + 24 + 18 + \cdots + 10.125 \)

In Exercises 93–106, find the sum of the infinite geometric series.

93. \( \sum_{n=0}^{\infty} \left(\frac{1}{2}\right)^{n} \)
94. \( \sum_{n=0}^{\infty} 2\left(\frac{1}{3}\right)^{n} \)
95. \( \sum_{n=0}^{\infty} (-\frac{1}{2})^{n} \)
96. \( \sum_{n=0}^{\infty} 2\left(-\frac{3}{5}\right)^{n} \)
97. \( \sum_{n=0}^{\infty} 4\left(\frac{1}{4}\right)^{n} \)
98. \( \sum_{n=0}^{\infty} \left(\frac{1}{10}\right)^{n} \)
99. \( \sum_{n=0}^{\infty} (0.4)^{n} \)
100. \( \sum_{n=0}^{\infty} 4(0.2)^{n} \)
101. \( \sum_{n=0}^{\infty} -3(0.9)^{n} \)
102. \( \sum_{n=0}^{\infty} -10(0.2)^{n} \)
103. \( 8 + 6 + \frac{9}{2} + \frac{27}{8} + \cdots \)
104. \( 9 + 6 + 4 + \frac{8}{3} + \cdots \)
105. \( 1 - \frac{1}{2} + 1 - 3 + \cdots \)
106. \( -\frac{125}{36} + \frac{25}{6} - 5 + 6 - \cdots \)

In Exercises 107–110, find the rational number representation of the repeating decimal.

107. \( 0.3\overline{6} \)
108. \( 0.2\overline{97} \)
109. \( 0.3\overline{78} \)
110. \( 1.3\overline{8} \)

**Graphical Reasoning** In Exercises 111 and 112, use a graphing utility to graph the function. Identify the horizontal asymptote of the graph and determine its relationship to the sum.

111. \( f(x) = 6 \left[ \frac{1 - (0.5)^x}{1 - (0.5)} \right] \)
112. \( f(x) = 2 \left[ \frac{1 - (0.8)^x}{1 - (0.8)} \right] \)

**Data Analysis: Population** The table shows the mid-year populations \( a_n \) of China (in millions) from 2002 through 2008. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>
<th>Population, ( a_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>

</tr>
<tr>
<td>2008</td>
<td>1330.0</td>
</tr>
</tbody>
</table>

(a) Use the exponential regression feature of a graphing utility to find a geometric sequence that models the data. Let \( n \) represent the year, with \( n = 2 \) corresponding to 2002.

(b) Use the sequence from part (a) to describe the rate at which the population of China is growing.

(c) Use the sequence from part (a) to predict the population of China in 2015. The U.S. Census Bureau predicts the population of China will be 1393.4 million in 2015. How does this value compare with your prediction?

(d) Use the sequence from part (a) to determine when the population of China will reach 1.35 billion.
114. **Compound Interest** A principal of $5000 is invested at 6% interest. Find the amount after 10 years if the interest is compounded (a) annually, (b) semi-annually, (c) quarterly, (d) monthly, and (e) daily.

115. **Compound Interest** A principal of $2500 is invested at 2% interest. Find the amount after 20 years if the interest is compounded (a) annually, (b) semi-annually, (c) quarterly, (d) monthly, and (e) daily.

116. **Depreciation** A tool and die company buys a machine for $175,000 and it depreciates at a rate of 30% per year. (In other words, at the end of each year the depreciated value is 70% of what it was at the beginning of the year.) Find the depreciated value of the machine after 5 full years.

117. **Annuities** A deposit of $100 is made at the beginning of each month in an account that pays 6% interest, compounded monthly. The balance $A$ in the account at the end of 5 years is

$$A = 100\left(1 + \frac{0.06}{12}\right)^1 + \cdots + 100\left(1 + \frac{0.06}{12}\right)^{60}.$$  
Find $A$.

118. **Annuities** A deposit of $50 is made at the beginning of each month in an account that pays 8% interest, compounded monthly. The balance $A$ in the account at the end of 5 years is

$$A = 50\left(1 + \frac{0.08}{12}\right)^1 + \cdots + 50\left(1 + \frac{0.08}{12}\right)^{60}.$$  
Find $A$.

119. **Annuities** A deposit of $P$ dollars is made at the beginning of each month in an account with an annual interest rate $r$, compounded monthly. The balance $A$ after $t$ years is

$$A = P\left(1 + \frac{r}{12}\right) + P\left(1 + \frac{r}{12}\right)^2 + \cdots + P\left(1 + \frac{r}{12}\right)^{12t}.$$  
Show that the balance is

$$A = P\left[\left(1 + \frac{r}{12}\right)^{12} - 1\right]\left(1 + \frac{12}{r}\right).$$

120. **Annuities** A deposit of $P$ dollars is made at the beginning of each month in an account with an annual interest rate $r$, compounded continuously. The balance $A$ after $t$ years is

$$A = Pe^{rt/12} + Pe^{2r/12} + \cdots + Pe^{12r/12}.$$  
Show that the balance is $A = \frac{Pe^{rt/12}(e^{rt} - 1)}{e^{rt/12} - 1}$.

**Annuities** In Exercises 121–124, consider making monthly deposits of $P$ dollars in a savings account with an annual interest rate $r$. Use the results of Exercises 119 and 120 to find the balance $A$ after $t$ years if the interest is compounded (a) monthly and (b) continuously.

121. $P = 50$, $r = 5\%$, $t = 20$ years
122. $P = 75$, $r = 3\%$, $t = 25$ years
123. $P = 100$, $r = 2\%$, $t = 40$ years
124. $P = 20$, $r = 4.5\%$, $t = 50$ years

125. **Multiplier Effect** Consider an initial deposit of $P$ dollars in an account with an annual interest rate $r$, compounded monthly. At the end of each month, a withdrawal of $W$ dollars will occur and the account will be depleted in $t$ years. The amount of the initial deposit required is

$$P = W\left(1 + \frac{r}{12}\right)^{-1} + W\left(1 + \frac{r}{12}\right)^{-2} + \cdots + \frac{W\left(1 + \frac{r}{12}\right)^{-12t}}{\left[1 - \left(1 + \frac{r}{12}\right)^{-12}\right]}.$$  
Show that the initial deposit is

$$P = \frac{12W}{r}\left[1 - \left(1 + \frac{r}{12}\right)^{-12}\right].$$

126. **Multiplier Effect** Determine the amount required in a retirement account for an individual who retires at age 65 and wants an income of $2000 from the account each month for 20 years. Use the result of Exercise 125 and assume that the account earns 9% compounded monthly.

**Multiplier Effect** In Exercises 127–130, use the following information. A tax rebate has been given to property owners by the state government with the anticipation that each property owner will spend approximately $p$% of the rebate, and in turn each recipient of this amount will spend $p$% of what they receive, and so on. Economists refer to this exchange of money and its circulation within the economy as the “multiplier effect.” The multiplier effect operates on the idea that the expenditures of one individual become the income of another individual. For the given tax rebate, find the total amount put back into the state’s economy, if this effect continues without end.

<table>
<thead>
<tr>

131. GEOMETRY  The sides of a square are 16 inches in length. A new square is formed by connecting the midpoints of the sides of the original square, and two of the resulting triangles are shaded (see figure). If this process is repeated five more times, determine the total area of the shaded region.

132. GEOMETRY  The sides of a square are 27 inches in length. New squares are formed by dividing the original square into nine squares. The center square is then shaded (see figure). If this process is repeated three more times, determine the total area of the shaded region.

133. SALARY  An investment firm has a job opening with a salary of $52,700 for the first year. Suppose that during the next 24 years, there is a 3% raise each year. Find the total compensation over the 25-year period.

134. SALARY  A technology services company has a job opening with a salary of $45,000 for the first year. Suppose that during the next 39 years, there is a 5% raise each year. Find the total compensation over the 40-year period.

135. DISTANCE  A bungee jumper is jumping off the New River Gorge Bridge in West Virginia, which has a height of 876 feet. The cord stretches 850 feet and the jumper rebounds 75% of the distance fallen.

(a) After jumping and rebounding 10 times, how far has the jumper traveled downward? How far has the jumper traveled upward? What is the total distance traveled downward and upward?

(b) Approximate the total distance, both downward and upward, that the jumper travels before coming to rest.

136. DISTANCE  A ball is dropped from a height of 16 feet. Each time it drops $h$ feet, it rebounds 0.81$h$ feet.

(a) Find the total vertical distance traveled by the ball.

(b) The ball takes the following times (in seconds) for each fall.

$$s_1 = -16r^2 + 16, \quad s_1 = 0 \text{ if } t = 1$$

$$s_2 = -16r^2 + 16(0.81), \quad s_2 = 0 \text{ if } t = 0.9$$

$$s_3 = -16r^2 + 16(0.81)^2, \quad s_3 = 0 \text{ if } t = (0.9)^2$$

$$s_4 = -16r^2 + 16(0.81)^3, \quad s_4 = 0 \text{ if } t = (0.9)^3$$

$$\vdots$$

$$s_n = -16r^2 + 16(0.81)^{n-1}, \quad s_n = 0 \text{ if } t = (0.9)^{n-1}$$

Beginning with $s_n$, the ball takes the same amount of time to bounce up as it does to fall, and so the total time elapsed before it comes to rest is

$$t = 1 + 2 \sum_{n=1}^{\infty} (0.9)^n.$$ 

Find this total time.

EXPLORATION

TRUE OR FALSE?  In Exercises 137 and 138, determine whether the statement is true or false. Justify your answer.

137. A sequence is geometric if the ratios of consecutive differences of consecutive terms are the same.

138. You can find the $n$th term of a geometric sequence by multiplying its common ratio by the first term of the sequence raised to the $(n - 1)$th power.

139. GRAPHICAL REASONING  Consider the graph of

$$y = \frac{1 - r^x}{1 - r}.$$ 

(a) Use a graphing utility to graph $y$ for $r = \frac{1}{2}, \frac{2}{3},$ and $\frac{3}{4}$. What happens as $x \to \infty$?

(b) Use a graphing utility to graph $y$ for $r = 1.5, 2,$ and 3. What happens as $x \to \infty$?

140. CAPSTONE 

(a) Write a brief paragraph that describes the similarities and differences between a geometric sequence and a geometric series.Give an example of each.

(b) Write a brief paragraph that describes the difference between a finite geometric series and an infinite geometric series. Is it always possible to find the sum of a finite geometric series? Is it always possible to find the sum of an infinite geometric series? Explain.

141. WRITING  Write a brief paragraph explaining why the terms of a geometric sequence decrease in magnitude when $-1 < r < 1$.

142. Find two different geometric series with sums of 4.

PROJECT: HOUSING VACANCIES  To work an extended application analyzing the numbers of vacant houses in the United States from 1990 through 2007, visit this text’s website at academic.cengage.com. (Data Source: U.S. Census Bureau)
Section 9.4 Mathematical Induction

What you should learn
• Use mathematical induction to prove statements involving a positive integer $n$.
• Recognize patterns and write the $n$th term of a sequence.
• Find the sums of powers of integers.
• Find finite differences of sequences.

Why you should learn it
Finite differences can be used to determine what type of model can be used to represent a sequence. For instance, in Exercise 79 on page 680, you will use finite differences to find a model that represents the numbers of Alaskan residents from 2002 through 2007.

9.4 MATHEMATICAL INDUCTION

Introduction
In this section, you will study a form of mathematical proof called mathematical induction. It is important that you see clearly the logical need for it, so take a closer look at the problem discussed in Example 5 in Section 9.2.

Judging from the pattern formed by these first five sums, it appears that the sum of the first odd integers is

\[ S_1 = 1 = 1^2 \]
\[ S_2 = 1 + 3 = 2^2 \]
\[ S_3 = 1 + 3 + 5 = 3^2 \]
\[ S_4 = 1 + 3 + 5 + 7 = 4^2 \]
\[ S_5 = 1 + 3 + 5 + 7 + 9 = 5^2 \]

Although this particular formula is valid, it is important for you to see that recognizing a pattern and then simply jumping to the conclusion that the pattern must be true for all values of $n$ is not a logically valid method of proof. There are many examples in which a pattern appears to be developing for small values of $n$ and then at some point the pattern fails. One of the most famous cases of this was the conjecture by the French mathematician Pierre de Fermat (1601–1665), who speculated that all numbers of the form

\[ F_n = 2^{2^n} + 1, \quad n = 0, 1, 2, \ldots \]

are prime. For $n = 0, 1, 2, 3,$ and $4$, the conjecture is true.

\[ F_0 = 3 \]
\[ F_1 = 5 \]
\[ F_2 = 17 \]
\[ F_3 = 257 \]
\[ F_4 = 65,537 \]

The size of the next Fermat number ($F_5 = 4,294,967,297$) is so great that it was difficult for Fermat to determine whether it was prime or not. However, another well-known mathematician, Leonhard Euler (1707–1783), later found the factorization

\[ F_5 = 4,294,967,297 \]
\[ = 641(6,700,417) \]

which proved that $F_5$ is not prime and therefore Fermat’s conjecture was false.

Just because a rule, pattern, or formula seems to work for several values of $n$, you cannot simply decide that it is valid for all values of $n$ without going through a legitimate proof. Mathematical induction is one method of proof.
To apply the Principle of Mathematical Induction, you need to be able to determine the statement for a given statement. To determine substitute the quantity for in the statement.

### A Preliminary Example

Find the statement for each given statement.

- **a.**
  
- **b.**
  
- **c.**
  
- **d.**

#### Solution

- **a.**
  
- **b.**
  
- **c.**
  
- **d.**

A well-known illustration used to explain why the Principle of Mathematical Induction works is the unending line of dominoes (see Figure 9.6). If the line actually contains infinitely many dominoes, it is clear that you could not knock the entire line down by knocking down only one domino at a time. However, suppose it were true that each domino would knock down the next one as it fell. Then you could knock them all down simply by pushing the first one and starting a chain reaction. Mathematical induction works in the same way. If the truth of implies the truth of and if is true, the chain reaction proceeds as follows: implies implies implies and so on.
When using mathematical induction to prove a summation formula (such as the one in Example 2), it is helpful to think of \( S_{k+1} \) as

\[
S_{k+1} = S_k + a_{k+1}
\]

where \( a_{k+1} \) is the \((k + 1)\)th term of the original sum.

**Example 2**  
**Using Mathematical Induction**

Use mathematical induction to prove the following formula.

\[
S_n = 1 + 3 + 5 + 7 + \cdots + (2n - 1)
\]

\[
= n^2
\]

**Solution**

Mathematical induction consists of two distinct parts. First, you must show that the formula is true when \( n = 1 \).

1. When \( n = 1 \), the formula is valid, because

\[
S_1 = 1 = 1^2.
\]

   The second part of mathematical induction has two steps. The first step is to assume that the formula is valid for some integer \( k \). The second step is to use this assumption to prove that the formula is valid for the next integer, \( k + 1 \).

2. Assuming that the formula

\[
S_k = 1 + 3 + 5 + 7 + \cdots + (2k - 1)
\]

\[
= k^2
\]

is true, you must show that the formula \( S_{k+1} = (k + 1)^2 \) is true.

\[
S_{k+1} = 1 + 3 + 5 + 7 + \cdots + (2k - 1) + [2(k + 1) - 1]
\]

\[
= [1 + 3 + 5 + 7 + \cdots + (2k - 1)] + (2k + 2 - 1)
\]

\[
= S_k + (2k + 1)
\]

\[
= k^2 + 2k + 1
\]

Replace \( S_k \) by \( k^2 \).

\[
= (k + 1)^2
\]

Combining the results of parts (1) and (2), you can conclude by mathematical induction that the formula is valid for all positive integer values of \( n \).

**CHECKPOINT**  
Now try Exercise 11.

It occasionally happens that a statement involving natural numbers is not true for the first \( k - 1 \) positive integers but is true for all values of \( n \geq k \). In these instances, you use a slight variation of the Principle of Mathematical Induction in which you verify \( P_k \) rather than \( P_1 \). This variation is called the *Extended Principle of Mathematical Induction*. To see the validity of this, note from Figure 9.6 that all but the first \( k - 1 \) dominoes can be knocked down by knocking over the \( k \)th domino. This suggests that you can prove a statement \( P_n \) to be true for \( n \geq k \) by showing that \( P_k \) is true and that \( P_k \) implies \( P_{k+1} \). In Exercises 25–30 of this section, you are asked to apply this extension of mathematical induction.
Chapter 9  Sequences, Series, and Probability

Example 3  Using Mathematical Induction

Use mathematical induction to prove the formula

\[ S_n = 1^2 + 2^2 + 3^2 + 4^2 + \ldots + n^2 = \frac{n(n + 1)(2n + 1)}{6} \]

for all integers \( n \geq 1 \).

Solution

1. When \( n = 1 \), the formula is valid, because

\[ S_1 = 1^2 = \frac{1(2)(3)}{6}. \]

2. Assuming that

\[ S_k = 1^2 + 2^2 + 3^2 + 4^2 + \ldots + k^2 \]

\[ = \frac{k(k + 1)(2k + 1)}{6} \]

you must show that

\[ S_{k+1} = \frac{(k + 1)(k + 1 + 1)[2(k + 1) + 1]}{6} \]

\[ = \frac{(k + 1)(k + 2)(2k + 3)}{6}. \]

To do this, write the following.

\[ S_{k+1} = S_k + a_{k+1} \]

\[ = (1^2 + 2^2 + 3^2 + 4^2 + \ldots + k^2) + (k + 1)^2 \]

Substitute for \( S_k \).

\[ = \frac{k(k + 1)(2k + 1)}{6} + (k + 1)^2 \]

By assumption

\[ = \frac{k(k + 1)(2k + 1) + 6(k + 1)^2}{6} \]

Combine fractions.

\[ = \frac{(k + 1)[k(2k + 1) + 6(k + 1)]}{6} \]

Factor.

\[ = \frac{(k + 1)(2k^2 + 7k + 6)}{6} \]

Simplify.

\[ = \frac{(k + 1)(k + 2)(2k + 3)}{6} \]

\( S_k \) implies \( S_{k+1} \).

Combining the results of parts (1) and (2), you can conclude by mathematical induction that the formula is valid for all integers \( n \geq 1 \).

CHECK POINT  Now try Exercise 17.

When proving a formula using mathematical induction, the only statement that you need to verify is \( P_1 \). As a check, however, it is a good idea to try verifying some of the other statements. For instance, in Example 3, try verifying \( P_2 \) and \( P_3 \).
Section 9.4 Mathematical Induction

Proving an Inequality by Mathematical Induction

Prove that \( n < 2^n \) for all positive integers \( n \).

Solution

1. For \( n = 1 \) and \( n = 2 \), the statement is true because
   \[ 1 < 2^1 \quad \text{and} \quad 2 < 2^2. \]

2. Assuming that
   \[ k < 2^k \]
   you need to show that \( k + 1 < 2^{k+1} \). For \( n = k \), you have
   \[ 2^{k+1} = 2(2^k) > 2k = 2k. \]
   By assumption
   Because \( 2k = k + k > k + 1 \) for all \( k > 1 \), it follows that
   \[ 2^{k+1} > 2k > k + 1 \quad \text{or} \quad k + 1 < 2^{k+1}. \]
   Combining the results of parts (1) and (2), you can conclude by mathematical induction that \( n < 2^n \) for all integers \( n \geq 1 \).

Example 4 Proving Factors by Mathematical Induction

Prove that 3 is a factor of \( 4^n - 1 \) for all positive integers \( n \).

Solution

1. For \( n = 1 \), the statement is true because
   \[ 4^1 - 1 = 3. \]
   So, 3 is a factor.

2. Assuming that 3 is a factor of \( 4^k - 1 \), you must show that 3 is a factor of \( 4^{k+1} - 1 \).
   To do this, write the following.
   \[
   4^{k+1} - 1 = 4^{k+1} - 4^k + 4^k - 1 \quad \text{Subtract and add } 4^k.
   = 4^k(4 - 1) + (4^k - 1) \quad \text{Regroup terms.}
   = 4^k \cdot 3 + (4^k - 1) \quad \text{Simplify.}
   
   \]
   Because 3 is a factor of \( 4^k \cdot 3 \) and 3 is also a factor of \( 4^k - 1 \), it follows that 3 is a factor of \( 4^{k+1} - 1 \). Combining the results of parts (1) and (2), you can conclude by mathematical induction that 3 is a factor of \( 4^n - 1 \) for all positive integers \( n \).

Example 5 Proving Factors by Mathematical Induction

Prove that 3 is a factor of \( 4^n - 1 \) for all positive integers \( n \).

Solution

1. For \( n = 1 \), the statement is true because
   \[ 4^1 - 1 = 3. \]
   So, 3 is a factor.

2. Assuming that 3 is a factor of \( 4^k - 1 \), you must show that 3 is a factor of \( 4^{k+1} - 1 \).
   To do this, write the following.
   \[
   4^{k+1} - 1 = 4^{k+1} - 4^k + 4^k - 1 \quad \text{Subtract and add } 4^k.
   = 4^k(4 - 1) + (4^k - 1) \quad \text{Regroup terms.}
   = 4^k \cdot 3 + (4^k - 1) \quad \text{Simplify.}
   
   \]
   Because 3 is a factor of \( 4^k \cdot 3 \) and 3 is also a factor of \( 4^k - 1 \), it follows that 3 is a factor of \( 4^{k+1} - 1 \). Combining the results of parts (1) and (2), you can conclude by mathematical induction that 3 is a factor of \( 4^n - 1 \) for all positive integers \( n \).

Pattern Recognition

Although choosing a formula on the basis of a few observations does not guarantee the validity of the formula, pattern recognition is important. Once you have a pattern or formula that you think works, you can try using mathematical induction to prove your formula.
Finding a Formula for the $n$th Term of a Sequence

To find a formula for the $n$th term of a sequence, consider these guidelines.

1. Calculate the first several terms of the sequence. It is often a good idea to write the terms in both simplified and factored forms.

2. Try to find a recognizable pattern for the terms and write a formula for the $n$th term of the sequence. This is your hypothesis or conjecture. You might try computing one or two more terms in the sequence to test your hypothesis.

3. Use mathematical induction to prove your hypothesis.

Example 6  Finding a Formula for a Finite Sum

Find a formula for the finite sum and prove its validity.

$$\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} + \cdots + \frac{1}{n(n + 1)}$$

Solution

Begin by writing out the first few sums.

$$S_1 = \frac{1}{1 \cdot 2} = \frac{1}{2} = \frac{1}{1 + 1}$$

$$S_2 = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} = \frac{4}{6} = \frac{2}{3} = \frac{2}{2 + 1}$$

$$S_3 = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} = \frac{9}{12} = \frac{3}{4} = \frac{3}{3 + 1}$$

$$S_4 = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \frac{1}{4 \cdot 5} = \frac{48}{60} = \frac{4}{5} = \frac{4}{4 + 1}$$

From this sequence, it appears that the formula for the $k$th sum is

$$S_k = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{k(k + 1)} = \frac{k}{k + 1}.$$ 

To prove the validity of this hypothesis, use mathematical induction. Note that you have already verified the formula for $n = 1$, so you can begin by assuming that the formula is valid for $n = k$ and trying to show that it is valid for $n = k + 1$.

$$S_{k+1} = \left[ \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \cdots + \frac{1}{k(k + 1)} \right] + \frac{1}{(k + 1)(k + 2)}$$

$$= \frac{k}{k + 1} + \frac{1}{(k + 1)(k + 2)} \quad \text{By assumption}$$

$$= \frac{k(k + 2) + 1}{(k + 1)(k + 2)} = \frac{k^2 + 2k + 1}{(k + 1)(k + 2)} = \frac{(k + 1)^2}{(k + 1)(k + 2)} = \frac{k + 1}{k + 2}$$

So, by mathematical induction, you can conclude that the hypothesis is valid.

CHECKPOINT  Now try Exercise 43.
Sums of Powers of Integers

The formula in Example 3 is one of a collection of useful summation formulas. This and other formulas dealing with the sums of various powers of the first positive integers are as follows.

**Sums of Powers of Integers**

1. \(1 + 2 + 3 + 4 + \cdots + n = \frac{n(n + 1)}{2}\)

2. \(1^2 + 2^2 + 3^2 + 4^2 + \cdots + n^2 = \frac{n(n + 1)(2n + 1)}{6}\)

3. \(1^3 + 2^3 + 3^3 + 4^3 + \cdots + n^3 = \frac{n^2(n + 1)^2}{4}\)

4. \(1^4 + 2^4 + 3^4 + 4^4 + \cdots + n^4 = \frac{n(n + 1)(3n^2 + 3n - 1)}{30}\)

5. \(1^5 + 2^5 + 3^5 + 4^5 + \cdots + n^5 = \frac{n^2(n + 1)^2(2n^2 + 2n - 1)}{12}\)

**Example 7** Finding a Sum of Powers of Integers

Find each sum.

a. \(\sum_{i=1}^{4} i^3 = 1^3 + 2^3 + 3^3 + 4^3 + 5^3 + 6^3 + 7^3\)

b. \(\sum_{i=1}^{4} (6i - 4i^2)\)

**Solution**

a. Using the formula for the sum of the cubes of the first \(n\) positive integers, you obtain

\[
\sum_{i=1}^{4} i^3 = 1^3 + 2^3 + 3^3 + 4^3 + 5^3 + 6^3 + 7^3
\]

\[
= \frac{7^2(7 + 1)^2}{4} = \frac{49(64)}{4} = 784.
\]

Formulas 3

b. \(\sum_{i=1}^{4} (6i - 4i^2) = \sum_{i=1}^{4} 6i - \sum_{i=1}^{4} 4i^2\)

\[
= 6 \sum_{i=1}^{4} i - 4 \sum_{i=1}^{4} i^2
\]

\[
= 6 \left[ \frac{4(4 + 1)}{2} \right] - 4 \left[ \frac{4(4 + 1)(8 + 1)}{6} \right]
\]

\[
= 6(10) - 4(30)
\]

\[
= 60 - 120 = -60
\]

**CHECK Point** Now try Exercise 55.
Finite Differences

The first differences of a sequence are found by subtracting consecutive terms. The second differences are found by subtracting consecutive first differences. The first and second differences of the sequence 3, 5, 8, 12, 17, 23, . . . are as follows.

<table>
<thead>
<tr>
<th>n</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a_n)</td>
<td>3</td>
<td>5</td>
<td>8</td>
<td>12</td>
<td>17</td>
<td>23</td>
</tr>
</tbody>
</table>

First differences: 2, 3, 4, 5, 6

Second differences: 1, 1, 1, 1

For this sequence, the second differences are all the same. When this happens, the sequence has a perfect quadratic model. If the first differences are all the same, the sequence has a linear model. That is, it is arithmetic.

Example 8  Finding a Quadratic Model

Find the quadratic model for the sequence

3, 5, 8, 12, 17, 23, . . .

Solution

You know from the second differences shown above that the model is quadratic and has the form

\[ a_n = an^2 + bn + c. \]

By substituting 1, 2, and 3 for \(n\), you can obtain a system of three linear equations in three variables.

\[
\begin{align*}
  a_1 &= a(1)^2 + b(1) + c = 3 & \text{Substitute 1 for } n. \\
  a_2 &= a(2)^2 + b(2) + c = 5 & \text{Substitute 2 for } n. \\
  a_3 &= a(3)^2 + b(3) + c = 8 & \text{Substitute 3 for } n.
\end{align*}
\]

You now have a system of three equations in \(a\), \(b\), and \(c\).

\[
\begin{align*}
  a + b + c &= 3 & \text{Equation 1} \\
  4a + 2b + c &= 5 & \text{Equation 2} \\
  9a + 3b + c &= 8 & \text{Equation 3}
\end{align*}
\]

Using the techniques discussed in Chapter 7, you can find the solution to be \(a = \frac{1}{2}\), \(b = \frac{1}{2}\), and \(c = 2\). So, the quadratic model is

\[ a_n = \frac{1}{2}n^2 + \frac{1}{2}n + 2. \]

Try checking the values of \(a_1\), \(a_2\), and \(a_3\).

CHECKPOINT  Now try Exercise 73.
9.4 EXERCISES

VOCABULARY: Fill in the blanks.
1. The first step in proving a formula by _______ _______ is to show that the formula is true when \( n = 1 \).
2. The _______ differences of a sequence are found by subtracting consecutive terms.
3. A sequence is an _______ sequence if the first differences are all the same nonzero number.
4. If the _______ differences of a sequence are all the same nonzero number, then the sequence has a perfect quadratic model.

SKILLS AND APPLICATIONS

In Exercises 5–10, find \( P_{k+1} \) for the given \( P_k \).

5. \( P_k = \frac{5}{k(k + 1)} \)
6. \( P_k = \frac{1}{2(k + 2)} \)
7. \( P_k = \frac{k^2(k + 3)^2}{6} \)
8. \( P_k = \frac{k}{3(2k + 1)} \)
9. \( P_k = \frac{3}{(k + 2)(k + 3)} \)
10. \( P_k = \frac{k^2}{2(k + 1)^2} \)

In Exercises 11–24, use mathematical induction to prove the formula for every positive integer \( n \).

11. \( 2 + 4 + 6 + 8 + \cdots + 2n = n(n + 1) \)
12. \( 3 + 7 + 11 + 15 + \cdots + (4n - 1) = n(2n + 1) \)
13. \( 2 + 7 + 12 + 17 + \cdots + (5n - 3) = n \frac{n(n - 1)}{2} \)
14. \( 1 + 4 + 7 + 10 + \cdots + (3n - 2) = \frac{n(n - 1)}{2} \)
15. \( 1 + 2 + 2^2 + 2^3 + \cdots + 2^{n-1} = 2^n - 1 \)
16. \( 2(1 + 3 + 3^2 + 3^3 + \cdots + 3^{n-1}) = 3^n - 1 \)
17. \( 1 + 2 + 3 + 4 + \cdots + n = \frac{n(n + 1)}{2} \)
18. \( 1^3 + 2^3 + 3^3 + 4^3 + \cdots + n^3 = \frac{n^2(n + 1)^2}{4} \)
19. \( 1^2 + 2^2 + 3^2 + \cdots + (2n - 1)^2 = \frac{n(2n - 1)(2n + 1)}{3} \)
20. \( (1 + 1 \frac{1}{2}) (1 + 1 \frac{1}{3}) (1 + 1 \frac{1}{4}) \cdots (1 + 1 \frac{1}{n}) = n + 1 \)
21. \( \sum_{i=1}^{n} i^3 = \frac{n^2(n + 1)^2(2n^2 + 2n - 1)}{12} \)
22. \( \sum_{i=1}^{n} i^4 = \frac{n(n + 1)(2n + 1)(3n^2 + 3n - 1)}{30} \)
23. \( \sum_{i=1}^{n} i(i + 1) = \frac{n(n + 1)(n + 2)}{3} \)
24. \( \sum_{i=1}^{n} \frac{1}{(2i - 1)(2i + 1)} = \frac{n}{2n + 1} \)

In Exercises 25–30, prove the inequality for the indicated integer values of \( n \).

25. \( n! > 2^n, \quad n \geq 4 \)
26. \( \left( \frac{4}{3} \right)^n > n, \quad n \geq 7 \)
27. \( \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \cdots + \frac{1}{\sqrt{n}} > \frac{1}{\sqrt{n}}, \quad n \geq 2 \)
28. \( \left( \frac{x}{y} \right)^{n + 1} < \left( \frac{x}{y} \right)^n, \quad n \geq 1 \quad \text{and} \quad 0 < x < y \)
29. \( (1 + a)^n \geq na, \quad n \geq 1 \quad \text{and} \quad a > 0 \)
30. \( 2n^2 > (n + 1)^2, \quad n \geq 3 \)

In Exercises 31–42, use mathematical induction to prove the property for all positive integers \( n \).

31. \( (ab)^n = a^n b^n \)
32. \( \frac{(a/b)^n}{b^n} = a^n \)
33. If \( x_1 \neq 0, \ x_2 \neq 0, \ldots , \ x_n \neq 0 \), then \( \left( x_1 x_2 x_3 \cdots x_n \right)^{-1} = x_1^{-1} x_2^{-1} x_3^{-1} \cdots x_n^{-1} \).
34. If \( x_1 > 0, \ x_2 > 0, \ldots , \ x_n > 0 \), then \( \ln(x_1 x_2 \cdots x_n) = \ln x_1 + \ln x_2 + \cdots + \ln x_n \).
35. Generalized Distributive Law: \( x(y_1 + y_2 + \cdots + y_n) = xy_1 + xy_2 + \cdots + xy_n \)
36. \( (a + bi)^n \) and \( (a - bi)^n \) are complex conjugates for all \( n \geq 1 \).
37. A factor of \( (n^3 + 3n^2 + 2n) \) is 3.
38. A factor of \( (n^3 - n + 3) \) is 3.
39. A factor of \( (n^3 + n + 4) \) is 2.
40. A factor of \( (2^{n+1} + 1) \) is 3.
41. A factor of \( (2^{3n-2} + 1) \) is 5.
42. A factor of \( (2^{2n-1} + 3^{2n-1}) \) is 5.

In Exercises 43–48, find a formula for the sum of the first \( n \) terms of the sequence.

43. 1, 5, 9, 13, . . .
44. 25, 22, 19, 16, . . .
45. \( \frac{9}{100} \), \( \frac{81}{1000} \), \( \frac{729}{10000} \), . . .
46. 3, \( -\frac{9}{2} \), \( \frac{27}{4} \), \( -\frac{81}{8} \), . . .
In Exercises 49–58, find the sum using the formulas for the sums of powers of integers.

49. \( \sum_{n=1}^{15} n \)
50. \( \sum_{n=1}^{30} n \)
51. \( \sum_{n=1}^{6} n^2 \)
52. \( \sum_{n=1}^{10} n^3 \)
53. \( \sum_{n=1}^{5} n^4 \)
54. \( \sum_{n=1}^{8} n^5 \)
55. \( \sum_{n=1}^{6} (n^2 - n) \)
56. \( \sum_{n=1}^{20} (n^3 - n) \)
57. \( \sum_{j=1}^{6} (6j^2 - 8i^3) \)
58. \( \sum_{j=1}^{10} \left( 3 - \frac{1}{2}j + \frac{1}{2}j^2 \right) \)

In Exercises 59–64, decide whether the sequence can be represented perfectly by a linear or a quadratic model. If so, find the model.
59. 5, 13, 21, 29, 37, 45, . . .
60. 2, 9, 16, 23, 30, 37, . . .
61. 6, 15, 30, 51, 78, 111, . . .
62. 0, 6, 16, 30, 48, 70, . . .
63. −2, 1, 6, 13, 22, 33, . . .
64. −1, 8, 23, 44, 71, 104, . . .

In Exercises 65–72, write the first six terms of the sequence beginning with the given term. Then calculate the first and second differences of the sequence. State whether the sequence has a linear model, a quadratic model, or neither.
65. \( a_1 = 0 \) \( a_n = a_{n-1} + 3 \)
66. \( a_1 = 2 \) \( a_n = a_{n-1} + 2 \)
67. \( a_1 = 3 \) \( a_n = a_{n-1} - n \)
68. \( a_1 = 3 \) \( a_n = a_{n-1} + 3 \)
69. \( a_0 = 2 \) \( a_n = a_{n-1} - a_{n-2} \)
70. \( a_0 = 0 \) \( a_n = a_{n-1} + n \)
71. \( a_1 = 2 \) \( a_n = n - a_{n-1} \)
72. \( a_1 = 0 \) \( a_n = a_{n-1} + 2n \)

73. \( a_0 = 3 , a_1 = 3 , a_4 = 15 \)
74. \( a_0 = 7 , a_1 = 6 , a_3 = 10 \)
75. \( a_0 = -3 , a_2 = 1 , a_4 = 9 \)
76. \( a_0 = 3 , a_2 = 0 , a_6 = 36 \)
77. \( a_1 = 0 , a_2 = 8 , a_4 = 30 \)
78. \( a_0 = -3 , a_2 = -5 , a_6 = -57 \)

79. DATA ANALYSIS: RESIDENTS The table shows the numbers \( a_n \) (in thousands) of Alaskan residents from 2002 through 2007. (Source: U.S. Census Bureau)

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of residents, ( a_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>
<td>643</td>

</tr>
</tbody>
</table>

(a) Find the first differences of the data shown in the table.
(b) Use your results from part (a) to determine whether a linear model can be used to approximate the data. If so, find a model algebraically. Let \( n \) represent the year, with \( n = 2 \) corresponding to 2002.
(c) Use the regression feature of a graphing utility to find a linear model for the data. Compare this model with the one from part (b).
(d) Use the models found in parts (b) and (c) to estimate the number of residents in 2013. How do these values compare?

EXPLORATION

80. CAPSTONE In your own words, explain what is meant by a proof by mathematical induction.

TRUE OR FALSE? In Exercises 81–85, determine whether the statement is true or false. Justify your answer.
81. If the statement \( P_1 \) is true but the true statement \( P_6 \) does not imply that the statement \( P_7 \) is true, then \( P_n \) is not necessarily true for all positive integers \( n \).
82. If the statement \( P_k \) is true and \( P_k \) implies \( P_{k+1} \), then \( P_1 \) is also true.
83. If the second differences of a sequence are all zero, then the sequence is arithmetic.
84. A sequence with \( n \) terms has \( n - 1 \) second differences.
85. If a sequence is arithmetic, then the first differences of the sequence are all zero.
Section 9.5

The Binomial Theorem

What you should learn

- Use the Binomial Theorem to calculate binomial coefficients.
- Use Pascal’s Triangle to calculate binomial coefficients.
- Use binomial coefficients to write binomial expansions.

Why you should learn it

You can use binomial coefficients to model and solve real-life problems. For instance, in Exercise 91 on page 687, you will use binomial coefficients to write the expansion of a model that represents the average dollar amounts of child support collected per case in the United States.

The Binomial Theorem

Binomial Coefficients

Recall that a binomial is a polynomial that has two terms. In this section, you will study a formula that provides a quick method of raising a binomial to a power. To begin, look at the expansion of \((x + y)^n\) for several values of \(n\).

\[
(x + y)^0 = 1 \\
(x + y)^1 = x + y \\
(x + y)^2 = x^2 + 2xy + y^2 \\
(x + y)^3 = x^3 + 3x^2y + 3xy^2 + y^3 \\
(x + y)^4 = x^4 + 4x^3y + 6x^2y^2 + 4xy^3 + y^4 \\
(x + y)^5 = x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + y^5
\]

There are several observations you can make about these expansions.

1. In each expansion, there are \(n + 1\) terms.
2. In each expansion, \(x\) and \(y\) have symmetrical roles. The powers of \(x\) decrease by 1 in successive terms, whereas the powers of \(y\) increase by 1.
3. The sum of the powers of each term is \(n\). For instance, in the expansion of \((x + y)^5\), the sum of the powers of each term is 5.

\[
4 + 1 = 5 \quad 3 + 2 = 5
\]

\[
(x + y)^5 = x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + y^5
\]

4. The coefficients increase and then decrease in a symmetric pattern.

The coefficients of a binomial expansion are called binomial coefficients. To find them, you can use the Binomial Theorem.

The Binomial Theorem

In the expansion of \((x + y)^n\)

\[
(x + y)^n = x^n + nx^{n-1}y + \cdots + \binom{n}{r} x^{n-r}y^r + \cdots + nx^{n-1}y + y^n
\]

the coefficient of \(x^{n-r}y^r\) is

\[
\binom{n}{r} = \frac{n!}{(n-r)!r!}
\]

The symbol \(\binom{n}{r}\) is often used in place of \(\binom{n}{r}\) to denote binomial coefficients.

For a proof of the Binomial Theorem, see Proofs in Mathematics on page 722.
Finding Binomial Coefficients

Find each binomial coefficient.

- \( \binom{6}{2} \)
- \( \binom{10}{3} \)
- \( \binom{7}{0} \)
- \( \binom{8}{5} \)

Solution

- \( \binom{6}{2} = \frac{6!}{2! \cdot 4!} = \frac{6 \cdot 5 \cdot 4!}{2 \cdot 1 \cdot 4!} = 15 \)
- \( \binom{10}{3} = \frac{10!}{3! \cdot 7!} = \frac{10 \cdot 9 \cdot 8}{3 \cdot 2 \cdot 1} = 120 \)
- \( \binom{7}{0} = \frac{7!}{0! \cdot 7!} = 1 \)
- \( \binom{8}{5} = \frac{8!}{5! \cdot 3!} = \frac{8 \cdot 7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = 56 \)

Now try Exercise 5.

When \( r \neq 0 \) and \( r \neq n \), as in parts (a) and (b) above, there is a simple pattern for evaluating binomial coefficients that works because there will always be factorial terms that divide out from the expression.

\[
\binom{n}{r} = \frac{n!}{r! \cdot (n-r)!}
\]

Example 2 Finding Binomial Coefficients

Find each binomial coefficient.

- \( \binom{3}{2} \)
- \( \binom{7}{4} \)
- \( \binom{12}{1} \)
- \( \binom{12}{11} \)

Solution

- \( \binom{3}{2} = \frac{3 \cdot 2 \cdot 1}{2 \cdot 1} = 3 \)
- \( \binom{7}{4} = \frac{7 \cdot 6 \cdot 5 \cdot 4}{4 \cdot 3 \cdot 2 \cdot 1} = 35 \)
- \( \binom{12}{1} = \frac{12}{1} = 12 \)
- \( \binom{12}{11} = \frac{12!}{11! \cdot 1!} = \frac{12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = 12 \)

Now try Exercise 11.

It is not a coincidence that the results in parts (a) and (b) of Example 2 are the same and that the results in parts (c) and (d) are the same. In general, it is true that

\[
\binom{n}{r} = \binom{n}{n-r}
\]

This shows the symmetric property of binomial coefficients that was identified earlier.
Pascal’s Triangle

There is a convenient way to remember the pattern for binomial coefficients. By arranging
the coefficients in a triangular pattern, you obtain the following array, which is called
Pascal’s Triangle. This triangle is named after the famous French mathematician
Blaise Pascal (1623–1662).

\[
\begin{array}{cccccccc}
& & & & & 1 & & \\
& & & & 1 & & 1 & \\
& & & 1 & & 2 & & 1 \\
& & 1 & & 3 & & 3 & & 1 \\
& 1 & & 4 & & 6 & & 4 & & 1 \\
1 & & 5 & & 10 & & 10 & & 5 & & 1 \\
1 & & 6 & & 15 & & 20 & & 15 & & 6 & & 1 \\
1 & & 7 & & 21 & & 35 & & 35 & & 21 & & 7 & & 1 \\
\end{array}
\]

The first and last numbers in each row of Pascal’s Triangle are 1. Every other number
in each row is formed by adding the two numbers immediately above the number.
Pascal noticed that numbers in this triangle are precisely the same numbers that are the
coefficients of binomial expansions, as follows.

\[
(x + y)^0 = 1 \quad \text{0th row}
\]
\[
(x + y)^1 = 1x + 1y \quad \text{1st row}
\]
\[
(x + y)^2 = 1x^2 + 2xy + 1y^2 \quad \text{2nd row}
\]
\[
(x + y)^3 = 1x^3 + 3x^2y + 3xy^2 + 1y^3 \quad \text{3rd row}
\]
\[
(x + y)^4 = 1x^4 + 4x^3y + 6x^2y^2 + 4xy^3 + 1y^4 \quad \vdots
\]
\[
(x + y)^5 = 1x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + 1y^5
\]
\[
(x + y)^6 = 1x^6 + 6x^5y + 15x^4y^2 + 20x^3y^3 + 15x^2y^4 + 6xy^5 + 1y^6
\]
\[
(x + y)^7 = 1x^7 + 7x^6y + 21x^5y^2 + 35x^4y^3 + 35x^3y^4 + 21x^2y^5 + 7xy^6 + 1y^7
\]

The top row in Pascal’s Triangle is called the zeroth row because it corresponds to
the binomial expansion \((x + y)^0 = 1\). Similarly, the next row is called the first row
because it corresponds to the binomial expansion \((x + y)^1 = (x + 1)(y)\). In general,
the \(n\)th row in Pascal’s Triangle gives the coefficients of \((x + y)^n\).

Example 3  Using Pascal’s Triangle

Use the seventh row of Pascal’s Triangle to find the binomial coefficients.

\[
\begin{array}{cccccccc}
& & & & & 1 & & \\
& & & & 1 & & 7 & & 1 \\
& & & 1 & & 8 & & 21 & & 1 \\
& & 1 & & 9 & & 28 & & 35 & & 35 & & 1 \\
& 1 & & 10 & & 35 & & 56 & & 56 & & 28 & & 8 & & 1 \\
\end{array}
\]

Solution

\[
\begin{array}{cccccccc}
& & & & & 1 & & \\
& & & & 1 & & 7 & & 1 \\
& & & 1 & & 8 & & 21 & & 1 \\
& & 1 & & 9 & & 28 & & 56 & & 1 \\
& 1 & & 10 & & 35 & & 70 & & 35 & & 1 \\
\end{array}
\]

Check Point  Now try Exercise 15.
HISTORICAL NOTE

Precious Mirror “Pascal’s”

Triangle and forms of the
Binomial Theorem were known in Eastern cultures prior to the Western “discovery” of the theorem. A Chinese text entitled Precious Mirror contains a triangle of binomial expansions through the eighth power.

Algebra Help

The property of exponents

\[(ab)^n = a^n b^n\]

is used in the solutions to Example 5. For instance, in Example 5(a)

\[(2x)^4 = 2^4 x^4 = 16x^4.\]

You can review properties of exponents in Appendix A.2.

Binomial Expansions

As mentioned at the beginning of this section, when you write out the coefficients for a binomial that is raised to a power, you are expanding a binomial. The formulas for binomial coefficients give you an easy way to expand binomials, as demonstrated in the next four examples.

**Example 4** Expanding a Binomial

Write the expansion of the expression

\[(x + 1)^3.\]

**Solution**

The binomial coefficients from the third row of Pascal’s Triangle are 1, 3, 3, 1.

So, the expansion is as follows.

\[(x + 1)^3 = (1)x^3 + (3)x^2(1) + (3)x(1^2) + (1)(1^3)\]

\[= x^3 + 3x^2 + 3x + 1\]

**CHECKPoint** Now try Exercise 19.

To expand binomials representing differences rather than sums, you alternate signs. Here are two examples.

\[(x - 1)^3 = x^3 - 3x^2 + 3x - 1\]

\[(x - 1)^4 = x^4 - 4x^3 + 6x^2 - 4x + 1\]

**Example 5** Expanding a Binomial

Write the expansion of each expression.

a. \((2x - 3)^4\)

b. \((x - 2y)^4\)

**Solution**

The binomial coefficients from the fourth row of Pascal’s Triangle are 1, 4, 6, 4, 1.

So, the expansions are as follows.

a. \((2x - 3)^4 = (1)(2x)^4 - (4)(2x)^3(3) + (6)(2x)^2(3)^2 - (4)(2x)(3)^3 + (1)(3)^4\)

\[= 16x^4 - 96x^3 + 216x^2 - 216x + 81\]

b. \((x - 2y)^4 = (1)x^4 - (4)x^3(2y) + (6)x^2(2y)^2 - (4)x(2y)^3 + (1)(2y)^4\)

\[= x^4 - 8x^3y + 24x^2y^2 - 32xy^3 + 16y^4\]

**CHECKPoint** Now try Exercise 31.
**Example 6** Expanding a Binomial

Write the expansion of \((x^2 + 4)^3\).

**Solution**

Use the third row of Pascal’s Triangle, as follows.

\[
(x^2 + 4)^3 = (1)(x^2)^3 + (3)(x^2)^2(4) + (3)x^2(4^2) + (1)(4^3)
\]

\[= x^6 + 12x^4 + 48x^2 + 64\]

Now try Exercise 33.

Sometimes you will need to find a specific term in a binomial expansion. Instead of writing out the entire expansion, you can use the fact that, from the Binomial Theorem, the term is

\[\binom{n}{r} a^{n-r} y^r\]

**Example 7** Finding a Term in a Binomial Expansion

a. Find the sixth term of \((a + 2b)^8\).

b. Find the coefficient of the term \(a^6b^5\) in the expansion of \((3a - 2b)^{11}\).

**Solution**

a. Remember that the formula is for the \((r + 1)\)th term, so \(r\) is one less than the number of the term you need. So, to find the sixth term in this binomial expansion, use \(r = 5, n = 8, x = a, y = 2b\), as shown.

\[
\binom{8}{4} a^{8-4} (2b)^4 = 70 \cdot a^4 \cdot (2b)^4 = 1792a^4b^4.
\]

b. In this case, \(n = 11, r = 5, x = 3a, y = -2b\). Substitute these values to obtain

\[
\binom{11}{5} a^{11-5} (-2b)^5 = 462(3a)^6(-32b^5)
\]

\[
= -10,777,536a^5b^5.
\]

So, the coefficient is \(-10,777,536\).

Now try Exercise 47.

**Classroom Discussion**

Error Analysis You are a math instructor and receive the following solutions from one of your students on a quiz. Find the error(s) in each solution. Discuss ways that your student could avoid the error(s) in the future.

a. Find the second term in the expansion of \((2x - 3y)^5\).

\[
5(2x)^4(3y)^1 = 720x^4y
\]

b. Find the fourth term in the expansion of \((\frac{1}{2}x + 7y)^6\).

\[
\binom{6}{3} (\frac{1}{2}x)^3 (7y)^3 = 9003.75x^2y^4
\]
9.5 EXERCISES

VOCABULARY: Fill in the blanks.
1. The coefficients of a binomial expansion are called _______ _______.
2. To find binomial coefficients, you can use the _______ _______ or _______ _______.
3. The notation used to denote a binomial coefficient is _______ or _______.
4. When you write out the coefficients for a binomial that is raised to a power, you are _______ a _______.

SKILLS AND APPLICATIONS

In Exercises 5–14, calculate the binomial coefficient.

5. \( \binom{3}{2} \)  
6. \( \binom{6}{4} \)  
7. \( \binom{12}{6} \)  
8. \( \binom{20}{2} \)  
9. \( \binom{30}{15} \)  
10. \( \binom{12}{5} \)  
11. \( \binom{10}{4} \)  
12. \( \binom{10}{6} \)  
13. \( \binom{100}{98} \)  
14. \( \binom{100}{2} \) 

In Exercises 15–18, evaluate using Pascal’s Triangle.

15. \( \binom{6}{5} \)  
16. \( \binom{9}{3} \)  
17. \( \binom{4}{3} \)  
18. \( \binom{10}{2} \) 

In Exercises 19–40, use the Binomial Theorem to expand and simplify the expression.

19. \((x + 1)^2\)  
20. \((x + 1)^6\)  
21. \((a + 6)^4\)  
22. \((a + 5)^3\)  
23. \((y - 4)^3\)  
24. \((y - 2)^5\)  
25. \((x + y)^3\)  
26. \((c + d)^3\)  
27. \((2x + y)^3\)  
28. \((7a + b)^3\)  
29. \((r + 3x)^6\)  
30. \((x + 2y)^4\)  
31. \((3a - 4b)^3\)  
32. \((2x - 5y)^5\)  
33. \((x^2 + y^2)^4\)  
34. \((x^2 + y^2)^6\)  
35. \(\left(\frac{1}{x} + y\right)^5\)  
36. \(\left(\frac{1}{x} + 2y\right)^6\)  
37. \(\left(\frac{2}{x} - y\right)^4\)  
38. \(\left(\frac{2}{x} - 3y\right)^5\)  
39. \(2(x - 3)^4 + 5(x - 3)^2\)  
40. \((4x - 1)^3 - 2(4x - 1)^4\) 

In Exercises 41–44, expand the binomial by using Pascal’s Triangle to determine the coefficients.

41. \((2r - 3)^5\)  
42. \((3 - 2z)^4\)  
43. \((x + 2y)^5\)  
44. \((3v + 2)^6\) 

In Exercises 45–52, find the specified th term in the expansion of the binomial.

45. \((x + y)^{10}, n = 4\)  
46. \((x - y)^6, n = 7\)  
47. \((x - 6y)^5, n = 3\)  
48. \((x - 10z)^7, n = 4\)  
49. \((4x + 3y)^9, n = 8\)  
50. \((5a + 6b)^5, n = 5\)  
51. \((10x - 3y)^{12}, n = 10\)  
52. \((7x + 2y)^{15}, n = 7\) 

In Exercises 53–60, find the coefficient \(a\) of the term in the expansion of the binomial.

In Exercises 61–66, use the Binomial Theorem to expand and simplify the expression.

61. \(\left(\sqrt{x} + 5\right)^3\)  
62. \(\left(2\sqrt{t} - 1\right)^3\)  
63. \((x^{2/3} - y^{1/3})^3\)  
64. \((a^{1/5} + 2)^5\)  
65. \((3\sqrt{x} + \sqrt[4]{x})^4\)  
66. \((x^{3/4} - 2x^{5/4})^4\) 

In Exercises 67–72, expand the expression in the difference quotient and simplify.

\(f(x + h) - f(x)\) \(\frac{h}{\text{Difference quotient}}\) 

67. \(f(x) = x^3\)  
68. \(f(x) = x^4\)  
69. \(f(x) = x^6\)  
70. \(f(x) = x^8\)  
71. \(f(x) = \sqrt{x}\)  
72. \(f(x) = \frac{1}{x}\)
In Exercises 73–78, use the Binomial Theorem to expand the complex number. Simplify your result.

73. \((1 + i)^4\)  
74. \((2 - i)^5\)  
75. \((2 - 3i)^6\)  
76. \((5 + \sqrt{-9})^3\)  
77. \(\left(- \frac{1}{2} + \frac{\sqrt{3}}{2}i\right)^3\)  
78. \((5 - \sqrt{3}i)^4\)

**Approximation** In Exercises 79–82, use the Binomial Theorem to approximate the quantity accurate to three decimal places. For example, in Exercise 79, use the expansion

\((1.02)^8 = (1 + 0.02)^8 \approx 1 + 8(0.02) + 28(0.02)^2 + \cdots.\)

79. \((1.02)^8\)  
80. \((2.005)^{10}\)  
81. \((2.99)^{12}\)  
82. \((1.98)^9\)

**Graphical Reasoning** In Exercises 83 and 84, use a graphing utility to graph \(f \) and \(g\) in the same viewing window. What is the relationship between the two graphs? Use the Binomial Theorem to write the polynomial function \(g\) in standard form.

83. \(f(x) = x^3 - 4x, \quad g(x) = f(x + 4)\)
84. \(f(x) = -x^4 + 4x^2 - 1, \quad g(x) = f(x - 3)\)

**Probability** In Exercises 85–88, consider independent trials of an experiment in which each trial has two possible outcomes: “success” or “failure.” The probability of a success on each trial is \(p\), and the probability of a failure is \(q = 1 - p\). In this context, the term \(\binom{n}{k} p^k q^{n-k}\) in the expansion of \((p + q)^n\) gives the probability of \(k\) successes in the \(n\) trials of the experiment.

85. A fair coin is tossed seven times. To find the probability of obtaining four heads, evaluate the term

\(\binom{7}{4} \left(\frac{1}{2}\right)^4 \left(\frac{1}{2}\right)^3\)

in the expansion of \((\frac{1}{2} + \frac{1}{2})^7\).
86. The probability of a baseball player getting a hit during any given time at bat is \(\frac{1}{3}\). To find the probability that the player gets three hits during the next 10 times at bat, evaluate the term

\(10\binom{10}{3} \left(\frac{1}{3}\right)^3 \left(\frac{2}{3}\right)^7\)

in the expansion of \((\frac{1}{3} + \frac{2}{3})^{10}\).
87. The probability of a sales representative making a sale with any one customer is \(\frac{1}{5}\). The sales representative makes eight contacts a day. To find the probability of making four sales, evaluate the term

\(8\binom{8}{4} \left(\frac{1}{5}\right)^4 \left(\frac{4}{5}\right)^4\)

in the expansion of \((\frac{1}{5} + \frac{4}{5})^8\).

88. To find the probability that the sales representative in Exercise 87 makes four sales if the probability of a sale with any one customer is \(\frac{1}{5}\), evaluate the term

\(8\binom{8}{4} \left(\frac{1}{5}\right)^4 \left(\frac{4}{5}\right)^4\)

in the expansion of \((\frac{1}{5} + \frac{4}{5})^8\).

89. **Finding a Pattern** Describe the pattern formed by the sums of the numbers along the diagonal segments of Pascal’s Triangle (see figure).

90. **Finding a Pattern** Use each of the encircled groups of numbers in the figure to form a \(2 \times 2\) matrix. Find the determinant of each matrix. Describe the pattern.

91. **Child Support** The average dollar amounts \(f(t)\) of child support collected per case in the United States from 2000 through 2007 can be approximated by the model

\[f(t) = -4.702t^2 + 110.18t + 1026.7, \quad 0 \leq t \leq 7\]

where \(t\) represents the year, with \(t = 0\) corresponding to 2000. (Source: U.S. Department of Health and Human Services)

(a) You want to adjust the model so that \(t = 0\) corresponds to 2005 rather than 2000. To do this, you shift the graph of \(f\) five units to the left to obtain

\(g(t) = f(t + 5)\). Write \(g(t)\) in standard form.

(b) Use a graphing utility to graph \(f\) and \(g\) in the same viewing window.

(c) Use the graphs to estimate when the average child support collections exceeded $1525.
92. DATA ANALYSIS: ELECTRICITY  The table shows the average prices $f(t)$ (in cents per kilowatt hour) of residential electricity in the United States from 2000 through 2007. (Source: Energy Information Administration)

<table>
<thead>
<tr>
<th>Year</th>
<th>Average price, $f(t)$</th>

</table>

(a) Use the regression feature of a graphing utility to find a cubic model for the data. Let $t$ represent the year, with $t = 0$ corresponding to 2000.

(b) Use the graphing utility to plot the data and the model in the same viewing window.

(c) You want to adjust the model so that $t = 0$ corresponds to 2005 rather than 2000. To do this, you shift the graph of $f$ five units to the left to obtain $g(t) = f(t + 5)$. Write $g(t)$ in standard form.

(d) Use the graphing utility to graph $g$ in the same viewing window as $f$.

(e) Use both models to estimate the average price in 2008. Do you obtain the same answer?

(f) Do your answers to part (e) seem reasonable? Explain.

(g) What factors do you think may have contributed to the change in the average price?

EXPLORATION

TRUE OR FALSE? In Exercises 93–95, determine whether the statement is true or false. Justify your answer.

93. The Binomial Theorem could be used to produce each row of Pascal’s Triangle.

94. A binomial that represents a difference cannot always be accurately expanded using the Binomial Theorem.

95. The $x^{10}$-term and the $x^{14}$-term of the expansion of $(x^3 + 3)^{12}$ have identical coefficients.

96. WRITING In your own words, explain how to form the rows of Pascal’s Triangle.

97. Form rows 8–10 of Pascal’s Triangle.

98. THINK ABOUT IT How many terms are in the expansion of $(x + y)^n$?

99. GRAPHICAL REASONING Which two functions have identical graphs, and why? Use a graphing utility to graph the functions in the given order and in the same viewing window. Compare the graphs.

(a) $f(x) = (1 - x)^3$

(b) $g(x) = 1 - x^3$

(c) $h(x) = 1 + 3x + 3x^2 + x^3$

(d) $k(x) = 1 - 3x + 3x^2 - x^3$

(e) $p(x) = 1 + 3x - 3x^2 + x^3$

100. CAPSTONE How do the expansions of $(x + y)^n$ and $(x - y)^n$ differ? Support your explanation with an example.

PROOF In Exercises 101–104, prove the property for all integers $r$ and $n$ where $0 \leq r \leq n$.

101. $\binom{n}{r} = \binom{n}{n-r}$

102. $\binom{n}{0} - \binom{n}{1} + \binom{n}{2} - \cdots \pm \binom{n}{n} = 0$

103. $\binom{n+1}{r} = \binom{n}{r} + \binom{n}{r-1}$

104. The sum of the numbers in the $n$th row of Pascal’s Triangle is $2^n$.

105. Complete the table and describe the result.

What characteristic of Pascal’s Triangle is illustrated by this table?

106. Another form of the Binomial Theorem is

$$(x + y)^n = x^n + \frac{n x^{n-1} y}{1!} + \frac{n(n-1)x^{n-2}y^2}{2!} + \cdots + \frac{n(n-1)(n-2)\cdots(n-r+1)x^{n-r}y^r}{r!} + \cdots + y^n.$$ Use this form of the Binomial Theorem to expand and simplify each expression.

(a) $(2x + 3)^6$

(b) $(x + ay)^4$

(c) $(x - ay)^5$

(d) $(1 + x)^{12}$
Section 9.6  Counting Principles

What you should learn

• Solve simple counting problems.
• Use the Fundamental Counting Principle to solve counting problems.
• Use permutations to solve counting problems.
• Use combinations to solve counting problems.

Why you should learn it

You can use counting principles to solve counting problems that occur in real life. For instance, in Exercise 78 on page 698, you are asked to use counting principles to determine the number of possible ways of selecting the winning numbers in the Powerball lottery.

COUNTING PRINCIPLES

Simple Counting Problems

This section and Section 9.7 present a brief introduction to some of the basic counting principles and their application to probability. In Section 9.7, you will see that much of probability has to do with counting the number of ways an event can occur. The following two examples describe simple counting problems.

Example 1  Selecting Pairs of Numbers at Random

Eight pieces of paper are numbered from 1 to 8 and placed in a box. One piece of paper is drawn from the box, its number is written down, and the piece of paper is replaced in the box. Then, a second piece of paper is drawn from the box, and its number is written down. Finally, the two numbers are added together. How many different ways can a sum of 12 be obtained?

Solution

To solve this problem, count the different ways that a sum of 12 can be obtained using two numbers from 1 to 8.

<table>
<thead>
<tr>
<th>First number</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Second number</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
</tr>
</tbody>
</table>

From this list, you can see that a sum of 12 can occur in five different ways.

CHECK POINT  Now try Exercise 11.

Example 2  Selecting Pairs of Numbers at Random

Eight pieces of paper are numbered from 1 to 8 and placed in a box. Two pieces of paper are drawn from the box at the same time, and the numbers on the pieces of paper are written down and totaled. How many different ways can a sum of 12 be obtained?

Solution

To solve this problem, count the different ways that a sum of 12 can be obtained using two different numbers from 1 to 8.

<table>
<thead>
<tr>
<th>First number</th>
<th>4</th>
<th>5</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Second number</td>
<td>8</td>
<td>7</td>
<td>5</td>
<td>4</td>
</tr>
</tbody>
</table>

So, a sum of 12 can be obtained in four different ways.

CHECK POINT  Now try Exercise 13.

The difference between the counting problems in Examples 1 and 2 can be described by saying that the random selection in Example 1 occurs with replacement, whereas the random selection in Example 2 occurs without replacement, which eliminates the possibility of choosing two 6’s.
The Fundamental Counting Principle

Examples 1 and 2 describe simple counting problems in which you can list each possible way that an event can occur. When it is possible, this is always the best way to solve a counting problem. However, some events can occur in so many different ways that it is not feasible to write out the entire list. In such cases, you must rely on formulas and counting principles. The most important of these is the Fundamental Counting Principle.

**Fundamental Counting Principle**

Let $E_1$ and $E_2$ be two events. The first event $E_1$ can occur in $m_1$ different ways. After $E_1$ has occurred, $E_2$ can occur in $m_2$ different ways. The number of ways that the two events can occur is $m_1 \cdot m_2$.

The Fundamental Counting Principle can be extended to three or more events. For instance, the number of ways that three events $E_1$, $E_2$, and $E_3$ can occur is $m_1 \cdot m_2 \cdot m_3$.

**Example 3** Using the Fundamental Counting Principle

How many different pairs of letters from the English alphabet are possible?

**Solution**

There are two events in this situation. The first event is the choice of the first letter, and the second event is the choice of the second letter. Because the English alphabet contains 26 letters, it follows that the number of two-letter pairs is

$$26 \cdot 26 = 676.$$  

Now try Exercise 19.

**Example 4** Using the Fundamental Counting Principle

Telephone numbers in the United States currently have 10 digits. The first three are the area code and the next seven are the local telephone number. How many different telephone numbers are possible within each area code? (Note that at this time, a local telephone number cannot begin with 0 or 1.)

**Solution**

Because the first digit of a local telephone number cannot be 0 or 1, there are only eight choices for the first digit. For each of the other six digits, there are 10 choices.

So, the number of local telephone numbers that are possible within each area code is

$$8 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 = 8,000,000.$$  

Now try Exercise 25.
Permutations

One important application of the Fundamental Counting Principle is in determining the number of ways that \( n \) elements can be arranged (in order). An ordering of \( n \) elements is called a permutation of the elements.

Definition of Permutation

A permutation of \( n \) different elements is an ordering of the elements such that one element is first, one is second, one is third, and so on.

Example 5 Finding the Number of Permutations of \( n \) Elements

How many permutations are possible for the letters A, B, C, D, E, and F?

Solution

Consider the following reasoning.

*First position:* Any of the six letters
*Second position:* Any of the remaining five letters
*Third position:* Any of the remaining four letters
*Fourth position:* Any of the remaining three letters
*Fifth position:* Either of the remaining two letters
*Sixth position:* The one remaining letter

So, the numbers of choices for the six positions are as follows.

\[
\begin{align*}
\text{First position:} & \quad 6 \\
\text{Second position:} & \quad 5 \\
\text{Third position:} & \quad 4 \\
\text{Fourth position:} & \quad 3 \\
\text{Fifth position:} & \quad 2 \\
\text{Sixth position:} & \quad 1
\end{align*}
\]

The total number of permutations of the six letters is

\[
6! = 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 = 720.
\]

Now try Exercise 39.

Number of Permutations of \( n \) Elements

The number of permutations of \( n \) elements is

\[
n \cdot (n - 1) \cdot \ldots \cdot 4 \cdot 3 \cdot 2 \cdot 1 = n!.
\]

In other words, there are \( n! \) different ways that \( n \) elements can be ordered.
Chapter 9 Sequences, Series, and Probability

Example 6 Counting Horse Race Finishes

Eight horses are running in a race. In how many different ways can these horses come in first, second, and third? (Assume that there are no ties.)

Solution

Here are the different possibilities.

- Win (first position): Eight choices
- Place (second position): Seven choices
- Show (third position): Six choices

Using the Fundamental Counting Principle, multiply these three numbers together to obtain the following.

So, there are $8 \cdot 7 \cdot 6 = 336$ different orders.

Now try Exercise 41.

It is useful, on occasion, to order a subset of a collection of elements rather than the entire collection. For example, you might want to choose and order $r$ elements out of a collection of $n$ elements. Such an ordering is called a permutation of $n$ elements taken $r$ at a time.

TECHNOLOGY

Most graphing calculators are programmed to evaluate $P_r$. Consult the user’s guide for your calculator and then evaluate $8P_3$. You should get an answer of 6720.

Permutations of $n$ Elements Taken $r$ at a Time

The number of permutations of $n$ elements taken $r$ at a time is

\[
\begin{align*}
\quad nPr &= \frac{n!}{(n-r)!} \\
&= n(n-1)(n-2) \cdots (n-r+1).
\end{align*}
\]

Using this formula, you can rework Example 6 to find that the number of permutations of eight horses taken three at a time is

\[
\begin{align*}
8P_3 &= \frac{8!}{(8-3)!} \\
&= \frac{8!}{5!} \\
&= \frac{8 \cdot 7 \cdot 6 \cdot 5!}{5!} \\
&= 8 \cdot 7 \cdot 6 \\
&= 336
\end{align*}
\]

which is the same answer obtained in the example.

Eleven thoroughbred racehorses hold the title of Triple Crown winner for winning the Kentucky Derby, the Preakness, and the Belmont Stakes in the same year. Forty-nine horses have won two out of the three races.
Remember that for permutations, order is important. So, if you are looking at the possible permutations of the letters A, B, C, and D taken three at a time, the permutations (A, B, D) and (B, A, D) are counted as different because the order of the elements is different.

Suppose, however, that you are asked to find the possible permutations of the letters A, A, B, and C. The total number of permutations of the four letters would be \(4! = 4!.\) However, not all of these arrangements would be distinguishable because there are two A’s in the list. To find the number of distinguishable permutations, you can use the following formula.

**Distinguishable Permutations**

Suppose a set of \(n\) objects has \(n_1\) of one kind of object, \(n_2\) of a second kind, \(n_3\) of a third kind, and so on, with

\[ n = n_1 + n_2 + n_3 + \cdots + n_k. \]

Then the number of distinguishable permutations of the \(n\) objects is

\[
\frac{n!}{n_1! \cdot n_2! \cdot n_3! \cdot \cdots \cdot n_k!}.
\]

**Example 7**  
**Distinguishable Permutations**

In how many distinguishable ways can the letters in BANANA be written?

**Solution**

This word has six letters, of which three are A’s, two are N’s, and one is a B. So, the number of distinguishable ways the letters can be written is

\[
\frac{6!}{3! \cdot 2! \cdot 1!} = \frac{6 \cdot 5 \cdot 4 \cdot 3!}{3! \cdot 2!} = 60.
\]

The 60 different distinguishable permutations are as follows.

- AAABNN  AAANBN  AAAANN  AABANN  AABNAN  AABNNA
- AANABN  AANANB  AANBAN  AANBNA  AANNAB  AANNBA
- ABAANN  ABANAN  ABANNA  ABNAAN  ABNANA  ABNANAA
- ANAABN  ANAANB  ANABAN  ANABNA  ANANAB  ANANBA
- ANBAAAN  ANBANA  ANBNAA  ANNAAB ANNABA  ANNABAA
- BAAANN  BAAANAN  BAANAN  BANAAN  BANANA  BANANAA
- BNAANAN  BNAANA  BNANAA  NAAABN  NAAANB  NAAANB
- NAAABN  NAAANB  NABANAA  NABAAAN  NABAAAN  NABANA
- NABNAA  NABANAB  NABABA  NABABAA  NABAAA  NABANAA
- NBANAA  NBNAAA  NNAAB  NNAABA  NNAABAA  NNABAA

*CHECK Point*  Now try Exercise 43.
Combinations

When you count the number of possible permutations of a set of elements, order is important. As a final topic in this section, you will look at a method of selecting subsets of a larger set in which order is not important. Such subsets are called combinations of \( n \) elements taken \( r \) at a time. For instance, the combinations

\[
\{A, B, C\} \quad \text{and} \quad \{B, A, C\}
\]

are equivalent because both sets contain the same three elements, and the order in which the elements are listed is not important. So, you would count only one of the two sets.

A common example of how a combination occurs is a card game in which the player is free to reorder the cards after they have been dealt.

Example 8  Combinations of \( n \) Elements Taken \( r \) at a Time

In how many different ways can three letters be chosen from the letters A, B, C, D, and E? (The order of the three letters is not important.)

Solution

The following subsets represent the different combinations of three letters that can be chosen from the five letters.

\[
\begin{align*}
\{A, B, C\} & \quad \{A, B, D\} \\
\{A, B, E\} & \quad \{A, C, D\} \\
\{A, C, E\} & \quad \{A, D, E\} \\
\{B, C, D\} & \quad \{B, C, E\} \\
\{B, D, E\} & \quad \{C, D, E\}
\end{align*}
\]

From this list, you can conclude that there are 10 different ways that three letters can be chosen from five letters.

Now try Exercise 61.

Combinations of \( n \) Elements Taken \( r \) at a Time

The number of combinations of \( n \) elements taken \( r \) at a time is

\[
\binom{n}{r} = \frac{n!}{(n - r)!r!}
\]

which is equivalent to

\[
\binom{n}{r} = \frac{n^P_r}{r!}.
\]

Note that the formula for \( \binom{n}{r} \) is the same one given for binomial coefficients. To see how this formula is used, solve the counting problem in Example 8. In that problem, you are asked to find the number of combinations of five elements taken three at a time. So, \( n = 5, r = 3 \), and the number of combinations is

\[
\binom{5}{3} = \frac{5!}{2!3!} = \frac{5 \cdot 4 \cdot 3!}{2 \cdot 1 \cdot 3!} = 10
\]

which is the same answer obtained in Example 8.
Section 9.6 Counting Principles

Counting Card Hands

A standard poker hand consists of five cards dealt from a deck of 52 (see Figure 9.7). How many different poker hands are possible? (After the cards are dealt, the player may reorder them, and so order is not important.)

Solution

You can find the number of different poker hands by using the formula for the number of combinations of 52 elements taken five at a time, as follows.

\[
\binom{52}{5} = \frac{52!}{(52 - 5)!5!} = \frac{52!}{47!5!} = \frac{52 \cdot 51 \cdot 50 \cdot 49 \cdot 48 \cdot 47!}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1 \cdot 47!} = 2,598,960
\]

Now try Exercise 63.

Forming a Team

You are forming a 12-member swim team from 10 girls and 15 boys. The team must consist of five girls and seven boys. How many different 12-member teams are possible?

Solution

There are \( \binom{10}{5} \) ways of choosing five girls. There are \( \binom{15}{7} \) ways of choosing seven boys. By the Fundamental Counting Principal, there are \( \binom{10}{5} \cdot \binom{15}{7} \) ways of choosing five girls and seven boys.

\[
\binom{10}{5} \cdot \binom{15}{7} = \frac{10!}{5! \cdot 5!} \cdot \frac{15!}{8! \cdot 7!} = 252 \cdot 6435 = 1,621,620
\]

So, there are 1,621,620 12-member swim teams possible.

Now try Exercise 71.

When solving problems involving counting principles, you need to be able to distinguish among the various counting principles in order to determine which is necessary to solve the problem correctly. To do this, ask yourself the following questions.

1. Is the order of the elements important? Permutation
2. Are the chosen elements a subset of a larger set in which order is not important? Combination
3. Does the problem involve two or more separate events? Fundamental Counting Principle
9.6  EXERCISES

VOCABULARY:  Fill in the blanks.

1. The ________ ________ ________ states that if there are $m_1$ ways for one event to occur and $m_2$ ways for a second event to occur, there are $m_1 \cdot m_2$ ways for both events to occur.

2. An ordering of $n$ elements is called a ________ of the elements.

3. The number of permutations of $n$ elements taken $r$ at a time is given by the formula ________.

4. The number of ________ ________ of $n$ objects is given by $\frac{n!}{n_1!n_2!\cdots n_k!}$.

5. When selecting subsets of a larger set in which order is not important, you are finding the number of ________ of $n$ elements taken $r$ at a time.

6. The number of combinations of $n$ elements taken $r$ at a time is given by the formula ________.

SKILLS AND APPLICATIONS

RANDOM SELECTION  In Exercises 7–14, determine the number of ways a computer can randomly generate one or more such integers from 1 through 12.

7. An odd integer
8. An even integer
9. A prime integer
10. An integer that is greater than 9
11. An integer that is divisible by 4
12. An integer that is divisible by 3
13. Two distinct integers whose sum is 9
14. Two distinct integers whose sum is 8

ENTERTAINMENT SYSTEMS  A customer can choose one of three amplifiers, one of two compact disc players, and one of five speaker models for an entertainment system. Determine the number of possible system configurations.

JOB APPLICANTS  A college needs two additional faculty members: a chemist and a statistician. In how many ways can these positions be filled if there are five applicants for the chemistry position and three applicants for the statistics position?

COURSE SCHEDULE  A college student is preparing a course schedule for the next semester. The student may select one of two mathematics courses, one of three science courses, and one of five courses from the social sciences and humanities. How many schedules are possible?

AIRCRAFT BOARDING  Eight people are boarding an aircraft. Two have tickets for first class and board before those in the economy class. In how many ways can the eight people board the aircraft?

TRUE-FALSE EXAM  In how many ways can a six-question true-false exam be answered? (Assume that no questions are omitted.)

20. TRUE-FALSE EXAM  In how many ways can a 12-question true-false exam be answered? (Assume that no questions are omitted.)

LICENSE PLATE NUMBERS  In the state of Pennsylvania, each standard automobile license plate number consists of three letters followed by a four-digit number. How many distinct license plate numbers can be formed in Pennsylvania?

LICENSE PLATE NUMBERS  In a certain state, each automobile license plate number consists of two letters followed by a four-digit number. To avoid confusion between “O” and “zero” and between “I” and “one,” the letters “O” and “I” are not used. How many distinct license plate numbers can be formed in this state?

THREE-DIGIT NUMBERS  How many three-digit numbers can be formed under each condition?
(a) The leading digit cannot be zero.
(b) The leading digit cannot be zero and no repetition of digits is allowed.
(c) The leading digit cannot be zero and the number must be a multiple of 5.
(d) The number is at least 400.

FOUR-DIGIT NUMBERS  How many four-digit numbers can be formed under each condition?
(a) The leading digit cannot be zero.
(b) The leading digit cannot be zero and no repetition of digits is allowed.
(c) The leading digit cannot be zero and the number must be less than 5000.
(d) The leading digit cannot be zero and the number must be even.

COMBINATION LOCK  A combination lock will open when the right choice of three numbers (from 1 to 40, inclusive) is selected. How many different lock combinations are possible?
26. **COMBINATION LOCK** A combination lock will open when the right choice of three numbers (from 1 to 50, inclusive) is selected. How many different lock combinations are possible?

27. **CONCERT SEATS** Four couples have reserved seats in a row for a concert. In how many different ways can they be seated if
(a) there are no seating restrictions?
(b) the two members of each couple wish to sit together?

28. **SINGLE FILE** In how many orders can four girls and four boys walk through a doorway single file if
(a) there are no restrictions?
(b) the girls walk through before the boys?

In Exercises 29–34, evaluate \( n \text{P}_r \).

29. \( 4 \text{P}_4 \)
30. \( 5 \text{P}_5 \)
31. \( 4 \text{P}_3 \)
32. \( 20 \text{P}_2 \)
33. \( 3 \text{P}_4 \)
34. \( 7 \text{P}_4 \)

In Exercises 35–38, evaluate \( n \text{C}_r \) using a graphing utility.

35. \( 20 \text{C}_5 \)
36. \( 100 \text{C}_5 \)
37. \( 100 \text{C}_3 \)
38. \( 10 \text{C}_8 \)

39. **POsing FOR A PHOTOGRAPH** In how many ways can five children posing for a photograph line up in a row?

40. **Riding In A CAR** In how many ways can six people sit in a six-passenger car?

41. **Choosing Officers** From a pool of 12 candidates, the offices of president, vice-president, secretary, and treasurer will be filled. In how many different ways can the offices be filled?

42. **Assembly Line Production** There are four processes involved in assembling a product, and these processes can be performed in any order. The management wants to test each order to determine which is the least time-consuming. How many different orders will have to be tested?

In Exercises 43–46, find the number of distinguishable permutations of the group of letters.

43. A, A, G, E, E, E, M
44. B, B, B, T, T, T, T
45. A, L, G, E, B, R, A

47. Write all permutations of the letters A, B, C, and D.
48. Write all permutations of the letters A, B, C, and D if the letters B and C must remain between the letters A and D.

49. **Batting Order** A baseball coach is creating a nine-player batting order by selecting from a team of 15 players. How many different batting orders are possible?

50. **Athletics** Eight sprinters have qualified for the finals in the 100-meter dash at the NCAA national track meet. In how many ways can the sprinters come in first, second, and third? (Assume there are no ties.)

In Exercises 51–56, evaluate \( n \text{C}_r \) using the formula from this section.

51. \( 5 \text{C}_2 \)
52. \( 6 \text{C}_3 \)
53. \( 7 \text{C}_1 \)
54. \( 5 \text{C}_1 \)
55. \( 25 \text{C}_0 \)
56. \( 20 \text{C}_0 \)

In Exercises 57–60, evaluate \( n \text{C}_r \) using a graphing utility.

57. \( 20 \text{C}_4 \)
58. \( 10 \text{C}_7 \)
59. \( 42 \text{C}_5 \)
60. \( 20 \text{C}_6 \)

61. Write all possible selections of two letters that can be formed from the letters A, B, C, D, E, and F. (The order of the two letters is not important.)

62. **Forming An Experimental Group** In order to conduct an experiment, five students are randomly selected from a class of 20. How many different groups of five students are possible?

63. **Jury Selection** From a group of 40 people, a jury of 12 people is to be selected. In how many different ways can the jury be selected?

64. **Committee Members** A U.S. Senate Committee has 14 members. Assuming party affiliation was not a factor in selection, how many different committees were possible from the 100 U.S. senators?

65. **Lottery Choices** In the Massachusetts Mass Cash game, a player chooses five distinct numbers from 1 to 35. In how many ways can a player select the five numbers?

66. **Lottery Choices** In the Louisiana Lotto game, a player chooses six distinct numbers from 1 to 40. In how many ways can a player select the six numbers?

67. **Defective Units** A shipment of 25 television sets contains three defective units. In how many ways can a vending company purchase four of these units and receive (a) all good units, (b) two good units, and (c) at least two good units?

68. **Interpersonal Relationships** The complexity of interpersonal relationships increases dramatically as the size of a group increases. Determine the numbers of different two-person relationships in groups of people of sizes (a) 3, (b) 8, (c) 12, and (d) 20.
69. **POKER HAND** You are dealt five cards from an ordinary deck of 52 playing cards. In how many ways can you get (a) a full house and (b) a five-card combination containing two jacks and three aces? (A full house consists of three of one kind and two of another. For example, A-A-A-5-5 and K-K-K-10-10 are full houses.)

70. **JOB APPLICANTS** A clothing manufacturer interviews 12 people for four openings in the human resources department of the company. Five of the 12 people are women. If all 12 are qualified, in how many ways can the employer fill the four positions if (a) the selection is random and (b) exactly two women are selected?

71. **FORMING A COMMITTEE** A six-member research committee at a local college is to be formed having one administrator, three faculty members, and two students. There are seven administrators, 12 faculty members, and 20 students in contention for the committee. How many six-member committees are possible?

72. **LAW ENFORCEMENT** A police department uses computer imaging to create digital photographs of alleged perpetrators from eyewitness accounts. One software package contains 195 hairlines, 99 sets of eyes and eyebrows, 89 noses, 105 mouths, and 74 chins and cheek structures.

(a) Find the possible number of different faces that the software could create.

(b) An eyewitness can clearly recall the hairline and eyes and eyebrows of a suspect. How many different faces can be produced with this information?

**GEOMETRY** In Exercises 73–76, find the number of diagonals of the polygon. (A line segment connecting any two nonadjacent vertices is called a diagonal of the polygon.)

73. Pentagon
74. Hexagon
75. Octagon
76. Decagon (10 sides)

77. **GEOMETRY** Three points that are not collinear determine three lines. How many lines are determined by nine points, no three of which are collinear?

78. **LOTTERY** Powerball is a lottery game that is operated by the Multi-State Lottery Association and is played in 30 states, Washington D.C., and the U.S. Virgin Islands. The game is played by drawing five white balls out of a drum of 59 white balls (numbered 1–59) and one red powerball out of a drum of 39 red balls (numbered 1–39). The jackpot is won by matching all five white balls in any order and the red powerball.

(a) Find the possible number of winning Powerball numbers.

(b) Find the possible number of winning Powerball numbers if the jackpot is won by matching all five white balls in order and the red powerball.

(c) Compare the results of part (a) with a state lottery in which a jackpot is won by matching six balls from a drum of 59 balls.

In Exercises 79–86, solve for \( n \).

79. \( 14 \cdot \binom{n}{3} = \binom{n+1}{2} \) \hspace{1cm} 80. \( \binom{n}{5} = 18 \cdot \binom{n-2}{4} \)

81. \( \binom{n}{4} = 10 \cdot \binom{n-1}{3} \) \hspace{1cm} 82. \( \binom{n}{6} = 12 \cdot \binom{n-1}{5} \)

83. \( \binom{n+1}{3} = 4 \cdot \binom{n}{2} \) \hspace{1cm} 84. \( \binom{n+2}{3} = 6 \cdot \binom{n+3}{1} \)

85. \( 4 \cdot \binom{n+1}{2} = \binom{n+2}{3} \) \hspace{1cm} 86. \( 5 \cdot \binom{n-1}{1} = \binom{n}{2} \)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 87 and 88, determine whether the statement is true or false. Justify your answer.

87. The number of letter pairs that can be formed in any order from any two of the first 13 letters in the alphabet (A–M) is an example of a permutation.

88. The number of permutations of \( n \) elements can be determined by using the Fundamental Counting Principle.

89. What is the relationship between \( \binom{n}{r} \) and \( \binom{n}{n-r} \)?

90. Without calculating the numbers, determine which of the following is greater. Explain.

(a) The number of combinations of 10 elements taken six at a time

(b) The number of permutations of 10 elements taken six at a time

**PROOF** In Exercises 91–94, prove the identity.

91. \( n \binom{n-1}{2} = n \binom{n}{3} \) \hspace{1cm} 92. \( n \binom{n}{n} = n \binom{n}{0} \)

93. \( n \binom{n-1}{3} = n \binom{n-1}{2} \) \hspace{1cm} 94. \( \binom{n}{r} = \frac{n P_r}{r!} \)

95. **THINK ABOUT IT** Can your calculator evaluate \( 100 P_{80} \)? If not, explain why.

96. **CAPSTONE** Decide whether each scenario should be counted using permutations or combinations. Explain your reasoning. (Do not calculate.)

(a) Number of ways 10 people can line up in a row for concert tickets.

(b) Number of different arrangements of three types of flowers from an array of 20 types.

(c) Number of four-digit pin numbers for a debit card.

(d) Number of two-scoop ice cream sundaes created from 31 different flavors.

97. **WRITING** Explain in words the meaning of \( n P_r \).
The Probability of an Event

Any happening for which the result is uncertain is called an experiment. The possible results of the experiment are outcomes, the set of all possible outcomes of the experiment is the sample space of the experiment, and any subcollection of a sample space is an event.

For instance, when a six-sided die is tossed, the sample space can be represented by the numbers 1 through 6. For this experiment, each of the outcomes is equally likely.

To describe sample spaces in such a way that each outcome is equally likely, you must sometimes distinguish between or among various outcomes in ways that appear artificial. Example 1 illustrates such a situation.

Example 1 Finding a Sample Space

Find the sample space for each of the following.

a. One coin is tossed.

b. Two coins are tossed.

c. Three coins are tossed.

Solution

a. Because the coin will land either heads up (denoted by H) or tails up (denoted by T), the sample space is

\[ S = \{ H, T \} \]

b. Because either coin can land heads up or tails up, the possible outcomes are as follows.

\[ HH = \text{heads up on both coins} \]

\[ HT = \text{heads up on first coin and tails up on second coin} \]

\[ TH = \text{tails up on first coin and heads up on second coin} \]

\[ TT = \text{tails up on both coins} \]

So, the sample space is

\[ S = \{ HH, HT, TH, TT \} \]

Note that this list distinguishes between the two cases HT and TH, even though these two outcomes appear to be similar.

c. Following the notation of part (b), the sample space is

\[ S = \{ HHH, HHT, HTH, HTT, THH, THT, TTH, TTT \} \]

Note that this list distinguishes among the cases HHT, HTH, and THH, and among the cases HHT, THT, and TTH.

CHECKPOINT Now try Exercise 9.
To calculate the probability of an event, count the number of outcomes in the event and in the sample space. The number of outcomes in event $E$ is denoted by $n(E)$, and the number of outcomes in the sample space $S$ is denoted by $n(S)$. The probability that event $E$ will occur is given by $n(E)/n(S)$.

### The Probability of an Event

If an event $E$ has $n(E)$ equally likely outcomes and its sample space $S$ has $n(S)$ equally likely outcomes, the probability of event $E$ is

$$P(E) = \frac{n(E)}{n(S)}.$$  

Because the number of outcomes in an event must be less than or equal to the number of outcomes in the sample space, the probability of an event must be a number between 0 and 1. That is,

$$0 \leq P(E) \leq 1$$

as indicated in Figure 9.8. If $P(E) = 0$, event $E$ cannot occur, and $E$ is called an impossible event. If $P(E) = 1$, event $E$ must occur, and $E$ is called a certain event.

### Example 2 Finding the Probability of an Event

a. Two coins are tossed. What is the probability that both land heads up?

b. A card is drawn from a standard deck of playing cards. What is the probability that it is an ace?

#### Solution

a. Following the procedure in Example 1(b), let

$$E = \{HH\}$$

and

$$S = \{HH, HT, TH, TT\}.$$  

The probability of getting two heads is

$$P(E) = \frac{n(E)}{n(S)} = \frac{1}{4}.$$  

b. Because there are 52 cards in a standard deck of playing cards and there are four aces (one in each suit), the probability of drawing an ace is

$$P(E) = \frac{n(E)}{n(S)} = \frac{4}{52} = \frac{1}{13}.$$  

#### Study Tip

You can write a probability as a fraction, a decimal, or a percent. For instance, in Example 2(a), the probability of getting two heads can be written as $\frac{1}{4}$, 0.25, or 25%.

#### Check Point

Now try Exercise 15.
Example 3  Finding the Probability of an Event

Two six-sided dice are tossed. What is the probability that the total of the two dice is 7? (See Figure 9.9.)

Solution

Because there are six possible outcomes on each die, you can use the Fundamental Counting Principle to conclude that there are \(6 \times 6 = 36\) different outcomes when two dice are tossed. To find the probability of rolling a total of 7, you must first count the number of ways in which this can occur.

<table>
<thead>
<tr>
<th>First die</th>
<th>Second die</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>5</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

So, a total of 7 can be rolled in six ways, which means that the probability of rolling a 7 is

\[
P(E) = \frac{n(E)}{n(S)} = \frac{6}{36} = \frac{1}{6}.
\]

Now try Exercise 25.

Example 4  Finding the Probability of an Event

Twelve-sided dice, as shown in Figure 9.10, can be constructed (in the shape of regular dodecahedrons) such that each of the numbers from 1 to 6 appears twice on each die. Prove that these dice can be used in any game requiring ordinary six-sided dice without changing the probabilities of the various outcomes.

Solution

For an ordinary six-sided die, each of the numbers 1, 2, 3, 4, 5, and 6 occurs only once, so the probability of any particular number coming up is

\[
P(E) = \frac{n(E)}{n(S)} = \frac{1}{6}.
\]

For one of the 12-sided dice, each number occurs twice, so the probability of any particular number coming up is

\[
P(E) = \frac{n(E)}{n(S)} = \frac{2}{12} = \frac{1}{6}.
\]

Now try Exercise 27.
Example 5  The Probability of Winning a Lottery

In Arizona’s The Pick game, a player chooses six different numbers from 1 to 44. If these six numbers match the six numbers drawn (in any order) by the lottery commission, the player wins (or shares) the top prize. What is the probability of winning the top prize if the player buys one ticket?

Solution

To find the number of elements in the sample space, use the formula for the number of combinations of 44 elements taken six at a time.

\[ n(S) = \frac{44!}{6! \cdot 38!} \]

\[ = \frac{44 \cdot 43 \cdot 42 \cdot 41 \cdot 40 \cdot 39}{6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} \]

\[ = 7,059,052 \]

If a person buys only one ticket, the probability of winning is

\[ P(E) = \frac{n(E)}{n(S)} = \frac{1}{7,059,052}. \]

CHECKPoint  Now try Exercise 31.

Example 6  Random Selection

The numbers of colleges and universities in various regions of the United States in 2007 are shown in Figure 9.11. One institution is selected at random. What is the probability that the institution is in one of the three southern regions? (Source: National Center for Education Statistics)

Solution

From the figure, the total number of colleges and universities is 4309. Because there are 738 + 276 + 406 = 1420 colleges and universities in the three southern regions, the probability that the institution is in one of these regions is

\[ P(E) = \frac{n(E)}{n(S)} = \frac{1420}{4309} \approx 0.330. \]

FIGURE 9.11

CHECKPoint  Now try Exercise 43.
Mutually Exclusive Events

Two events $A$ and $B$ (from the same sample space) are mutually exclusive if $A$ and $B$ have no outcomes in common. In the terminology of sets, the intersection of $A$ and $B$ is the empty set, which implies that

$$P(A \cap B) = 0.$$ 

For instance, if two dice are tossed, the event of rolling a total of 6 and the event of rolling a total of 9 are mutually exclusive. To find the probability that one or the other of two mutually exclusive events will occur, you can *add* their individual probabilities.

**Probability of the Union of Two Events**

If $A$ and $B$ are events in the same sample space, the probability of $A$ or $B$ occurring is given by

$$P(A \cup B) = P(A) + P(B) - P(A \cap B).$$

If $A$ and $B$ are mutually exclusive, then

$$P(A \cup B) = P(A) + P(B).$$

**Example 7** The Probability of a Union of Events

One card is selected from a standard deck of 52 playing cards. What is the probability that the card is either a heart or a face card?

**Solution**

Because the deck has 13 hearts, the probability of selecting a heart (event $A$) is

$$P(A) = \frac{13}{52}.$$  

Similarly, because the deck has 12 face cards, the probability of selecting a face card (event $B$) is

$$P(B) = \frac{12}{52}.$$  

Because three of the cards are hearts and face cards (see Figure 9.12), it follows that

$$P(A \cap B) = \frac{3}{52}.$$  

Finally, applying the formula for the probability of the union of two events, you can conclude that the probability of selecting a heart or a face card is

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$= \frac{13}{52} + \frac{12}{52} - \frac{3}{52} = \frac{22}{52} \approx 0.423.$$ 

Now try Exercise 57.
The personnel department of a company has compiled data on the numbers of employees who have been with the company for various periods of time. The results are shown in the table.

<table>
<thead>
<tr>
<th>Years of Service</th>
<th>Number of employees</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–4</td>
<td>157</td>
</tr>
<tr>
<td>5–9</td>
<td>89</td>
</tr>
<tr>
<td>10–14</td>
<td>74</td>
</tr>
<tr>
<td>15–19</td>
<td>63</td>
</tr>
<tr>
<td>20–24</td>
<td>42</td>
</tr>
<tr>
<td>25–29</td>
<td>38</td>
</tr>
<tr>
<td>30–34</td>
<td>37</td>
</tr>
<tr>
<td>35–39</td>
<td>21</td>
</tr>
<tr>
<td>40–44</td>
<td>8</td>
</tr>
</tbody>
</table>

If an employee is chosen at random, what is the probability that the employee has (a) 4 or fewer years of service and (b) 9 or fewer years of service?

**Solution**

a. To begin, add the number of employees to find that the total is 529. Next, let event \( A \) represent choosing an employee with 0 to 4 years of service. Then the probability of choosing an employee who has 4 or fewer years of service is

\[
P(A) = \frac{157}{529} \approx 0.297.
\]

b. Let event \( B \) represent choosing an employee with 5 to 9 years of service. Then

\[
P(B) = \frac{89}{529}.
\]

Because event \( A \) from part (a) and event \( B \) have no outcomes in common, you can conclude that these two events are mutually exclusive and that

\[
P(A \cup B) = P(A) + P(B) = \frac{157}{529} + \frac{89}{529} = \frac{246}{529} \approx 0.465.
\]

So, the probability of choosing an employee who has 9 or fewer years of service is about 0.465.

**CHECKPOINT** Now try Exercise 59.
Independent Events

Two events are independent if the occurrence of one has no effect on the occurrence of the other. For instance, rolling a total of 12 with two six-sided dice has no effect on the outcome of future rolls of the dice. To find the probability that two independent events will occur, multiply the probabilities of each.

**Probability of Independent Events**

If $A$ and $B$ are independent events, the probability that both $A$ and $B$ will occur is

$$P(A \text{ and } B) = P(A) \cdot P(B).$$

**Example 9**  
**Probability of Independent Events**

A random number generator on a computer selects three integers from 1 to 20. What is the probability that all three numbers are less than or equal to 5?

**Solution**

The probability of selecting a number from 1 to 5 is

$$P(A) = \frac{5}{20} = \frac{1}{4}.$$  

So, the probability that all three numbers are less than or equal to 5 is

$$P(A) \cdot P(A) \cdot P(A) = \left(\frac{1}{4}\right)^3 = \frac{1}{64}.$$  

**Example 10**  
**Probability of Independent Events**

In 2009, approximately 13% of the adult population of the United States got most of their news from the Internet. In a survey, 10 people were chosen at random from the adult population. What is the probability that all 10 got most of their news from the Internet?  
(Source: CBS News/New York Times Poll)

**Solution**

Let $A$ represent choosing an adult who gets most of his or her news from the Internet. The probability of choosing an adult who got most of his or her news from the Internet is 0.13, the probability of choosing a second adult who got most of his or her news from the Internet is 0.13, and so on. Because these events are independent, you can conclude that the probability that all 10 people got most of their news from the Internet is

$$[P(A)]^{10} = (0.13)^{10} \approx 0.000000001.$$  

**Check Point**  
Now try Exercise 61.
The Complement of an Event

The complement of an event \( A \) is the collection of all outcomes in the sample space that are not in \( A \). The complement of event \( A \) is denoted by \( A' \). Because \( P(A \text{ or } A') = 1 \) and because \( A \) and \( A' \) are mutually exclusive, it follows that \( P(A) + P(A') = 1 \). So, the probability of \( A' \) is

\[
P(A') = 1 - P(A).
\]

For instance, if the probability of winning a certain game is

\[
P(A) = \frac{1}{4}
\]

the probability of losing the game is

\[
P(A') = 1 - \frac{1}{4} = \frac{3}{4}.
\]

Probability of a Complement

Let \( A \) be an event and let \( A' \) be its complement. If the probability of \( A \) is \( P(A) \), the probability of the complement is

\[
P(A') = 1 - P(A).
\]

Example 11 Finding the Probability of a Complement

A manufacturer has determined that a machine averages one faulty unit for every 1000 it produces. What is the probability that an order of 200 units will have one or more faulty units?

Solution

To solve this problem as stated, you would need to find the probabilities of having exactly one faulty unit, exactly two faulty units, exactly three faulty units, and so on. However, using complements, you can simply find the probability that all units are perfect and then subtract this value from 1. Because the probability that any given unit is perfect is 999/1000, the probability that all 200 units are perfect is

\[
P(A) = \left( \frac{999}{1000} \right)^{200}
\]

\[
\approx 0.819.
\]

So, the probability that at least one unit is faulty is

\[
P(A') = 1 - P(A)
\]

\[
\approx 1 - 0.819
\]

\[
= 0.181.
\]

CHECKPOINT Now try Exercise 65.
9.7 Exercises

Vocabulary

In Exercises 1–7, fill in the blanks.

1. An ________ is an event whose result is uncertain, and the possible results of the event are called ________.
2. The set of all possible outcomes of an experiment is called the ________ ________.
3. To determine the ________ of an event, you can use the formula where is the number of outcomes in the event and is the number of outcomes in the sample space.
4. If then is an ________ event, and if then is a ________ event.
5. If two events from the same sample space have no outcomes in common, then the two events are ________ ________.
6. If the occurrence of one event has no effect on the occurrence of a second event, then the events are ________.
7. The ________ of an event is the collection of all outcomes in the sample space that are not in ________.

Skills and Applications

In Exercises 9–14, determine the sample space for the experiment.

9. A coin and a six-sided die are tossed.
10. A six-sided die is tossed twice and the sum of the results is recorded.
11. A taste tester has to rank three varieties of yogurt, A, B, and C, according to preference.
12. Two marbles are selected (without replacement) from a bag containing two red marbles, two blue marbles, and one yellow marble. The color of each marble is recorded.
13. Two county supervisors are selected from five supervisors, A, B, C, D, and E, to study a recycling plan.
14. A sales representative makes presentations about a product in three homes per day. In each home, there may be a sale (denote by S) or there may be no sale (denote by F).

Tossing a Coin

In Exercises 15–20, find the probability for the experiment of tossing a coin three times. Use the sample space \( S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\} \).

15. The probability of getting exactly one tail
16. The probability of getting exactly two tails
17. The probability of getting a head on the first toss
18. The probability of getting a tail on the last toss
19. The probability of getting at least one head
20. The probability of getting at least two heads

Drawing a Card

In Exercises 21–24, find the probability for the experiment of selecting one card from a standard deck of 52 playing cards.

21. The card is a face card.
22. The card is not a face card.
23. The card is a red face card.
24. The card is a 9 or lower. (Aces are low.)

Tossing a Die

In Exercises 25–30, find the probability for the experiment of tossing a six-sided die twice.

25. The sum is 6.
26. The sum is at least 8.
27. The sum is less than 11.
28. The sum is 2, 3, or 12.
29. The sum is odd and no more than 7.
30. The sum is odd or prime.

Drawing Marbles

In Exercises 31–34, find the probability for the experiment of drawing two marbles (without replacement) from a bag containing one green, two yellow, and three red marbles.

31. Both marbles are red.
32. Both marbles are yellow.
33. Neither marble is yellow.
34. The marbles are of different colors.
In Exercises 35–38, you are given the probability that an event will happen. Find the probability that the event will not happen.

35. \( P(E) = 0.87 \)  36. \( P(E) = 0.36 \)
37. \( P(E) = \frac{1}{4} \)  38. \( P(E) = \frac{2}{3} \)

In Exercises 39–42, you are given the probability that an event will not happen. Find the probability that the event will happen.

39. \( P(E') = 0.23 \)  40. \( P(E') = 0.92 \)
41. \( P(E') = \frac{17}{35} \)  42. \( P(E') = \frac{61}{100} \)

43. **GRAPHICAL REASONING** In 2008, there were approximately 8.92 million unemployed workers in the United States. The circle graph shows the age profile of these unemployed workers. *(Source: U.S. Bureau of Labor Statistics)*

Ages of Unemployed Workers

![](Ages_of_Unemployed_Workers.png)

(a) Estimate the number of unemployed workers in the 16–19 age group.

(b) What is the probability that a person selected at random from the population of unemployed workers is in the 25–44 age group?

(c) What is the probability that a person selected at random from the population of unemployed workers is in the 45–64 age group?

(d) What is the probability that a person selected at random from the population of unemployed workers is 45 or older?

44. **GRAPHICAL REASONING** The educational attainment of the United States population age 25 years or older in 2007 is shown in the circle graph. Use the fact that the population of people 25 years or older was approximately 194.32 million in 2007. *(Source: U.S. Census Bureau)*

Educational Attainment

![](Educational_Attainment.png)

(a) Estimate the number of people 25 years or older who have high school diplomas.

(b) Estimate the number of people 25 years or older who have advanced degrees.

(c) Find the probability that a person 25 years or older selected at random has earned a Bachelor’s degree or higher.

(d) Find the probability that a person 25 years or older selected at random has earned a high school diploma or gone on to post-secondary education.

(e) Find the probability that a person 25 years or older selected at random has earned an Associate’s degree or higher.

45. **GRAPHICAL REASONING** The figure shows the results of a recent survey in which 1011 adults were asked to grade U.S. public schools. *(Source: Phi Delta Kappa/Gallup Poll)*

Grading Public Schools

![](Grading_Public_Schools.png)

(a) Estimate the number of adults who gave U.S. public schools a B.

(b) An adult is selected at random. What is the probability that the adult will give the U.S. public schools an A?

(c) An adult is selected at random. What is the probability the adult will give the U.S. public schools a C or a D?

46. **GRAPHICAL REASONING** The figure shows the results of a survey in which auto racing fans listed their favorite type of racing. *(Source: ESPN Sports Poll/TNS Sports)*

Favorite Type of Racing

![](Favorite_Type_of_Racing.png)

(a) What is the probability that an auto racing fan selected at random lists NASCAR racing as his or her favorite type of racing?
(b) What is the probability that an auto racing fan selected at random lists Formula One or motorcycle racing as his or her favorite type of racing?

(c) What is the probability that an auto racing fan selected at random does not list NHRA drag racing as his or her favorite type of racing?

47. DATA ANALYSIS A study of the effectiveness of a flu vaccine was conducted with a sample of 500 people. Some participants in the study were given no vaccine, some were given one injection, and some were given two injections. The results of the study are listed in the table.

<table>
<thead>
<tr>
<th></th>
<th>No vaccine</th>
<th>One injection</th>
<th>Two injections</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flu</td>
<td>7</td>
<td>2</td>
<td>13</td>
<td>22</td>
</tr>
<tr>
<td>No flu</td>
<td>149</td>
<td>52</td>
<td>277</td>
<td>478</td>
</tr>
<tr>
<td>Total</td>
<td>156</td>
<td>54</td>
<td>290</td>
<td>500</td>
</tr>
</tbody>
</table>

A person is selected at random from the sample. Find the specified probability.

(a) The person had two injections.

(b) The person did not get the flu.

(c) The person got the flu and had one injection.

48. DATA ANALYSIS One hundred college students were interviewed to determine their political party affiliations and whether they favored a balanced-budget amendment to the Constitution. The results of the study are listed in the table, where D represents Democrat and R represents Republican.

<table>
<thead>
<tr>
<th></th>
<th>Favor</th>
<th>Not favor</th>
<th>Unsure</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>23</td>
<td>25</td>
<td>7</td>
<td>55</td>
</tr>
<tr>
<td>R</td>
<td>32</td>
<td>9</td>
<td>4</td>
<td>45</td>
</tr>
<tr>
<td>Total</td>
<td>55</td>
<td>34</td>
<td>11</td>
<td>100</td>
</tr>
</tbody>
</table>

A person is selected at random from the sample. Find the probability that the described person is selected.

(a) A person who doesn’t favor the amendment

(b) A Republican

(c) A Democrat who favors the amendment

49. ALUMNI ASSOCIATION A college sends a survey to selected members of the class of 2009. Of the 1254 people who graduated that year, 672 are women, of whom 124 went on to graduate school. Of the 582 male graduates, 198 went on to graduate school. An alumni member is selected at random. What are the probabilities that the person is (a) female, (b) male, and (c) female and did not attend graduate school?

50. EDUCATION In a high school graduating class of 128 students, 52 are on the honor roll. Of these, 48 are going on to college; of the other 76 students, 56 are going on to college. A student is selected at random from the class. What is the probability that the person chosen is (a) going to college, (b) not going to college, and (c) not going to college and on the honor roll?

51. WINNING AN ELECTION Three people have been nominated for president of a class. From a poll, it is estimated that the first candidate has a 37% chance of winning and the second candidate has a 44% chance of winning. What is the probability that the third candidate will win?

52. PAYROLL ERROR The employees of a company work in six departments: 31 are in sales, 54 are in research, 42 are in marketing, 20 are in engineering, 47 are in finance, and 58 are in production. One employee’s paycheck is lost. What is the probability that the employee works in the research department?

In Exercises 53–60, the sample spaces are large and you should use the counting principles discussed in Section 9.6.

53. PREPARING FOR A TEST A class is given a list of 20 study problems, from which 10 will be part of an upcoming exam. A student knows how to solve 15 of the problems. Find the probabilities that the student will be able to answer (a) all 10 questions on the exam, (b) exactly eight questions on the exam, and (c) at least nine questions on the exam.

54. PAYROLL MIX-UP Five paychecks and envelopes are addressed to five different people. The paychecks are randomly inserted into the envelopes. What are the probabilities that (a) exactly one paycheck will be inserted in the correct envelope and (b) at least one paycheck will be inserted in the correct envelope?

55. GAME SHOW On a game show, you are given five digits to arrange in the proper order to form the price of a car. If you are correct, you win the car. What is the probability of winning, given the following conditions?

(a) You guess the position of each digit.

(b) You know the first digit and guess the positions of the other digits.

56. CARD GAME The deck for a card game is made up of 108 cards. Twenty-five each are red, yellow, blue, and green, and eight are wild cards. Each player is randomly dealt a seven-card hand.

(a) What is the probability that a hand will contain exactly two wild cards?

(b) What is the probability that a hand will contain two wild cards, two red cards, and three blue cards?
57. **DRAWING A CARD** One card is selected at random from an ordinary deck of 52 playing cards. Find the probabilities that (a) the card is an even-numbered card, (b) the card is a heart or a diamond, and (c) the card is a nine or a face card.

58. **POKER HAND** Five cards are drawn from an ordinary deck of 52 playing cards. What is the probability that the hand drawn is a full house? (A full house is a hand that consists of two of one kind and three of another kind.)

59. **DEFECTIVE UNITS** A shipment of 12 microwave ovens contains three defective units. A vending company has ordered four of these units, and because each is identically packaged, the selection will be random. What are the probabilities that (a) all four units are good, (b) exactly two units are good, and (c) at least two units are good?

60. **PIN CODES** ATM personal identification number (PIN) codes typically consist of four-digit sequences of numbers. Find the probability that if you forget your PIN, you can guess the correct sequence (a) at random and (b) if you recall the first two digits.

61. **RANDOM NUMBER GENERATOR** Two integers from 1 through 40 are chosen by a random number generator. What are the probabilities that (a) the numbers are both even, (b) one number is even and one is odd, (c) both numbers are less than 30, and (d) the same number is chosen twice?

62. **RANDOM NUMBER GENERATOR** Repeat Exercise 61 for a random number generator that chooses two integers from 1 through 80.

63. **FLEXIBLE WORK HOURS** In a survey, people were asked if they would prefer to work flexible hours—even if it meant slower career advancement—so they could spend more time with their families. The results of the survey are shown in the figure. Three people from the survey were chosen at random. What is the probability that all three people would prefer flexible work hours?

64. **CONSUMER AWARENESS** Suppose that the methods used by shoppers to pay for merchandise are as shown in the circle graph. Two shoppers are chosen at random. What is the probability that both shoppers paid for their purchases only in cash?

65. **BACKUP SYSTEM** A space vehicle has an independent backup system for one of its communication networks. The probability that either system will function satisfactorily during a flight is 0.985. What are the probabilities that during a given flight (a) both systems function satisfactorily, (b) at least one system functions satisfactorily, and (c) both systems fail?

66. **BACKUP VEHICLE** A fire company keeps two rescue vehicles. Because of the demand on the vehicles and the chance of mechanical failure, the probability that a specific vehicle is available when needed is 90%. The availability of one vehicle is independent of the availability of the other. Find the probabilities that (a) both vehicles are available at a given time, (b) neither vehicle is available at a given time, and (c) at least one vehicle is available at a given time.

67. **ROULETTE** American roulette is a game in which a wheel turns on a spindle and is divided into 38 pockets. Thirty-six of the pockets are numbered 1–36, of which half are red and half are black. Two of the pockets are green and are numbered 0 and 00 (see figure). The dealer spins the wheel and a small ball in opposite directions. As the ball slows to a stop, it has an equal probability of landing in any of the numbered pockets.

   (a) Find the probability of landing in the number 00 pocket.
   (b) Find the probability of landing in a red pocket.
   (c) Find the probability of landing in a green pocket or a black pocket.
   (d) Find the probability of landing in the number 14 pocket on two consecutive spins.
   (e) Find the probability of landing in a red pocket on three consecutive spins.
68. **A BOY OR A GIRL?** Assume that the probability of the birth of a child of a particular sex is 50%. In a family with four children, what are the probabilities that (a) all the children are boys, (b) all the children are the same sex, and (c) there is at least one boy?

69. **GEOMETRY** You and a friend agree to meet at your favorite fast-food restaurant between 5:00 and 6:00 P.M. The one who arrives first will wait 15 minutes for the other, and then will leave (see figure). What is the probability that the two of you will actually meet, assuming that your arrival times are random within the hour?

70. **ESTIMATING π** A coin of diameter $d$ is dropped onto a paper that contains a grid of squares $d$ units on a side (see figure).

(a) Find the probability that the coin covers a vertex of one of the squares on the grid.

(b) Perform the experiment 100 times and use the results to approximate $\pi$.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 71 and 72, determine whether the statement is true or false. Justify your answer.

71. If $A$ and $B$ are independent events with nonzero probabilities, then $A$ can occur when $B$ occurs.

72. Rolling a number less than 3 on a normal six-sided die has a probability of $\frac{1}{3}$. The complement of this event is to roll a number greater than 3, and its probability is $\frac{2}{3}$.

73. **PATTERN RECOGNITION** Consider a group of $n$ people.

(a) Explain why the following pattern gives the probabilities that the $n$ people have distinct birthdays.

$$P(n) = \frac{365}{365} \cdot \frac{364}{365} \cdot \frac{363}{365} \cdot \cdots \cdot \frac{365 - (n - 1)}{365}$$

(b) Use the pattern in part (a) to write an expression for the probability that $n = 4$ people have distinct birthdays.

(c) Let $P_n$ be the probability that the $n$ people have distinct birthdays. Verify that this probability can be obtained recursively by

$$P_1 = 1 \quad \text{and} \quad P_n = \frac{365 - (n - 1)}{365} P_{n-1}.$$

(d) Explain why $Q_n = 1 - P_n$ gives the probability that at least two people in a group of $n$ people have the same birthday.

(e) Use the results of parts (c) and (d) to complete the table.

<table>
<thead>
<tr>
<th>$n$</th>
<th>10</th>
<th>15</th>
<th>20</th>
<th>23</th>
<th>30</th>
<th>40</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>$P_n$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>$Q_n$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(f) How many people must be in a group so that the probability of at least two of them having the same birthday is greater than $\frac{1}{2}$? Explain.

74. **CAPSTONE** Write a short paragraph defining the following.

(a) Sample space of an experiment
(b) Event
(c) The probability of an event $E$ in a sample space $S$
(d) The probability of the complement of $E$

75. **THINK ABOUT IT** A weather forecast indicates that the probability of rain is 40%. What does this mean?

76. Toss two coins 100 times and write down the number of heads that occur on each toss (0, 1, or 2). How many times did two heads occur? How many times would you expect two heads to occur if you did the experiment 1000 times?

</table>
In Exercises 1–4, write the first five terms of the sequence. (Assume that $n$ begins with 1)

1. $a_n = 2 + \frac{6}{n}$
2. $a_n = \frac{(-1)^n5n}{2n - 1}$
3. $a_n = \frac{72}{n!}$
4. $a_n = n(n - 1)$

In Exercises 5–8, write an expression for the apparent $n$th term of the sequence. (Assume that $n$ begins with 1)

5. $-2, 2, -2, 2, -2, \ldots$
6. $-1, 2, 7, 14, 23, \ldots$
7. $4, 2, 3, 1, 5, \ldots$
8. $1, -\frac{1}{2}, \frac{1}{2}, -\frac{1}{2}, \frac{1}{2}, \ldots$

In Exercises 9–12, simplify the factorial expression.

9. $9!$
10. $4! \cdot 0!$
11. $\frac{3! \cdot 5!}{6!}$
12. $\frac{7! \cdot 6!}{6! \cdot 8!}$

In Exercises 13–18, find the sum.

13. $\sum_{j=1}^{6} 8$
14. $\sum_{k=2}^{5} 4k$
15. $\sum_{j=1}^{4} \frac{6}{j^2}$
16. $\sum_{i=1}^{n} \frac{i}{i + 1}$
17. $\sum_{k=1}^{10} 2k^3$
18. $\sum_{j=0}^{4} (j^2 + 1)$

In Exercises 19 and 20, use sigma notation to write the sum.

19. $\frac{1}{2(1)} + \frac{1}{2(2)} + \frac{1}{2(3)} + \ldots + \frac{1}{2(20)}$
20. $\frac{1}{2} + \frac{2}{3} + \frac{3}{4} + \ldots + \frac{9}{10}$

In Exercises 21 and 22, find the sum of the infinite series.

21. $\sum_{j=1}^{\infty} \frac{4}{10^j}$
22. $\sum_{k=1}^{\infty} \frac{2}{100^k}$

23. **COMPOUND INTEREST** A deposit of $10,000 is made in an account that earns 8% interest compounded monthly. The balance in the account after $n$ months is given by

$$A_n = 10,000 \left(1 + \frac{0.08}{12}\right)^n, \quad n = 1, 2, 3, \ldots$$

(a) Write the first 10 terms of this sequence.
(b) Find the balance in this account after 10 years by finding the 120th term of the sequence.

24. **LOTTERY TICKET SALES** The total sales $a_n$ (in billions of dollars) of lottery tickets in the United States from 1999 through 2007 can be approximated by the model

$$a_n = 0.02n^2 + 1.8n + 18, \quad n = 9, 10, \ldots, 17$$

where $n$ is the year, with $n = 9$ corresponding to 1999. Find the terms of this finite sequence. Use a graphing utility to construct a bar graph that represents the sequence. (Source: TLF Publications, Inc.)

25. **JOB OFFER** The starting salary for an accountant is $43,800 with a guaranteed salary increase of $1950 per year. Determine (a) the salary during the fifth year and (b) the total compensation through five full years of employment.

26. **BALING HAY** In the first two trips baling hay around a large field, a farmer obtains 123 bales and 112 bales, respectively. Because each round gets shorter, the farmer estimates that the same pattern will continue. Estimate the total number of bales made if the farmer takes another six trips around the field.
9.3 In Exercises 47–50, determine whether the sequence is geometric. If so, find the common ratio.

47. 6, 12, 24, 48, . . .
48. 54, −18, 6, −2, . . .
49. \frac{1}{5}, −\frac{3}{5}, \frac{9}{5}, −\frac{27}{5}, . . .
50. \frac{1}{3}, \frac{3}{3}, \frac{9}{5}, \frac{27}{7}, . . .

In Exercises 51–54, write the first five terms of the geometric sequence.

51. \(a_1 = 4, \quad r = \frac{-1}{2}\)
52. \(a_1 = 2, \quad r = 15\)
53. \(a_1 = 9, \quad a_3 = 4\)
54. \(a_1 = 2, \quad a_3 = 12\)

In Exercises 55–58, write an expression for the \(n\)th term of the geometric sequence. Then find the 10th term of the sequence.

55. \(a_1 = 18, \quad a_2 = -9\)
56. \(a_3 = 6, \quad a_4 = 1\)
57. \(a_1 = 100, \quad r = 1.05\)
58. \(a_1 = 5, \quad r = 0.2\)

In Exercises 59–64, find the sum of the finite geometric sequence.

59. \[\sum_{i=1}^{3} 2^{i-1}\]
60. \[\sum_{i=1}^{5} 3^{i-1}\]
61. \[\sum_{i=1}^{4} \left(\frac{1}{2}\right)^{i-1}\]
62. \[\sum_{i=1}^{6} \left(\frac{1}{3}\right)^{i-1}\]
63. \[\sum_{i=1}^{5} (2)^{i-1}\]
64. \[\sum_{i=1}^{4} 6(3)^{i-1}\]

In Exercises 65 and 66, use a graphing utility to find the sum of the finite geometric sequence.

65. \[\sum_{i=1}^{10} 10(3)^{i-1}\]
66. \[\sum_{i=1}^{5} 20(0.2)^{i-1}\]

In Exercises 67–70, find the sum of the infinite geometric series.

67. \[\sum_{i=1}^{\infty} \left(\frac{1}{2}\right)^{i-1}\]
68. \[\sum_{i=1}^{\infty} (0.5)^{i-1}\]
69. \[\sum_{k=1}^{\infty} 4\left(\frac{1}{3}\right)^{k-1}\]
70. \[\sum_{k=1}^{\infty} 1.3\left(\frac{1}{10}\right)^{k-1}\]

71. DEPRECIATION A paper manufacturer buys a machine for $120,000. During the next 5 years, it will depreciate at a rate of 30% per year. (In other words, at the end of each year the depreciated value will be 70% of what it was at the beginning of the year.)

(a) Find the formula for the \(n\)th term of a geometric sequence that gives the value of the machine \(t\) full years after it was purchased.

(b) Find the depreciated value of the machine after 5 full years.

72. ANNUITY You deposit $800 in an account at the beginning of each month for 10 years. The account pays 6% compounded monthly. What will your balance be at the end of 10 years? What would the balance be if the interest were compounded continuously?

73. \(3 + 5 + 7 + \cdots + (2n + 1) = n(n + 2)\)
74. \(1 + \frac{3}{2} + 2 + \frac{5}{2} + \cdots + \frac{1}{2}(n + 1) = \frac{n}{4}(n + 3)\)
75. \[\sum_{i=0}^{n-1} ar^i = \frac{a(1 - r^n)}{1 - r}\]
76. \[\sum_{i=0}^{n-1} (a + kd) = \frac{n}{2}[2a + (n - 1)d]\]

In Exercises 77–80, find a formula for the sum of the first \(n\) terms of the sequence.

77. 9, 13, 17, 21, . . .
78. 68, 60, 52, 44, . . .
79. 1, \(\frac{3}{2}\), \(\frac{5}{2}\), \(\frac{7}{2}\), . . .
80. 12, \(-1\), \(-\frac{1}{2}\), . . .

In Exercises 81 and 82, find the sum using the formulas for the sums of powers of integers.

81. \[\sum_{n=1}^{50} n\]
82. \[\sum_{n=1}^{5} (n^5 - n^2)\]

In Exercises 83–86, write the first five terms of the sequence beginning with the given term. Then calculate the first and second differences of the sequence. State whether the sequence has a linear model, a quadratic model, or neither.

83. \(a_1 = 5\)
84. \(a_1 = -3\)
85. \(a_1 = 16\)
86. \(a_0 = 0\)

9.5 In Exercises 87 and 88, use the Binomial Theorem to calculate the binomial coefficient.

87. \(6C_4\)
88. \(12C_3\)

In Exercises 89 and 90, use Pascal’s Triangle to calculate the binomial coefficient.

89. \[\binom{8}{6}\]
90. \[\binom{9}{4}\]

In Exercises 91–96, use the Binomial Theorem to expand and simplify the expression. (Remember that \(i = \sqrt{-1}\).)

91. \((x + 4)^4\)
92. \((x - 3)^6\)
93. \((a - 3b)^5\)
94. \((3x + y^2)^7\)
95. \((5 + 2i)^4\)
96. \((4 - 5i)^3\)
9.6  97. NUMBERS IN A HAT  Slips of paper numbered 1 through 14 are placed in a hat. In how many ways can you draw two numbers with replacement that total 12?
98. SHOPPING  A customer in an electronics store can choose one of six speaker systems, one of five DVD players, and one of six plasma televisions to design a home theater system. How many systems can be designed?
99. TELEPHONE NUMBERS  The same three-digit prefix is used for all of the telephone numbers in a small town. How many different telephone numbers are possible by changing only the last four digits?
100. COURSE SCHEDULE  A college student is preparing a course schedule for the next semester. The student may select one of three mathematics courses, one of four science courses, and one of six history courses. How many schedules are possible?
101. RACE  There are 10 bicyclists entered in a race. In how many different ways could the top 3 places be decided?
102. JURY SELECTION  A group of potential jurors has been narrowed down to 32 people. In how many ways can a jury of 12 people be selected?
103. APPAREL  You have eight different suits to choose from to take on a trip. How many combinations of three suits could you take on your trip?
104. MENU CHOICES  A local sub shop offers five different breads, four different meats, three different cheeses, and six different vegetables. You can choose one bread and any number of the other items. Find the total number of combinations of sandwiches possible.
105. APPAREL  A man has five pairs of socks, of which no two pairs are the same color. He randomly selects two socks from a drawer. What is the probability that he gets a matched pair?
106. BOOKSHELF ORDER  A child returns a five-volume set of books to a bookshelf. The child is not able to read, and so cannot distinguish one volume from another. What is the probability that the books are shelved in the correct order?
107. STUDENTS BY CLASS  At a particular university, the number of students in the four classes are broken down by percents, as shown in the table.

<table>
<thead>
<tr>
<th>Class</th>
<th>Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freshmen</td>
<td>31</td>
</tr>
<tr>
<td>Sophomores</td>
<td>26</td>
</tr>
<tr>
<td>Juniors</td>
<td>25</td>
</tr>
<tr>
<td>Seniors</td>
<td>18</td>
</tr>
</tbody>
</table>

A single student is picked randomly by lottery for a cash scholarship. What is the probability that the scholarship winner is

(a) a junior or senior?
(b) a freshman, sophomore, or junior?

108. DATA ANALYSIS  A sample of college students, faculty, and administration were asked whether they favored a proposed increase in the annual activity fee to enhance student life on campus. The results are listed in the table.

<table>
<thead>
<tr>
<th></th>
<th>Students</th>
<th>Faculty</th>
<th>Admin.</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Favor</td>
<td>237</td>
<td>37</td>
<td>18</td>
<td>292</td>
</tr>
<tr>
<td>Oppose</td>
<td>163</td>
<td>38</td>
<td>7</td>
<td>208</td>
</tr>
<tr>
<td>Total</td>
<td>400</td>
<td>75</td>
<td>25</td>
<td>500</td>
</tr>
</tbody>
</table>

A person is selected at random from the sample. Find each specified probability.

(a) The person is not in favor of the proposal.
(b) The person is a student.
(c) The person is a faculty member and is in favor of the proposal.

109. TOSSING A DIE  A six-sided die is tossed four times. What is the probability of getting a 5 on each roll?
110. TOSSING A DIE  A six-sided die is tossed six times. What is the probability that each side appears exactly once?
111. DRAWING A CARD  You randomly select a card from a 52-card deck. What is the probability that the card is not a club?
112. TOSSING A COIN  Find the probability of obtaining at least one tail when a coin is tossed five times.

EXPLORATION

TRUE OR FALSE? In Exercises 113–116, determine whether the statement is true or false. Justify your answer.

113. \[ \frac{(n + 2)!}{n!} = (n + 2)(n + 1) \]
114. \[ \sum_{i=1}^{5} (i^3 + 2i) = \sum_{i=1}^{5} i^3 + \sum_{i=1}^{5} 2i \]
115. \[ \sum_{k=1}^{8} 3k = 3 \sum_{k=1}^{8} k \]
116. \[ \sum_{j=1}^{6} 2^j = \sum_{j=3}^{6} 2^{j-2} \]

117. THINK ABOUT IT  An infinite sequence is a function. What is the domain of the function?

118. THINK ABOUT IT  How do the two sequences differ?

(a) \[ a_n = \frac{(-1)^n}{n} \]
(b) \[ a_n = \frac{(-1)^{n+1}}{n} \]

119. WRITING  Explain what is meant by a recursion formula.

120. WRITING  Write a brief paragraph explaining how to identify the graph of an arithmetic sequence and the graph of a geometric sequence.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Write the first five terms of the sequence \( a_n = \frac{(-1)^n}{3n + 2} \) (Assume that \( n \) begins with 1.)

2. Write an expression for the \( n \)th term of the sequence.

\[
\frac{3}{1!}, \frac{4}{2!}, \frac{5}{3!}, \frac{6}{4!}, \frac{7}{5!}, \ldots
\]

3. Find the next three terms of the series. Then find the sixth partial sum of the series.

\[8 + 21 + 34 + 47 + \cdots\]

4. The fifth term of an arithmetic sequence is 5.4, and the 12th term is 11.0. Find the \( n \)th term.

5. The second term of a geometric sequence is 28, and the sixth term is 7168. Find the \( n \)th term.

6. Write the first five terms of the sequence (Assume that begins with 1.)

In Exercises 7–9, find the sum.

7. \[\sum_{i=1}^{50} (2i^2 + 5)\]

8. \[\sum_{n=1}^{9} (12n - 7)\]

9. \[\sum_{j=1}^{25} \left(\frac{1}{2}\right)^j\]

10. Use mathematical induction to prove the formula.

\[5 + 10 + 15 + \cdots + 5n = \frac{5n(n + 1)}{2}\]

11. Use the Binomial Theorem to expand and simplify (a) \((x + 6y)^3\) and (b) \(3(x - 2)^3 + 4(x - 2)^2\).

12. Find the coefficient of the term \(a^ib^3\) in the expansion of \((3a - 2b)^7\).

In Exercises 13 and 14, evaluate each expression.

13. (a) \(\gamma P_2\)  (b) \(\gamma P_3\)

14. (a) \(\gamma C_4\)  (b) \(\gamma C_4\)

15. How many distinct license plates can be issued consisting of one letter followed by a three-digit number?

16. Eight people are going for a ride in a boat that seats eight people. One person will drive, and only three of the remaining people are willing to ride in the two bow seats. How many seating arrangements are possible?

17. You attend a karaoke night and hope to hear your favorite song. The karaoke song book has 300 different songs (your favorite song is among them). Assuming that the singers are equally likely to pick any song and no song is repeated, what is the probability that your favorite song is one of the 20 that you hear that night?

18. You are with three of your friends at a party. Names of all of the 30 guests are placed in a hat and drawn randomly to award four door prizes. Each guest is limited to one prize. What is the probability that you and your friends win all four of the prizes?

19. The weather report calls for a 90% chance of snow. According to this report, what is the probability that it will not snow?
CUMULATIVE TEST FOR CHAPTERS 7–9

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1–4, solve the system by the specified method.

1. Substitution
   \[
   \begin{align*}
   y &= 3 - x^2 \\
   2(y - 2) &= x - 1
   \end{align*}
   \]

2. Elimination
   \[
   \begin{align*}
   x + 3y &= -6 \\
   2x + 4y &= -10
   \end{align*}
   \]

3. Elimination
   \[
   \begin{align*}
   -2x + 4y - z &= -16 \\
   x - 2y + 2z &= 5 \\
   x - 3y - z &= 13
   \end{align*}
   \]

4. Gauss-Jordan Elimination
   \[
   \begin{align*}
   x + 3y - 2z &= -7 \\
   -2x + y - z &= -5 \\
   4x + y + z &= 3
   \end{align*}
   \]

In Exercises 5 and 6, sketch the graph of the solution set of the system of inequalities.

5. \[
\begin{align*}
2x + y &\geq -3 \\
x - 3y &\leq 2
\end{align*}
\]

6. \[
\begin{align*}
x - y &> 6 \\
5x + 2y &< 10
\end{align*}
\]

7. Sketch the region determined by the constraints. Then find the minimum and maximum values, and where they occur, of the objective function \( z = 3x + 2y \), subject to the indicated constraints.
   
   \[
   \begin{align*}
x + 4y &\leq 20 \\
2x + y &\leq 12 \\
x &\geq 0 \\
y &\geq 0
\end{align*}
\]

8. A custom-blend bird seed is to be mixed from seed mixtures costing $0.75 per pound and $1.25 per pound. How many pounds of each seed mixture are used to make 200 pounds of custom-blend bird seed costing $0.95 per pound?

9. Find the equation of the parabola \( y = ax^2 + bx + c \) passing through the points \((0, 6), (2, 3), \) and \((4, 2)\).

In Exercises 10 and 11, use the system of equations at the left.

10. Write the augmented matrix corresponding to the system of equations.

11. Solve the system using the matrix found in Exercise 10 and Gauss-Jordan elimination.

In Exercises 12–17, perform the operations using the following matrices.

\[
A = \begin{bmatrix} 3 & 0 \\ -1 & 4 \end{bmatrix}, \quad B = \begin{bmatrix} -2 & 5 \\ 0 & -1 \end{bmatrix}
\]

12. \( A + B \)

13. \(-8B\)

14. \(2A - 5B\)

15. \(AB\)

16. \(A^2\)

17. \(BA - B^2\)

18. Find the determinant of the matrix at the left.

19. Find the inverse of the matrix (if it exists):

\[
\begin{bmatrix}
1 & 2 & -1 \\
3 & 7 & -10 \\
-5 & -7 & -15
\end{bmatrix}
\]
20. The percents (by age group) of the total amounts spent on three types of footwear in a recent year are shown in the matrix. The total amounts (in millions) spent by each age group on the three types of footwear were $442.20 (14–17 age group), $466.57 (18–24 age group), and $1088.09 (25–34 age group). How many dollars worth of gym shoes, jogging shoes, and walking shoes were sold that year? (Source: National Sporting Goods Association)

<table>

In Exercises 21 and 22, use Cramer's Rule to solve the system of equations.

21. \[ \begin{cases} 8x - 3y = -52 \\ 3x + 5y = 5 \end{cases} \]

22. \[ \begin{cases} 5x + 4y + 3z = 7 \\ -3x - 8y + 7z = -9 \\ 7x - 5y - 6z = -53 \end{cases} \]

23. Find the area of the triangle shown in the figure.

24. Write the first five terms of the sequence \( a_n = \frac{(-1)^{n+1}}{2n + 3} \). (Assume that \( n \) begins with 1.)

25. Write an expression for the \( n \)th term of the sequence.

\[ \frac{2!}{4}, \frac{3!}{5}, \frac{4!}{6}, \frac{5!}{7}, \frac{6!}{8}, \ldots \]

26. Find the sum of the first 16 terms of the arithmetic sequence 6, 18, 30, 42, \ldots

27. The sixth term of an arithmetic sequence is 20.6, and the ninth term is 30.2.

(a) Find the 20th term.

(b) Find the \( n \)th term.

28. Write the first five terms of the sequence \( a_n = 3(2)^{n-1} \). (Assume that \( n \) begins with 1.)

29. Find the sum: \( \sum_{i=0}^{\infty} 1.3 \left( \frac{1}{8} \right)^{i-1} \).

30. Use mathematical induction to prove the formula

\[ 3 + 7 + 11 + 15 + \cdots + (4n - 1) = n(2n + 1) \]

31. Use the Binomial Theorem to expand and simplify \((w - 9)^4\).

In Exercises 32–35, evaluate the expression.

32. \( _4P_3 \)

33. \( _5P_2 \)

34. \( \binom{8}{4} \)

35. \( _{11}C_6 \)

In Exercises 36 and 37, find the number of distinguishable permutations of the group of letters.

38. A personnel manager at a department store has 10 applicants to fill three different sales positions. In how many ways can this be done, assuming that all the applicants are qualified for any of the three positions?

39. On a game show, the digits 3, 4, and 5 must be arranged in the proper order to form the price of an appliance. If the digits are arranged correctly, the contestant wins the appliance. What is the probability of winning if the contestant knows that the price is at least $400?
Infinite Series
The study of infinite series was considered a novelty in the fourteenth century. Logician Richard Suiseth, whose nickname was Calculator, solved this problem.

If throughout the first half of a given time interval a variation continues at a certain intensity; throughout the next quarter of the interval at double the intensity; throughout the following eighth interval at triple the intensity and so ad infinitum; The average intensity for the whole interval will be a constant.

This is the same as saying that the sum of the infinite series

\[
\frac{1}{2} + \frac{2}{4} + \frac{3}{8} + \ldots + \frac{n}{2^n} + \ldots
\]

is 2.

Proof
Each of these properties follows directly from the properties of real numbers.

1. \[\sum_{i=1}^{n} c = c + c + c + \cdots + c = cn\] is \(n\) terms.

The Distributive Property is used in the proof of Property 2.

2. \[\sum_{i=1}^{n} ca_i = ca_1 + ca_2 + ca_3 + \cdots + ca_n\]

\[= c(a_1 + a_2 + a_3 + \cdots + a_n)\]

\[= c\sum_{i=1}^{n} a_i\]

The proof of Property 3 uses the Commutative and Associative Properties of Addition.

3. \[\sum_{i=1}^{n} (a_i + b_i) = (a_1 + b_1) + (a_2 + b_2) + (a_3 + b_3) + \cdots + (a_n + b_n)\]

\[= (a_1 + a_2 + a_3 + \cdots + a_n) + (b_1 + b_2 + b_3 + \cdots + b_n)\]

\[= \sum_{i=1}^{n} a_i + \sum_{i=1}^{n} b_i\]

The proof of Property 4 uses the Commutative and Associative Properties of Addition and the Distributive Property.

4. \[\sum_{i=1}^{n} (a_i - b_i) = (a_1 - b_1) + (a_2 - b_2) + (a_3 - b_3) + \cdots + (a_n - b_n)\]

\[= (a_1 + a_2 + a_3 + \cdots + a_n) + (-b_1 - b_2 - b_3 - \cdots - b_n)\]

\[= (a_1 + a_2 + a_3 + \cdots + a_n) - (b_1 + b_2 + b_3 + \cdots + b_n)\]

\[= \sum_{i=1}^{n} a_i - \sum_{i=1}^{n} b_i\]
The Sum of a Finite Arithmetic Sequence \((p. 654)\)

The sum of a finite arithmetic sequence with \(n\) terms is

\[
S_n = \frac{n}{2}(a_1 + a_n).
\]

Proof

Begin by generating the terms of the arithmetic sequence in two ways. In the first way, repeatedly add \(d\) to the first term to obtain

\[
S_n = a_1 + a_2 + a_3 + \cdots + a_{n-1} + a_n.
\]

In the second way, repeatedly subtract \(d\) from the \(n\)th term to obtain

\[
S_n = a_n + a_{n-1} + a_{n-2} + \cdots + a_3 + a_2 + a_1.
\]

If you add these two versions of \(S_n\) the multiples of \(d\) subtract out and you obtain

\[
2S_n = (a_1 + a_n) + (a_1 + a_n) + (a_1 + a_n) + \cdots + (a_1 + a_n)
\]

\[-\text{\(n\) terms}\]

\[
S_n = \frac{n}{2}(a_1 + a_n).
\]

The Sum of a Finite Geometric Sequence \((p. 664)\)

The sum of the finite geometric sequence

\[
a_1, \ a_1r, \ a_1r^2, \ a_1r^3, \ a_1r^4, \ \ldots, \ a_1r^{n-1}
\]

with common ratio \(r \neq 1\) is given by

\[
S_n = \sum_{i=1}^{n} a_1r^{i-1} = a_1\left(\frac{1-r^n}{1-r}\right).
\]

Proof

\[
S_n = a_1 + a_1r + a_1r^2 + \cdots + a_1r^{n-1} + a_1r^n.
\]

Multiply by \(r\),

\[
rS_n = a_1r + a_1r^2 + a_1r^3 + \cdots + a_1r^{n-1} + a_1r^n
\]

Subtracting the second equation from the first yields

\[
S_n - rS_n = a_1 - a_1r^n.
\]

So, \(S_n(1-r) = a_1(1 - r^n)\), and, because \(r \neq 1\), you have \(S_n = a_1\left(\frac{1-r^n}{1-r}\right)\).
The Binomial Theorem (p. 681)

In the expansion of \((x + y)^n\)

\[ (x + y)^n = x^n + nx^{n-1}y + \cdots + \binom{n}{r} x^{n-r}y^r + \cdots + nxy^{n-1} + y^n \]

the coefficient of \(x^{n-r}y^r\) is

\[ \binom{n}{r} = \frac{n!}{(n-r)!r!}. \]

Proof

The Binomial Theorem can be proved quite nicely using mathematical induction. The steps are straightforward but look a little messy, so only an outline of the proof is presented.

1. If \(n = 1\), you have \((x + y)^1 = x^1 + y^1 = \binom{1}{0}x + \binom{1}{1}y\), and the formula is valid.

2. Assuming that the formula is true for \(n = k\), the coefficient of \(x^{k-r}y^r\) is

\[ \binom{k}{r} = \frac{k!}{(k-r)!r!} = \frac{k(k-1)(k-2)\cdots(k-r+1)}{r!}. \]

To show that the formula is true for \(n = k + 1\), look at the coefficient of \(x^{k+1-r}y^r\) in the expansion of

\[(x + y)^{k+1} = (x + y)^k(x + y).\]

From the right-hand side, you can determine that the term involving \(x^{k+1-r}y^r\) is the sum of two products.

\[ (\binom{k}{r}x^{k-r}y^r)(x) + (\binom{k}{r}x^{k+1-r}y^r-1)(y) \]

\[ = \left[ \frac{k!}{(k-r)!r!} + \frac{k!}{(k+1-r)!r!} \right] x^{k+1-r}y^r \]

\[ = \left[ \frac{(k + 1 - r)k!}{(k + 1 - r)!r!} + \frac{k!r}{(k + 1 - r)!r!} \right] x^{k+1-r}y^r \]

\[ = \left[ \frac{k!(k + 1 - r + r)}{(k + 1 - r)!r!} \right] x^{k+1-r}y^r \]

\[ = \left[ \frac{(k + 1)!}{(k + 1 - r)!r!} \right] x^{k+1-r}y^r \]

\[ = \binom{k+1}{r}x^{k+1-r}y^r \]

So, by mathematical induction, the Binomial Theorem is valid for all positive integers \(n\).
This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. Let \( x_0 = 1 \) and consider the sequence \( x_n \) given by
   \[ x_n = \frac{1}{2} x_{n-1} + \frac{1}{x_{n-1}}, \quad n = 1, 2, \ldots \]
   Use a graphing utility to compute the first 10 terms of the sequence and make a conjecture about the value of \( x_n \) as \( n \) approaches infinity.

2. Consider the sequence
   \[ a_n = \frac{n + 1}{n^2 + 1} \]
   (a) Use a graphing utility to graph the first 10 terms of the sequence.
   (b) Use the graph from part (a) to estimate the value of \( a_n \) as \( n \) approaches infinity.
   (c) Complete the table.

   \[
   \begin{array}{c|c|c|c|c|c}
   n & 1 & 10 & 100 & 1000 & 10,000 \\
   \hline
   a_n & & & & & \\
   \end{array}
   \]

   (d) Use the table from part (c) to determine (if possible) the value of \( a_n \) as \( n \) approaches infinity.

3. Consider the sequence
   \[ a_n = 3 + (-1)^n \]
   (a) Use a graphing utility to graph the first 10 terms of the sequence.
   (b) Use the graph from part (a) to describe the behavior of the graph of the sequence.
   (c) Complete the table.

   \[
   \begin{array}{c|c|c|c|c|c}
   n & 1 & 10 & 101 & 1000 & 10,001 \\
   \hline
   a_n & & & & & \\
   \end{array}
   \]

   (d) Use the table from part (c) to determine (if possible) the value of \( a_n \) as \( n \) approaches infinity.

4. The following operations are performed on each term of an arithmetic sequence. Determine if the resulting sequence is arithmetic, and if so, state the common difference.
   (a) A constant \( C \) is added to each term.
   (b) Each term is multiplied by a nonzero constant \( C \).
   (c) Each term is squared.

5. The following sequence of perfect squares is not arithmetic.
   \[ 1, 4, 9, 16, 25, 36, 49, 64, 81, \ldots \]
   However, you can form a related sequence that is arithmetic by finding the differences of consecutive terms.
   (a) Write the first eight terms of the related arithmetic sequence described above. What is the \( n \)th term of this sequence?
   (b) Describe how you can find an arithmetic sequence that is related to the following sequence of perfect cubes.

   \[ 1, 8, 27, 64, 125, 216, 343, 512, 729, \ldots \]
   (c) Write the first seven terms of the related sequence in part (b) and find the \( n \)th term of the sequence.
   (d) Describe how you can find the arithmetic sequence that is related to the following sequence of perfect fourth powers.

   \[ 1, 16, 81, 256, 625, 1296, 2401, 4096, 6561, \ldots \]
   (e) Write the first six terms of the related sequence in part (d) and find the \( n \)th term of the sequence.

6. Can the Greek hero Achilles, running at 20 feet per second, ever catch a tortoise, starting 20 feet ahead of Achilles and running at 10 feet per second? The Greek mathematician Zeno said no. When Achilles runs 20 feet, the tortoise will be 10 feet ahead. Then, when Achilles runs 10 feet, the tortoise will be 5 feet ahead. Achilles will keep cutting the distance in half but will never catch the tortoise. The table shows Zeno’s reasoning. From the table you can see that both the distances and the times required to achieve them form infinite geometric series. Using the table, show that both series have finite sums. What do these sums represent?

<table>
<thead>

7. Recall that a fractal is a geometric figure that consists of a pattern that is repeated infinitely on a smaller and smaller scale. A well-known fractal is called the Sierpinski Triangle. In the first stage, the midpoints of the three sides are used to create the vertices of a new triangle, which is then removed, leaving three triangles. The first three stages are shown on the next page. Note that each remaining triangle is similar to the original triangle. Assume that the length of each side of the original triangle is one unit.
Write a formula that describes the side length of the triangles that will be generated in the \( n \)th stage. Write a formula for the area of the triangles that will be generated in the \( n \)th stage.

\[ \text{FIGURE FOR 7] } \]

8. You can define a sequence using a piecewise formula.
   The following is an example of a piecewise-defined sequence.
   \[ a_1 = 7, \quad a_n = \begin{cases} 
   \frac{a_{n-1}}{2}, & \text{if } a_{n-1} \text{ is even} \\
   3a_{n-1} + 1, & \text{if } a_{n-1} \text{ is odd}
   \end{cases} \]
   (a) Write the first 20 terms of the sequence.
   (b) Find the first 10 terms of the sequences for which \( a_1 = 4, a_1 = 5, \) and \( a_1 = 12 \) (using \( a_n \) as defined above). What conclusion can you make about the behavior of each sequence?

9. The numbers 1, 5, 12, 22, 35, 51, . . . are called pentagonal numbers because they represent the numbers of dots used to make pentagons, as shown below. Use mathematical induction to prove that the \( n \)th pentagonal number \( P_n \) is given by

\[ P_n = \frac{n(3n - 1)}{2}. \]

10. What conclusion can be drawn from the following information about the sequence of statements \( P_n \)?
   (a) \( P_1 \) is true and \( P_k \) implies \( P_{k+1} \).
   (b) \( P_1, P_2, P_3, \ldots, P_{50} \) are all true.
   (c) \( P_1, P_2, \) and \( P_3 \) are all true, but the truth of \( P_k \) does not imply that \( P_{k+1} \) is true.
   (d) \( P_2 \) is true and \( P_{2k} \) implies \( P_{2k+2} \).

11. Let \( f_1, f_2, \ldots, f_m, \ldots \) be the Fibonacci sequence.
   (a) Use mathematical induction to prove that
   \[ f_1 + f_2 + \cdots + f_n = f_{n+2} - 1. \]
   (b) Find the sum of the first 20 terms of the Fibonacci sequence.

12. The odds in favor of an event occurring are the ratio of the probability that the event will occur to the probability that the event will not occur. The reciprocal of this ratio represents the odds against the event occurring.
   (a) Six of the marbles in a bag are red. The odds against choosing a red marble are 4 to 1. How many marbles are in the bag?
   (b) A bag contains three blue marbles and seven yellow marbles. What are the odds in favor of choosing a blue marble? What are the odds against choosing a blue marble?
   (c) Write a formula for converting the odds in favor of an event to the probability of the event.
   (d) Write a formula for converting the probability of an event to the odds in favor of the event.

13. You are taking a test that contains only multiple choice questions (there are five choices for each question). You are on the last question and you know that the answer is not B or D, but you are not sure about answers A, C, and E. What is the probability that you will get the right answer if you take a guess?

14. A dart is thrown at the circular target shown below. The dart is equally likely to hit any point inside the target. What is the probability that it hits the region outside the triangle?

15. An event \( A \) has \( n \) possible outcomes, which have the values \( x_1, x_2, \ldots, x_n \). The probabilities of the \( n \) outcomes occurring are \( p_1, p_2, \ldots, p_n \). The expected value \( V \) of an event \( A \) is the sum of the products of the outcomes’ probabilities and their values,

\[ V = p_1x_1 + p_2x_2 + \cdots + p_nx_n. \]
   (a) To win California’s Super Lotto Plus game, you must match five different numbers chosen from the numbers 1 to 47, plus one Mega number chosen from the numbers 1 to 27. You purchase a ticket for $1. If the jackpot for the next drawing is $12,000,000, what is the expected value of the ticket?
   (b) You are playing a dice game in which you need to score 60 points to win. On each turn, you roll two six-sided dice. Your score for the turn is 0 if the dice do not show the same number, and the product of the numbers on the dice if they do show the same number. What is the expected value of each turn? How many turns will it take on average to score 60 points?
Topics in Analytic Geometry

10.1 Lines
10.2 Introduction to Conics: Parabolas
10.3 Ellipses
10.4 Hyperbolas
10.5 Rotation of Conics
10.6 Parametric Equations
10.7 Polar Coordinates
10.8 Graphs of Polar Equations
10.9 Polar Equations of Conics

In Mathematics
A conic is a collection of points satisfying a geometric property.

In Real Life
Conics are used as models in construction, planetary orbits, radio navigation, and projectile motion. For instance, you can use conics to model the orbits of the planets as they move about the sun. Using the techniques presented in this chapter, you can determine the distances between the planets and the center of the sun. (See Exercises 55–62, page 796.)

IN CAREERS
There are many careers that use conics and other topics in analytic geometry. Several are listed below.

• Home Contractor
  Exercise 69, page 732

• Civil Engineer
  Exercises 73 and 74, page 740

• Artist
  Exercise 51, page 759

• Astronomer
  Exercises 63 and 64, page 796
Inclination of a Line

In Section 1.3, you learned that the graph of the linear equation

$$y = mx + b$$

is a nonvertical line with slope $m$ and y-intercept $(0, b)$. There, the slope of a line was described as the rate of change in $y$ with respect to $x$. In this section, you will look at the slope of a line in terms of the angle of inclination of the line.

Every nonhorizontal line must intersect the x-axis. The angle formed by such an intersection determines the **inclination** of the line, as specified in the following definition.

**Definition of Inclination**

The **inclination** of a nonhorizontal line is the positive angle $\theta$ (less than $\pi$) measured counterclockwise from the x-axis to the line. (See Figure 10.1.)

The inclination of a line is related to its slope in the following manner.

**Inclination and Slope**

If a nonvertical line has inclination $\theta$ and slope $m$, then

$$m = \tan \theta.$$ 

For a proof of this relation between inclination and slope, see Proofs in Mathematics on page 804.
**Example 1** Finding the Inclination of a Line

Find the inclination of the line $x - y = 2$.

**Solution**

The slope of this line is $m = 1$. So, its inclination is determined from the equation

$$\tan \theta = 1.$$ 

From Figure 10.2, it follows that $0 < \theta < \frac{\pi}{2}$. This means that

$$\theta = \arctan 1$$

$$= \frac{\pi}{4}.$$ 

The angle of inclination is $\frac{\pi}{4}$ radians or $45^\circ$.

Now try Exercise 27.

**Example 2** Finding the Inclination of a Line

Find the inclination of the line $2x + 3y = 6$.

**Solution**

The slope of this line is $m = -\frac{2}{3}$. So, its inclination is determined from the equation

$$\tan \theta = -\frac{2}{3}.$$ 

From Figure 10.3, it follows that $\frac{\pi}{2} < \theta < \pi$. This means that

$$\theta = \pi + \arctan \left(-\frac{2}{3}\right)$$

$$\approx \pi + (-0.588)$$

$$= \pi - 0.588$$

$$\approx 2.554.$$ 

The angle of inclination is about 2.554 radians or about 146.3°.

Now try Exercise 33.

**The Angle Between Two Lines**

Two distinct lines in a plane are either parallel or intersecting. If they intersect and are nonperpendicular, their intersection forms two pairs of opposite angles. One pair is acute and the other pair is obtuse. The smaller of these angles is called the **angle between the two lines**. As shown in Figure 10.4, you can use the inclinations of the two lines to find the angle between the two lines. If two lines have inclinations $\theta_1$ and $\theta_2$, where $\theta_1 < \theta_2$ and $\theta_2 - \theta_1 < \pi/2$, the angle between the two lines is

$$\theta = \theta_2 - \theta_1.$$
You can use the formula for the tangent of the difference of two angles
\[
\tan \theta = \frac{\tan \theta_2 - \tan \theta_1}{1 + \tan \theta_1 \tan \theta_2}
\]
to obtain the formula for the angle between two lines.

### Angle Between Two Lines
If two nonperpendicular lines have slopes \(m_1\) and \(m_2\), the angle between the two lines is
\[
\tan \theta = \left| \frac{m_2 - m_1}{1 + m_1 m_2} \right|
\]

#### Example 3 Finding the Angle Between Two Lines
Find the angle between the two lines.

**Line 1:** \(2x - y - 4 = 0\)  \(\text{Line 2:} \ 3x + 4y - 12 = 0\)

**Solution**
The two lines have slopes of \(m_1 = 2\) and \(m_2 = -\frac{3}{4}\), respectively. So, the tangent of the angle between the two lines is
\[
\tan \theta = \left| \frac{-\frac{3}{4} - 2}{1 + (2)(-\frac{3}{4})} \right| = \left| \frac{-\frac{11}{4}}{-\frac{1}{2}} \right| = \frac{11}{2}
\]
Finally, you can conclude that the angle is
\[
\theta = \arctan \frac{11}{2} \approx 1.391 \text{ radians} \approx 79.70^\circ
\]
as shown in Figure 10.5.

**Checkpoint** Now try Exercise 41.

### The Distance Between a Point and a Line
Finding the distance between a line and a point not on the line is an application of perpendicular lines. This distance is defined as the length of the perpendicular line segment joining the point and the line, as shown in Figure 10.6.

#### Distance Between a Point and a Line
The distance between the point \((x_1, y_1)\) and the line \(Ax + By + C = 0\) is
\[
d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}.
\]
Remember that the values of \(A\), \(B\), and \(C\) in this distance formula correspond to the general equation of a line, \(Ax + By + C = 0\). For a proof of this formula for the distance between a point and a line, see Proofs in Mathematics on page 804.
Finding the Distance Between a Point and a Line

Find the distance between the point and the line

**Solution**

The general form of the equation is $2x + y - 1 = 0$. So, the distance between the point and the line is

$$d = \frac{|-2(4) + 1(1) + (-1)|}{\sqrt{(-2)^2 + 1^2}} = \frac{8}{\sqrt{5}} \approx 3.58 \text{ units.}$$

The line and the point are shown in Figure 10.7.

Now try Exercise 53.

An Application of Two Distance Formulas

Figure 10.8 shows a triangle with vertices $A(-3, 0), B(0, 4)$, and $C(5, 2)$.

a. Find the altitude $h$ from vertex $B$ to side $AC$.

b. Find the area of the triangle.

**Solution**

a. To find the altitude, use the formula for the distance between line $AC$ and the point $(0, 4)$. The equation of line $AC$ is obtained as follows.

$\text{Slope: } m = \frac{2 - 0}{5 - (-3)} = \frac{2}{8} = \frac{1}{4}$

$\text{Equation: } y - 0 = \frac{1}{4}(x + 3) \quad \text{Point-slope form}$

$4y = x + 3 \quad \text{Multiply each side by 4.}$

$x - 4y + 3 = 0 \quad \text{General form}$

So, the distance between this line and the point $(0, 4)$ is

$$\text{Altitude } h = \frac{|1(0) + (-4)(4) + 3|}{\sqrt{1^2 + (-4)^2}} = \frac{13}{\sqrt{17}} \text{ units.}$$

b. Using the formula for the distance between two points, you can find the length of the base $AC$ to be

$$b = \sqrt{(5 - (-3))^2 + (2 - 0)^2} \quad \text{Distance Formula}$$

$$= \sqrt{8^2 + 2^2} \quad \text{Simplify.}$$

$$= 2\sqrt{17} \text{ units.} \quad \text{Simplify.}$$

Finally, the area of the triangle in Figure 10.8 is

$$A = \frac{1}{2}bh \quad \text{Formula for the area of a triangle}$$

$$= \frac{1}{2}(2\sqrt{17})(\frac{13}{\sqrt{17}}) \quad \text{Substitute for } b \text{ and } h.$$

$$= 13 \text{ square units.} \quad \text{Simplify.}$$

Now try Exercise 59.
VOCABULARY: Fill in the blanks.

1. The ________ of a nonhorizontal line is the positive angle (less than \( \pi \)) measured counterclockwise from the x-axis to the line.

2. If a nonvertical line has inclination \( \theta \) and slope \( m \), then \( m = \frac{\tan \theta}{1} \).

3. If two nonperpendicular lines have slopes \( m_1 \) and \( m_2 \), the angle between the two lines is \( \tan \theta = \frac{m_1 - m_2}{1 + m_1 m_2} \).

4. The distance between the point \((x_1, y_1)\) and the line \(Ax + By + C = 0\) is given by \( d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}\).

SKILLS AND APPLICATIONS

In Exercises 5–12, find the slope of the line with inclination \( \theta \).

5. \( \theta = \frac{\pi}{4} \) radian

6. \( \theta = \frac{3\pi}{4} \) radian

7. \( \theta = \frac{\pi}{3} \) radian

8. \( \theta = \frac{2\pi}{3} \) radian

9. \( \theta = \frac{\pi}{3} \) radians

10. \( \theta = \frac{5\pi}{6} \) radians

11. \( \theta = 1.27 \) radians

12. \( \theta = 2.88 \) radians

In Exercises 13–18, find the inclination \( \theta \) (in radians and degrees) of the line with a slope of \( m \).

13. \( m = -1 \)

14. \( m = -2 \)

15. \( m = 1 \)

16. \( m = 2 \)

17. \( m = \frac{3}{2} \)

18. \( m = -\frac{3}{2} \)

In Exercises 19–26, find the inclination \( \theta \) (in radians and degrees) of the line passing through the points.

19. \((\sqrt{3}, 2), (0, 1)\)

20. \((1, 2\sqrt{3}), (0, \sqrt{3})\)

21. \((-\sqrt{3}, -1), (0, -2)\)

22. \((3, \sqrt{3}), (6, -2\sqrt{3})\)

23. \((6, 1), (10, 8)\)

24. \((12, 8), (-4, -3)\)

25. \((-2, 20), (10, 0)\)

26. \((0, 100), (50, 0)\)

In Exercises 27–36, find the inclination \( \theta \) (in radians and degrees) of the line.

27. \(2x + 2y - 5 = 0\)

28. \(x - \sqrt{3}y + 1 = 0\)

29. \(3x - 3y + 1 = 0\)

30. \(\sqrt{3}x - y + 2 = 0\)

31. \(x + \sqrt{3}y + 2 = 0\)

32. \(-2\sqrt{3}x - 2y = 0\)

33. \(6x - 2y + 8 = 0\)

34. \(4x + 5y - 9 = 0\)

35. \(5x + 3y = 0\)

36. \(2x - 6y - 12 = 0\)

In Exercises 37–46, find the angle \( \theta \) (in radians and degrees) between the lines.

37. \(3x + y = 3\)

\(x - y = 2\)

38. \(x + 3y = 2\)

\(x - 2y = -3\)
39. \( x - y = 0 \)
\[ 3x - 2y = -1 \]
40. \( 2x - y = 2 \)
\[ 4x + 3y = 24 \]

41. \( x - 2y = 7 \)
\[ 6x + 2y = 5 \]
42. \( 5x + 2y = 16 \)
\[ 3x - 5y = -1 \]
43. \( x + 2y = 8 \)
\[ x - 2y = 2 \]
44. \( 3x - 5y = 3 \)
\[ 3x + 5y = 12 \]
45. \( 0.05x - 0.03y = 0.21 \)
\[ 0.07x + 0.02y = 0.16 \]
46. \( 0.02x - 0.05y = -0.19 \)
\[ 0.03x + 0.04y = 0.52 \]

**ANGLE MEASUREMENT** In Exercises 47–50, find the slope of each side of the triangle and use the slopes to find the measures of the interior angles.

47.

48.

49.

50.

In Exercises 51–58, find the distance between the point and the line.

<table>
<thead>
<tr>
<th>Point</th>

53. \( (2, 3) \)
\[ 3x + y = 1 \]
54. \( (-2, 1) \)
\[ x - y = 2 \]
55. \( (6, 2) \)
\[ x + 1 = 0 \]
56. \( (2, 1) \)
\[ -2x + y - 2 = 0 \]
57. \( (0, 8) \)
\[ 6x - y = 0 \]
58. \( (4, 2) \)
\[ x - y = 20 \]

In Exercises 59–62, the points represent the vertices of a triangle. (a) Draw triangle \( ABC \) in the coordinate plane, (b) find the altitude from vertex \( \text{of the triangle to side } AC \), and (c) find the area of the triangle.

59. \( A = (0, 0), B = (1, 4), C = (4, 0) \)
60. \( A = (0, 0), B = (4, 5), C = (5, -2) \)
61. \( A = (-\frac{1}{2}, \frac{5}{2}), B = (2, 3), C = (\frac{5}{2}, 0) \)
62. \( A = (-4, -5), B = (3, 10), C = (6, 12) \)

In Exercises 63 and 64, find the distance between the parallel lines.

63. \( x + y = 1 \)
\[ x + y = 5 \]
\[ 3x - 4y = 1 \]
\[ 3x - 4y = 10 \]

65. **ROAD GRADE** A straight road rises with an inclination of 0.10 radian from the horizontal (see figure). Find the slope of the road and the change in elevation over a two-mile stretch of the road.

66. **ROAD GRADE** A straight road rises with an inclination of 0.20 radian from the horizontal. Find the slope of the road and the change in elevation over a one-mile stretch of the road.
67. **PITCH OF A ROOF** A roof has a rise of 3 feet for every horizontal change of 5 feet (see figure). Find the inclination of the roof.

68. **CONVEYOR DESIGN** A moving conveyor is built so that it rises 1 meter for each 3 meters of horizontal travel. (a) Draw a diagram that gives a visual representation of the problem. (b) Find the inclination of the conveyor. (c) The conveyor runs between two floors in a factory. The distance between the floors is 5 meters. Find the length of the conveyor.

69. **TRUSS** Find the angles $\alpha$ and $\beta$ shown in the drawing of the roof truss.

70. The Falls Incline Railway in Niagara Falls, Ontario, Canada is an inclined railway that was designed to carry people from the City of Niagara Falls to Queen Victoria Park. The railway is approximately 170 feet long with a 36% uphill grade (see figure). (a) Find the inclination $\theta$ of the railway. (b) Find the change in elevation from the base to the top of the railway.

(c) Using the origin of a rectangular coordinate system as the base of the inclined plane, find the equation of the line that models the railway track. (d) Sketch a graph of the equation you found in part (c).

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 71 and 72, determine whether the statement is true or false. Justify your answer.

71. A line that has an inclination greater than $\pi/2$ radians has a negative slope.

72. To find the angle between two lines whose angles of inclination $\theta_1$ and $\theta_2$ are known, substitute $\theta_1$ and $\theta_2$ for $m_1$ and $m_2$, respectively, in the formula for the angle between two lines.

73. Consider a line with slope $m$ and $y$-intercept $(0, 4)$. (a) Write the distance $d$ between the origin and the line as a function of $m$. (b) Graph the function in part (a). (c) Find the slope that yields the maximum distance between the origin and the line. (d) Find the asymptote of the graph in part (b) and interpret its meaning in the context of the problem.

74. **CAPSTONE** Discuss why the inclination of a line can be an angle that is larger than $\pi/2$, but the angle between two lines cannot be larger than $\pi/2$. Decide whether the following statement is true or false: “The inclination of a line is the angle between the line and the $x$-axis.” Explain.

75. Consider a line with slope $m$ and $y$-intercept $(0, 4)$. (a) Write the distance $d$ between the point $(3, 1)$ and the line as a function of $m$. (b) Graph the function in part (a). (c) Find the slope that yields the maximum distance between the point and the line. (d) Is it possible for the distance to be 0? If so, what is the slope of the line that yields a distance of 0? (e) Find the asymptote of the graph in part (b) and interpret its meaning in the context of the problem.
Conics

Conic sections were discovered during the classical Greek period, 600 to 300 B.C. The early Greeks were concerned largely with the geometric properties of conics. It was not until the 17th century that the broad applicability of conics became apparent and played a prominent role in the early development of calculus.

A \textit{conic section} (or simply \textit{conic}) is the intersection of a plane and a double-napped cone. Notice in Figure 10.9 that in the formation of the four basic conics, the intersecting plane does not pass through the vertex of the cone. When the plane does pass through the vertex, the resulting figure is a \textit{degenerate conic}, as shown in Figure 10.10.

There are several ways to approach the study of conics. You could begin by defining conics in terms of the intersections of planes and cones, as the Greeks did, or you could define them algebraically, in terms of the general second-degree equation

\[ Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0. \]

However, you will study a third approach, in which each of the conics is defined as a \textit{locus} (collection) of points satisfying a geometric property. For example, in Section 1.2, you learned that a circle is defined as the collection of all points \((x, y)\) that are equidistant from a fixed point \((h, k)\). This leads to the standard form of the equation of a circle

\[ (x - h)^2 + (y - k)^2 = r^2. \]
Parabolas
In Section 2.1, you learned that the graph of the quadratic function
\[ f(x) = ax^2 + bx + c \]
is a parabola that opens upward or downward. The following definition of a parabola is more general in the sense that it is independent of the orientation of the parabola.

**Definition of Parabola**
A parabola is the set of all points in a plane that are equidistant from a fixed line (directrix) and a fixed point (focus) not on the line.

The midpoint between the focus and the directrix is called the vertex, and the line passing through the focus and the vertex is called the axis of the parabola. Note in Figure 10.11 that a parabola is symmetric with respect to its axis. Using the definition of a parabola, you can derive the following standard form of the equation of a parabola whose directrix is parallel to the -axis or to the -axis.

For a proof of the standard form of the equation of a parabola, see Proofs in Mathematics on page 805.

**Standard Equation of a Parabola**
The standard form of the equation of a parabola with vertex at \((h, k)\) is as follows.

\[
\begin{align*}
(x - h)^2 &= 4p(y - k), \quad p \neq 0 & \text{Vertical axis, directrix: } y = k - p \\
(y - k)^2 &= 4p(x - h), \quad p \neq 0 & \text{Horizontal axis, directrix: } x = h - p \\
\end{align*}
\]

The focus lies on the axis \(p\) units (directed distance) from the vertex. If the vertex is at the origin \((0, 0)\), the equation takes one of the following forms.

\[
\begin{align*}
x^2 &= 4py & \text{Vertical axis} \\
y^2 &= 4px & \text{Horizontal axis} \\
\end{align*}
\]

See Figure 10.12.

For a proof of the standard form of the equation of a parabola, see Proofs in Mathematics on page 805.
Section 10.2 Introduction to Conics: Parabolas

### Example 1  Vertex at the Origin

Find the standard equation of the parabola with vertex at the origin and focus (2, 0).

**Solution**

The axis of the parabola is horizontal, passing through (0, 0) and (2, 0), as shown in Figure 10.13.

The standard form is where and So, the equation is

Now try Exercise 23.

### Example 2  Finding the Focus of a Parabola

Find the focus of the parabola given by \( y^2 = 8x \).

**Solution**

To find the focus, convert to standard form by completing the square.

\[
\begin{align*}
  y &= -\frac{1}{2}x^2 - x + \frac{1}{2} \\
  -2y &= x^2 + 2x - 1 \\
  1 - 2y &= x^2 + 2x \\
  1 + 1 - 2y &= x^2 + 2x + 1 \\
  2 - 2y &= x^2 + 2x + 1 \\
  -2(y - 1) &= (x + 1)^2
\end{align*}
\]

Comparing this equation with \((x - h)^2 = 4p(y - k)\)

you can conclude that \(h = -1, k = 1,\) and \(p = -\frac{1}{2}\). Because \(p\) is negative, the parabola opens downward, as shown in Figure 10.14. So, the focus of the parabola is \((h, k + p) = (-1, \frac{1}{2})\).

Now try Exercise 43.
Example 3 Finding the Standard Equation of a Parabola

Find the standard form of the equation of the parabola with vertex (2, 1) and focus (2, 4). Then write the quadratic form of the equation.

Solution

Because the axis of the parabola is vertical, passing through (2, 1) and (2, 4), consider the equation

\[(x - h)^2 = 4p(y - k)\]

where \(h = 2, k = 1,\) and \(p = 4 - 1 = 3.\) So, the standard form is

\[(x - 2)^2 = 12(y - 1).\]

You can obtain the more common quadratic form as follows.

\[
(x - 2)^2 = 12(y - 1) \quad \text{Write original equation.}
\]
\[
x^2 - 4x + 4 = 12y - 12 \quad \text{Multiply.}
\]
\[
x^2 - 4x + 16 = 12y \quad \text{Add 12 to each side.}
\]
\[
\frac{1}{12}(x^2 - 4x + 16) = y \quad \text{Divide each side by 12.}
\]

The graph of this parabola is shown in Figure 10.15.

CHECKPOINT Now try Exercise 55.

Application

A line segment that passes through the focus of a parabola and has endpoints on the parabola is called a focal chord. The specific focal chord perpendicular to the axis of the parabola is called the latus rectum.

Parabolas occur in a wide variety of applications. For instance, a parabolic reflector can be formed by revolving a parabola around its axis. The resulting surface has the property that all incoming rays parallel to the axis are reflected through the focus of the parabola. This is the principle behind the construction of the parabolic mirrors used in reflecting telescopes. Conversely, the light rays emanating from the focus of a parabolic reflector used in a flashlight are all parallel to one another, as shown in Figure 10.16.

A line is tangent to a parabola at a point on the parabola if the line intersects, but does not cross, the parabola at the point. Tangent lines to parabolas have special properties related to the use of parabolas in constructing reflective surfaces.

Reflective Property of a Parabola

The tangent line to a parabola at a point \(P\) makes equal angles with the following two lines (see Figure 10.17).

1. The line passing through \(P\) and the focus
2. The axis of the parabola
Example 4  Finding the Tangent Line at a Point on a Parabola

Find the equation of the tangent line to the parabola given by $y = x^2$ at the point (1, 1).

**Solution**

For this parabola, $p = \frac{1}{4}$ and the focus is $(0, \frac{1}{4})$, as shown in Figure 10.18. You can find the $y$-intercept $(0, b)$ of the tangent line by equating the lengths of the two sides of the isosceles triangle shown in Figure 10.18:

$$d_1 = \frac{1}{4} - b$$

and

$$d_2 = \sqrt{ (1 - 0)^2 + \left(1 - \left(\frac{1}{4} \right) \right)^2 } = \frac{5}{4}$$

Note that $d_1 = \frac{1}{4} - b$ rather than $b - \frac{1}{4}$. The order of subtraction for the distance is important because the distance must be positive. Setting $d_1 = d_2$ produces

$$\frac{1}{4} - b = \frac{5}{4}$$

$$b = -1.$$ 

So, the slope of the tangent line is

$$m = \frac{1 - (-1)}{1 - 0} = 2$$

and the equation of the tangent line in slope-intercept form is

$$y = 2x - 1.$$ 

Now try Exercise 65.

**Technology**

Use a graphing utility to confirm the result of Example 4. By graphing $y_1 = x^2$ and $y_2 = 2x - 1$ in the same viewing window, you should be able to see that the line touches the parabola at the point (1, 1).

**Classroom Discussion**

Satellite Dishes  Cross sections of satellite dishes are parabolic in shape. Use the figure shown to write a paragraph explaining why satellite dishes are parabolic.
10.2 EXERCISES

VOCABULARY: Fill in the blanks.
1. A ________ is the intersection of a plane and a double-napped cone.
2. When a plane passes through the vertex of a double-napped cone, the intersection is a ________ ________.
3. A collection of points satisfying a geometric property can also be referred to as a ________ of points.
4. A ________ is defined as the set of all points (x, y) in a plane that are equidistant from a fixed line, called
the ________, and a fixed point, called the ________, not on the line.
5. The line that passes through the focus and the vertex of a parabola is called the ________ of the parabola.
6. The ________ of a parabola is the midpoint between the focus and the directrix.
7. A line segment that passes through the focus of a parabola and has endpoints on the parabola is called
a ________ ________.
8. A line is ________ to a parabola at a point on the parabola if the line intersects, but does not cross, the parabola
at the point.

SKILLS AND APPLICATIONS

In Exercises 9–12, describe in words how a plane could intersect with the double-napped cone shown to form the
conic section.

9. Circle 10. Ellipse

In Exercises 13–18, match the equation with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

13. \( y^2 = -4x \) 14. \( x^2 = 2y \)
15. \( x^2 = -8y \) 16. \( y^2 = -12x \)
17. \((y - 1)^2 = 4(x - 3)\) 18. \((x + 3)^2 = -2(y - 1)\)

In Exercises 19–32, find the standard form of the equation of the parabola with the given characteristic(s) and vertex at the
origin.

19. Focus: \((0, \frac{1}{2})\)
20. Focus: \((-\frac{3}{2}, 0)\)
21. Focus: \((-2, 0)\)
22. Focus: \((0, -2)\)
23. Directrix: \(y = 1\)
24. Directrix: \(y = -2\)
25. Directrix: \(x = -1\)
26. Directrix: \(x = 3\)
27. Vertical axis and passes through the point \((4, 6)\)
28. Vertical axis and passes through the point \((3, -2)\)
29. Horizontal axis and passes through the point \((-3, -3)\)
30. Horizontal axis and passes through the point \((-2, 5)\)
31. Horizontal axis and passes through the point \((-2, 5)\)
In Exercises 33–46, find the vertex, focus, and directrix of the parabola, and sketch its graph.

33. \( y = \frac{1}{2}x^2 \)  
34. \( y = -2x^2 \)  
35. \( y^2 = -6x \)  
36. \( y^2 = 3x \)  
37. \( x^2 + 6y = 0 \)  
38. \( x + y^2 = 0 \)  
39. \( (x - 1)^2 + 8(y + 2) = 0 \)  
40. \( (x + 5) + (y - 1)^2 = 0 \)  
41. \( (x + 3)^2 = 4(y - \frac{1}{2}) \)  
42. \( (x + \frac{1}{2})^2 = 4(y - 1) \)  
43. \( y = \frac{1}{2}(x^2 - 2x + 5) \)  
44. \( x = \frac{1}{2}(y^2 + 2y + 33) \)  
45. \( y^2 + 6y + 8x + 25 = 0 \)  
46. \( y^2 - 4y - 4x = 0 \)

In Exercises 47–50, find the vertex, focus, and directrix of the parabola. Use a graphing utility to graph the parabola.

47. \( x^2 + 4x + 6y - 2 = 0 \)  
48. \( x^2 - 2x + 8y + 9 = 0 \)  
49. \( y^2 + x + y = 0 \)  
50. \( y^2 - 4x - 4 = 0 \)

In Exercises 51–60, find the standard form of the equation of the parabola with the given characteristics.

51. \( y = \frac{1}{2}(x - 2)^2 + 0 \)  
52. \( y = \frac{1}{2}(x - 4.5)^2 + 4 \)  
53. \( y = \frac{1}{2}(x + 4)^2 + 0 \)  
54. \( y = \frac{1}{2}(x + 3)^2 + 0 \)  
55. Vertex: \((4, 3)\); focus: \((6, 3)\)  
56. Vertex: \((-1, 2)\); focus: \((-1, 0)\)  
57. Vertex: \((0, 2)\); directrix: \(y = 4\)  
58. Vertex: \((1, 2)\); directrix: \(y = -1\)  
59. Focus: \((2, 2)\); directrix: \(x = -2\)  
60. Focus: \((0, 0)\); directrix: \(y = 8\)

In Exercises 61 and 62, change the equation of the parabola so that its graph matches the description.

61. \( (y - 3)^2 = 6(x + 1) \); upper half of parabola  
62. \( (y + 1)^2 = 2(x - 4) \); lower half of parabola

In Exercises 63 and 64, the equations of a parabola and a tangent line to the parabola are given. Use a graphing utility to graph both equations in the same viewing window. Determine the coordinates of the point of tangency.

**Parabola**  
63. \( y^2 - 8x = 0 \)  
64. \( x^2 + 12y = 0 \)

**Tangent Line**  
63. \( x - y + 2 = 0 \)  
64. \( x + y - 3 = 0 \)

In Exercises 65–68, find an equation of the tangent line to the parabola at the given point, and find the \(x\)-intercept of the line.

65. \( x^2 = 2y, \ (4, 8) \)  
66. \( x^2 = 2y, \ (3, \frac{9}{2}) \)

67. \( y = -2x^2, \ (-1, -2) \)  
68. \( y = -2x^2, \ (2, -8) \)

**69. REVENUE** The revenue \( R \) (in dollars) generated by the sale of \( x \) units of a patio furniture set is given by

\[
R = 14,045 \left( 1 - \frac{4}{5} \right) \left( x - 106 \right)^2
\]

Use a graphing utility to graph the function and approximate the number of sales that will maximize revenue.

**70. REVENUE** The revenue \( R \) (in dollars) generated by the sale of \( x \) units of a digital camera is given by

\[
R = 25,515 \left( 1 - \frac{5}{7} \right) \left( x - 135 \right)^2
\]

Use a graphing utility to graph the function and approximate the number of sales that will maximize revenue.

**71. SUSPENSION BRIDGE** Each cable of the Golden Gate Bridge is suspended (in the shape of a parabola) between two towers that are 1280 meters apart. The top of each tower is 152 meters above the roadway. The cables touch the roadway midway between the towers.

(a) Draw a sketch of the bridge. Locate the origin of a rectangular coordinate system at the center of the roadway. Label the coordinates of the known points.

(b) Write an equation that models the cables.

(c) Complete the table by finding the height \( y \) of the suspension cables over the roadway at a distance of \( x \) meters from the center of the bridge.

<table>
<thead>
<tr>
<th>Distance, ( x )</th>

</tbody>
</table>
72. **SATELLITE DISH** The receiver in a parabolic satellite dish is 4.5 feet from the vertex and is located at the focus (see figure). Write an equation for a cross section of the reflector. (Assume that the dish is directed upward and the vertex is at the origin.)

73. **ROAD DESIGN** Roads are often designed with parabolic surfaces to allow rain to drain off. A particular road that is 32 feet wide is 0.4 foot higher in the center than it is on the sides (see figure).

(a) Find an equation of the parabola that models the road surface. (Assume that the origin is at the center of the road.)

(b) How far from the center of the road is the road surface 0.1 foot lower than in the middle?

74. **HIGHWAY DESIGN** Highway engineers design a parabolic curve for an entrance ramp from a straight street to an interstate highway (see figure). Find an equation of the parabola.

75. **BEAM DEFLECTION** A simply supported beam is 12 meters long and has a load at the center (see figure). The deflection of the beam at its center is 2 centimeters. Assume that the shape of the deflected beam is parabolic.

(a) Write an equation of the parabola. (Assume that the origin is at the center of the deflected beam.)

(b) How far from the center of the beam is the deflection equal to 1 centimeter?

76. **BEAM DEFLECTION** Repeat Exercise 75 if the length of the beam is 16 meters and the deflection of the beam at the center is 3 centimeters.

77. **FLUID FLOW** Water is flowing from a horizontal pipe 48 feet above the ground. The falling stream of water has the shape of a parabola whose vertex (0, 48) is at the end of the pipe (see figure). The stream of water strikes the ground at the point \( (10\sqrt{3}, 0) \). Find the equation of the path taken by the water.

78. **LATTICE ARCH** A parabolic lattice arch is 16 feet high at the vertex. At a height of 6 feet, the width of the lattice arch is 4 feet (see figure). How wide is the lattice arch at ground level?

79. **SATELLITE ORBIT** A satellite in a 100-mile-high circular orbit around Earth has a velocity of approximately 17,500 miles per hour. If this velocity is multiplied by \( \sqrt{2} \), the satellite will have the minimum velocity necessary to escape Earth’s gravity and it will follow a parabolic path with the center of Earth as the focus (see figure on the next page).
Section 10.2 Introduction to Conics: Parabolas

(a) Find the escape velocity of the satellite.

(b) Find an equation of the parabolic path of the satellite (assume that the radius of Earth is 4000 miles).

80. PATH OF A SOFTBALL The path of a softball is modeled by \(-12.5(y - 7.125) = (x - 6.25)^2\), where the coordinates \(x\) and \(y\) are measured in feet, with \(x = 0\) corresponding to the position from which the ball was thrown.

(a) Use a graphing utility to graph the trajectory of the softball.

(b) Use the \(\text{trace}\) feature of the graphing utility to approximate the highest point and the range of the trajectory.

PROJECTILE MOTION In Exercises 81 and 82, consider the path of a projectile projected horizontally with a velocity of \(v\) feet per second at a height of \(s\) feet, where the model for the path is

\[ x^2 = -\frac{v^2}{16}(y - s). \]

In this model (in which air resistance is disregarded), \(y\) is the height (in feet) of the projectile and \(x\) is the horizontal distance (in feet) the projectile travels.

81. A ball is thrown from the top of a 100-foot tower with a velocity of 28 feet per second.

(a) Find the equation of the parabolic path.

(b) How far does the ball travel horizontally before striking the ground?

82. A cargo plane is flying at an altitude of 30,000 feet and a speed of 540 miles per hour. A supply crate is dropped from the plane. How many feet will the crate travel horizontally before it hits the ground?

EXPLORATION

TRUE OR FALSE? In Exercises 83 and 84, determine whether the statement is true or false. Justify your answer.

83. It is possible for a parabola to intersect its directrix.

84. If the vertex and focus of a parabola are on a horizontal line, then the directrix of the parabola is vertical.

85. Let \((x_1, y_1)\) be the coordinates of a point on the parabola \(x^2 = 4py\). The equation of the line tangent to the parabola at the point is

\[ y - y_1 = \frac{x_1}{2p}(x - x_1). \]

What is the slope of the tangent line?

86. CAPSTONE Explain what each of the following equations represents, and how equations (a) and (b) are equivalent.

(a) \(y = a(x - h)^2 + k, \quad a \neq 0\)

(b) \((x - h)^2 = 4p(y - k), \quad p \neq 0\)

(c) \((y - k)^2 = 4p(x - h), \quad p \neq 0\)

87. GRAPHICAL REASONING Consider the parabola \(x^2 = 4py\). 

(a) Use a graphing utility to graph the parabola for \(p = 1, \quad p = 2, \quad p = 3, \quad \text{and} \quad p = 4\). Describe the effect on the graph when \(p\) increases.

(b) Locate the focus for each parabola in part (a).

(c) For each parabola in part (a), find the length of the latus rectum (see figure). How can the length of the latus rectum be determined directly from the standard form of the equation of the parabola?

(d) Explain how the result of part (c) can be used as a sketching aid when graphing parabolas.

88. GEOMETRY The area of the shaded region in the figure is \(A = \frac{1}{4}p^{3/2}b^{3/2}\).

(a) Find the area when \(p = 2\) and \(b = 4\).

(b) Give a geometric explanation of why the area approaches 0 as \(p\) approaches 0.
10.3 Ellipses

What you should learn

• Write equations of ellipses in standard form and graph ellipses.
• Use properties of ellipses to model and solve real-life problems.
• Find eccentricities of ellipses.

Why you should learn it

Ellipses can be used to model and solve many types of real-life problems. For instance, in Exercise 65 on page 749, an ellipse is used to model the orbit of Halley’s comet.

Introduction

The second type of conic is called an ellipse, and is defined as follows.

Definition of Ellipse

An ellipse is the set of all points \((x, y)\) in a plane, the sum of whose distances from two distinct fixed points (foci) is constant. See Figure 10.19.

The line through the foci intersects the ellipse at two points called vertices. The chord joining the vertices is the major axis, and its midpoint is the center of the ellipse. The chord perpendicular to the major axis at the center is the minor axis of the ellipse. See Figure 10.20.

You can visualize the definition of an ellipse by imagining two thumbtacks placed at the foci, as shown in Figure 10.21. If the ends of a fixed length of string are fastened to the thumbtacks and the string is drawn taut with a pencil, the path traced by the pencil will be an ellipse.

To derive the standard form of the equation of an ellipse, consider the ellipse in Figure 10.22 with the following points: center, \((h, k)\); vertices, \((h \pm a, k)\); foci, \((h \pm c, k)\). Note that the center is the midpoint of the segment joining the foci. The sum of the distances from any point on the ellipse to the two foci is constant. Using a vertex point, this constant sum is

\[
(a + c) + (a - c) = 2a
\]

or simply the length of the major axis. Now, if you let \((x, y)\) be any point on the ellipse, the sum of the distances between \((x, y)\) and the two foci must also be \(2a\).
That is,
\[
\sqrt{[x - (h - c)]^2 + (y - k)^2} + \sqrt{[x - (h + c)]^2 + (y - k)^2} = 2a
\]
which, after expanding and regrouping, reduces to
\[
(a^2 - c^2)(x - h)^2 + a^2(y - k)^2 = a^2(a^2 - c^2).
\]
Finally, in Figure 10.22, you can see that
\[
b^2 = a^2 - c^2
\]
which implies that the equation of the ellipse is
\[
b^2(x - h)^2 + a^2(y - k)^2 = a^2b^2
\]
\[
\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1.
\]
You would obtain a similar equation in the derivation by starting with a vertical major axis. Both results are summarized as follows.

**Study Tip**

Consider the equation of the ellipse
\[
\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1.
\]
If you let \(a = b\), then the equation can be rewritten as
\[
(x - h)^2 + (y - k)^2 = a^2
\]
which is the standard form of the equation of a circle with radius \(r = a\) (see Section 1.2). Geometrically, when \(a = b\) for an ellipse, the major and minor axes are of equal length, and so the graph is a circle.

**Standard Equation of an Ellipse**

The **standard form of the equation of an ellipse**, with center \((h, k)\) and major and minor axes of lengths \(2a\) and \(2b\), respectively, where \(0 < b < a\), is

\[
\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1 \quad \text{Major axis is horizontal.}
\]

\[
\frac{(x - h)^2}{b^2} + \frac{(y - k)^2}{a^2} = 1 \quad \text{Major axis is vertical.}
\]

The foci lie on the major axis, \(c\) units from the center, with \(c^2 = a^2 - b^2\).

If the center is at the origin \((0,0)\), the equation takes one of the following forms.

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{Major axis is horizontal.}
\]

\[
\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1 \quad \text{Major axis is vertical.}
\]

Figure 10.23 shows both the horizontal and vertical orientations for an ellipse.
**Example 1  Finding the Standard Equation of an Ellipse**

Find the standard form of the equation of the ellipse having foci at \((0, 1)\) and \((4, 1)\) and a major axis of length 6, as shown in Figure 10.24.

**Solution**

Because the foci occur at \((0, 1)\) and \((4, 1)\), the center of the ellipse is \((2, 1)\) and the distance from the center to one of the foci is \(c = 2\). Because \(2a = 6\), you know that \(a = 3\). Now, from \(c^2 = a^2 - b^2\), you have

\[
b = \sqrt{a^2 - c^2} = \sqrt{3^2 - 2^2} = \sqrt{5}.
\]

Because the major axis is horizontal, the standard equation is

\[
\frac{(x - 2)^2}{3^2} + \frac{(y - 1)^2}{(\sqrt{5})^2} = 1.
\]

This equation simplifies to

\[
\frac{(x - 2)^2}{9} + \frac{(y - 1)^2}{5} = 1.
\]

**CHECKPOINT**  Now try Exercise 23.

**Example 2  Sketching an Ellipse**

Sketch the ellipse given by \(x^2 + 4y^2 + 6x - 8y + 9 = 0\).

**Solution**

Begin by writing the original equation in standard form. In the fourth step, note that 9 and 4 are added to both sides of the equation when completing the squares.

\[
x^2 + 4y^2 + 6x - 8y + 9 = 0 \quad \text{Write original equation.}
\]

\[
(x^2 + 6x + \underline{9}) + (4y^2 - 8y + \underline{4}) = -9 \quad \text{Group terms.}
\]

\[
(x^2 + 6x + 9) + 4(y^2 - 2y + 1) = -9 + 9 + 4(1) \quad \text{Factor 4 out of \(-2y+1\).}
\]

\[
(x + 3)^2 + 4(y - 1)^2 = 4 \quad \text{Write in completed square form.}
\]

\[
\frac{(x + 3)^2}{4} + \frac{(y - 1)^2}{1} = 1 \quad \text{Divide each side by 4.}
\]

\[
\frac{(x + 3)^2}{2^2} + \frac{(y - 1)^2}{1^2} = 1 \quad \text{Write in standard form.}
\]

From this standard form, it follows that the center is \((h, k) = (-3, 1)\). Because the denominator of the \(x\)-term is \(a^2 = 2^2\), the endpoints of the major axis lie two units to the right and left of the center. Similarly, because the denominator of the \(y\)-term is \(b^2 = 1^2\), the endpoints of the minor axis lie one unit up and down from the center. Now, from \(c^2 = a^2 - b^2\), you have \(c = \sqrt{2^2 - 1^2} = \sqrt{3}\). So, the foci of the ellipse are \((-3 - \sqrt{3}, 1)\) and \((-3 + \sqrt{3}, 1)\). The ellipse is shown in Figure 10.25.

**CHECKPOINT**  Now try Exercise 47.
Section 10.3  Ellipses

Find the center, vertices, and foci of the ellipse $4x^2 + y^2 - 8x + 4y - 8 = 0$.

**Solution**

By completing the square, you can write the original equation in standard form.

$$4x^2 + y^2 - 8x + 4y - 8 = 0$$  \hspace{1cm} \text{Write original equation.}

$$\left(4x^2 - 8x + \_\right) + \left(y^2 + 4y + \_\right) = 8$$  \hspace{1cm} \text{Group terms.}

$$4\left(x^2 - 2x + \_\right) + \left(y^2 + 4y + \_\right) = 8$$  \hspace{1cm} \text{Factor 4 out of $x$-terms.}

$$4(x^2 - 2x + 1) + (y^2 + 4y + 4) = 8 + 4(1) + 4$$

$$4(x - 1)^2 + (y + 2)^2 = 16$$  \hspace{1cm} \text{Write in completed square form.}

$$\frac{(x - 1)^2}{4} + \frac{(y + 2)^2}{16} = 1$$  \hspace{1cm} \text{Divide each side by 16.}

$$\frac{(x - 1)^2}{2^2} + \frac{(y + 2)^2}{4^2} = 1$$  \hspace{1cm} \text{Write in standard form.}

The major axis is vertical, where $h = 1, k = -2, a = 4, b = 2$, and

$$c = \sqrt{a^2 - b^2} = \sqrt{16 - 4} = \sqrt{12} = 2\sqrt{3}.$$ 

So, you have the following.

Center: $(1, -2)$  \hspace{1cm} Vertices: $(1, -6)$  \hspace{1cm} Foci: $(1, -2 - 2\sqrt{3})$  \hspace{1cm} $(1, 2)$  \hspace{1cm} $(1, -2 + 2\sqrt{3})$

The graph of the ellipse is shown in Figure 10.26.

**CHECKPOINT**  Now try Exercise 51.

---

**TECHNOLOGY**

You can use a graphing utility to graph an ellipse by graphing the upper and lower portions in the same viewing window. For instance, to graph the ellipse in Example 3, first solve for $y$ to get

$$y_1 = -2 + 4 \sqrt{1 - \frac{(x - 1)^2}{4}}$$  \hspace{1cm} \text{and}  \hspace{1cm} $$y_2 = -2 - 4 \sqrt{1 - \frac{(x - 1)^2}{4}}.$$ 

Use a viewing window in which $-6 \leq x \leq 9$ and $-7 \leq y \leq 3$. You should obtain the graph shown below.
Application

Ellipses have many practical and aesthetic uses. For instance, machine gears, supporting arches, and acoustic designs often involve elliptical shapes. The orbits of satellites and planets are also ellipses. Example 4 investigates the elliptical orbit of the moon about Earth.

Example 4  An Application Involving an Elliptical Orbit

The moon travels about Earth in an elliptical orbit with Earth at one focus, as shown in Figure 10.27. The major and minor axes of the orbit have lengths of 768,800 kilometers and 767,640 kilometers, respectively. Find the greatest and smallest distances (the apogee and perigee, respectively) from Earth’s center to the moon’s center.

Solution

Because and you have

which implies that

So, the greatest distance between the center of Earth and the center of the moon is

and the smallest distance is

Check Point  Now try Exercise 65.

Eccentricity

One of the reasons it was difficult for early astronomers to detect that the orbits of the planets are ellipses is that the foci of the planetary orbits are relatively close to their centers, and so the orbits are nearly circular. To measure the ovalness of an ellipse, you can use the concept of eccentricity.

Definition of Eccentricity

The eccentricity $e$ of an ellipse is given by the ratio

Note that $0 < e < 1$ for every ellipse.
To see how this ratio is used to describe the shape of an ellipse, note that because the foci of an ellipse are located along the major axis between the vertices and the center, it follows that

\[ 0 < c < a. \]

For an ellipse that is nearly circular, the foci are close to the center and the ratio \( c/a \) is small, as shown in Figure 10.28. On the other hand, for an elongated ellipse, the foci are close to the vertices and the ratio \( c/a \) is close to 1, as shown in Figure 10.29.

The orbit of the moon has an eccentricity of \( e \approx 0.0549 \), and the eccentricities of the eight planetary orbits are as follows.

- Mercury: \( e \approx 0.2056 \)
- Venus: \( e \approx 0.0068 \)
- Earth: \( e \approx 0.0167 \)
- Mars: \( e \approx 0.0934 \)
- Jupiter: \( e \approx 0.0484 \)
- Saturn: \( e \approx 0.0542 \)
- Uranus: \( e \approx 0.0472 \)
- Neptune: \( e \approx 0.0086 \)

**CLASSROOM DISCUSSION**

**Ellipses and Circles**

a. Show that the equation of an ellipse can be written as

\[
\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2(1 - e^2)} = 1.
\]

b. For the equation in part (a), let \( a = 4, h = 1, \) and \( k = 2, \) and use a graphing utility to graph the ellipse for \( e = 0.95, e = 0.75, e = 0.5, e = 0.25, \) and \( e = 0.1. \) Discuss the changes in the shape of the ellipse as \( e \) approaches 0.

c. Make a conjecture about the shape of the graph in part (b) when \( e = 0. \) What is the equation of this ellipse? What is another name for an ellipse with an eccentricity of 0?

*The time it takes Saturn to orbit the sun is about 29.4 Earth years.*
10.3 EXERCISES

VOCABULARY: Fill in the blanks.
1. An ________ is the set of all points \((x, y)\) in a plane, the sum of whose distances from two distinct fixed points, called ________, is constant.

2. The chord joining the vertices of an ellipse is called the ________ ________, and its midpoint is the ________ of the ellipse.

3. The chord perpendicular to the major axis at the center of the ellipse is called the ________ ________ of the ellipse.

4. The concept of ________ is used to measure the ovalness of an ellipse.

SKILLS AND APPLICATIONS

In Exercises 5–10, match the equation with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

\[ \frac{x^2}{4} + \frac{y^2}{9} = 1 \]

\[ \frac{x^2}{9} + \frac{y^2}{4} = 1 \]

\[ \frac{x^2}{25} + \frac{y^2}{4} = 1 \]

\[ x^2 + y^2 = 1 \]

\[ \frac{(x - 2)^2}{16} + \frac{(y + 1)^2}{4} = 1 \]

\[ \frac{(x + 2)^2}{9} + \frac{(y + 2)^2}{4} = 1 \]

In Exercises 11–18, find the standard form of the equation of the ellipse with the given characteristics and center at the origin.

11. Center: \((-2, 0)\); vertices: \((0, 4)\) and \((0, -4)\)

12. Center: \((0, \frac{3}{2})\); vertices: \((2, 0)\) and \((-2, 0)\)

13. Vertices: \((\pm 7, 0)\); foci: \((\pm 2, 0)\)

14. Vertices: \((0, \pm 8)\); foci: \((0, \pm 4)\)

15. Foci: \((\pm 5, 0)\); major axis of length 14

16. Foci: \((\pm 2, 0)\); major axis of length 10

17. Vertices: \((0, \pm 5)\); passes through the point \((4, 2)\)

18. Vertical major axis; passes through the points \((0, 6)\) and \((3, 0)\)

In Exercises 19–28, find the standard form of the equation of the ellipse with the given characteristics.

19. Center: \((1, 3)\); vertices: \((2, 6)\) and \((3, 3)\)

20. Center: \((2, 0)\); vertices: \((-1, 2)\) and \((-3, 2)\)

21. Vertices: \((0, 2)\), \((8, 2)\); minor axis of length 2

22. Foci: \((0, 0)\), \((4, 0)\); major axis of length 6

23. Foci: \((0, 0)\), \((0, 8)\); major axis of length 16

24. Center: \((2, -1)\); vertex: \((2, \frac{1}{2})\); minor axis of length 2

25. Center: \((0, 4)\); \(a = 2c\); vertices: \((-4, 4)\), \((4, 4)\)

26. Center: \((3, 2)\); \(a = 3c\); foci: \((1, 2)\), \((5, 2)\)
In Exercises 29–52, identify the conic as a circle or an ellipse. Then find the center, radius, vertices, foci, and eccentricity of the conic (if applicable), and sketch its graph.

29. \( \frac{x^2}{25} + \frac{y^2}{16} = 1 \)  
30. \( \frac{x^2}{16} + \frac{y^2}{81} = 1 \)  
31. \( \frac{x^2}{25} + \frac{y^2}{5} = 1 \)  
32. \( \frac{x^2}{9} + \frac{y^2}{9} = 1 \)  
33. \( \frac{x^2}{5} + \frac{y^2}{9} = 1 \)  
34. \( \frac{x^2}{64} + \frac{y^2}{28} = 1 \)  
35. \( \frac{(x - 4)^2}{16} + \frac{(y + 1)^2}{25} = 1 \)  
36. \( \frac{(x + 3)^2}{12} + \frac{(y - 2)^2}{16} = 1 \)  
37. \( \frac{x^2}{4/9} + \frac{(y + 1)^2}{4/9} = 1 \)  
38. \( \frac{(x + 5)^2}{9/4} + (y - 1)^2 = 1 \)  
39. \( (x + 2)^2 + \frac{(y + 4)^2}{1/4} = 1 \)  
40. \( \frac{(x - 3)^2}{25/4} + \frac{(y - 1)^2}{25/4} = 1 \)  
41. \( 9x^2 + 4y^2 + 36x - 24y + 36 = 0 \)  
42. \( 9x^2 + 4y^2 - 54x + 40y + 37 = 0 \)  
43. \( x^2 + y^2 - 2x + 4y - 31 = 0 \)  
44. \( x^2 + 5y^2 - 8x - 30y - 39 = 0 \)  
45. \( 3x^2 + y^2 + 18x - 2y - 8 = 0 \)  
46. \( 6x^2 + 2y^2 + 18x - 10y + 2 = 0 \)  
47. \( x^2 + 4y^2 - 6x + 20y - 2 = 0 \)  
48. \( x^2 + y^2 - 4x + 6y - 3 = 0 \)  
49. \( 9x^2 + 9y^2 + 18x - 18y + 14 = 0 \)  
50. \( 16x^2 + 25y^2 - 32x + 50y + 16 = 0 \)  
51. \( 9x^2 + 25y^2 - 36x - 50y + 60 = 0 \)  
52. \( 16x^2 + 16y^2 - 64x + 32y + 55 = 0 \)  

In Exercises 53–56, use a graphing utility to graph the ellipse. Find the center, foci, and vertices. (Recall that it may be necessary to solve the equation for y and obtain two equations.)

53. \( 5x^2 + 3y^2 = 15 \)  
54. \( 3x^2 + 4y^2 = 12 \)  
55. \( 12x^2 + 20y^2 - 12x + 40y - 37 = 0 \)  
56. \( 36x^2 + 9y^2 + 48x - 36y - 72 = 0 \)
66. **SATELLITE ORBIT** The first artificial satellite to orbit Earth was Sputnik I (launched by the former Soviet Union in 1957). Its highest point above Earth’s surface was 947 kilometers, and its lowest point was 228 kilometers (see figure). The center of Earth was at one focus of the elliptical orbit, and the radius of Earth is 6378 kilometers. Find the eccentricity of the orbit.

![Image of Earth with Sputnik orbit](image)

67. **MOTION OF A PENDULUM** The relation between the velocity \( y \) (in radians per second) of a pendulum and its angular displacement from the vertical can be modeled by a semiellipse. A 12-centimeter pendulum crests when the angular displacement is 0.2 radian and 0.2 radian. When the pendulum is at equilibrium the velocity is radians per second.

(a) Find an equation that models the motion of the pendulum. Place the center at the origin.

(b) Graph the equation from part (a).

(c) Which half of the ellipse models the motion of the pendulum?

68. **GEOMETRY** A line segment through a focus of an ellipse with endpoints on the ellipse and perpendicular to the major axis is called a **latus rectum** of the ellipse. Therefore, an ellipse has two latera recta. Knowing the length of the latus recta is helpful in sketching an ellipse because it yields other points on the curve (see figure). Show that the length of each latus rectum is \( 2b^2/a \).

![Image of ellipse with latus recta](image)

In Exercises 69–72, sketch the graph of the ellipse, using latera recta (see Exercise 68).

69. \( \frac{x^2}{9} + \frac{y^2}{16} = 1 \) 
70. \( \frac{x^2}{4} + \frac{y^2}{1} = 1 \) 
71. \( 5x^2 + 3y^2 = 15 \) 
72. \( 9x^2 + 4y^2 = 36 \)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 73 and 74, determine whether the statement is true or false. Justify your answer.

73. The graph of \( x^2 + 4y^4 - 4 = 0 \) is an ellipse.

74. It is easier to distinguish the graph of an ellipse from the graph of a circle if the eccentricity of the ellipse is large (close to 1).

75. Consider the ellipse

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \quad a + b = 20.
\]

(a) The area of the ellipse is given by \( A = \pi ab \). Write the area of the ellipse as a function of \( a \).

(b) Find the equation of an ellipse with an area of 264 square centimeters.

(c) Complete the table using your equation from part (a), and make a conjecture about the shape of the ellipse with maximum area.

<table>
<thead>

</tbody>
</table>

(d) Use a graphing utility to graph the area function and use the graph to support your conjecture in part (c).

76. **THINK ABOUT IT** At the beginning of this section it was noted that an ellipse can be drawn using two thumbtacks, a string of fixed length (greater than the distance between the two tacks), and a pencil. If the ends of the string are fastened at the tacks and the string is drawn taut with a pencil, the path traced by the pencil is an ellipse.

(a) What is the length of the string in terms of \( a \)?

(b) Explain why the path is an ellipse.

77. **THINK ABOUT IT** Find the equation of an ellipse such that for any point on the ellipse, the sum of the distances from the point \((2, 2)\) and \((10, 2)\) is 36.

78. **CAPSTONE** Describe the relationship between circles and ellipses. How are they similar? How do they differ?

79. **PROOF** Show that \( a^2 = b^2 + c^2 \) for the ellipse

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1
\]

where \( a > 0, b > 0, \) and the distance from the center of the ellipse \((0, 0)\) to a focus is \( c \).
What you should learn

- Write equations of hyperbolas in standard form.
- Find asymptotes of and graph hyperbolas.
- Use properties of hyperbolas to solve real-life problems.
- Classify conics from their general equations.

Why you should learn it

Hyperbolas can be used to model and solve many types of real-life problems. For instance, in Exercise 54 on page 759, hyperbolas are used in long distance radio navigation for aircraft and ships.

Definition of Hyperbola

A hyperbola is the set of all points (x, y) in a plane, the difference of whose distances from two distinct fixed points (foci) is a positive constant. See Figure 10.30.

The graph of a hyperbola has two disconnected branches. The line through the two foci intersects the hyperbola at its two vertices. The line segment connecting the vertices is the transverse axis, and the midpoint of the transverse axis is the center of the hyperbola. See Figure 10.31. The development of the standard form of the equation of a hyperbola is similar to that of an ellipse. Note in the definition below that a, b, and c are related differently for hyperbolas than for ellipses.

Standard Equation of a Hyperbola

The standard form of the equation of a hyperbola with center (h, k) is

\[
\frac{(x - h)^2}{a^2} - \frac{(y - k)^2}{b^2} = 1 \quad \text{Transverse axis is horizontal.}
\]

\[
\frac{(y - k)^2}{a^2} - \frac{(x - h)^2}{b^2} = 1 \quad \text{Transverse axis is vertical.}
\]

The vertices are a units from the center, and the foci are c units from the center. Moreover, \(c^2 = a^2 + b^2\). If the center of the hyperbola is at the origin (0, 0), the equation takes one of the following forms.

\[
\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{Transverse axis is horizontal.}
\]

\[
\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1 \quad \text{Transverse axis is vertical.}
\]
Figure 10.32 shows both the horizontal and vertical orientations for a hyperbola.

**Finding the Standard Equation of a Hyperbola**

Find the standard form of the equation of the hyperbola with foci (-1, 2) and (5, 2) and vertices (0, 2) and (4, 2).

**Solution**

By the Midpoint Formula, the center of the hyperbola occurs at the point (2, 2). Furthermore, \( c = 5 - 2 = 3 \) and \( a = 4 - 2 = 2 \), and it follows that

\[ b = \sqrt{c^2 - a^2} = \sqrt{3^2 - 2^2} = \sqrt{9 - 4} = \sqrt{5} \]

So, the hyperbola has a horizontal transverse axis and the standard form of the equation is

\[ \frac{(x - 2)^2}{2^2} - \frac{(y - 2)^2}{(\sqrt{5})^2} = 1 \]  

See Figure 10.33.

This equation simplifies to

\[ \frac{(x - 2)^2}{4} - \frac{(y - 2)^2}{5} = 1 \]

Example 1

**Finding the Standard Equation of a Hyperbola**

Find the standard form of the equation of the hyperbola with foci (-1, 2) and (5, 2) and vertices (0, 2) and (4, 2).

**Solution**

By the Midpoint Formula, the center of the hyperbola occurs at the point (2, 2). Furthermore, \( c = 5 - 2 = 3 \) and \( a = 4 - 2 = 2 \), and it follows that

\[ b = \sqrt{c^2 - a^2} = \sqrt{3^2 - 2^2} = \sqrt{9 - 4} = \sqrt{5} \]

So, the hyperbola has a horizontal transverse axis and the standard form of the equation is

\[ \frac{(x - 2)^2}{2^2} - \frac{(y - 2)^2}{(\sqrt{5})^2} = 1 \]  

See Figure 10.33.

This equation simplifies to

\[ \frac{(x - 2)^2}{4} - \frac{(y - 2)^2}{5} = 1 \]

**Example 1**

**Finding the Standard Equation of a Hyperbola**

Find the standard form of the equation of the hyperbola with foci (-1, 2) and (5, 2) and vertices (0, 2) and (4, 2).

**Solution**

By the Midpoint Formula, the center of the hyperbola occurs at the point (2, 2). Furthermore, \( c = 5 - 2 = 3 \) and \( a = 4 - 2 = 2 \), and it follows that

\[ b = \sqrt{c^2 - a^2} = \sqrt{3^2 - 2^2} = \sqrt{9 - 4} = \sqrt{5} \]

So, the hyperbola has a horizontal transverse axis and the standard form of the equation is

\[ \frac{(x - 2)^2}{2^2} - \frac{(y - 2)^2}{(\sqrt{5})^2} = 1 \]  

See Figure 10.33.

This equation simplifies to

\[ \frac{(x - 2)^2}{4} - \frac{(y - 2)^2}{5} = 1 \]

**Example 1**

**Finding the Standard Equation of a Hyperbola**

Find the standard form of the equation of the hyperbola with foci (-1, 2) and (5, 2) and vertices (0, 2) and (4, 2).

**Solution**

By the Midpoint Formula, the center of the hyperbola occurs at the point (2, 2). Furthermore, \( c = 5 - 2 = 3 \) and \( a = 4 - 2 = 2 \), and it follows that

\[ b = \sqrt{c^2 - a^2} = \sqrt{3^2 - 2^2} = \sqrt{9 - 4} = \sqrt{5} \]

So, the hyperbola has a horizontal transverse axis and the standard form of the equation is

\[ \frac{(x - 2)^2}{2^2} - \frac{(y - 2)^2}{(\sqrt{5})^2} = 1 \]  

See Figure 10.33.

This equation simplifies to

\[ \frac{(x - 2)^2}{4} - \frac{(y - 2)^2}{5} = 1 \]
Asymptotes of a Hyperbola

Each hyperbola has two asymptotes that intersect at the center of the hyperbola, as shown in Figure 10.34. The asymptotes pass through the vertices of a rectangle of dimensions 2a by 2b, with its center at (h, k). The line segment of length 2b joining (h, k + b) and (h, k - b) [or (h + b, k) and (h - b, k)] is the conjugate axis of the hyperbola.

Asymptotes of a Hyperbola

The equations of the asymptotes of a hyperbola are

\[
y = k \pm \frac{b}{a}(x - h) \quad \text{Transverse axis is horizontal.}
\]

\[
y = k \pm \frac{a}{b}(x - h) \quad \text{Transverse axis is vertical.}
\]

Example 2 Using Asymptotes to Sketch a Hyperbola

Sketch the hyperbola whose equation is \(4x^2 - y^2 = 16\).

**Algebraic Solution**

Divide each side of the original equation by 16, and rewrite the equation in standard form.

\[
\frac{x^2}{2^2} - \frac{y^2}{4^2} = 1 \quad \text{Write in standard form.}
\]

From this, you can conclude that \(a = 2\), \(b = 4\), and the transverse axis is horizontal. So, the vertices occur at (-2, 0) and (2, 0), and the endpoints of the conjugate axis occur at (0, -4) and (0, 4). Using these four points, you are able to sketch the rectangle shown in Figure 10.35. Now, from \(c^2 = a^2 + b^2\), you have \(c = \sqrt{2^2 + 4^2} = \sqrt{20} = 2\sqrt{5}\). So, the foci of the hyperbola are \((-2\sqrt{5}, 0)\) and \((2\sqrt{5}, 0)\). Finally, by drawing the asymptotes through the corners of this rectangle, you can complete the sketch shown in Figure 10.36. Note that the asymptotes are \(y = 2x\) and \(y = -2x\).

**Graphical Solution**

Solve the equation of the hyperbola for \(y\) as follows.

\[
4x^2 - y^2 = 16
\]

\[
4x^2 - 16 = y^2
\]

\[
\pm \sqrt{4x^2 - 16} = y
\]

Then use a graphing utility to graph \(y_1 = \sqrt{4x^2 - 16}\) and \(y_2 = -\sqrt{4x^2 - 16}\) in the same viewing window. Be sure to use a square setting. From the graph in Figure 10.37, you can see that the transverse axis is horizontal. You can use the zoom and trace features to approximate the vertices to be (-2, 0) and (2, 0).

**Graphical Solution**

Solve the equation of the hyperbola for \(y\) as follows.

\[
4x^2 - y^2 = 16
\]

\[
4x^2 - 16 = y^2
\]

\[
\pm \sqrt{4x^2 - 16} = y
\]

Then use a graphing utility to graph \(y_1 = \sqrt{4x^2 - 16}\) and \(y_2 = -\sqrt{4x^2 - 16}\) in the same viewing window. Be sure to use a square setting. From the graph in Figure 10.37, you can see that the transverse axis is horizontal. You can use the zoom and trace features to approximate the vertices to be (-2, 0) and (2, 0).

\[
\pm \sqrt{4x^2 - 16} = y
\]

Now try Exercise 11.
**Example 3**  Finding the Asymptotes of a Hyperbola

Sketch the hyperbola given by \(4x^2 − 3y^2 + 8x + 16 = 0\) and find the equations of its asymptotes and the foci.

**Solution**

\[
\begin{align*}
4x^2 − 3y^2 + 8x + 16 &= 0 & \text{Write original equation.} \\
(4x^2 + 8x) − 3y^2 &= −16 & \text{Group terms.} \\
4(x^2 + 2x) − 3y^2 &= −16 & \text{Factor 4 from } x\text{-terms.} \\
4(x + 1)^2 − 3y^2 &= −16 + 4 & \text{Add 4 to each side.} \\
4(x + 1)^2 − 3y^2 &= −12 & \text{Write in completed square form.} \\
\frac{(x + 1)^2}{3} + \frac{y^2}{4} &= 1 & \text{Divide each side by } −12. \\
y^2 &= \frac{(x + 1)^2}{\left(\frac{2}{\sqrt{3}}\right)^2} = 1 & \text{Write in standard form.}
\end{align*}
\]

From this equation you can conclude that the hyperbola has a vertical transverse axis, centered at \((-1, 0)\), has vertices \((-1, 2)\) and \((-1, -2)\), and has a conjugate axis with endpoints \((-1 - \sqrt{3}, 0)\) and \((-1 + \sqrt{3}, 0)\). To sketch the hyperbola, draw a rectangle through these four points. The asymptotes are the lines passing through the corners of the rectangle. Using \(a = 2\) and \(b = \sqrt{3}\), you can conclude that the equations of the asymptotes are

\[
y = \frac{2}{\sqrt{3}}(x + 1) \quad \text{and} \quad y = -\frac{2}{\sqrt{3}}(x + 1).
\]

Finally, you can determine the foci by using the equation \(c^2 = a^2 + b^2\). So, you have \(c = \sqrt{2^2 + (\sqrt{3})^2} = \sqrt{7}\), and the foci are \((-1, \sqrt{7})\) and \((-1, -\sqrt{7})\). The hyperbola is shown in Figure 10.38.

**Check Point**  Now try Exercise 19.

**Technology**

You can use a graphing utility to graph a hyperbola by graphing the upper and lower portions in the same viewing window. For instance, to graph the hyperbola in Example 3, first solve for \(y\) to get

\[
y_1 = 2\sqrt{1 + \frac{(x + 1)^2}{3}} \quad \text{and} \quad y_2 = -2\sqrt{1 + \frac{(x + 1)^2}{3}}.
\]

Use a viewing window in which \(-9 \leq x \leq 9\) and \(-6 \leq y \leq 6\). You should obtain the graph shown below. Notice that the graphing utility does not draw the asymptotes. However, if you trace along the branches, you will see that the values of the hyperbola approach the asymptotes.
Using Asymptotes to Find the Standard Equation

Find the standard form of the equation of the hyperbola having vertices (3, −5) and (3, 1) and having asymptotes

\[ y = 2x - 8 \quad \text{and} \quad y = -2x + 4 \]

as shown in Figure 10.39.

**Solution**

By the Midpoint Formula, the center of the hyperbola is \((3, -2)\). Furthermore, the hyperbola has a vertical transverse axis with \(a = 3\). From the original equations, you can determine the slopes of the asymptotes to be

\[ m_1 = \frac{2}{a} = \frac{2}{3} \quad \text{and} \quad m_2 = -\frac{a}{b} = -\frac{3}{b} \]

and, because \(a = 3\), you can conclude

\[ \frac{2}{3} = \frac{a}{b} \quad \text{and} \quad \frac{3}{2} = \frac{a}{b} \]

So, the standard form of the equation is

\[ \frac{(y + 2)^2}{3^2} - \frac{(x - 3)^2}{(\frac{3}{2})^2} = 1. \]

**Check Point** Now try Exercise 43.

As with ellipses, the **eccentricity** of a hyperbola is

\[ e = \frac{c}{a} \quad \text{Eccentricity} \]

and because \(c > a\), it follows that \(e > 1\). If the eccentricity is large, the branches of the hyperbola are nearly flat, as shown in Figure 10.40. If the eccentricity is close to 1, the branches of the hyperbola are more narrow, as shown in Figure 10.41.
Applications

The following application was developed during World War II. It shows how the properties of hyperbolas can be used in radar and other detection systems.

Example 5  An Application Involving Hyperbolas

Two microphones, 1 mile apart, record an explosion. Microphone A receives the sound 2 seconds before microphone B. Where did the explosion occur? (Assume sound travels at 1100 feet per second.)

Solution

Assuming sound travels at 1100 feet per second, you know that the explosion took place 2200 feet farther from B than from A, as shown in Figure 10.42. The locus of all points that are 2200 feet closer to A than to B is one branch of the hyperbola

\[ \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \]

where

\[ c = \frac{5280}{2} = 2640 \]

and

\[ a = \frac{2200}{2} = 1100. \]

So, \( b^2 = c^2 - a^2 = 2640^2 - 1100^2 = 5,759,600 \), and you can conclude that the explosion occurred somewhere on the right branch of the hyperbola

\[ \frac{x^2}{1,210,000} - \frac{y^2}{5,759,600} = 1. \]

Now try Exercise 53.

Another interesting application of conic sections involves the orbits of comets in our solar system. Of the 610 comets identified prior to 1970, 245 have elliptical orbits, 295 have parabolic orbits, and 70 have hyperbolic orbits. The center of the sun is a focus of each of these orbits, and each orbit has a vertex at the point where the comet is closest to the sun, as shown in Figure 10.43. Undoubtedly, there have been many comets with parabolic or hyperbolic orbits that were not identified. We only get to see such comets once. Comets with elliptical orbits, such as Halley’s comet, are the only ones that remain in our solar system.

If \( p \) is the distance between the vertex and the focus (in meters), and \( v \) is the velocity of the comet at the vertex (in meters per second), then the type of orbit is determined as follows.

1. Ellipse: \( v < \sqrt{2GM/p} \)
2. Parabola: \( v = \sqrt{2GM/p} \)
3. Hyperbola: \( v > \sqrt{2GM/p} \)

In each of these relations, \( M = 1.989 \times 10^{30} \) kilograms (the mass of the sun) and \( G \approx 6.67 \times 10^{-11} \) cubic meter per kilogram-second squared (the universal gravitational constant).
General Equations of Conics

Classifying a Conic from Its General Equation
The graph of \(Ax^2 + Cy^2 + Dx + Ey + F = 0\) is one of the following.

1. **Circle:** \(A = C\)
2. **Parabola:** \(AC = 0\) \(\quad A = 0\) or \(C = 0\), but not both.
3. **Ellipse:** \(AC > 0\) \(\quad A\) and \(C\) have like signs.
4. **Hyperbola:** \(AC < 0\) \(\quad A\) and \(C\) have unlike signs.

The test above is valid if the graph is a conic. The test does not apply to equations such as \(x^2 + y^2 = -1\), whose graph is not a conic.

**Example 6** Classifying Conics from General Equations

Classify the graph of each equation.

a. \(4x^2 - 9x + y - 5 = 0\)
b. \(4x^2 - y^2 + 8x - 6y + 4 = 0\)
c. \(2x^2 + 4y^2 - 4x + 12y = 0\)
d. \(2x^2 + 2y^2 - 8x + 12y + 2 = 0\)

**Solution**

a. For the equation \(4x^2 - 9x + y - 5 = 0\), you have
\[AC = 4(0) = 0, \quad \text{Parabola}\]
So, the graph is a parabola.

b. For the equation \(4x^2 - y^2 + 8x - 6y + 4 = 0\), you have
\[AC = 4(-1) < 0, \quad \text{Hyperbola}\]
So, the graph is a hyperbola.

c. For the equation \(2x^2 + 4y^2 - 4x + 12y = 0\), you have
\[AC = 2(4) > 0, \quad \text{Ellipse}\]
So, the graph is an ellipse.

d. For the equation \(2x^2 + 2y^2 - 8x + 12y + 2 = 0\), you have
\[A = C = 2, \quad \text{Circle}\]
So, the graph is a circle.

**CLASSROOM DISCUSSION**

**Sketching Conics** Sketch each of the conics described in Example 6. Write a paragraph describing the procedures that allow you to sketch the conics efficiently.
10.4 EXERCISES

VOCABULARY: Fill in the blanks.

1. A ________ is the set of all points \((x, y)\) in a plane, the difference of whose distances from two distinct fixed points, called ________, is a positive constant.

2. The graph of a hyperbola has two disconnected parts called ________.

3. The line segment connecting the vertices of a hyperbola is called the ________ ________, and the midpoint of the line segment is the ________ of the hyperbola.

4. Each hyperbola has two ________ that intersect at the center of the hyperbola.

SKILLS AND APPLICATIONS

In Exercises 5–8, match the equation with its graph. [The graphs are labeled (a), (b), (c), and (d).]

5. \(\frac{y^2}{9} - \frac{x^2}{25} = 1\)

6. \(\frac{y^2}{25} - \frac{x^2}{9} = 1\)

7. \(\frac{(x - 1)^2}{16} - \frac{y^2}{4} = 1\)

8. \(\frac{(x + 1)^2}{16} - \frac{(y - 2)^2}{9} = 1\)

In Exercises 9–22, find the center, vertices, foci, and the equations of the asymptotes of the hyperbola, and sketch its graph using the asymptotes as an aid.

9. \(x^2 - y^2 = 1\)

10. \(\frac{x^2}{9} - \frac{y^2}{25} = 1\)

11. \(\frac{y^2}{25} - \frac{x^2}{81} = 1\)

12. \(\frac{x^2}{36} - \frac{y^2}{4} = 1\)

13. \(\frac{y^2}{4} - \frac{x^2}{1} = 1\)

14. \(\frac{y^2}{9} - \frac{x^2}{1} = 1\)

15. \(\frac{(x - 1)^2}{4} - \frac{(y + 2)^2}{1} = 1\)

16. \(\frac{(x + 3)^2}{144} - \frac{(y - 2)^2}{25} = 1\)

17. \(\frac{(y + 6)^2}{1/9} - \frac{(x - 2)^2}{1/4} = 1\)

18. \(\frac{(y - 1)^2}{1/4} - \frac{(x + 3)^2}{1/16} = 1\)

19. \(9x^2 - y^2 - 36x - 6y + 18 = 0\)

20. \(x^2 - 9y^2 + 36y - 72 = 0\)

21. \(x^2 - 9y^2 + 2x - 54y - 80 = 0\)

22. \(16y^2 - x^2 + 2x + 64y + 63 = 0\)

In Exercises 23–28, find the center, vertices, foci, and the equations of the asymptotes of the hyperbola. Use a graphing utility to graph the hyperbola and its asymptotes.

23. \(2x^2 - 3y^2 = 6\)

24. \(6y^2 - 3x^2 = 18\)

25. \(4x^2 - 9y^2 = 36\)

26. \(25x^2 - 4y^2 = 100\)

27. \(9y^2 - x^2 + 2x + 54y + 62 = 0\)

28. \(9x^2 - y^2 + 54x + 10y + 55 = 0\)

In Exercises 29–34, find the standard form of the equation of the hyperbola with the given characteristics and center at the origin.

29. Vertices: \((0, \pm 2)\); foci: \((0, \pm 4)\)

30. Vertices: \((\pm 4, 0)\); foci: \((\pm 6, 0)\)

31. Vertices: \((\pm 1, 0)\); asymptotes: \(y = \pm 5x\)

32. Vertices: \((0, \pm 3)\); asymptotes: \(y = \pm 3x\)

33. Foci: \((0, \pm 8)\); asymptotes: \(y = \pm 4x\)

34. Foci: \((\pm 10, 0)\); asymptotes: \(y = \pm \sqrt{2}x\)

In Exercises 35–46, find the standard form of the equation of the hyperbola with the given characteristics.

35. Vertices: \((2, 0), (6, 0)\); foci: \((0, 0), (8, 0)\)

36. Vertices: \((2, 3), (2, -3)\); foci: \((2, 6), (2, -6)\)

37. Vertices: \((4, 1), (4, 9)\); foci: \((4, 0), (4, 10)\)

38. Vertices: \((-2, 1), (2, 1)\); foci: \((-3, 1), (3, 1)\)
39. Vertices: (2, 3), (2, −3); 
   passes through the point (0, 5)
40. Vertices: (−2, 1), (2, 1); 
   passes through the point (5, 4)
41. Vertices: (0, 4), (0, 0); 
   passes through the point (√5, −1)
42. Vertices: (1, 2), (1, −2); 
   passes through the point (0, √5)
43. Vertices: (1, 2), (3, 2); 
   asymptotes: y = x, y = 4 − x
44. Vertices: (3, 0), (3, 6); 
   asymptotes: y = 6 − x, y = x
45. Vertices: (0, 2), (6, 2); 
   asymptotes: y = 3x, y = 4 − 3x
46. Vertices: (3, 0), (3, 4); 
   asymptotes: y = 2x, y = 4 − 2x

In Exercises 47–50, write the standard form of the equation of the hyperbola.

47. 
48. 

49. 
50. 

51. ART A sculpture has a hyperbolic cross section (see figure).

(a) Write an equation that models the curved sides of the sculpture.
(b) Each unit in the coordinate plane represents 1 foot.
   Find the width of the sculpture at a height of 5 feet.

52. SOUND LOCATION You and a friend live 4 miles apart (on the same “east-west” street) and are talking on the phone. You hear a clap of thunder from lightning in a storm, and 18 seconds later your friend hears the thunder. Find an equation that gives the possible places where the lightning could have occurred. (Assume that the coordinate system is measured in feet and that sound travels at 1100 feet per second.)

53. SOUND LOCATION Three listening stations located at (3300, 0), (3300, 1100), and (−3300, 0) monitor an explosion. The last two stations detect the explosion 1 second and 4 seconds after the first, respectively. Determine the coordinates of the explosion. (Assume that the coordinate system is measured in feet and that sound travels at 1100 feet per second.)

54. LORAN Long distance radio navigation for aircraft and ships uses synchronized pulses transmitted by widely separated transmitting stations. These pulses travel at the speed of light (186,000 miles per second). The difference in the times of arrival of these pulses at an aircraft or ship is constant on a hyperbola having the transmitting stations as foci. Assume that two stations, 300 miles apart, are positioned on the rectangular coordinate system at points with coordinates (−150, 0) and (150, 0), and that a ship is traveling on a hyperbolic path with coordinates (x, 75) (see figure).

(a) Find the x-coordinate of the position of the ship if the time difference between the pulses from the transmitting stations is 1000 microseconds (0.001 second).
(b) Determine the distance between the ship and station 1 when the ship reaches the shore.
(c) The ship wants to enter a bay located between the two stations. The bay is 30 miles from station 1. What should be the time difference between the pulses?
(d) The ship is 60 miles offshore when the time difference in part (c) is obtained. What is the position of the ship?
55. **PENDULUM** The base for a pendulum of a clock has the shape of a hyperbola (see figure).

(a) Write an equation of the cross section of the base.
(b) Each unit in the coordinate plane represents \(\frac{1}{2}\) foot. Find the width of the base of the pendulum 4 inches from the bottom.

56. **HYPERBOLIC MIRROR** A hyperbolic mirror (used in some telescopes) has the property that a light ray directed at a focus will be reflected to the other focus. The focus of a hyperbolic mirror (see figure) has coordinates \((24, 0)\). Find the vertex of the mirror if the mount at the top edge of the mirror has coordinates \((24, 24)\).

In Exercises 57–72, classify the graph of the equation as a circle, a parabola, an ellipse, or a hyperbola.

57. \(9x^2 + 4y^2 - 18x + 16y - 119 = 0\)
58. \(x^2 + y^2 - 4x - 6y - 23 = 0\)
59. \(4x^2 - y^2 - 4x - 3 = 0\)
60. \(y^2 - 6y - x + 21 = 0\)
61. \(y^2 - 4x^2 + 4x - 2y - 4 = 0\)
62. \(x^2 + y^2 - 4x + 6y - 3 = 0\)
63. \(y^2 + 12x + 4y + 28 = 0\)
64. \(4x^2 + 25y^2 + 16x + 250y + 541 = 0\)
65. \(4x^2 + 3y^2 + 8x - 24y + 51 = 0\)
66. \(4y^2 - 2x^2 - 4y - 8x - 15 = 0\)
67. \(25x^2 - 10x - 200y - 119 = 0\)
68. \(4y^2 + 4x^2 - 24x + 35 = 0\)
69. \(x^2 - 6x - 2y + 7 = 0\)
70. \(9x^2 + 4y^2 - 90x + 8y + 228 = 0\)
71. \(100x^2 + 100y^2 - 100x + 400y + 409 = 0\)
72. \(4x^2 - y^2 + 4x + 2y - 1 = 0\)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 73–76, determine whether the statement is true or false. Justify your answer.

73. In the standard form of the equation of a hyperbola, the larger the ratio of \(b\) to \(a\), the larger the eccentricity of the hyperbola.
74. In the standard form of the equation of a hyperbola, the trivial solution of two intersecting lines occurs when \(b = 0\).
75. If \(D \neq 0\) and \(E \neq 0\), then the graph of \(x^2 - y^2 + Dx + Ey = 0\) is a hyperbola.
76. If the asymptotes of the hyperbola \(\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1\), where \(a, b > 0\), intersect at right angles, then \(a = b\).
77. Consider a hyperbola centered at the origin with a horizontal transverse axis. Use the definition of a hyperbola to derive its standard form.
78. **WRITING** Explain how the central rectangle of a hyperbola can be used to sketch its asymptotes.
79. **THINK ABOUT IT** Change the equation of the hyperbola so that its graph is the bottom half of the hyperbola.

\[9x^2 - 54x - 4y^2 + 8y + 41 = 0\]

80. **CAPSTONE** Given the hyperbolas

\[\frac{x^2}{16} - \frac{y^2}{9} = 1\quad \text{and} \quad \frac{y^2}{9} - \frac{x^2}{16} = 1\]

describe any common characteristics that the hyperbolas share, as well as any differences in the graphs of the hyperbolas. Verify your results by using a graphing utility to graph each of the hyperbolas in the same viewing window.

81. A circle and a parabola can have 0, 1, 2, 3, or 4 points of intersection. Sketch the circle given by \(x^2 + y^2 = 4\). Discuss how this circle could intersect a parabola with an equation of the form \(y = x^2 + C\). Then find the values of \(C\) for each of the five cases described below. Use a graphing utility to verify your results.

(a) No points of intersection
(b) One point of intersection
(c) Two points of intersection
(d) Three points of intersection
(e) Four points of intersection
10.5

What you should learn
• Rotate the coordinate axes to eliminate the xy-term in equations of conics.
• Use the discriminant to classify conics.

Why you should learn it
As illustrated in Exercises 13–26 on page 767, rotation of the coordinate axes can help you identify the graph of a general second-degree equation.

Rotation of Conics

Rotation
In the preceding section, you learned that the equation of a conic with axes parallel to one of the coordinate axes has a standard form that can be written in the general form

\[ Ax^2 + Cy^2 + Dx + Ey + F = 0. \]

Horizontal or vertical axis

In this section, you will study the equations of conics whose axes are rotated so that they are not parallel to either the x-axis or the y-axis. The general equation for such conics contains an xy-term.

\[ Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \]

Equation in xy-plane

To eliminate this xy-term, you can use a procedure called rotation of axes. The objective is to rotate the x- and y-axes until they are parallel to the axes of the conic. The rotated axes are denoted as the x’-axis and the y’-axis, as shown in Figure 10.44.

After the rotation, the equation of the conic in the new x’y’-plane will have the form

\[ A'(x')^2 + C'(y')^2 + D'x' + E'y' + F' = 0. \]

Equation in x’y’-plane

Because this equation has no xy-term, you can obtain a standard form by completing the square. The following theorem identifies how much to rotate the axes to eliminate the xy-term and also the equations for determining the new coefficients A’, C’, D’, E’, and F’.

Rotation of Axes to Eliminate an xy-Term
The general second-degree equation

\[ Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \]

can be rewritten as

\[ A'(x')^2 + C'(y')^2 + D'x' + E'y' + F' = 0 \]

by rotating the coordinate axes through an angle \( \theta \), where

\[ \cot 2\theta = \frac{A - C}{B}. \]

The coefficients of the new equation are obtained by making the substitutions

\[ x = x' \cos \theta - y' \sin \theta \] and \[ y = x' \sin \theta + y' \cos \theta. \]
Remember that the substitutions

\[ x = x' \cos \theta - y' \sin \theta \]

and

\[ y = x' \sin \theta + y' \cos \theta \]

were developed to eliminate the \( x'y' \)-term in the rotated system. You can use this as a check on your work. In other words, if your final equation contains an \( x'y' \)-term, you know that you have made a mistake.

---

**Example 1**  **Rotation of Axes for a Hyperbola**

Write the equation \( xy - 1 = 0 \) in standard form.

**Solution**

Because \( A = 0, B = 1, \) and \( C = 0, \) you have

\[
\cot 2\theta = \frac{A - C}{B} = 0 \quad \Rightarrow \quad 2\theta = \frac{\pi}{2} \quad \Rightarrow \quad \theta = \frac{\pi}{4}
\]

which implies that

\[
x = x' \cos \frac{\pi}{4} - y' \sin \frac{\pi}{4}
\]

\[
= x' \left( \frac{1}{\sqrt{2}} \right) - y' \left( \frac{1}{\sqrt{2}} \right)
\]

\[
= \frac{x' - y'}{\sqrt{2}}
\]

and

\[
y = x' \sin \frac{\pi}{4} + y' \cos \frac{\pi}{4}
\]

\[
= x' \left( \frac{1}{\sqrt{2}} \right) + y' \left( \frac{1}{\sqrt{2}} \right)
\]

\[
= \frac{x' + y'}{\sqrt{2}}.
\]

The equation in the \( x'y' \)-system is obtained by substituting these expressions in the equation \( xy - 1 = 0. \)

\[
\frac{(x' - y')^2}{\sqrt{2}} - \frac{(x' + y')^2}{\sqrt{2}} = 1
\]

\[
\frac{(x')^2 - (y')^2}{2} = 1
\]

\[
\frac{(x')^2}{\sqrt{2}^2} - \frac{(y')^2}{\sqrt{2}^2} = 1
\]

Write in standard form.

In the \( x'y' \)-system, this is a hyperbola centered at the origin with vertices at \((\pm \sqrt{2}, 0)\), as shown in Figure 10.45. To find the coordinates of the vertices in the \( xy \)-system, substitute the coordinates \((\pm \sqrt{2}, 0)\) in the equations

\[
x = \frac{x' - y'}{\sqrt{2}} \quad \text{and} \quad y = \frac{x' + y'}{\sqrt{2}}.
\]

This substitution yields the vertices \((1, 1)\) and \((-1, -1)\) in the \( xy \)-system. Note also that the asymptotes of the hyperbola have equations \( y' = \pm x' \), which correspond to the original \( x \)- and \( y \)-axes.

**CHECKPoint**  
Now try Exercise 13.
Example 2  Rotation of Axes for an Ellipse

Sketch the graph of $7x^2 - 6\sqrt{3}xy + 13y^2 - 16 = 0$.

Solution

Because $A = 7$, $B = -6\sqrt{3}$, and $C = 13$, you have

$$\cot 2\theta = \frac{A - C}{B} = \frac{7 - 13}{-6\sqrt{3}} = \frac{1}{\sqrt{3}}$$

which implies that $\theta = \pi/6$. The equation in the $x'y'$-system is obtained by making the substitutions

$$x = x' \cos \frac{\pi}{6} - y' \sin \frac{\pi}{6}$$

$$= x' \left(\frac{\sqrt{3}}{2}\right) - y' \left(\frac{1}{2}\right)$$

$$= \frac{\sqrt{3}}{2} x' - \frac{1}{2} y'$$

and

$$y = x' \sin \frac{\pi}{6} + y' \cos \frac{\pi}{6}$$

$$= x' \left(\frac{1}{2}\right) + y' \left(\frac{\sqrt{3}}{2}\right)$$

$$= \frac{1}{2} x' + \frac{\sqrt{3}}{2} y'$$

in the original equation. So, you have

$$7\left(\frac{\sqrt{3}}{2} x' - \frac{1}{2} y'\right)^2 - 6\sqrt{3} \left(\frac{1}{2} x' + \frac{\sqrt{3}}{2} y'\right) \left(\frac{\sqrt{3}}{2} x' - \frac{1}{2} y'\right) + 13\left(\frac{1}{2} x' + \frac{\sqrt{3}}{2} y'\right)^2 - 16 = 0$$

which simplifies to

$$4(x')^2 + 16(y')^2 - 16 = 0$$

$$4(x')^2 + 16(y')^2 = 16$$

$$\frac{(x')^2}{4} + \frac{(y')^2}{1} = 1$$

$$\frac{(x')^2}{2^2} + \frac{(y')^2}{1^2} = 1.$$  

Write in standard form.

This is the equation of an ellipse centered at the origin with vertices $(\pm 2, 0)$ in the $x'y'$-system, as shown in Figure 10.46.

Now try Exercise 19.
**Example 3** Rotation of Axes for a Parabola

Sketch the graph of \( x^2 - 4xy + 4y^2 + 5\sqrt{5}y + 1 = 0 \).

**Solution**

Because \( A = 1, B = -4, \) and \( C = 4 \), you have

\[
\cot 2\theta = \frac{A - C}{B} = \frac{1 - 4}{-4} = \frac{3}{4}.
\]

Using this information, draw a right triangle as shown in Figure 10.47. From the figure, you can see that \( \cos 2\theta = \frac{3}{5} \). To find the values of \( \sin \theta \) and \( \cos \theta \), you can use the half-angle formulas in the forms

\[
\sin \theta = \sqrt{1 - \cos^2 \theta} \quad \text{and} \quad \cos \theta = \sqrt{1 + \cos^2 \theta}.
\]

So,

\[
\sin \theta = \sqrt{1 - \left(\frac{3}{5}\right)^2} = \sqrt{\frac{16}{25}} = \frac{4}{5} \quad \text{and} \quad \cos \theta = \sqrt{1 + \left(\frac{3}{5}\right)^2} = \sqrt{\frac{34}{25}} = \frac{\sqrt{34}}{5}.
\]

Consequently, you use the substitutions

\[
x = x' \cos \theta - y' \sin \theta = x'\left(\frac{3}{\sqrt{5}}\right) - y'\left(\frac{4}{\sqrt{5}}\right) = \frac{2x' - y'}{\sqrt{5}}
\]

\[
y = x' \sin \theta + y' \cos \theta = x'\left(\frac{4}{\sqrt{5}}\right) + y'\left(\frac{3}{\sqrt{5}}\right) = \frac{4x' + 3y'}{\sqrt{5}}
\]

Substituting these expressions in the original equation, you have

\[
x^2 - 4xy + 4y^2 + 5\sqrt{5}y + 1 = 0 \quad \Rightarrow \quad \left(\frac{2x' - y'}{\sqrt{5}}\right)^2 - 4\left(\frac{2x' - y'}{\sqrt{5}}\right)\left(\frac{4x' + 3y'}{\sqrt{5}}\right) + 4\left(\frac{4x' + 3y'}{\sqrt{5}}\right)^2 + 5\sqrt{5}\left(\frac{4x' + 3y'}{\sqrt{5}}\right) + 1 = 0
\]

which simplifies as follows.

\[
5(y')^2 + 5x' + 10y' + 1 = 0
\]

\[
5[(y')^2 + 2y'] = -5x' - 1 \quad \text{Group terms.}
\]

\[
5(y' + 1)^2 = -5x' + 4 \quad \text{Write in completed square form.}
\]

\[
(y' + 1)^2 = -1\left(x' - \frac{4}{5}\right) \quad \text{Write in standard form.}
\]

The graph of this equation is a parabola with vertex \((\frac{4}{5}, -1)\). Its axis is parallel to the \(x\)-axis in the \(x'y'\)-system, and because \( \sin \theta = 1/\sqrt{5}, \theta = 26.6^\circ \), as shown in Figure 10.48.

CHECKPOINT Now try Exercise 25.
Invariants Under Rotation

In the rotation of axes theorem listed at the beginning of this section, note that the constant term is the same in both equations, \( F' = F \). Such quantities are invariant under rotation. The next theorem lists some other rotation invariants.

### Rotation Invariants

The rotation of the coordinate axes through an angle \( \theta \) that transforms the equation

\[
Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0
\]

into the form

\[
A'(x')^2 + C'(y')^2 + D'x' + E'y' + F' = 0
\]

has the following rotation invariants.

1. \( F = F' \)

2. \( A + C = A' + C' \)

3. \( B^2 - 4AC = (B')^2 - 4A'C' \)

You can use the results of this theorem to classify the graph of a second-degree equation with an \( xy \)-term in much the same way you do for a second-degree equation without an \( xy \)-term. Note that because \( B' = 0 \), the invariant \( B^2 - 4AC \) reduces to \( \text{Discriminant} \)

\[
B^2 - 4AC = -4A'C'.
\]

This quantity is called the discriminant of the equation

\[
Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0.
\]

Now, from the classification procedure given in Section 10.4, you know that the sign of \( A'C' \) determines the type of graph for the equation

\[
A'(x')^2 + C'(y')^2 + D'x' + E'y' + F' = 0.
\]

Consequently, the sign of \( B^2 - 4AC \) will determine the type of graph for the original equation, as given in the following classification.

### Classification of Conics by the Discriminant

The graph of the equation \( Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \) is, except in degenerate cases, determined by its discriminant as follows.

1. **Ellipse or circle**: \( B^2 - 4AC < 0 \)

2. **Parabola**: \( B^2 - 4AC = 0 \)

3. **Hyperbola**: \( B^2 - 4AC > 0 \)

For example, in the general equation

\[
3x^2 + 7xy + 5y^2 - 6x - 7y + 15 = 0
\]

you have \( A = 3, B = 7, \) and \( C = 5 \). So the discriminant is

\[
B^2 - 4AC = 7^2 - 4(3)(5) = 49 - 60 = -11.
\]

Because \(-11 < 0\), the graph of the equation is an ellipse or a circle.
Example 4  Rotation and Graphing Utilities

For each equation, classify the graph of the equation, use the Quadratic Formula to solve for $y$, and then use a graphing utility to graph the equation.

a. $2x^2 - 3xy + 2y^2 - 2x = 0$

b. $x^2 - 6xy + 9y^2 - 2y + 1 = 0$

c. $3x^2 + 8xy + 4y^2 - 7 = 0$

Solution

a. Because $B^2 - 4AC = 9 - 16 < 0$, the graph is a circle or an ellipse. Solve for $y$ as follows.

\[
2x^2 - 3xy + 2y^2 - 2x = 0
\]

Write original equation.

\[
2y^2 - 3xy + (2x^2 - 2x) = 0
\]

Quadratic form $ay^2 + by + c = 0$

\[
y = \frac{-(-3x) \pm \sqrt{(-3x)^2 - 4(2)(2x^2 - 2x)}}{2(2)}
\]

\[
y = \frac{3x \pm \sqrt{x(16 - 7x)}}{4}
\]

Graph both of the equations to obtain the ellipse shown in Figure 10.49.

\[
y_1 = \frac{3x + \sqrt{x(16 - 7x)}}{4}
\]

Top half of ellipse

\[
y_2 = \frac{3x - \sqrt{x(16 - 7x)}}{4}
\]

Bottom half of ellipse

b. Because $B^2 - 4AC = 36 - 36 = 0$, the graph is a parabola.

\[
x^2 - 6xy + 9y^2 - 2y + 1 = 0
\]

Write original equation.

\[
9y^2 - (6x + 2)y + (x^2 + 1) = 0
\]

Quadratic form $ay^2 + by + c = 0$

\[
y = \frac{(6x + 2) \pm \sqrt{(6x + 2)^2 - 4(9)(x^2 + 1)}}{2(9)}
\]

Graphing both of the equations to obtain the parabola shown in Figure 10.50.

c. Because $B^2 - 4AC = 64 - 48 > 0$, the graph is a hyperbola.

\[
3x^2 + 8xy + 4y^2 - 7 = 0
\]

Write original equation.

\[
4y^2 + 8xy + (3x^2 - 7) = 0
\]

Quadratic form $ay^2 + by + c = 0$

\[
y = \frac{-8x \pm \sqrt{(8x)^2 - 4(4)(3x^2 - 7)}}{2(4)}
\]

The graphs of these two equations yield the hyperbola shown in Figure 10.51.

CHECKPOINT Now try Exercise 43.

Classroom Discussion

Classifying a Graph as a Hyperbola  In Section 2.6, it was mentioned that the graph of $f(x) = \frac{1}{x}$ is a hyperbola. Use the techniques in this section to verify this, and justify each step. Compare your results with those of another student.
10.5 EXERCISES

VOCABULARY: Fill in the blanks.

1. The procedure used to eliminate the \(xy\)-term in a general second-degree equation is called ________ of ________.
2. After rotating the coordinate axes through an angle \(\theta\), the general second-degree equation in the new \(x'y'\)-plane will have the form ________.
3. Quantities that are equal in both the original equation of a conic and the equation of the rotated conic are ________ ________ ________.
4. The quantity \(B^2 - 4AC\) is called the ________ of the equation \(Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0\).

SKILLS AND APPLICATIONS

In Exercises 5–12, the \(x'y'\)-coordinate system has been rotated \(\theta\) degrees from the \(xy\)-coordinate system. The coordinates of a point in the \(xy\)-coordinate system are given. Find the coordinates of the point in the rotated coordinate system.

5. \(\theta = 90^\circ\), (0, 3)  
6. \(\theta = 90^\circ\), (2, 2)  
7. \(\theta = 30^\circ\), (1, 3)  
8. \(\theta = 30^\circ\), (2, 4)  
9. \(\theta = 45^\circ\), (2, 1)  
10. \(\theta = 45^\circ\), (4, 4)  
11. \(\theta = 60^\circ\), (1, 2)  
12. \(\theta = 60^\circ\), (3, 1)

In Exercises 13–26, rotate the axes to eliminate the \(xy\)-term in the equation. Then write the equation in standard form. Sketch the graph of the resulting equation, showing both sets of axes.

13. \(xy + 1 = 0\)
14. \(xy - 4 = 0\)
15. \(x^2 - 2xy + y^2 - 1 = 0\)
16. \(xy + 2x - y + 4 = 0\)
17. \(xy - 8x - 4y = 0\)
18. \(2x^2 - 3xy - 2y^2 + 10 = 0\)
19. \(5x^2 = 6xy + 5y^2 - 12 = 0\)
20. \(2x^2 + xy + 2y^2 - 8 = 0\)
21. \(x^2 + 2xy + y^2 - 4x + 4y = 0\)
22. \(13x^2 + 6\sqrt{3}xy + 7y^2 - 16 = 0\)
23. \(3x^2 - 2\sqrt{3}xy + y^2 + 2x + 2\sqrt{3}y = 0\)
24. \(16x^2 - 24xy + 9y^2 - 60x - 80y + 100 = 0\)
25. \(9x^2 + 24xy + 16y^2 + 90x - 130y = 0\)
26. \(9x^2 + 24xy + 16y^2 + 80x - 60y = 0\)

In Exercises 27–36, use a graphing utility to graph the conic. Determine the angle \(\theta\) through which the axes are rotated. Explain how you used the graphing utility to obtain the graph.

27. \(x^2 + 2xy + y^2 = 20\)
28. \(x^2 - 4xy + 2y^2 = 6\)
29. \(17x^2 + 32xy - 7y^2 = 75\)
30. \(40x^2 + 36xy + 25y^2 = 52\)
31. \(32x^2 + 48xy + 8y^2 = 50\)
32. \(24x^2 + 18xy + 12y^2 = 34\)
33. \(2x^2 + 4xy + 2y^2 + \sqrt{26}x + 3y = -15\)
34. \(7x^2 - 2\sqrt{3}xy + 5y^2 = 16\)
35. \(4x^2 - 12xy + 9y^2 + (\sqrt{13} - 12)x - (6\sqrt{13} + 8)y = 91\)
36. \(6x^2 - 4xy + 8y^2 + (5\sqrt{5} - 10)x - (7\sqrt{5} + 5)y = 80\)

In Exercises 37–42, match the graph with its equation. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]
In Exercises 51–56, sketch (if possible) the graph of the conic.
51. $y^2 - 16x^2 = 0$
52. $x^2 + y^2 - 2x + 6y + 10 = 0$
53. $x^2 - 2xy + y^2 = 0$
54. $5x^2 - 2xy + 5y^2 = 0$
55. $x^2 + 2xy + y^2 - 1 = 0$
56. $x^2 - 10xy + y^2 = 0$

In Exercises 57–70, find any points of intersection of the conics algebraically and then verify using a graphing utility.
57. $-x^2 + y^2 + 4x - 6y + 4 = 0$
   $x^2 + y^2 - 4x - 6y + 12 = 0$
58. $-x^2 - y^2 - 8x + 20y - 7 = 0$
   $x^2 + 9y^2 + 8x + 4y + 7 = 0$
59. $-4x^2 - y^2 - 16x + 24y - 16 = 0$
   $4x^2 + y^2 + 40x - 24y + 208 = 0$
60. $x^2 - 4y^2 - 20x - 64y - 172 = 0$
   $16x^2 + 4y^2 - 320x + 64y + 1600 = 0$
61. $x^2 - y^2 - 12x + 16y - 64 = 0$
   $x^2 + y^2 - 12x - 16y + 64 = 0$
62. $x^2 + 4y^2 - 2x - 8y + 1 = 0$
   $-x^2 + 2x - 4y - 1 = 0$
63. $-16x^2 - y^2 + 24y - 80 = 0$
   $16x^2 + 25y^2 - 400 = 0$
64. $16x^2 - y^2 + 16y - 128 = 0$
   $y^2 - 48x - 16y - 32 = 0$
65. $x^2 + y^2 - 4 = 0$
   $3x - y^2 = 0$
66. $4x^2 + 9y^2 - 36y = 0$
   $x^2 + 9y - 27 = 0$
67. $x^2 + 2y^2 - 4x + 6y - 5 = 0$
   $-x + y - 4 = 0$
68. $x^2 + 2y^2 - 4x + 6y - 5 = 0$
   $x^2 - 4x - y + 4 = 0$
69. $xy + x - 2y + 3 = 0$
   $x^2 + 4y^2 - 9 = 0$
70. $5x^2 - 2xy + 5y^2 - 12 = 0$
   $x + y - 1 = 0$

EXPLORATION

TRUE OR FALSE? In Exercises 71 and 72, determine whether the statement is true or false. Justify your answer.
71. The graph of the equation $x^2 + xy + ky^2 + 6x + 10 = 0$
   where $k$ is any constant less than $\frac{1}{2}$, is a hyperbola.
72. After a rotation of axes is used to eliminate the $xy$-term from an equation of the form
   $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$
   the coefficients of the $x^2$- and $y^2$-terms remain $A$ and $C$, respectively.
73. Show that the equation $x^2 + y^2 = r^2$
   is invariant under rotation of axes.

74. CAPSTONE Consider the equation $6x^2 - 3xy + 6y^2 - 25 = 0$.
   (a) Without calculating, explain how to rewrite the equation so that it does not have an $xy$-term.
   (b) Explain how to identify the graph of the equation.
75. Find the lengths of the major and minor axes of the ellipse graphed in Exercise 22.
What you should learn
- Evaluate sets of parametric equations for given values of the parameter.
- Sketch curves that are represented by sets of parametric equations.
- Rewrite sets of parametric equations as single rectangular equations by eliminating the parameter.
- Find sets of parametric equations for graphs.

Why you should learn it
Parametric equations are useful for modeling the path of an object. For instance, in Exercise 63 on page 775, you will use a set of parametric equations to model the path of a baseball.

Plane Curves
Up to this point you have been representing a graph by a single equation involving the two variables \(x\) and \(y\). In this section, you will study situations in which it is useful to introduce a third variable to represent a curve in the plane.

To see the usefulness of this procedure, consider the path followed by an object that is propelled into the air at an angle of 45°. If the initial velocity of the object is 48 feet per second, it can be shown that the object follows the parabolic path

\[
y = -\frac{x^2}{72} + x
\]

Rectangular equation

as shown in Figure 10.52. However, this equation does not tell the whole story. Although it does tell you where the object has been, it does not tell you when the object was at a given point \((x, y)\) on the path. To determine this time, you can introduce a third variable \(t\), called a parameter. It is possible to write both \(x\) and \(y\) as functions of \(t\) to obtain the parametric equations

\[
x = 24\sqrt{2}t
\]

Parametric equation for \(x\)

\[
y = -16t^2 + 24\sqrt{2}t
\]

Parametric equation for \(y\)

From this set of equations you can determine that at time \(t = 0\), the object is at the point \((0, 0)\). Similarly, at time \(t = 1\), the object is at the point \((24\sqrt{2}, 24\sqrt{2} - 16)\), and so on, as shown in Figure 10.52.

For this particular motion problem, \(x\) and \(y\) are continuous functions of \(t\), and the resulting path is a plane curve. (Recall that a continuous function is one whose graph can be traced without lifting the pencil from the paper.)

Definition of Plane Curve
If \(f\) and \(g\) are continuous functions of \(t\) on an interval \(I\), the set of ordered pairs \((f(t), g(t))\) is a plane curve \(C\). The equations

\[
x = f(t) \quad \text{and} \quad y = g(t)
\]

are parametric equations for \(C\), and \(t\) is the parameter.
Sketching a Plane Curve

When sketching a curve represented by a pair of parametric equations, you still plot points in the \(xy\)-plane. Each set of coordinates \((x, y)\) is determined from a value chosen for the parameter. Plotting the resulting points in the order of increasing values of \(t\) traces the curve in a specific direction. This is called the orientation of the curve.

**Example 1** Sketching a Curve

Sketch the curve given by the parametric equations

\[
x = t^2 - 4 \quad \text{and} \quad y = \frac{t}{2}, \quad -2 \leq t \leq 3.
\]

**Solution**

Using values of \(t\) in the specified interval, the parametric equations yield the points \((x, y)\) shown in the table.

<table>
<thead>
<tr>
<th>(t)</th>
<th>(x)</th>
<th>(y)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>0</td>
<td>-1</td>
</tr>
<tr>
<td>-1</td>
<td>-3</td>
<td>-\frac{1}{2}</td>
</tr>
<tr>
<td>0</td>
<td>-4</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>-3</td>
<td>\frac{1}{2}</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>5</td>
<td>\frac{3}{2}</td>
</tr>
</tbody>
</table>

By plotting these points in the order of increasing \(t\), you obtain the curve \(C\) shown in Figure 10.53. Note that the arrows on the curve indicate its orientation as \(t\) increases from -2 to 3. So, if a particle were moving on this curve, it would start at \((0, -1)\) and then move along the curve to the point \((5, \frac{3}{2})\).

**Checkpoint** Now try Exercises 5(a) and (b).

Note that the graph shown in Figure 10.53 does not define \(y\) as a function of \(x\). This points out one benefit of parametric equations—they can be used to represent graphs that are more general than graphs of functions.

It often happens that two different sets of parametric equations have the same graph. For example, the set of parametric equations

\[
x = 4t^2 - 4 \quad \text{and} \quad y = t, \quad -1 \leq t \leq \frac{3}{2}
\]

has the same graph as the set given in Example 1. However, by comparing the values of \(t\) in Figures 10.53 and 10.54, you can see that this second graph is traced out more rapidly (considering \(t\) as time) than the first graph. So, in applications, different parametric representations can be used to represent various speeds at which objects travel along a given path.
Eliminating the Parameter

Example 1 uses simple point plotting to sketch the curve. This tedious process can sometimes be simplified by finding a rectangular equation (in $x$ and $y$) that has the same graph. This process is called **eliminating the parameter**.

Now you can recognize that the equation represents a parabola with a horizontal axis and vertex at $(-4, 0)$. When converting equations from parametric to rectangular form, you may need to alter the domain of the rectangular equation so that its graph matches the graph of the parametric equations. Such a situation is demonstrated in Example 2.

**Example 2**

Eliminating the Parameter

Sketch the curve represented by the equations

$$x = \frac{1}{\sqrt{t + 1}}, \quad y = \frac{t}{t + 1}$$

by eliminating the parameter and adjusting the domain of the resulting rectangular equation.

**Solution**

Solving for $t$ in the equation for $x$ produces

$$x = \frac{1}{\sqrt{t + 1}} \Rightarrow x^2 = \frac{1}{t + 1}$$

which implies that

$$t = \frac{1 - x^2}{x^2}.$$ 

Now, substituting in the equation for $y$, you obtain the rectangular equation

$$y = \frac{t}{t + 1} = \frac{(1 - x^2)}{x^2 + (1 - x^2)} + 1 = \frac{1 - x^2}{x^2} + 1 = \frac{x^2}{x^2} = 1 - x^2.$$ 

From this rectangular equation, you can recognize that the curve is a parabola that opens downward and has its vertex at $(0, 1)$. Also, this rectangular equation is defined for all values of $x$, but from the parametric equation for $x$ you can see that the curve is defined only when $t > -1$. This implies that you should restrict the domain of $x$ to positive values, as shown in Figure 10.55.

**Check Point** Now try Exercise 5(c).
It is not necessary for the parameter in a set of parametric equations to represent time. The next example uses an angle as the parameter.

### Example 3  Eliminating an Angle Parameter

Sketch the curve represented by

\[
x = 3 \cos \theta \quad \text{and} \quad y = 4 \sin \theta, \quad 0 \leq \theta \leq 2\pi
\]

by eliminating the parameter.

**Solution**

Begin by solving for \(\cos \theta\) and \(\sin \theta\) in the equations.

\[
\cos \theta = \frac{x}{3} \quad \text{and} \quad \sin \theta = \frac{y}{4}
\]

Solve for \(\cos \theta\) and \(\sin \theta\). Use the identity \(\sin^2 \theta + \cos^2 \theta = 1\) to form an equation involving only \(x\) and \(y\).

\[
\cos^2 \theta + \sin^2 \theta = 1
\]

Pythagorean identity

\[
\left(\frac{x}{3}\right)^2 + \left(\frac{y}{4}\right)^2 = 1
\]

Substitute \(\frac{x}{3}\) for \(\cos \theta\) and \(\frac{y}{4}\) for \(\sin \theta\).

\[
\frac{x^2}{9} + \frac{y^2}{16} = 1
\]

Rectangular equation

From this rectangular equation, you can see that the graph is an ellipse centered at \((0, 0)\), with vertices \((0, 4)\) and \((0, -4)\) and minor axis of length \(2b = 6\), as shown in Figure 10.56. Note that the elliptic curve is traced out counterclockwise as \(\theta\) varies from 0 to \(2\pi\).

**CheckPoint** Now try Exercise 17.

In Examples 2 and 3, it is important to realize that eliminating the parameter is primarily an aid to curve sketching. If the parametric equations represent the path of a moving object, the graph alone is not sufficient to describe the object’s motion. You still need the parametric equations to tell you the position, direction, and speed at a given time.

### Finding Parametric Equations for a Graph

You have been studying techniques for sketching the graph represented by a set of parametric equations. Now consider the reverse problem—that is, how can you find a set of parametric equations for a given graph or a given physical description? From the discussion following Example 1, you know that such a representation is not unique. That is, the equations

\[
x = 4t^2 - 4 \quad \text{and} \quad y = t, \quad -1 \leq t \leq \frac{3}{2}
\]

produced the same graph as the equations

\[
x = t^2 - 4 \quad \text{and} \quad y = \frac{t}{2}, \quad -2 \leq t \leq 3.
\]

This is further demonstrated in Example 4.
Section 10.6 Parametric Equations

Finding Parametric Equations for a Graph

Find a set of parametric equations to represent the graph of using the following parameters.

a. 

Solution

a. Letting you obtain the parametric equations

\[ x = t \quad \text{and} \quad y = 1 - x^2 = 1 - t^2. \]

b. Letting you obtain the parametric equations

\[ x = 1 - t \quad \text{and} \quad y = 1 - x^2 = 1 - (1 - t^2) = 2t - t^2. \]

In Figure 10.57, note how the resulting curve is oriented by the increasing values of \( t \). For part (a), the curve would have the opposite orientation.

Now try Exercise 45.

Example 5 Parametric Equations for a Cycloid

Describe the cycloid traced out by a point on the circumference of a circle of radius \( a \) as the circle rolls along a straight line in a plane.

Solution

As the parameter, let \( \theta \) be the measure of the circle’s rotation, and let the point \( P = (x, y) \) begin at the origin. When \( \theta = 0 \), \( P \) is at the origin; when \( \theta = \pi \), \( P \) is at a maximum point \((\pi a, 2a)\); and when \( \theta = 2\pi \), \( P \) is back on the \( x \)-axis at \((2\pi a, 0)\). From Figure 10.58, you can see that \( \angle APC = 180^\circ - \theta \). So, you have

\[ \sin \theta = \sin(180^\circ - \theta) = \sin(\angle APC) = \frac{AC}{a} = \frac{BD}{a} \]

\[ \cos \theta = -\cos(180^\circ - \theta) = -\cos(\angle APC) = -\frac{AP}{a} \]

which implies that \( BD = a \sin \theta \) and \( AP = -a \cos \theta \). Because the circle rolls along the \( x \)-axis, you know that \( OD = PD = a\theta \). Furthermore, because \( BA = DC = a \), you have

\[ x = OD - BD = a\theta - a \sin \theta \quad \text{and} \quad y = BA + AP = a - a \cos \theta. \]

So, the parametric equations are \( x = a(\theta - \sin \theta) \) and \( y = a(1 - \cos \theta) \).

In Example 5, \( PD \) represents the arc of the circle between points \( P \) and \( D \).

Example 4 Finding Parametric Equations for a Graph

Find a set of parametric equations to represent the graph of \( y = 1 - x^2 \), using the following parameters.

a. \( t = x \) \quad b. \( t = 1 - x \)

Solution

a. Letting \( t = x \), you obtain the parametric equations

\[ x = t \quad \text{and} \quad y = 1 - x^2 = 1 - t^2. \]

Now try Exercise 67.

\[ y = 2t - t^2 \]

\[ t = 1 \]

\[ t = 2 \]

\[ t = 3 \]

\[ t = -1 \]

\[ x \]

\[ y \]

\[ t = 0 \]

\[ t = 1 \]

\[ t = 2 \]

\[ t = 3 \]

\[ t = -1 \]
10.6 **EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. If \( f \) and \( g \) are continuous functions of \( t \) on an interval \( I \), the set of ordered pairs \((f(t), g(t))\) is a ________ ________.

2. The _____ of a curve is the direction in which the curve is traced out for increasing values of the parameter.

3. The process of converting a set of parametric equations to a corresponding rectangular equation is called ________ the ________.

4. A curve traced by a point on the circumference of a circle as the circle rolls along a straight line in a plane is called a ________.

**SKILLS AND APPLICATIONS**

5. Consider the parametric equations \( x = \sqrt{t} \) and \( y = 3 - t \).
   (a) Create a table of \( x \) - and \( y \) -values using \( t = 0, 1, 2, 3, \) and 4.
   (b) Plot the points \((x, y)\) generated in part (a), and sketch a graph of the parametric equations.
   (c) Find the rectangular equation by eliminating the parameter. Sketch its graph. How do the graphs differ?

6. Consider the parametric equations \( x = 4 \cos^2 \theta \) and \( y = 2 \sin \theta \).
   (a) Create a table of \( x \) - and \( y \) -values using \( \theta = -\pi/2, -\pi/4, 0, \pi/4, \) and \( \pi/2 \).
   (b) Plot the points \((x, y)\) generated in part (a), and sketch a graph of the parametric equations.
   (c) Find the rectangular equation by eliminating the parameter. Sketch its graph. How do the graphs differ?

In Exercises 7–26, (a) sketch the curve represented by the parametric equations (indicate the orientation of the curve) and (b) eliminate the parameter and write the corresponding rectangular equation whose graph represents the curve. Adjust the domain of the resulting rectangular equation if necessary.

7. \( x = t - 1 \)
   \( y = 3t + 1 \)

8. \( x = 3 - 2t \)
   \( y = 2 + 3t \)

9. \( x = \frac{1}{4}t \)
   \( y = t^2 \)

10. \( x = t \)
    \( y = t^3 \)

11. \( x = t + 2 \)
    \( y = t^2 \)

12. \( x = \sqrt{t} \)
    \( y = 1 - t \)

13. \( x = t + 1 \)
    \( y = \frac{t}{t + 1} \)

14. \( x = t - 1 \)
    \( y = \frac{t}{t - 1} \)

15. \( x = 2(t + 1) \)
    \( y = |t - 2| \)

16. \( x = |t - 1| \)
    \( y = t + 2 \)

17. \( x = 4 \cos \theta \)
    \( y = 2 \sin \theta \)

18. \( x = 2 \cos \theta \)
    \( y = 3 \sin \theta \)

19. \( x = 6 \sin 2\theta \)
    \( y = 6 \cos 2\theta \)

20. \( x = \cos \theta \)
    \( y = 2 \sin 2\theta \)

21. \( x = 1 + \cos \theta \)
    \( y = 1 + 2 \sin \theta \)

22. \( x = 2 + 5 \cos \theta \)
    \( y = -6 + 4 \sin \theta \)

23. \( x = e^{-t} \)
    \( y = e^t \)

24. \( x = e^{2t} \)
    \( y = e^t \)

25. \( x = t^3 \)
    \( y = 3 \ln t \)

26. \( x = \ln 2t \)
    \( y = 2t^2 \)

In Exercises 27 and 28, determine how the plane curves differ from each other.

27. (a) \( x = t \)
    \( y = 2t + 1 \)

(b) \( x = \cos \theta \)
    \( y = 2 \cos \theta + 1 \)

(c) \( x = e^{-t} \)
    \( y = 2e^{-t} + 1 \)

(d) \( x = e^t \)
    \( y = 2e^t + 1 \)

28. (a) \( x = t \)
    \( y = t^2 - 1 \)

(b) \( x = t^2 \)
    \( y = t^4 - 1 \)

(c) \( x = \sin t \)
    \( y = \sin^2 t - 1 \)

(d) \( x = e^t \)
    \( y = e^{2t} - 1 \)

In Exercises 29–32, eliminate the parameter and obtain the standard form of the rectangular equation.

29. Line through \((x_1, y_1)\) and \((x_2, y_2)\):
    \( x = x_1 + t(x_2 - x_1), \ y = y_1 + t(y_2 - y_1) \)

30. Circle: \( x = h + r \cos \theta, \ y = k + r \sin \theta \)

31. Ellipse: \( x = h + a \cos \theta, \ y = k + b \sin \theta \)

32. Hyperbola: \( x = h + a \sec \theta, \ y = k + b \tan \theta \)

In Exercises 33–40, use the results of Exercises 29–32 to find a set of parametric equations for the line or conic.

33. Line: passes through \((0, 0)\) and \((3, 6)\)

34. Line: passes through \((3, 2)\) and \((-6, 3)\)

35. Circle: center: \((3, 2)\); radius: 4

36. Circle: center: \((5, -3)\); radius: 4
37. Ellipse: vertices: \((\pm 5, 0)\); foci: \((\pm 4, 0)\)
38. Ellipse: vertices: \((3, 7), (3, -1)\);
foci: \((3, 5), (3, 1)\)
39. Hyperbola: vertices: \((\pm 4, 0)\); foci: \((\pm 5, 0)\)
40. Hyperbola: vertices: \((\pm 2, 0)\); foci: \((\pm 4, 0)\)

In Exercises 41–48, find a set of parametric equations for the rectangular equation using \(a\) \(t = x\) and \(b\) \(t = 2 - x\).
41. \(y = 3x - 2\)
42. \(x = 3y - 2\)
43. \(y = 2 - x\)
44. \(y = x^2 + 1\)
45. \(y = x^2 - 3\)
46. \(y = 1 - 2x^2\)
47. \(y = \frac{1}{x}\)
48. \(y = \frac{1}{2x}\)

In Exercises 49–56, use a graphing utility to graph the curve represented by the parametric equations.
49. Cycloid: \(x = 4(\theta - \sin \theta)\), \(y = 4(1 - \cos \theta)\)
50. Cycloid: \(x = \theta + \sin \theta\), \(y = 1 - \cos \theta\)
51. Prolate cycloid: \(x = \theta - \frac{3}{7} \sin \theta\), \(y = 1 - \frac{3}{7} \cos \theta\)
52. Prolate cycloid: \(x = 2\theta - 4 \sin \theta\), \(y = 2 - 4 \cos \theta\)
53. Hypocycloid: \(x = 3 \cos^3 \theta\), \(y = 3 \sin^3 \theta\)
54. Curtate cycloid: \(x = 8\theta - 4 \sin \theta\), \(y = 8 - 4 \cos \theta\)
55. Witch of Agnesi: \(x = 2 \cot \theta\), \(y = 2 \sin^2 \theta\)
56. Folium of Descartes: \(x = \frac{3t}{1 + t^3}\), \(y = \frac{3t^2}{1 + t^3}\)

In Exercises 57–60, match the parametric equations with the correct graph and describe the domain and range. [The graphs are labeled (a), (b), (c), and (d).]

(a) \(y = x^3\)
(b) \(y = x^2\)
(c) \(y = \frac{1}{x}\)
(d) \(y = \frac{1}{\sqrt{x}}\)

57. Lissajous curve: \(x = 2 \cos \theta\), \(y = \sin 2\theta\)
58. Evolute of ellipse: \(x = 4 \cos^3 \theta\), \(y = 6 \sin^3 \theta\)
59. Involute of circle: \(x = \frac{1}{2}(\cos \theta + \theta \sin \theta)\)
\(\quad y = \frac{1}{2}(\sin \theta - \theta \cos \theta)\)
60. Serpentine curve: \(x = \frac{1}{2} \cot \theta\), \(y = 4 \sin \theta \cos \theta\)

**PROJECTILE MOTION** A projectile is launched at a height of \(h\) feet above the ground at an angle of \(\theta\) with the horizontal. The initial velocity is \(v_0\) feet per second, and the path of the projectile is modeled by the parametric equations
\[x = (v_0 \cos \theta)t\quad \text{and} \quad y = h + (v_0 \sin \theta)t - 16t^2.\]

In Exercises 61 and 62, use a graphing utility to graph the paths of a projectile launched from ground level at each value of \(\theta\) and \(v_0\). For each case, use the graph to approximate the maximum height and the range of the projectile.
61. (a) \(\theta = 60^\circ\), \(v_0 = 88\) feet per second
   (b) \(\theta = 60^\circ\), \(v_0 = 132\) feet per second
   (c) \(\theta = 45^\circ\), \(v_0 = 88\) feet per second
   (d) \(\theta = 45^\circ\), \(v_0 = 132\) feet per second
62. (a) \(\theta = 15^\circ\), \(v_0 = 50\) feet per second
   (b) \(\theta = 15^\circ\), \(v_0 = 120\) feet per second
   (c) \(\theta = 10^\circ\), \(v_0 = 50\) feet per second
   (d) \(\theta = 10^\circ\), \(v_0 = 120\) feet per second

**SPORTS** The center field fence in Yankee Stadium is 7 feet high and 408 feet from home plate. A baseball is hit at a point 3 feet above the ground. It leaves the bat at an angle of \(\theta\) degrees with the horizontal at a speed of 100 miles per hour (see figure).

(a) Write a set of parametric equations that model the path of the baseball.
(b) Use a graphing utility to graph the path of the baseball when \(\theta = 15^\circ\). Is the hit a home run?
(c) Use the graphing utility to graph the path of the baseball when \(\theta = 23^\circ\). Is the hit a home run?
(d) Find the minimum angle required for the hit to be a home run.
64. **SPORTS** An archer releases an arrow from a bow at a point 5 feet above the ground. The arrow leaves the bow at an angle of 15° with the horizontal and at an initial speed of 225 feet per second.

(a) Write a set of parametric equations that model the path of the arrow.

(b) Assuming the ground is level, find the distance the arrow travels before it hits the ground. (Ignore air resistance.)

(c) Use a graphing utility to graph the path of the arrow and approximate its maximum height.

(d) Find the total time the arrow is in the air.

65. **PROJECTILE MOTION** Eliminate the parameter \( t \) from the parametric equations

\[
\begin{align*}
  x &= (v_0 \cos \theta)t \\
  y &= h + (v_0 \sin \theta)t - 16t^2
\end{align*}
\]

for the motion of a projectile to show that the rectangular equation is

\[
y = -\frac{16 \sec^2 \theta}{v_0^2} x^2 + (\tan \theta)x + h.
\]

66. **PATH OF A PROJECTILE** The path of a projectile is given by the rectangular equation

\[
y = 7 + x - 0.02x^2.
\]

(a) Use the result of Exercise 65 to find \( h \), \( v_0 \), and \( \theta \). Find the parametric equations of the path.

(b) Use a graphing utility to graph the rectangular equation for the path of the projectile. Confirm your answer in part (a) by sketching the curve represented by the parametric equations.

(c) Use the graphing utility to approximate the maximum height of the projectile and its range.

67. **CURTATE CYCLOID** A wheel of radius \( a \) units rolls along a straight line without slipping. The curve traced by a point that is \( b \) units from the center \( (b < a) \) is called a **curtate cycloid** (see figure). Use the angle \( \theta \) shown in the figure to find a set of parametric equations for the curve.

68. **EPICYCLOID** A circle of radius one unit rolls around the outside of a circle of radius two units without slipping. The curve traced by a point on the circumference of the smaller circle is called an **epicycloid** (see figure). Use the angle \( \theta \) shown in the figure to find a set of parametric equations for the curve.

**EXPLORATION**

69. The two sets of parametric equations \( x = t \), \( y = t^2 + 1 \) and \( x = 3t \), \( y = 9t^2 + 1 \) have the same rectangular equation.

70. If \( y \) is a function of \( t \), and \( x \) is a function of \( t \), then \( y \) must be a function of \( x \).

71. **WRITING** Write a short paragraph explaining why parametric equations are useful.

72. **WRITING** Explain the process of sketching a plane curve given by parametric equations. What is meant by the orientation of the curve?

73. Use a graphing utility set in parametric mode to enter the parametric equations from Example 2. Over what values should you let \( t \) vary to obtain the graph shown in Figure 10.55?

74. **CAPSTONE** Consider the parametric equations

\[
\begin{align*}
  x &= 8 \cos t \\
  y &= 8 \sin t
\end{align*}
\]

(a) Describe the curve represented by the parametric equations.

(b) How does the curve represented by the parametric equations \( x = 8 \cos t + 3 \) and \( y = 8 \sin t + 6 \) compare with the curve described in part (a)?

(c) How does the original curve change when cosine and sine are interchanged?
10.7 Polar Coordinates

What you should learn

• Plot points on the polar coordinate system.
• Convert points from rectangular to polar form and vice versa.
• Convert equations from rectangular to polar form and vice versa.

Why you should learn it

Polar coordinates offer a different mathematical perspective on graphing. For instance, in Exercises 5–18 on page 781, you are asked to find multiple representations of polar coordinates.

Introduction

So far, you have been representing graphs of equations as collections of points \((x, y)\) on the rectangular coordinate system, where \(x\) and \(y\) represent the directed distances from the coordinate axes to the point \((x, y)\). In this section, you will study a different system called the polar coordinate system.

To form the polar coordinate system in the plane, fix a point called the pole (or origin), and construct from an initial ray called the polar axis, as shown in Figure 10.59. Then each point \(P\) in the plane can be assigned polar coordinates \((r, \theta)\) as follows.

1. \(r = \text{directed distance from } O \text{ to } P\)
2. \(\theta = \text{directed angle, counterclockwise from polar axis to segment } OP\)

**Example 1** Plotting Points on the Polar Coordinate System

a. The point \((r, \theta) = (2, \pi/3)\) lies two units from the pole on the terminal side of the angle \(\theta = \pi/3\), as shown in Figure 10.60.

b. The point \((r, \theta) = (3, -\pi/6)\) lies three units from the pole on the terminal side of the angle \(\theta = -\pi/6\), as shown in Figure 10.61.

c. The point \((r, \theta) = (3, 11\pi/6)\) coincides with the point \((3, -\pi/6)\), as shown in Figure 10.62.

**CHECK POINT** Now try Exercise 7.
In rectangular coordinates, each point \((x, y)\) has a unique representation. This is not true for polar coordinates. For instance, the coordinates \((r, \theta)\) and \((-r, \theta + \pi)\) represent the same point, as illustrated in Example 1. Another way to obtain multiple representations of a point is to use negative values for \(r\). Because \(r\) is a directed distance, the coordinates \((r, \theta)\) and \((-r, \theta + \pi)\) represent the same point. In general, the point \((r, \theta)\) can be represented as

\[
(r, \theta) = (r, \theta \pm 2n\pi) \quad \text{or} \quad (r, \theta) = (-r, \theta \pm (2n + 1)\pi)
\]

where \(n\) is any integer. Moreover, the pole is represented by \((0, \theta)\), where \(\theta\) is any angle.

**Example 2**  
**Multiple Representations of Points**

Plot the point \((3, -\frac{3\pi}{4})\) and find three additional polar representations of this point, using \(-2\pi < \theta < 2\pi\).

**Solution**

The point is shown in Figure 10.63. Three other representations are as follows.

\[
\left(3, -\frac{3\pi}{4} + 2\pi\right) = \left(3, \frac{5\pi}{4}\right) \quad \text{Add } 2\pi \text{ to } \theta.
\]

\[
\left(-3, -\frac{3\pi}{4} - \pi\right) = \left(-3, -\frac{7\pi}{4}\right) \quad \text{Replace } r \text{ by } -r; \text{ subtract } \pi \text{ from } \theta.
\]

\[
\left(-3, -\frac{3\pi}{4} + \pi\right) = \left(-3, \frac{\pi}{4}\right) \quad \text{Replace } r \text{ by } -r; \text{ add } \pi \text{ to } \theta.
\]

**CHECK POINT**  
Now try Exercise 13.

**Coordinate Conversion**

To establish the relationship between polar and rectangular coordinates, let the polar axis coincide with the positive \(x\)-axis and the pole with the origin, as shown in Figure 10.64. Because \((x, y)\) lies on a circle of radius \(r\), it follows that \(r^2 = x^2 + y^2\). Moreover, for \(r > 0\), the definitions of the trigonometric functions imply that

\[
\tan \theta = \frac{y}{x}, \quad \cos \theta = \frac{x}{r}, \quad \text{and} \quad \sin \theta = \frac{y}{r}.
\]

If \(r < 0\), you can show that the same relationships hold.

**Coordinate Conversion**

The polar coordinates \((r, \theta)\) are related to the rectangular coordinates \((x, y)\) as follows.

<table>
<thead>
<tr>
<th>Polar-to-Rectangular</th>
<th>Rectangular-to-Polar</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x = r \cos \theta)</td>
<td>(r = \sqrt{x^2 + y^2})</td>
</tr>
<tr>
<td>(y = r \sin \theta)</td>
<td>(\tan \theta = \frac{y}{x})</td>
</tr>
</tbody>
</table>
### Example 3  Polar-to-Rectangular Conversion

Convert each point to rectangular coordinates.

a. \((2, \pi)\)  
   \(b. \left(\sqrt{3}, \frac{\pi}{6}\right)\)

**Solution**

a. For the point \((r, \theta) = (2, \pi)\), you have the following.

\[
x = r \cos \theta = 2 \cos \pi = -2
\]
\[
y = r \sin \theta = 2 \sin \pi = 0
\]

The rectangular coordinates are \((x, y) = (-2, 0)\). (See Figure 10.65.)

b. For the point \((r, \theta) = \left(\sqrt{3}, \frac{\pi}{6}\right)\), you have the following.

\[
x = \sqrt{3} \cos \frac{\pi}{6} = \sqrt{3} \left(\frac{\sqrt{3}}{2}\right) = \frac{3}{2}
\]
\[
y = \sqrt{3} \sin \frac{\pi}{6} = \sqrt{3} \left(\frac{1}{2}\right) = \frac{\sqrt{3}}{2}
\]

The rectangular coordinates are \((x, y) = \left(\frac{3}{2}, \frac{\sqrt{3}}{2}\right)\).

**CHECK POINT** Now try Exercise 23.

### Example 4  Rectangular-to-Polar Conversion

Convert each point to polar coordinates.

a. \((-1, 1)\)  
   \(b. \,(0, 2)\)

**Solution**

a. For the second-quadrant point \((x, y) = (-1, 1)\), you have

\[
\tan \theta = \frac{y}{x} = -1
\]
\[
\theta = \frac{3 \pi}{4}.
\]

Because \(\theta\) lies in the same quadrant as \((x, y)\), use positive \(r\).

\[
r = \sqrt{x^2 + y^2} = \sqrt{(-1)^2 + (1)^2} = \sqrt{2}
\]

So, one set of polar coordinates is \((r, \theta) = \left(\sqrt{2}, \frac{3 \pi}{4}\right)\), as shown in Figure 10.66.

b. Because the point \((x, y) = (0, 2)\) lies on the positive \(y\)-axis, choose

\[
\theta = \frac{\pi}{2} \quad \text{and} \quad r = 2.
\]

This implies that one set of polar coordinates is \((r, \theta) = (2, \pi/2)\), as shown in Figure 10.67.

**CHECK POINT** Now try Exercise 41.
Equation Conversion

By comparing Examples 3 and 4, you can see that point conversion from the polar to the rectangular system is straightforward, whereas point conversion from the rectangular to the polar system is more involved. For equations, the opposite is true. To convert a rectangular equation to polar form, you simply replace \( x \) by \( r \cos \theta \) and \( y \) by \( r \sin \theta \). For instance, the rectangular equation \( y = x^2 \) can be written in polar form as follows.

\[
\begin{align*}
\text{Rectangular equation} & : \\
\text{Polar equation} & : \\
\text{Simplest form} & : \\
y & = x^2 \\
r \sin \theta & = (r \cos \theta)^2 \\
r & = \sec \theta \tan \theta
\end{align*}
\]

On the other hand, converting a polar equation to rectangular form requires considerable ingenuity.

Example 5 demonstrates several polar-to-rectangular conversions that enable you to sketch the graphs of some polar equations.

**Example 5  Converting Polar Equations to Rectangular Form**

Describe the graph of each polar equation and find the corresponding rectangular equation.

a. \( r = 2 \)  
   b. \( \theta = \frac{\pi}{3} \)  
   c. \( r = \sec \theta \)

**Solution**

a. The graph of the polar equation \( r = 2 \) consists of all points that are two units from the pole. In other words, this graph is a circle centered at the origin with a radius of 2, as shown in Figure 10.68. You can confirm this by converting to rectangular form, using the relationship \( r^2 = x^2 + y^2 \).

\[
\begin{align*}
\text{Polar equation} & : \\
\text{Rectangular equation} & : \\
r = 2 & \quad \Rightarrow \quad r^2 = 2^2 & \quad \Rightarrow \quad x^2 + y^2 = 2^2
\end{align*}
\]

b. The graph of the polar equation \( \theta = \frac{\pi}{3} \) consists of all points on the line that makes an angle of \( \pi/3 \) with the positive polar axis, as shown in Figure 10.69. To convert to rectangular form, make use of the relationship \( \tan \theta = y/x \).

\[
\begin{align*}
\text{Polar equation} & : \\
\text{Rectangular equation} & : \\
\theta = \frac{\pi}{3} & \quad \Rightarrow \quad \tan \theta = \sqrt{3} & \quad \Rightarrow \quad y = \sqrt{3}x
\end{align*}
\]

c. The graph of the polar equation \( r = \sec \theta \) is not evident by simple inspection, so convert to rectangular form by using the relationship \( r \cos \theta = x \).

\[
\begin{align*}
\text{Polar equation} & : \\
\text{Rectangular equation} & : \\
r = \sec \theta & \quad \Rightarrow \quad r \cos \theta = 1 & \quad \Rightarrow \quad x = 1
\end{align*}
\]

Now you see that the graph is a vertical line, as shown in Figure 10.70.
10.7 EXERCISES

VOCABULARY: Fill in the blanks.
1. The origin of the polar coordinate system is called the ________.
2. For the point \( (r, \theta) \), \( r \) is the ________ ________ from \( O \) to \( P \) and \( \theta \) is the ________ ________ , counterclockwise from the polar axis to the line segment \( OP \).
3. To plot the point \( (r, \theta) \), use the ________ coordinate system.
4. The polar coordinates \( (r, \theta) \) are related to the rectangular coordinates \( (x, y) \) as follows:
   \[
x = _____ \quad y = _____ \quad \tan \theta = _____ \quad r^2 = _____
   \]

SKILLS AND APPLICATIONS

In Exercises 5–18, plot the point given in polar coordinates and find two additional polar representations of the point, using \(-2\pi < \theta < 2\pi\).

5. \( \left( 2, \frac{5\pi}{6} \right) \)  6. \( \left( 3, \frac{5\pi}{4} \right) \)

7. \( 4, -\frac{\pi}{3} \)  8. \( -1, -\frac{3\pi}{4} \)

9. \( 2, 3\pi \)  10. \( 4, \frac{5\pi}{2} \)

11. \( -2, \frac{2\pi}{3} \)  12. \( -3, \frac{11\pi}{6} \)

13. \( 0, -\frac{7\pi}{6} \)  14. \( 0, -\frac{7\pi}{2} \)

15. \( \sqrt{2}, \sqrt{2} \)  16. \( 2\sqrt{2}, 4.71 \)

17. \( -3, -1.57 \)  18. \( -5, -2.36 \)

In Exercises 19–28, a point in polar coordinates is given. Convert the point to rectangular coordinates.

19. \( 3, \frac{\pi}{2} \)  20. \( 3, \frac{3\pi}{2} \)

21. \( -1, \frac{5\pi}{4} \)  22. \( 0, -\pi \)

23. \( 2, 3\pi/4 \)  24. \( 1, 5\pi/4 \)

25. \( -2, 7\pi/6 \)  26. \( -3, 5\pi/6 \)

27. \( -2.5, 1.1 \)  28. \( -2, 5.76 \)

In Exercises 29–36, use a graphing utility to find the rectangular coordinates of the point given in polar coordinates. Round your results to two decimal places.

29. \( 2, 2\pi/9 \)  30. \( 4, 11\pi/9 \)

31. \( -4.5, 1.3 \)  32. \( 8.25, 3.5 \)

33. \( 2.5, 1.58 \)  34. \( 5.4, 2.85 \)

35. \( -4.1, -0.5 \)  36. \( 8.2, -3.2 \)

In Exercises 37–54, a point in rectangular coordinates is given. Convert the point to polar coordinates.

37. \( 1, 1 \)  38. \( 2, 2 \)

39. \( -3, -3 \)  40. \( -4, -4 \)

41. \( -6, 0 \)  42. \( 3, 0 \)

43. \( 0, -5 \)  44. \( 0, 5 \)

45. \( -3, 4 \)  46. \( -4, -3 \)

47. \( -\sqrt{3}, -\sqrt{3} \)  48. \( -\sqrt{3}, \sqrt{3} \)

49. \( \sqrt{3}, -1 \)  50. \( -1, \sqrt{3} \)

51. \( 6, 9 \)  52. \( 6, 2 \)

53. \( 5, 12 \)  54. \( 7, 15 \)

In Exercises 55–64, use a graphing utility to find one set of polar coordinates for the point given in rectangular coordinates.

55. \( 3, -2 \)  56. \( -4, -2 \)

57. \( -5, 2 \)  58. \( 7, -2 \)

59. \( \sqrt{3}, 2 \)  60. \( 5, -\sqrt{2} \)

61. \( \frac{4}{3}, \frac{4}{3} \)  62. \( \frac{4}{3}, \frac{4}{3} \)

63. \( \frac{2}{3}, \frac{2}{3} \)  64. \( \frac{2}{3}, \frac{2}{3} \)

In Exercises 65–84, convert the rectangular equation to polar form. Assume \( a > 0 \).

65. \( x^2 + y^2 = 9 \)  66. \( x^2 + y^2 = 16 \)
In Exercises 109–118, describe the graph of the polar equation and find the corresponding rectangular equation. Sketch its graph.

109. \( r = 6 \) 
110. \( r = 8 \) 
111. \( \theta = \pi/6 \) 
112. \( \theta = 3\pi/4 \) 
113. \( r = 2 \sin \theta \) 
114. \( r = 4 \cos \theta \) 
115. \( r = -6 \cos \theta \) 
116. \( r = -3 \sin \theta \) 
117. \( r = 3 \sec \theta \) 
118. \( r = 2 \csc \theta \)

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 119 and 120, determine whether the statement is true or false. Justify your answer.

119. If \( \theta_1 = \theta_2 + 2\pi n \) for some integer \( n \), then \( (r, \theta_1) \) and \( (r, \theta_2) \) represent the same point on the polar coordinate system.

120. If \( |r_1| = |r_2| \), then \( (r_1, \theta) \) and \( (r_2, \theta) \) represent the same point on the polar coordinate system.

121. Convert the polar equation \( r = 2(h \cos \theta + k \sin \theta) \) to rectangular form and verify that it is the equation of a circle. Find the radius of the circle and the rectangular coordinates of the center of the circle.

122. Convert the polar equation \( r = \cos \theta + 3 \sin \theta \) to rectangular form and identify the graph.

123. **THINK ABOUT IT**

(a) Show that the distance between the points \( (r_1, \theta_1) \) and \( (r_2, \theta_2) \) is \( \sqrt{r_1^2 + r_2^2 - 2r_1 r_2 \cos(\theta_1 - \theta_2)} \).

(b) Describe the positions of the points relative to each other for \( \theta_1 = \theta_2 \). Simplify the Distance Formula for this case. Is the simplification what you expected? Explain.

(c) Simplify the Distance Formula for \( \theta_1 - \theta_2 = 90^\circ \). Is the simplification what you expected? Explain.

(d) Choose two points on the polar coordinate system and find the distance between them. Then choose different polar representations of the same two points and apply the Distance Formula again. Discuss the result.

124. **GRAPHICAL REASONING**

(a) Set the window format of your graphing utility on rectangular coordinates and locate the cursor at any position off the coordinate axes. Move the cursor horizontally and observe any changes in the displayed coordinates of the points. Explain the changes in the coordinates. Now repeat the process moving the cursor vertically.

(b) Set the window format of your graphing utility on polar coordinates and locate the cursor at any position off the coordinate axes. Move the cursor horizontally and observe any changes in the displayed coordinates of the points. Explain the changes in the coordinates. Now repeat the process moving the cursor vertically.

(c) Explain why the results of parts (a) and (b) are not the same.

125. **GRAPHICAL REASONING**

(a) Use a graphing utility in polar mode to graph the equation \( r = 3 \).

(b) Use the trace feature to move the cursor around the circle. Can you locate the point \( (3, 5\pi/4) \)?

(c) Can you find other polar representations of the point \( (3, 5\pi/4) \)? If so, explain how you did it.

**CAPSTONE** In the rectangular coordinate system, each point \((x, y)\) has a unique representation. Explain why this is not true for a point \((r, \theta)\) in the polar coordinate system.
10.8 Graphs of Polar Equations

What you should learn

• Graph polar equations by point plotting.
• Use symmetry to sketch graphs of polar equations.
• Use zeros and maximum \( r \)-values to sketch graphs of polar equations.
• Recognize special polar graphs.

Why you should learn it

Equations of several common figures are simpler in polar form than in rectangular form. For instance, Exercise 12 on page 789 shows the graph of a circle and its polar equation.

Introduction

In previous chapters, you learned how to sketch graphs on rectangular coordinate systems. You began with the basic point-plotting method. Then you used sketching aids such as symmetry, intercepts, asymptotes, periods, and shifts to further investigate the natures of graphs. This section approaches curve sketching on the polar coordinate system similarly, beginning with a demonstration of point plotting.

Example 1 Graphing a Polar Equation by Point Plotting

Sketch the graph of the polar equation \( r = 4 \sin \theta \).

Solution

The sine function is periodic, so you can get a full range of \( r \)-values by considering values of \( \theta \) in the interval \( 0 \leq \theta \leq 2\pi \), as shown in the following table.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0</th>
<th>( \frac{\pi}{6} )</th>
<th>( \frac{\pi}{3} )</th>
<th>( \frac{\pi}{2} )</th>
<th>( \frac{2\pi}{3} )</th>
<th>( \frac{5\pi}{6} )</th>
<th>( \pi )</th>
<th>( \frac{7\pi}{6} )</th>
<th>( \frac{3\pi}{2} )</th>
<th>( \frac{11\pi}{6} )</th>
<th>( 2\pi )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>0</td>
<td>2</td>
<td>( 2\sqrt{3} )</td>
<td>4</td>
<td>( 2\sqrt{3} )</td>
<td>2</td>
<td>0</td>
<td>(-2)</td>
<td>(-4)</td>
<td>(-2)</td>
<td>0</td>
</tr>
</tbody>
</table>

If you plot these points as shown in Figure 10.71, it appears that the graph is a circle of radius 2 whose center is at the point \((x, y) = (0, 2)\).

![Figure 10.71](image)

CHECK POINT Now try Exercise 27.

You can confirm the graph in Figure 10.71 by converting the polar equation to rectangular form and then sketching the graph of the rectangular equation. You can also use a graphing utility set to polar mode and graph the polar equation or set the graphing utility to parametric mode and graph a parametric representation.
**Symmetry**

In Figure 10.71 on the preceding page, note that as \( \theta \) increases from 0 to \( 2\pi \), the graph is traced out twice. Moreover, note that the graph is symmetric with respect to the line \( \theta = \pi/2 \). Had you known about this symmetry and retracing ahead of time, you could have used fewer points.

Symmetry with respect to the line \( \theta = \pi/2 \) is one of three important types of symmetry to consider in polar curve sketching. (See Figure 10.72.)

**Tests for Symmetry in Polar Coordinates**

The graph of a polar equation is symmetric with respect to the following if the given substitution yields an equivalent equation.

1. The line \( \theta = \pi/2 \): Replace \((r, \theta)\) by \((r, \pi/2 - \theta)\) or \((-r, -\theta)\).
2. The polar axis: Replace \((r, \theta)\) by \((r, \pi - \theta)\) or \((-r, \pi - \theta)\).
3. The pole: Replace \((r, \theta)\) by \((r, \pi + \theta)\) or \((-r, \theta)\).

**Example 2** Using Symmetry to Sketch a Polar Graph

Use symmetry to sketch the graph of \( r = 3 + 2 \cos \theta \).

**Solution**

Replacing \((r, \theta)\) by \((r, -\theta)\) produces

\[
r = 3 + 2 \cos(-\theta) = 3 + 2 \cos \theta.
\]

So, you can conclude that the curve is symmetric with respect to the polar axis. Plotting the points in the table and using polar axis symmetry, you obtain the graph shown in Figure 10.73. This graph is called a **limaçon**.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0</th>
<th>( \pi/3 )</th>
<th>( \pi/2 )</th>
<th>( 2\pi/3 )</th>
<th>( \pi )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

**Check Point** Now try Exercise 33.
The three tests for symmetry in polar coordinates listed on page 784 are sufficient to guarantee symmetry, but they are not necessary. For instance, Figure 10.74 shows the graph of \( r = \theta + 2\pi \) to be symmetric with respect to the line \( \theta = \pi/2 \), and yet the tests on page 784 fail to indicate symmetry because neither of the following replacements yields an equivalent equation.

<table>
<thead>
<tr>
<th>Original Equation</th>
<th>Replacement</th>
<th>New Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r = \theta + 2\pi )</td>
<td>( (r, \theta) ) by (-r, -\theta)</td>
<td>(-r = -\theta + 2\pi)</td>
</tr>
<tr>
<td>( r = \theta + 2\pi )</td>
<td>( (r, \theta) ) by ((r, \pi - \theta))</td>
<td>(-r = -\theta + 3\pi)</td>
</tr>
</tbody>
</table>

The equations discussed in Examples 1 and 2 are of the form

- \( r = 4 \sin \theta = f(\sin \theta) \)
- \( r = 3 + 2 \cos \theta = g(\cos \theta) \)

The graph of the first equation is symmetric with respect to the line \( \theta = \pi/2 \), and the graph of the second equation is symmetric with respect to the polar axis. This observation can be generalized to yield the following tests.

### Quick Tests for Symmetry in Polar Coordinates

1. The graph of \( r = f(\sin \theta) \) is symmetric with respect to the line \( \theta = \pi/2 \).
2. The graph of \( r = g(\cos \theta) \) is symmetric with respect to the polar axis.

### Zeros and Maximum \( r \)-Values

Two additional aids to graphing of polar equations involve knowing the \( \theta \)-values for which \(|r|\) is maximum and knowing the \( \theta \)-values for which \( r = 0 \). For instance, in Example 1, the maximum value of \(|r|\) for \( r = 4 \sin \theta \) is \(|r| = 4\), and this occurs when \( \theta = \pi/2 \), as shown in Figure 10.71. Moreover, \( r = 0 \) when \( \theta = 0 \).

### Example 3  Sketching a Polar Graph

Sketch the graph of \( r = 1 - 2 \cos \theta \).

**Solution**

From the equation \( r = 1 - 2 \cos \theta \), you can obtain the following.

**Symmetry:**
With respect to the polar axis

**Maximum value of \(|r|\):** \( r = 3 \) when \( \theta = \pi \)

**Zero of \( r \):** \( r = 0 \) when \( \theta = \pi/3 \)

The table shows several \( \theta \)-values in the interval \([0, \pi]\). By plotting the corresponding points, you can sketch the graph shown in Figure 10.75.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0</th>
<th>( \frac{\pi}{6} )</th>
<th>( \frac{\pi}{3} )</th>
<th>( \frac{\pi}{2} )</th>
<th>( \frac{2\pi}{3} )</th>
<th>( \frac{5\pi}{6} )</th>
<th>( \pi )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>-1</td>
<td>-0.73</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>2.73</td>
<td>3</td>
</tr>
</tbody>
</table>

Note how the negative \( r \)-values determine the *inner loop* of the graph in Figure 10.75. This graph, like the one in Figure 10.73, is a limaçon.

**Check Point**

Now try Exercise 35.
Some curves reach their zeros and maximum $r$-values at more than one point, as shown in Example 4.

**Example 4**  Sketching a Polar Graph

Sketch the graph of $r = 2 \cos 3\theta$.

**Solution**

Symmetry: 

With respect to the polar axis

Maximum value of $r$: 

$|r| = 2$ when $3\theta = 0, \pi, 2\pi, 3\pi$ or $\theta = 0, \frac{2\pi}{3}, \pi$

Zeros of $r$: 

$r = 0$ when $3\theta = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}$ or $\theta = \frac{\pi}{6}, \frac{\pi}{2}, \frac{5\pi}{6}$

<table>
<thead>
<tr>
<th>$\theta$</th>
<th>0</th>
<th>$\frac{\pi}{12}$</th>
<th>$\frac{\pi}{6}$</th>
<th>$\frac{\pi}{4}$</th>
<th>$\frac{\pi}{3}$</th>
<th>$\frac{5\pi}{12}$</th>
<th>$\frac{\pi}{2}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$r$</td>
<td>2</td>
<td>$\sqrt{2}$</td>
<td>0</td>
<td>$-\sqrt{2}$</td>
<td>-2</td>
<td>$-\sqrt{2}$</td>
<td>0</td>
</tr>
</tbody>
</table>

By plotting these points and using the specified symmetry, zeros, and maximum values, you can obtain the graph shown in Figure 10.76. This graph is called a **rose curve**, and each of the loops on the graph is called a **petal** of the rose curve. Note how the entire curve is generated as $\theta$ increases from 0 to $\pi$.

**TECHNOLOGY**

Use a graphing utility in polar mode to verify the graph of $r = 2 \cos 3\theta$ shown in Figure 10.76.

**CHECK POINT**  Now try Exercise 39.
Special Polar Graphs

Several important types of graphs have equations that are simpler in polar form than in rectangular form. For example, the circle

\[ r = 4 \sin \theta \]

in Example 1 has the more complicated rectangular equation

\[ x^2 + (y - 2)^2 = 4. \]

Several other types of graphs that have simple polar equations are shown below.

**Limaçons**

- \( r = a \pm b \cos \theta \)
- \( r = a \pm b \sin \theta \)

\((a > 0, b > 0)\)

\( \frac{a}{b} < 1 \) Limaçon with inner loop

\( \frac{a}{b} = 1 \) Cardioid (heart-shaped)

\( 1 < \frac{a}{b} < 2 \) Dimpled limaçon

\( \frac{a}{b} \geq 2 \) Convex limaçon

**Rose Curves**

- \( r = a \cos n\theta \) Rose curve
- \( r = a \sin n\theta \) Rose curve

\( n \) petals if \( n \) is odd,

\( 2n \) petals if \( n \) is even

\((n \geq 2)\)

**Circles and Lemniscates**

- \( r = a \cos \theta \) Circle
- \( r = a \sin \theta \) Circle
- \( r^2 = a^2 \sin 2\theta \) Lemniscate
- \( r^2 = a^2 \cos 2\theta \) Lemniscate
**Example 5**  **Sketching a Rose Curve**

Sketch the graph of \( r = 3 \cos 2\theta \).

**Solution**

Type of curve: Rose curve with \( 2n = 4 \) petals

Symmetry: With respect to polar axis, the line \( \theta = \frac{\pi}{2} \), and the pole

Maximum value of \(|r|\): \(|r| = 3\) when \( \theta = 0, \frac{\pi}{2}, \frac{3\pi}{2} \)

Zeros of \( r \): \( r = 0 \) when \( \theta = \frac{\pi}{4}, \frac{3\pi}{4} \)

Using this information together with the additional points shown in the following table, you obtain the graph shown in Figure 10.77.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0</th>
<th>( \frac{\pi}{6} )</th>
<th>( \frac{\pi}{4} )</th>
<th>( \frac{\pi}{3} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>3</td>
<td>( \frac{3}{2} )</td>
<td>0</td>
<td>( -\frac{3}{2} )</td>
</tr>
</tbody>
</table>

**Check Point** Now try Exercise 41.

**Example 6**  **Sketching a Lemniscate**

Sketch the graph of \( r^2 = 9 \sin 2\theta \).

**Solution**

Type of curve: Lemniscate

Symmetry: With respect to the pole

Maximum value of \(|r|\): \(|r| = 3\) when \( \theta = \frac{\pi}{4} \)

Zeros of \( r \): \( r = 0 \) when \( \theta = 0, \frac{\pi}{2} \)

If \( \sin 2\theta < 0 \), this equation has no solution points. So, you restrict the values of \( \theta \) to those for which \( \sin 2\theta \geq 0 \).

\[
0 \leq \theta \leq \frac{\pi}{2} \quad \text{or} \quad \pi \leq \theta \leq \frac{3\pi}{2}
\]

Moreover, using symmetry, you need to consider only the first of these two intervals. By finding a few additional points (see table below), you can obtain the graph shown in Figure 10.78.

<table>
<thead>
<tr>
<th>( \theta )</th>
<th>0</th>
<th>( \frac{\pi}{12} )</th>
<th>( \frac{\pi}{4} )</th>
<th>( \frac{5\pi}{12} )</th>
<th>( \frac{\pi}{2} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r = \pm 3 \sqrt{\sin 2\theta} )</td>
<td>0</td>
<td>( \pm 3 \frac{\sqrt{2}}{2} )</td>
<td>( \pm 3 )</td>
<td>( \pm 3 \frac{\sqrt{2}}{2} )</td>
<td>0</td>
</tr>
</tbody>
</table>

**Check Point** Now try Exercise 47.
In Exercises 13–18, test for symmetry with respect to \( \theta = \pi/2 \), the polar axis, and the pole.

13. \( r = 4 + 3 \cos \theta \)  
14. \( r = 9 \cos 3\theta \)  
15. \( r = \frac{2}{1 + \sin \theta} \)  
16. \( r = \frac{3}{2 + \cos \theta} \)  
17. \( r^2 = 36 \cos 2\theta \)  
18. \( r^2 = 25 \sin 2\theta \)

In Exercises 19–22, find the maximum value of \(|r|\) and any zeros of \(r\).

19. \( r = 10 - 10 \sin \theta \)  
20. \( r = 6 + 12 \cos \theta \)  
21. \( r = 4 \cos 3\theta \)  
22. \( r = 3 \sin 2\theta \)

In Exercises 23–48, sketch the graph of the polar equation using symmetry, zeros, maximum \(r\)-values, and any other additional points.

23. \( r = 4 \)  
24. \( r = -7 \)  
25. \( r = \frac{\pi}{3} \)  
26. \( r = -\frac{3\pi}{4} \)  
27. \( r = \sin \theta \)  
28. \( r = 4 \cos \theta \)  
29. \( r = 3(1 - \cos \theta) \)  
30. \( r = 4(1 - \sin \theta) \)  
31. \( r = 4(1 + \sin \theta) \)  
32. \( r = 2(1 + \cos \theta) \)  
33. \( r = 3 + 6 \sin \theta \)  
34. \( r = 4 - 3 \sin \theta \)  
35. \( r = 1 - 2 \sin \theta \)  
36. \( r = 2 - 4 \cos \theta \)  
37. \( r = 3 - 4 \cos \theta \)  
38. \( r = 4 + 3 \cos \theta \)  
39. \( r = 5 \sin 2\theta \)  
40. \( r = 2 \cos 2\theta \)  
41. \( r = 6 \cos 3\theta \)  
42. \( r = 3 \sin 3\theta \)  
43. \( r = 2 \sec \theta \)  
44. \( r = 5 \csc \theta \)  
45. \( r = \frac{3}{\sin \theta - 2 \cos \theta} \)  
46. \( r = \frac{6}{2 \sin \theta - 3 \cos \theta} \)  
47. \( r^2 = 9 \cos 2\theta \)  
48. \( r^2 = 4 \sin \theta \)

In Exercises 49–58, use a graphing utility to graph the polar equation. Describe your viewing window.

49. \( r = \frac{9}{4} \)  
50. \( r = -\frac{5}{2} \)  
51. \( r = \frac{5\pi}{8} \)  
52. \( r = -\frac{\pi}{10} \)  
53. \( r = 8 \cos \theta \)  
54. \( r = \cos 2\theta \)  
55. \( r = 3(2 - \sin \theta) \)  
56. \( r = 2 \cos(3\theta - 2) \)  
57. \( r = 8 \sin \theta \cos^2 \theta \)  
58. \( r = 2 \csc \theta + 5 \)

In Exercises 59–64, use a graphing utility to graph the polar equation. Find an interval for \(\theta\) for which the graph is traced only once.

59. \( r = 3 - 8 \cos \theta \)  
60. \( r = 5 + 4 \cos \theta \)  
61. \( r = 2 \cos \left(\frac{3\theta}{2}\right) \)  
62. \( r = 3 \sin \left(\frac{5\theta}{2}\right) \)
63. \( r^2 = 16 \sin 2\theta \)  
64. \( r^2 = \frac{1}{\theta} \)

In Exercises 65–68, use a graphing utility to graph the polar equation and show that the indicated line is an asymptote of the graph.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 69 and 70, determine whether the statement is true or false. Justify your answer.

69. In the polar coordinate system, if a graph that has symmetry with respect to the polar axis were folded on the line \( \theta = 0 \), the portion of the graph above the polar axis would coincide with the portion of the graph below the polar axis.

70. In the polar coordinate system, if a graph that has symmetry with respect to the pole were folded on the line \( \theta = 3\pi/4 \), the portion of the graph on one side of the fold would coincide with the portion of the graph on the other side of the fold.

71. Sketch the graph of \( r = 6 \cos \theta \) over each interval. Describe the part of the graph obtained in each case.
   (a) \( 0 \leq \theta \leq \frac{\pi}{2} \)  
   (b) \( \frac{\pi}{2} \leq \theta \leq \pi \)  
   (c) \( -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2} \)  
   (d) \( \frac{\pi}{4} \leq \theta \leq \frac{3\pi}{4} \)

72. **GRAPHICAL REASONING** Use a graphing utility to graph the polar equation \( r = 6[1 + \cos(\theta - \phi)] \) for (a) \( \phi = 0 \), (b) \( \phi = \pi/4 \), and (c) \( \phi = \pi/2 \). Use the graphs to describe the effect of the angle \( \phi \). Write the equation as a function of \( \sin \theta \) for part (c).

73. The graph of \( r = f(\theta) \) is rotated about the pole through an angle \( \phi \). Show that the equation of the rotated graph is \( r = f(\theta - \phi) \).

74. Consider the graph of \( r = f(\sin \theta) \).
   (a) Show that if the graph is rotated counterclockwise \( \pi/2 \) radians about the pole, the equation of the rotated graph is \( r = f(-\cos \theta) \).
   (b) Show that if the graph is rotated counterclockwise \( \pi \) radians about the pole, the equation of the rotated graph is \( r = f(-\sin \theta) \).
   (c) Show that if the graph is rotated counterclockwise \( 3\pi/2 \) radians about the pole, the equation of the rotated graph is \( r = f(\cos \theta) \).

In Exercises 75–78, use the results of Exercises 73 and 74.

75. Write an equation for the limaçon \( r = 2 - \sin \theta \) after it has been rotated through the given angle.
   (a) \( \frac{\pi}{4} \)  
   (b) \( \frac{\pi}{2} \)  
   (c) \( \pi \)  
   (d) \( \frac{3\pi}{2} \)

76. Write an equation for the rose curve \( r = 2 \sin 2\theta \) after it has been rotated through the given angle.
   (a) \( \frac{\pi}{6} \)  
   (b) \( \frac{\pi}{2} \)  
   (c) \( \frac{2\pi}{3} \)  
   (d) \( \pi \)

77. Sketch the graph of each equation.
   (a) \( r = 1 - \sin \theta \)  
   (b) \( r = 1 - \sin(\theta - \frac{\pi}{4}) \)

78. Sketch the graph of each equation.
   (a) \( r = 3 \sec \theta \)  
   (b) \( r = 3 \sec(\theta - \frac{\pi}{4}) \)  
   (c) \( r = 3 \sec(\theta + \frac{\pi}{3}) \)  
   (d) \( r = 3 \sec(\theta - \frac{\pi}{2}) \)

79. **THINK ABOUT IT** How many petals do the rose curves given by \( r = 2 \cos 4\theta \) and \( r = 2 \sin 3\theta \) have? Determine the numbers of petals for the curves given by \( r = 2 \cos n\theta \) and \( r = 2 \sin n\theta \), where \( n \) is a positive integer.

80. Use a graphing utility to graph and identify \( r = 2 + k \sin \theta \) for \( k = 0, 1, 2, \) and 3.

81. Consider the equation \( r = 3 \sin k\theta \).
   (a) Use a graphing utility to graph the equation for \( k = 1.5 \). Find the interval for \( \theta \) over which the graph is traced only once.
   (b) Use a graphing utility to graph the equation for \( k = 2.5 \). Find the interval for \( \theta \) over which the graph is traced only once.
   (c) Is it possible to find an interval for \( \theta \) over which the graph is traced only once for any rational number \( k \)? Explain.

82. **CAPSTONE** Write a brief paragraph that describes why some polar curves have equations that are simpler in polar form than in rectangular form. Besides a circle, give an example of a curve that is simpler in polar form than in rectangular form. Give an example of a curve that is simpler in rectangular form than in polar form.
What you should learn

- Define conics in terms of eccentricity.
- Write and graph equations of conics in polar form.
- Use equations of conics in polar form to model real-life problems.

Why you should learn it

The orbits of planets and satellites can be modeled with polar equations. For instance, in Exercise 65 on page 796, a polar equation is used to model the orbit of a satellite.

**Polar Equations of Conics**

### Alternative Definition of Conic

In Sections 10.3 and 10.4, you learned that the rectangular equations of ellipses and hyperbolas take simple forms when the origin lies at their *centers*. As it happens, there are many important applications of conics in which it is more convenient to use one of the *foci* as the origin. In this section, you will learn that polar equations of conics take simple forms if one of the foci lies at the pole.

To begin, consider the following alternative definition of conic that uses the concept of eccentricity.

In Figure 10.79, note that for each type of conic, the focus is at the pole.

In Figure 10.79, note that for each type of conic, the focus is at the pole.

**Alternative Definition of Conic**

The locus of a point in the plane that moves so that its distance from a fixed point (focus) is in a constant ratio to its distance from a fixed line (directrix) is a *conic*. The constant ratio is the eccentricity of the conic and is denoted by $e$. Moreover, the conic is an *ellipse* if $e < 1$, a *parabola* if $e = 1$, and a *hyperbola* if $e > 1$. (See Figure 10.79.)

**Polar Equations of Conics**

The benefit of locating a focus of a conic at the pole is that the equation of the conic takes on a simpler form. For a proof of the polar equations of conics, see Proofs in Mathematics on page 806.

**Polar Equations of Conics**

The graph of a polar equation of the form

1. \[ r = \frac{ep}{1 \pm e \cos \theta} \]
2. \[ r = \frac{ep}{1 \pm e \sin \theta} \]

is a conic, where $e > 0$ is the eccentricity and $|p|$ is the distance between the focus (pole) and the directrix.
Equations of the form
\[ r = \frac{ep}{1 \pm e \cos \theta} = g(\cos \theta) \]
correspond to conics with a vertical directrix and symmetry with respect to the polar axis. Equations of the form
\[ r = \frac{ep}{1 \pm e \sin \theta} = g(\sin \theta) \]
correspond to conics with a horizontal directrix and symmetry with respect to the line \( \theta = \frac{\pi}{2} \). Moreover, the converse is also true—that is, any conic with a focus at the pole and having a horizontal or vertical directrix can be represented by one of these equations.

**Example 1  Identifying a Conic from Its Equation**

Identify the type of conic represented by the equation \( r = \frac{15}{3 - 2 \cos \theta} \).

**Algebraic Solution**

To identify the type of conic, rewrite the equation in the form \( r = (ep)/(1 \pm e \cos \theta) \).

\[
\begin{align*}
\frac{r}{15} &= \frac{3 - 2 \cos \theta}{(2/3) \cos \theta} \\
&= \frac{15}{3 - 2 \cos \theta} \\
&= \frac{5}{1 - (2/3) \cos \theta}
\end{align*}
\]

Because \( e = \frac{2}{3} < 1 \), you can conclude that the graph is an ellipse.

**Graphical Solution**

You can start sketching the graph by plotting points from \( \theta = 0 \) to \( \theta = \pi \). Because the equation is of the form \( r = g(\cos \theta) \), the graph of \( r \) is symmetric with respect to the polar axis. So, you can complete the sketch, as shown in Figure 10.80. From this, you can conclude that the graph is an ellipse.

For the ellipse in Figure 10.80, the major axis is horizontal and the vertices lie at \((15, 0)\) and \((3, \pi)\). So, the length of the major axis is \(2a = 18\). To find the length of the minor axis, you can use the equations \( e = c/a \) and \( b^2 = a^2 - c^2 \) to conclude that

\[
b^2 = a^2 - c^2 \\
= a^2 - (ea)^2 \\
= a^2(1 - e^2).
\]

Because \( e = \frac{2}{3} \), you have \( b^2 = 9\left[1 - \left(\frac{2}{3}\right)^2\right] = 45 \), which implies that \( b = \sqrt{45} = 3\sqrt{5} \). So, the length of the minor axis is \(2b = 6\sqrt{5} \). A similar analysis for hyperbolas yields

\[
b^2 = c^2 - a^2 \\
= (ea)^2 - a^2 \\
= a^2(e^2 - 1).
\]

Hyperbola
Section 10.9  Polar Equations of Conics

Example 2  Sketching a Conic from Its Polar Equation

Identify the conic \( r = \frac{32}{3 + 5 \sin \theta} \) and sketch its graph.

Solution

Dividing the numerator and denominator by 3, you have

\[
nr = \frac{32/3}{1 + (5/3) \sin \theta}
\]

Because \( e = \frac{5}{3} > 1 \), the graph is a hyperbola. The transverse axis of the hyperbola lies on the line \( \theta = \pi/2 \), and the vertices occur at \( (4, \pi/2) \) and \( (-16, 3\pi/2) \). Because the length of the transverse axis is 12, you can see that \( a = 6 \). To find \( b \), write

\[
b^2 = a^2(e^2 - 1) = 6\left[\left(\frac{5}{3}\right)^2 - 1\right] = 64.
\]

So, \( b = 8 \). Finally, you can use \( a \) and \( b \) to determine that the asymptotes of the hyperbola are \( y = 10 \pm \frac{4}{3}x \). The graph is shown in Figure 10.81.

Example 3  Finding the Polar Equation of a Conic

Find the polar equation of the parabola whose focus is the pole and whose directrix is the line \( y = 3 \).

Solution

From Figure 10.82, you can see that the directrix is horizontal and above the pole, so you can choose an equation of the form

\[
r = \frac{ep}{1 + e \sin \theta}
\]

Moreover, because the eccentricity of a parabola is \( e = 1 \) and the distance between the pole and the directrix is \( p = 3 \), you have the equation

\[
r = \frac{3}{1 + \sin \theta}
\]

Solution

Dividing the numerator and denominator by 3, you have

\[
rr = \frac{32/3}{1 + (5/3) \sin \theta}
\]

Because \( e = \frac{5}{3} > 1 \), the graph is a hyperbola. The transverse axis of the hyperbola lies on the line \( \theta = \pi/2 \), and the vertices occur at \( (4, \pi/2) \) and \( (-16, 3\pi/2) \). Because the length of the transverse axis is 12, you can see that \( a = 6 \). To find \( b \), write

\[
b^2 = a^2(e^2 - 1) = 6\left[\left(\frac{5}{3}\right)^2 - 1\right] = 64.
\]

So, \( b = 8 \). Finally, you can use \( a \) and \( b \) to determine that the asymptotes of the hyperbola are \( y = 10 \pm \frac{4}{3}x \). The graph is shown in Figure 10.81.

Example 2  Sketching a Conic from Its Polar Equation

Identify the conic \( r = \frac{32}{3 + 5 \sin \theta} \) and sketch its graph.

Solution

Dividing the numerator and denominator by 3, you have

\[
r = \frac{32/3}{1 + (5/3) \sin \theta}
\]

Because \( e = \frac{5}{3} > 1 \), the graph is a hyperbola. The transverse axis of the hyperbola lies on the line \( \theta = \pi/2 \), and the vertices occur at \( (4, \pi/2) \) and \( (-16, 3\pi/2) \). Because the length of the transverse axis is 12, you can see that \( a = 6 \). To find \( b \), write

\[
b^2 = a^2(e^2 - 1) = 6\left[\left(\frac{5}{3}\right)^2 - 1\right] = 64.
\]

So, \( b = 8 \). Finally, you can use \( a \) and \( b \) to determine that the asymptotes of the hyperbola are \( y = 10 \pm \frac{4}{3}x \). The graph is shown in Figure 10.81.

Example 3  Finding the Polar Equation of a Conic

Find the polar equation of the parabola whose focus is the pole and whose directrix is the line \( y = 3 \).

Solution

From Figure 10.82, you can see that the directrix is horizontal and above the pole, so you can choose an equation of the form

\[
r = \frac{ep}{1 + e \sin \theta}
\]

Moreover, because the eccentricity of a parabola is \( e = 1 \) and the distance between the pole and the directrix is \( p = 3 \), you have the equation

\[
r = \frac{3}{1 + \sin \theta}
\]
Applications

Kepler’s Laws (listed below), named after the German astronomer Johannes Kepler (1571–1630), can be used to describe the orbits of the planets about the sun.

1. Each planet moves in an elliptical orbit with the sun at one focus.

2. A ray from the sun to the planet sweeps out equal areas of the ellipse in equal times.

3. The square of the period (the time it takes for a planet to orbit the sun) is proportional to the cube of the mean distance between the planet and the sun.

Although Kepler simply stated these laws on the basis of observation, they were later validated by Isaac Newton (1642–1727). In fact, Newton was able to show that each law can be deduced from a set of universal laws of motion and gravitation that govern the movement of all heavenly bodies, including comets and satellites. This is illustrated in the next example, which involves the comet named after the English mathematician and physicist Edmund Halley (1656–1742).

If you use Earth as a reference with a period of 1 year and a distance of 1 astronomical unit (an astronomical unit is defined as the mean distance between Earth and the sun, or about 93 million miles), the proportionality constant in Kepler’s third law is 1. For example, because Mars has a mean distance to the sun of 1.524 astronomical units, its period $P$ is given by $d^3 = P^2$. So, the period of Mars is $P \approx 1.88$ years.

Example 4 Halley’s Comet

Halley’s comet has an elliptical orbit with an eccentricity of $e \approx 0.967$. The length of the major axis of the orbit is approximately 35.88 astronomical units. Find a polar equation for the orbit. How close does Halley’s comet come to the sun?

Solution

Using a vertical axis, as shown in Figure 10.83, choose an equation of the form $r = ep/(1 + e \sin \theta)$. Because the vertices of the ellipse occur when $\theta = \pi/2$ and $\theta = 3\pi/2$, you can determine the length of the major axis to be the sum of the $r$-values of the vertices. That is,

$$2a = \frac{0.967p}{1 + 0.967} + \frac{0.967p}{1 - 0.967} \approx 29.79p \approx 35.88.$$

So, $p \approx 1.204$ and $ep = (0.967)(1.204) \approx 1.164$. Using this value of $ep$ in the equation, you have

$$r = \frac{1.164}{1 + 0.967 \sin \theta}$$

where $r$ is measured in astronomical units. To find the closest point to the sun (the focus), substitute $\theta = \pi/2$ in this equation to obtain

$$r = \frac{1.164}{1 + 0.967 \sin(\pi/2)}$$

$$\approx 0.59 \text{ astronomical unit}$$

$$\approx 55,000,000 \text{ miles.}$$

CHECKPOINT Now try Exercise 63.
10.9 EXERCISES

VOCABULARY
In Exercises 1–3, fill in the blanks.

1. The locus of a point in the plane that moves so that its distance from a fixed point (focus) is in a constant ratio to its distance from a fixed line (directrix) is a ________.

2. The constant ratio is the ________ of the conic and is denoted by ________.

3. An equation of the form \( r = \frac{ep}{1 + e \cos \theta} \) has a ________ directrix to the ________ of the pole.

4. Match the conic with its eccentricity.
   (a) \( e < 1 \)  (b) \( e = 1 \)  (c) \( e > 1 \)
   (i) parabola  (ii) hyperbola  (iii) ellipse

SKILLS AND APPLICATIONS
In Exercises 5–8, write the polar equation of the conic for \( e = 1, e = 0.5, \) and \( e = 1.5 \). Identify the conic for each equation. Verify your answers with a graphing utility.

5. \( r = \frac{2e}{1 + e \cos \theta} \)

6. \( r = \frac{2e}{1 - e \cos \theta} \)

7. \( r = \frac{2e}{1 - e \sin \theta} \)

8. \( r = \frac{2e}{1 + e \sin \theta} \)

In Exercises 9–14, match the polar equation with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

9. \( r = \frac{4}{1 - \cos \theta} \)

10. \( r = \frac{3}{2 - \cos \theta} \)

11. \( r = \frac{3}{1 + 2 \sin \theta} \)

12. \( r = \frac{3}{2 + \cos \theta} \)

13. \( r = \frac{4}{1 + \sin \theta} \)

14. \( r = \frac{4}{1 - 3 \sin \theta} \)

In Exercises 15–28, identify the conic and sketch its graph.

15. \( r = \frac{3}{1 - \cos \theta} \)

16. \( r = \frac{7}{1 + \sin \theta} \)

17. \( r = \frac{5}{1 + \sin \theta} \)

18. \( r = \frac{6}{1 + \cos \theta} \)

19. \( r = \frac{2}{2 - \cos \theta} \)

20. \( r = \frac{4}{4 + \sin \theta} \)

21. \( r = \frac{6}{2 + \sin \theta} \)

22. \( r = \frac{9}{3 - 2 \cos \theta} \)

23. \( r = \frac{3}{2 + 4 \sin \theta} \)

24. \( r = \frac{5}{-1 + 2 \cos \theta} \)

25. \( r = \frac{3}{2 - 6 \cos \theta} \)

26. \( r = \frac{3}{2 + 6 \sin \theta} \)

27. \( r = \frac{4}{2 - \cos \theta} \)

28. \( r = \frac{2}{2 + 3 \sin \theta} \)

In Exercises 29–34, use a graphing utility to graph the polar equation. Identify the graph.

29. \( r = \frac{-1}{1 - \sin \theta} \)

30. \( r = \frac{-5}{2 + 4 \sin \theta} \)

31. \( r = \frac{3}{-4 + 2 \cos \theta} \)

32. \( r = \frac{4}{1 - 2 \cos \theta} \)

33. \( r = \frac{14}{14 + 17 \sin \theta} \)

34. \( r = \frac{12}{2 - \cos \theta} \)
In Exercises 35–38, use a graphing utility to graph the rotated conic.

35. \( r = \frac{3}{1 - \cos(\theta - \pi/4)} \) (See Exercise 15.)
36. \( r = \frac{4}{4 + \sin(\theta - \pi/3)} \) (See Exercise 20.)
37. \( r = \frac{6}{2 + \sin(\theta + \pi/6)} \) (See Exercise 21.)
38. \( r = \frac{5}{-1 + 2 \cos(\theta + 2\pi/3)} \) (See Exercise 24.)

In Exercises 39–54, find a polar equation of the conic with its focus at the pole.

**Conic** | **Eccentricity** | **Directrix**
--- | --- | ---
39. Parabola | \( e = 1 \) | \( x = -1 \)
40. Parabola | \( e = 1 \) | \( y = -4 \)
41. Ellipse | \( e = \frac{1}{2} \) | \( y = 1 \)
42. Ellipse | \( e = \frac{1}{4} \) | \( y = -2 \)
43. Hyperbola | \( e = 2 \) | \( x = 1 \)
44. Hyperbola | \( e = \frac{3}{2} \) | \( x = -1 \)

**Conic** | **Vertex or Vertices**
--- | ---
45. Parabola | \((1, -\pi/2)\)
46. Parabola | \((8, 0)\)
47. Parabola | \((5, \pi)\)
48. Parabola | \((10, \pi/2)\)
49. Ellipse | \((2, 0), (10, \pi)\)
50. Ellipse | \((2, \pi/2), (4, 3\pi/2)\)
51. Ellipse | \((20, 0), (4, \pi)\)
52. Hyperbola | \((2, 0), (8, 0)\)
53. Hyperbola | \((1, 3\pi/2); (9, 3\pi/2)\)
54. Hyperbola | \((4, \pi/2); (1, \pi/2)\)

55. **PLANETARY MOTION** The planets travel in elliptical orbits with the sun at one focus. Assume that the focus is at the pole, the major axis lies on the polar axis, and the length of the major axis is \(2a\) (see figure). Show that the polar equation of the orbit is \(r = a(1 - e^2)/(1 - e \cos \theta)\), where \(e\) is the eccentricity.

56. **PLANETARY MOTION** Use the result of Exercise 55 to show that the minimum distance (perihielion distance) from the sun to the planet is \(r = a(1 - e)\) and the maximum distance (aphelion distance) is \(r = a(1 + e)\).

**PLANETARY MOTION** In Exercises 57–62, use the results of Exercises 55 and 56 to find the polar equation of the planet’s orbit and the perihelion and aphelion distances.

57. Earth  \( a = 95.956 \times 10^6 \) miles, \( e = 0.0167 \)
58. Saturn  \( a = 1.427 \times 10^8 \) kilometers, \( e = 0.0542 \)
59. Venus  \( a = 108.209 \times 10^6 \) kilometers, \( e = 0.0068 \)
60. Mercury  \( a = 35.98 \times 10^6 \) miles, \( e = 0.2056 \)
61. Mars  \( a = 141.63 \times 10^6 \) miles, \( e = 0.0934 \)
62. Jupiter  \( a = 778.41 \times 10^6 \) kilometers, \( e = 0.0484 \)

63. **ASTRONOMY** The comet Encke has an elliptical orbit with an eccentricity of \(e \approx 0.847\). The length of the major axis of the orbit is approximately 4.42 astronomical units. Find a polar equation for the orbit. How close does the comet come to the sun?

64. **ASTRONOMY** The comet Hale-Bopp has an elliptical orbit with an eccentricity of \(e \approx 0.995\). The length of the major axis of the orbit is approximately 500 astronomical units. Find a polar equation for the orbit. How close does the comet come to the sun?

65. **SATELLITE TRACKING** A satellite in a 100-mile-high circular orbit around Earth has a velocity of approximately 17,500 miles per hour. If this velocity is multiplied by \(\sqrt{2}\), the satellite will have the minimum velocity necessary to escape Earth’s gravity and will follow a parabolic path with the center of Earth as the focus (see figure).

- (a) Find a polar equation of the parabolic path of the satellite (assume the radius of Earth is 4000 miles).
- (b) Use a graphing utility to graph the equation you found in part (a).
- (c) Find the distance between the surface of the Earth and the satellite when \(\theta = 30^\circ\).
- (d) Find the distance between the surface of Earth and the satellite when \(\theta = 60^\circ\).
66. **ROMAN COLISEUM** The Roman Coliseum is an elliptical amphitheater measuring approximately 188 meters long and 156 meters wide.

(a) Find an equation to model the coliseum that is of the form
\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.
\]

(b) Find a polar equation to model the coliseum. (Assume \( e = 0.5581 \) and \( p \approx 115.98 \).)

(c) Use a graphing utility to graph the equations you found in parts (a) and (b). Are the graphs the same? Why or why not?

(d) In part (c), did you prefer graphing the rectangular equation or the polar equation? Explain.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 67–70, determine whether the statement is true or false. Justify your answer.

67. For a given value of \( e > 1 \) over the interval \( \theta = 0 \) to \( \theta = 2\pi \), the graph of
\[
r = \frac{e\theta}{1 - e\cos \theta}
\]
is the same as the graph of
\[
r = \frac{e(-\theta)}{1 + e\cos \theta}
\]

68. The graph of
\[
r = \frac{4}{-3 - 3\sin \theta}
\]
has a horizontal directrix above the pole.

69. The conic represented by the following equation is an ellipse.
\[
r^2 = \frac{16}{9 - 4\cos(\theta + \frac{\pi}{4})}
\]

70. The conic represented by the following equation is a parabola.
\[
r = \frac{6}{3 - 2\cos \theta}
\]

71. **WRITING** Explain how the graph of each conic differs from the graph of \( r = \frac{5}{1 + \sin \theta} \) (See Exercise 17.)

(a) \( r = \frac{5}{1 - \cos \theta} \)  (b) \( r = \frac{5}{1 - \sin \theta} \)

72. **CAPSTONE** In your own words, define the term *eccentricity* and explain how it can be used to classify conics.

73. Show that the polar equation of the ellipse
\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \text{is} \quad r^2 = \frac{b^2}{1 - e^2\cos^2 \theta}
\]

74. Show that the polar equation of the hyperbola
\[
\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{is} \quad r^2 = \frac{b^2}{1 - e^2\cos^2 \theta}
\]

In Exercises 75–80, use the results of Exercises 73 and 74 to write the polar form of the equation of the conic.

75. \( \frac{x^2}{169} + \frac{y^2}{144} = 1 \)  76. \( \frac{x^2}{25} + \frac{y^2}{16} = 1 \)

77. \( \frac{x^2}{9} - \frac{y^2}{16} = 1 \)  78. \( \frac{x^2}{36} - \frac{y^2}{4} = 1 \)

79. Hyperbola One focus: \( (5, \frac{\pi}{2}) \)  Vertices: \( (4, \frac{\pi}{2}), (4, -\frac{\pi}{2}) \)

80. Ellipse One focus: \( (4, 0) \)  Vertices: \( (5, 0), (5, \pi) \)

81. Consider the polar equation
\[
r = \frac{4}{1 - 0.4\cos \theta}
\]

(a) Identify the conic without graphing the equation.

(b) Without graphing the following polar equations, describe how each differs from the given polar equation.
\[
r_1 = \frac{4}{1 + 0.4\cos \theta} \quad r_2 = \frac{4}{1 - 0.4\sin \theta}
\]

(c) Use a graphing utility to verify your results in part (b).

82. The equation
\[
r = \frac{ep}{1 \pm e\sin \theta}
\]
is the equation of an ellipse with \( e < 1 \). What happens to the lengths of both the major axis and the minor axis when the value of \( e \) remains fixed and the value of \( p \) changes? Use an example to explain your reasoning.

Section 10.6

Evaluate sets of parametric equations for given values of the parameter (p. 769).

If \( f \) and \( g \) are continuous functions of \( t \) on an interval \( I \), the set of ordered pairs \((f(t), g(t))\) is a plane curve \( C \). The equations \( x = f(t) \) and \( y = g(t) \) are parametric equations for \( C \), and \( t \) is the parameter.

Section 10.7

Sketch curves that are represented by sets of parametric equations (p. 770).

Sketching a curve represented by parametric equations requires plotting points in the \( xy \)-plane. Each set of coordinates \((x, y)\) is determined from a value chosen for \( t \).

Section 10.8

Rewrite sets of parametric equations as single rectangular equations by eliminating the parameter (p. 771).

To eliminate the parameter in a pair of parametric equations, solve for \( t \) in one equation and substitute that value of \( t \) into the other equation. The result is the corresponding rectangular equation.

Section 10.9

Find sets of parametric equations for graphs (p. 772).

When finding a set of parametric equations for a given graph, remember that the parametric equations are not unique.

</table>
| Convert points (p. 778) and equations (p. 780) from rectangular to polar form and vice versa. | **Polar Coordinates** \((r, \theta)\) and **Rectangular Coordinates** \((x, y)\) \n
- Polar-to-Rectangular: \( x = r \cos \theta, \ y = r \sin \theta \) \n
- Rectangular-to-Polar: \( \tan \theta = y/x, \ r^2 = x^2 + y^2 \) \n
To convert a rectangular equation to polar form, replace \( x \) by \( r \cos \theta \) and \( y \) by \( r \sin \theta \). Converting from a polar equation to rectangular form is more complex. | 69–88 |
| Use point plotting (p. 783) and symmetry (p. 784) to sketch graphs of polar equations. | Graphing a polar equation by point plotting is similar to graphing a rectangular equation. \n
A polar graph is symmetric with respect to the following if the given substitution yields an equivalent equation. \n
1. Line \( \theta = \pi/2 \): Replace \((r, \theta)\) by \((r, \pi - \theta)\) or \((-r, -\theta)\). \n
2. Polar axis: Replace \((r, \theta)\) by \((r, -\theta)\) or \((-r, \pi - \theta)\). \n
3. Pole: Replace \((r, \theta)\) by \((r, \pi + \theta)\) or \((-r, \theta)\). | 89–98 |
| Use zeros and maximum \( r \)-values to sketch graphs of polar equations (p. 785). | Two additional aids to graphing polar equations involve knowing the \( \theta \)-values for which \(|r|\) is maximum and knowing the \( \theta \)-values for which \( r = 0 \). | 89–98 |
| Recognize special polar graphs (p. 787). | Several types of graphs, such as limaçons, rose curves, circles, and lemniscates, have equations that are simpler in polar form than in rectangular form. (See page 787.) | 99–102 |
| Define conics in terms of eccentricity (p. 791). | The eccentricity of a conic is denoted by \( e \). \n
- **ellipse**: \( e < 1 \) \n
- **parabola**: \( e = 1 \) \n
- **hyperbola**: \( e > 1 \) \n
The graph of a polar equation of the form \((1) r = (ep)/(1 \pm e \cos \theta)\) or \((2) r = (ep)/(1 \pm e \sin \theta)\) is a conic, where \( e > 0 \) is the eccentricity and \(|p|\) is the distance between the focus (pole) and the directrix. | 103–110 |
| Write and graph equations of conics in polar form (p. 791). | Equations of conics in polar form can be used to model the orbit of Halley’s comet. (See Example 4.) | 111, 112 |
10 REVIEW EXERCISES

10.1 In Exercises 1–4, find the inclination \( \theta \) (in radians and degrees) of the line with the given characteristics.
1. Passes through the points \((-1, 2)\) and \((2, 5)\)
2. Passes through the points \((3, 4)\) and \((-2, 7)\)
3. Equation: \( y = 2x + 4 \)
4. Equation: \( x - 5y = 7 \)

In Exercises 5–8, find the angle \( \theta \) (in radians and degrees) between the lines.
5. \( 4x + y = 2 \)
6. \(-5x + 3y = 3 \)
\(-5x + y = -1 \)
\(-2x + 3y = 1 \)
7. \( 2x - 7y = 8 \)
8. \( 0.02x + 0.07y = 0.18 \)
\( 0.4x + y = 0 \)
\( 0.09x - 0.04y = 0.17 \)

In Exercises 9 and 10, find the distance between the point and the line.
9. \((5, 3)\) \( x - y - 10 = 0 \)
10. \((0, 4)\) \( x + 2y - 2 = 0 \)

10.2 In Exercises 11 and 12, state what type of conic is formed by the intersection of the plane and the double-napped cone.
11. 
12. 

In Exercises 13–16, find the standard form of the equation of the parabola with the given characteristics. Then graph the parabola.
13. Vertex: \((0, 0)\)
   Focus: \((4, 0)\)
14. Vertex: \((2, 0)\)
   Focus: \((0, 0)\)
15. Vertex: \((0, 2)\)
   Directrix: \(x = -3\)
16. Vertex: \((-3, -3)\)
   Directrix: \(y = 0\)

In Exercises 17 and 18, find an equation of the tangent line to the parabola at the given point, and find the x-intercept of the line.
17. \( y = 2x^2 \), \((-1, 2)\)
18. \( x^2 = -2y \), \((-4, -8)\)

19. ARCHITECTURE A parabolic archway is 12 meters high at the vertex. At a height of 10 meters, the width of the archway is 8 meters (see figure). How wide is the archway at ground level?

20. FLASHLIGHT The light bulb in a flashlight is at the focus of its parabolic reflector, 1.5 centimeters from the vertex of the reflector (see figure). Write an equation of a cross section of the flashlight’s reflector with its focus on the positive x-axis and its vertex at the origin.

21. In Exercises 21–24, find the standard form of the equation of the ellipse with the given characteristics. Then graph the ellipse.
   21. Vertices: \((-2, 0)\), \((8, 0)\); foci: \((0, 0)\), \((6, 0)\)
   22. Vertices: \((4, 3)\), \((4, 7)\); foci: \((4, 4)\), \((4, 6)\)
   23. Vertices: \((0, 1)\), \((4, 1)\); endpoints of the minor axis: \((2, 0)\), \((2, 2)\)
   24. Vertices: \((-4, -1)\), \((-4, 11)\); endpoints of the minor axis: \((-6, 5)\), \((-2, 5)\)

25. ARCHITECTURE A semielliptical archway is to be formed over the entrance to an estate. The arch is to be set on pillars that are 10 feet apart and is to have a height (atop the pillars) of 4 feet. Where should the foci be placed in order to sketch the arch?

26. WADING POOL You are building a wading pool that is in the shape of an ellipse. Your plans give an equation for the elliptical shape of the pool measured in feet as
\[
\frac{x^2}{324} + \frac{y^2}{196} = 1.
\]
Find the longest distance across the pool, the shortest distance, and the distance between the foci.

In Exercises 27–30, find the center, vertices, foci, and eccentricity of the ellipse.
27. \( \frac{(x + 1)^2}{25} + \frac{(y - 2)^2}{49} = 1 \)
28. \( \frac{(x - 5)^2}{1} + \frac{(y + 3)^2}{36} = 1 \)
29. \( 16x^2 + 9y^2 - 32x + 72y + 16 = 0 \)
30. \( 4x^2 + 25y^2 + 16x - 150y + 141 = 0 \)

10.4 In Exercises 31–34, find the standard form of the equation of the hyperbola with the given characteristics.

31. Vertices: (0, ±1); foci: (0, ±2)
32. Vertices: (3, 3), (−3, 3); foci: (4, 3), (−4, 3)
33. Foci: (0, 0), (8, 0); asymptotes: \( y = ±2(x − 4) \)
34. Foci: (3, ±2); asymptotes: \( y = ±2(x − 3) \)

In Exercises 35–38, find the center, vertices, foci, and the equation of the hyperbola with the given characteristics.

35. \( \frac{(x − 5)^2}{36} − \frac{(y + 3)^2}{16} = 1 \)
36. \( \frac{(y − 1)^2}{4} − x^2 = 1 \)
37. \( 9x^2 − 16y^2 − 18x − 32y − 151 = 0 \)
38. \( −4x^2 + 25y^2 − 8x + 150y + 121 = 0 \)

39. LORAN Radio transmitting station A is located 200 miles east of transmitting station B. A ship is in an area to the north and 40 miles west of station A. Synchronized radio pulses transmitted at 186,000 miles per second by the two stations are received 0.0005 second sooner from station A than from station B. How far north is the ship?

40. LOCATING AN EXPLOSION Two of your friends live 4 miles apart and on the same “east-west” street, and you live halfway between them. You are having a three-way phone conversation when you hear an explosion. Six seconds later, your friend to the east hears the explosion, and your friend to the west hears it 8 seconds after you do. Find equations of two hyperbolas that would locate the explosion. (Assume that the coordinate system is measured in feet and that sound travels at 1100 feet per second.)

In Exercises 41–44, classify the graph of the equation as a circle, a parabola, an ellipse, or a hyperbola.

41. \( 5x^2 − 2y^2 + 10x − 4y + 17 = 0 \)
42. \( −4x^2 + 5x + 3y + 7 = 0 \)
43. \( 3x^2 + 2y^2 − 12x + 12y + 29 = 0 \)
44. \( 4x^2 + 4y^2 − 4x + 8y − 11 = 0 \)

10.5 In Exercises 45–48, rotate the axes to eliminate the \( xy \)-term in the equation. Then write the equation in standard form. Sketch the graph of the resulting equation, showing both sets of axes.

45. \( xy + 3 = 0 \)
46. \( x^2 − 4xy + y^2 + 9 = 0 \)
47. \( 5x^2 − 2xy + 5y^2 − 12 = 0 \)

48. \( 4x^2 + 8xy + 4y^2 + 7\sqrt{2}x + 9\sqrt{2}y = 0 \)

In Exercises 49–52, (a) use the discriminant to classify the graph, (b) use the Quadratic Formula to solve for \( y \), and (c) use a graphing utility to graph the equation.

49. \( 16x^2 − 24xy + 9y^2 − 30x − 40y = 0 \)
50. \( 13x^2 − 8xy + 7y^2 − 45 = 0 \)
51. \( x^2 + y^2 + 2xy + 2\sqrt{2}x − 2\sqrt{2}y + 2 = 0 \)
52. \( x^2 − 10xy + y^2 + 1 = 0 \)

10.6 In Exercises 53 and 54, (a) create a table of \( x \)- and \( y \)-values for the parametric equations using \( t = −2, −1, 0, 1, \) and \( 2 \), and (b) plot the points \((x, y)\) generated in part (a) and sketch a graph of the parametric equations.

53. \( x = 3t − 2 \) and \( y = 7 − 4t \)
54. \( x = \frac{1}{4}t \) and \( y = \frac{6}{t + 3} \)

In Exercises 55–60, sketch the curve represented by the parametric equations (indicate the orientation of the curve) and (b) eliminate the parameter and write the corresponding rectangular equation whose graph represents the curve. Adjust the domain of the resulting rectangular equation, if necessary. (c) Verify your result with a graphing utility.

55. \( x = 2t \)
56. \( x = 1 + 4t \)
\( y = 4t \)
\( y = 2 − 3t \)
57. \( x = t^2 \)
58. \( x = t + 4 \)
\( y = \sqrt{t} \)
\( y = t^2 \)
59. \( x = 3 \cos \theta \)
60. \( x = 3 + 3 \cos \theta \)
\( y = 3 \sin \theta \)
\( y = 2 + 5 \sin \theta \)

61. Find a parametric representation of the line that passes through the points \((-4, 4)\) and \((9, -10)\).

62. Find a parametric representation of the circle with center \((5, 4)\) and radius 6.

63. Find a parametric representation of the ellipse with center \((-3, 4)\), major axis horizontal and eight units in length, and minor axis six units in length.

64. Find a parametric representation of the hyperbola with vertices \((0, ±4)\) and foci \((0, ±5)\).

10.7 In Exercises 65–68, plot the point given in polar coordinates and find two additional polar representations of the point, using \( −2 \pi < \theta < 2 \pi \).

65. \((2, \frac{\pi}{4})\)
66. \((-5, −\frac{\pi}{3})\)
67. \((-7, 4.19)\)
68. \((\sqrt{3}, 2.62)\)
In Exercises 69–72, a point in polar coordinates is given. Convert the point to rectangular coordinates.

69. \( \left( -1, \frac{\pi}{3} \right) \)  
70. \( \left( 2, \frac{5\pi}{4} \right) \)  
71. \( \left( 3, \frac{3\pi}{4} \right) \)  
72. \( \left( 0, \frac{\pi}{2} \right) \)

In Exercises 73–76, a point in rectangular coordinates is given. Convert the point to polar coordinates.

73. \( (0, 1) \)  
74. \( (-\sqrt{5}, \sqrt{5}) \)  
75. \( (4, 6) \)  
76. \( (3, -4) \)

In Exercises 77–82, convert the rectangular equation to polar form.

77. \( x^2 + y^2 = 81 \)  
78. \( x^2 + y^2 = 48 \)  
79. \( x^2 + y^2 - 6y = 0 \)  
80. \( x^2 + y^2 - 4x = 0 \)  
81. \( xy = 5 \)  
82. \( xy = -2 \)

In Exercises 83–88, convert the polar equation to rectangular form.

83. \( r = 5 \)  
84. \( r = 12 \)  
85. \( r = 3 \cos \theta \)  
86. \( r = 8 \sin \theta \)  
87. \( r^2 = \sin \theta \)  
88. \( r^2 = 4 \cos 2\theta \)

10.8 In Exercises 89–98, determine the symmetry of \( r \), the maximum value of \( |r| \), and any zeros of \( r \). Then sketch the graph of the polar equation (plot additional points if necessary).

89. \( r = 6 \)  
90. \( r = 11 \)  
91. \( r = 4 \sin 2\theta \)  
92. \( r = \cos 5\theta \)  
93. \( r = -2(1 + \cos \theta) \)  
94. \( r = 1 - 4 \cos \theta \)  
95. \( r = 2 + 6 \sin \theta \)  
96. \( r = 5 - 5 \cos \theta \)  
97. \( r = -3 \cos 2\theta \)  
98. \( r^2 = \cos 2\theta \)

In Exercises 99–102, identify the type of polar graph and use a graphing utility to graph the equation.

99. \( r = 3(2 - \cos \theta) \)  
100. \( r = 5(1 - 2 \cos \theta) \)  
101. \( r = 8 \cos 3\theta \)  
102. \( r^2 = 2 \sin 2\theta \)

10.9 In Exercises 103–106, identify the conic and sketch its graph.

103. \( r = \frac{1}{1 + 2 \sin \theta} \)  
104. \( r = \frac{6}{1 + \sin \theta} \)  
105. \( r = \frac{4}{5 - 3 \cos \theta} \)  
106. \( r = \frac{16}{4 + 5 \cos \theta} \)

In Exercises 107–110, find a polar equation of the conic with its focus at the pole.

107. Parabola  
108. Parabola  
109. Ellipse  
110. Hyperbola

11.11 EXPLORER 18 On November 27, 1963, the United States launched Explorer 18. Its low and high points above the surface of Earth were 119 miles and 122,800 miles, respectively. The center of Earth was at one focus of the orbit (see figure). Find the polar equation of the orbit and find the distance between the surface of Earth (assume Earth has a radius of 4000 miles) and the satellite when \( \theta = \pi/3 \).

11.12 ASTEROID An asteroid takes a parabolic path with Earth as its focus. It is about 6,000,000 miles from Earth at its closest approach. Write the polar equation of the path of the asteroid with its vertex at \( \theta = \pi/2 \). Find the distance between the asteroid and Earth when \( \theta = -\pi/3 \).

EXPLORATION

TRUE OR FALSE? In Exercises 113–115, determine whether the statement is true or false. Justify your answer.

113. The graph of \( \frac{1}{4}x^2 - y^4 = 1 \) is a hyperbola.
114. Only one set of parametric equations can represent the line \( y = 3 - 2x \).
115. There is a unique polar coordinate representation of each point in the plane.

116. Consider an ellipse with the major axis horizontal and 10 units in length. The number \( b \) in the standard form of the equation of the ellipse must be less than what real number? Explain the change in the shape of the ellipse as \( b \) approaches this number.

117. What is the relationship between the graphs of the rectangular and polar equations?
(a) \( x^2 + y^2 = 25 \), \( r = 5 \)
(b) \( x - y = 0 \), \( \theta = \frac{\pi}{4} \)
Chapter Test

Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Find the inclination of the line $2x - 5y + 5 = 0$.
2. Find the angle between the lines $3x + 2y - 4 = 0$ and $4x - y + 6 = 0$.
3. Find the distance between the point $(7, 5)$ and the line $y = 5 - x$.

In Exercises 4–7, classify the conic and write the equation in standard form. Identify the center, vertices, foci, and asymptotes (if applicable). Then sketch the graph of the conic.

4. $y^2 - 2x + 2 = 0$
5. $x^2 - 4y^2 - 4x = 0$
6. $9x^2 + 16y^2 + 54x - 32y - 47 = 0$
7. $2x^2 + 2y^2 - 8x - 4y + 9 = 0$

8. Find the standard form of the equation of the parabola with vertex $(2, -3)$, with a vertical axis, and passing through the point $(4, 0)$.
9. Find the standard form of the equation of the hyperbola with foci $(0, 0)$ and $(0, 4)$ and asymptotes $y = \pm \frac{1}{2} x + 2$.
10. (a) Determine the number of degrees the axis must be rotated to eliminate the $xy$-term of the conic $x^2 + 6xy + y^2 - 6 = 0$.

(b) Graph the conic from part (a) and use a graphing utility to confirm your result.
11. Sketch the curve represented by the parametric equations $x = 2 + 3 \cos \theta$ and $y = 2 \sin \theta$. Eliminate the parameter and write the corresponding rectangular equation.
12. Find a set of parametric equations of the line passing through the points $(2, -3)$ and $(6, 4)$. (There are many correct answers.)
13. Convert the polar coordinate $\left( -2, \frac{5\pi}{6} \right)$ to rectangular form.
14. Convert the rectangular coordinate $(2, -2)$ to polar form and find two additional polar representations of this point.
15. Convert the rectangular equation $x^2 + y^2 - 3x = 0$ to polar form.

In Exercises 16–19, sketch the graph of the polar equation. Identify the type of graph.

16. $r = \frac{4}{1 + \cos \theta}$
17. $r = \frac{4}{2 + \sin \theta}$
18. $r = 2 + 3 \sin \theta$
19. $r = 2 \sin 4\theta$

20. Find a polar equation of the ellipse with focus at the pole, eccentricity $e = \frac{1}{4}$, and directrix $y = 4$.
21. A straight road rises with an inclination of 0.15 radian from the horizontal. Find the slope of the road and the change in elevation over a one-mile stretch of the road.
22. A baseball is hit at a point 3 feet above the ground toward the left field fence. The fence is 10 feet high and 375 feet from home plate. The path of the baseball can be modeled by the parametric equations $x = (115 \cos \theta)t$ and $y = 3 + (115 \sin \theta)t - 16t^2$. Will the baseball go over the fence if it is hit at an angle of $\theta = 30^\circ$? Will the baseball go over the fence if $\theta = 35^\circ$?
PROOFS IN MATHEMATICS

Inclination and Slope  (p. 726)
If a nonvertical line has inclination $\theta$ and slope $m$, then $m = \tan \theta$.

**Proof**

If $m = 0$, the line is horizontal and $\theta = 0$. So, the result is true for horizontal lines because $m = 0 = \tan 0$.

If the line has a positive slope, it will intersect the $x$-axis. Label this point $(x_1, 0)$, as shown in the figure. If $(x_2, y_2)$ is a second point on the line, the slope is

$$m = \frac{y_2 - 0}{x_2 - x_1} = \frac{y_2}{x_2 - x_1} = \tan \theta.$$ 

The case in which the line has a negative slope can be proved in a similar manner.

**Distance Between a Point and a Line**  (p. 728)
The distance between the point $(x_1, y_1)$ and the line $Ax + By + C = 0$ is

$$d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}.$$ 

**Proof**

For simplicity, assume that the given line is neither horizontal nor vertical (see figure). By writing the equation $Ax + By + C = 0$ in slope-intercept form

$$y = -\frac{A}{B}x - \frac{C}{B},$$

you can see that the line has a slope of $m = -A/B$. So, the slope of the line passing through $(x_1, y_1)$ and perpendicular to the given line is $B/A$, and its equation is

$$y - y_1 = \frac{B}{A}(x - x_1).$$

These two lines intersect at the point $(x_2, y_2)$, where

$$x_2 = \frac{B(x_1 - y_1) - AC}{A^2 + B^2} \quad \text{and} \quad y_2 = \frac{A(-Bx_1 + Ay_1) - BC}{A^2 + B^2}.$$ 

Finally, the distance between $(x_1, y_1)$ and $(x_2, y_2)$ is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$= \sqrt{\left(\frac{B^2x_1 - ABx_1 - AC}{A^2 + B^2} - x_1\right)^2 + \left(-\frac{ABx_1 + A^2y_1 - BC}{A^2 + B^2} - y_1\right)^2}$$

$$= \sqrt{\frac{A^2(Ax_1 + By_1 + C)^2 - B^2(Ax_1 + By_1 + C)^2}{(A^2 + B^2)^2}}$$

$$= \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}.$$
Parabolic Paths
There are many natural occurrences of parabolas in real life. For instance, the famous astronomer Galileo discovered in the 17th century that an object that is projected upward and obliquely to the pull of gravity travels in a parabolic path. Examples of this are the center of gravity of a jumping dolphin and the path of water molecules in a drinking fountain.

![Parabola with vertical axis](image)

**Standard Equation of a Parabola (p. 734)**
The standard form of the equation of a parabola with vertex at \((h, k)\) is as follows.

\[
(x - h)^2 = 4p(y - k), \quad p \neq 0 \quad \text{Vertical axis, directrix: } y = k - p
\]

\[
(y - k)^2 = 4p(x - h), \quad p \neq 0 \quad \text{Horizontal axis, directrix: } x = h - p
\]

The focus lies on the axis \(p\) units (directed distance) from the vertex. If the vertex is at the origin \((0, 0)\), the equation takes one of the following forms.

\[
x^2 = 4py
\]

\[
y^2 = 4px
\]

**Proof**
For the case in which the directrix is parallel to the \(x\)-axis and the focus lies above the vertex, as shown in the top figure, if \((x, y)\) is any point on the parabola, then, by definition, it is equidistant from the focus \((h, k + p)\) and the directrix \(y = k - p\). So, you have

\[
\sqrt{(x - h)^2 + [y - (k + p)]^2} = y - (k - p)
\]

\[
(x - h)^2 + [y - (k + p)]^2 = [y - (k - p)]^2
\]

\[
(x - h)^2 + y^2 - 2y(k + p) + (k + p)^2 = y^2 - 2y(k - p) + (k - p)^2
\]

\[
(x - h)^2 + y^2 - 2ky - 2py + k^2 + 2pk + p^2 = y^2 - 2ky + 2py + k^2 - 2pk + p^2
\]

\[
(x - h)^2 - 2py + 2pk = 2py - 2pk
\]

\[
(x - h)^2 = 4p(y - k).
\]

For the case in which the directrix is parallel to the \(y\)-axis and the focus lies to the right of the vertex, as shown in the bottom figure, if \((x, y)\) is any point on the parabola, then, by definition, it is equidistant from the focus \((h + p, k)\) and the directrix \(x = h - p\). So, you have

\[
\sqrt{(x - (h + p))^2 + (y - k)^2} = x - (h - p)
\]

\[
[x - (h + p)]^2 + (y - k)^2 = [x - (h - p)]^2
\]

\[
x^2 - 2x(h + p) + (h + p)^2 + (y - k)^2 = x^2 - 2x(h - p) + (h - p)^2
\]

\[
x^2 - 2hx - 2px + h^2 + 2ph + p^2 + (y - k)^2 = x^2 - 2hx + 2px + h^2 - 2ph + p^2
\]

\[
-2px + 2ph + (y - k)^2 = 2px - 2ph
\]

\[
(y - k)^2 = 4p(x - h).
\]

Note that if a parabola is centered at the origin, then the two equations above would simplify to \(x^2 = 4py\) and \(y^2 = 4px\), respectively.
A proof for with is shown here. The proofs of the other cases are similar. In the figure, consider a vertical directrix, units to the right of the focus if is a point on the graph of the distance between and the directrix is Moreover, because the distance between and the pole is simply the ratio of to , is a conic, where is the eccentricity and |p| is the distance between the focus (pole) and the directrix.

### Proof

A proof for with is shown here. The proofs of the other cases are similar. In the figure, consider a vertical directrix, units to the right of the focus if is a point on the graph of

\[
r = \frac{ep}{1 + e \cos \theta}
\]

the distance between and the directrix is

\[
PQ = |p - x| = |p - r \cos \theta| = \left| p - \left( \frac{ep}{1 + e \cos \theta} \right) \cos \theta \right|
\]

\[
= \left| p \left( 1 - \frac{e \cos \theta}{1 + e \cos \theta} \right) \right|
\]

\[
= \left| \frac{p}{1 + e \cos \theta} \right|
\]

Moreover, because the distance between and the pole is simply \(PF = |r|\), the ratio of \(PF\) to \(PQ\) is

\[
\frac{PF}{PQ} = \frac{|r|}{|r/e|} = |e| = e
\]

and, by definition, the graph of the equation must be a conic.
1. Several mountain climbers are located in a mountain pass between two peaks. The angles of elevation to the two peaks are 0.84 radian and 1.10 radians. A range finder shows that the distances to the peaks are 3250 feet and 6700 feet, respectively (see figure).

(a) Find the angle between the two lines of sight to the peaks.
(b) Approximate the amount of vertical climb that is necessary to reach the summit of each peak.

2. Statuary Hall is an elliptical room in the United States Capitol in Washington D.C. The room is also called the Whispering Gallery because a person standing at one focus of the room can hear even a whisper spoken by a person standing at the other focus. This occurs because any sound that is emitted from one focus of an ellipse will reflect off the side of the ellipse to the other focus. Statuary Hall is 46 feet wide and 97 feet long.

(a) Find an equation that models the shape of the room.
(b) How far apart are the two foci?
(c) What is the area of the floor of the room? (The area of an ellipse is \( A = \pi ab \).)

3. Find the equation(s) of all parabolas that have the x-axis as the axis of symmetry and focus at the origin.

4. Find the area of the square inscribed in the ellipse below.

5. The involute of a circle is described by the endpoint \( P \) of a string that is held taut as it is unwound from a spool (see figure). The spool does not rotate. Show that

\[
x = r(\cos \theta + \theta \sin \theta) \quad y = r(\sin \theta - \theta \cos \theta)
\]

is a parametric representation of the involute of a circle.

6. A tour boat travels between two islands that are 12 miles apart (see figure). For a trip between the islands, there is enough fuel for a 20-mile trip.

(a) Explain why the region in which the boat can travel is bounded by an ellipse.
(b) Let \((0, 0)\) represent the center of the ellipse. Find the coordinates of each island.
(c) The boat travels from one island, straight past the other island to the vertex of the ellipse, and back to the second island. How many miles does the boat travel? Use your answer to find the coordinates of the vertex.
(d) Use the results from parts (b) and (c) to write an equation of the ellipse that bounds the region in which the boat can travel.

7. Find an equation of the hyperbola such that for any point on the hyperbola, the difference between its distances from the points \( A \) and \( C \) is 6.

8. Prove that the graph of the equation

\[ Ax^2 + Cy^2 + Dx + Ey + F = 0 \]

is one of the following (except in degenerate cases).

**Conic Condition**

(a) Circle \( A = C \)
(b) Parabola \( A = 0 \) or \( C = 0 \) (but not both)
(c) Ellipse \( AC > 0 \)
(d) Hyperbola \( AC < 0 \)

9. The following sets of parametric equations model projectile motion.

\[
\begin{align*}
x &= (v_0 \cos \theta) t \\
y &= (v_0 \sin \theta) t - \frac{1}{2} g t^2
\end{align*}
\]

(a) Under what circumstances would you use each model?
(b) Eliminate the parameter for each set of equations.
(c) In which case is the path of the moving object not affected by a change in the velocity \( v_0 \)? Explain.
10. As \( t \) increases, the ellipse given by the parametric equations \( x = \cos t \) and \( y = 2 \sin t \) is traced out counterclockwise. Find a parametric representation for which the same ellipse is traced out clockwise.

11. A hypocycloid has the parametric equations

\[
x = (a - b) \cos t + b \cos \left( \frac{a - b}{b} t \right)
\]

and

\[
y = (a - b) \sin t - b \sin \left( \frac{a - b}{b} t \right).
\]

Use a graphing utility to graph the hypocycloid for each value of \( a \) and \( b \). Describe each graph.

(a) \( a = 2, b = 1 \)
(b) \( a = 3, b = 1 \)
(c) \( a = 4, b = 1 \)
(d) \( a = 10, b = 1 \)
(e) \( a = 3, b = 2 \)
(f) \( a = 4, b = 3 \)

12. The curve given by the parametric equations

\[
x = \frac{1 - t^2}{1 + t^2} \quad \text{and} \quad y = \frac{t(1 - t^2)}{1 + t^2}
\]

is called a strophoid.

(a) Find a rectangular equation of the strophoid.
(b) Find a polar equation of the strophoid.
(c) Use a graphing utility to graph the strophoid.

13. The rose curves described in this chapter are of the form

\[
r = a \cos n \theta \quad \text{or} \quad r = a \sin n \theta
\]

where \( n \) is a positive integer that is greater than or equal to 2. Use a graphing utility to graph \( r = a \cos n \theta \) and \( r = a \sin n \theta \) for some noninteger values of \( n \). Describe the graphs.

14. What conic section is represented by the polar equation

\[
r = a \sin \theta + b \cos \theta
\]

15. The graph of the polar equation

\[
r = e^{\cos \theta} - 2 \cos 4\theta + \sin^5 \left( \frac{\theta}{12} \right)
\]

is called the butterfly curve, as shown in the figure.

16. Use a graphing utility to graph the polar equation

\[
r = \cos 5\theta + n \cos \theta
\]

for \( 0 \leq \theta \leq \pi \) for the integers \( n = -5 \) to \( n = 5 \). As you graph these equations, you should see the graph change shape from a heart to a bell. Write a short paragraph explaining what values of \( n \) produce the heart portion of the curve and what values of \( n \) produce the bell portion.

17. The planets travel in elliptical orbits with the sun at one focus. The polar equation of the orbit of a planet with one focus at the pole and major axis of length \( 2a \) (see figure) is

\[
r = \frac{(1 - e^2)a}{1 - e \cos \theta}
\]

where \( e \) is the eccentricity. The minimum distance (perihelion) from the sun to a planet is \( r = a(1 - e) \) and the maximum distance (aphelion) is \( r = a(1 + e) \). For the planet Neptune, \( a = 4.495 \times 10^9 \) kilometers and \( e = 0.0086 \). For the dwarf planet Pluto, \( a = 5.906 \times 10^9 \) kilometers and \( e = 0.2488 \).

(a) Find the polar equation of the orbit of each planet.
(b) Find the perihelion and aphelion distances for each planet.
(c) Use a graphing utility to graph the equations of the orbits of Neptune and Pluto in the same viewing window.
(d) Is Pluto ever closer to the sun than Neptune? Until recently, Pluto was considered the ninth planet. Why was Pluto called the ninth planet and Neptune the eighth planet?
(e) Do the orbits of Neptune and Pluto intersect? Will Neptune and Pluto ever collide? Why or why not?
Analytic Geometry in Three Dimensions

11.1 The Three-Dimensional Coordinate System
11.2 Vectors in Space
11.3 The Cross Product of Two Vectors
11.4 Lines and Planes in Space

In Mathematics
A three-dimensional coordinate system is formed by passing a z-axis perpendicular to both the x- and y-axes at the origin. When the concept of vectors is extended to three-dimensional space, they are denoted by ordered triples $\mathbf{v} = (v_1, v_2, v_3)$.

In Real Life
The concepts discussed in this chapter have many applications in physics and engineering. For instance, vectors can be used to find the angle between two adjacent sides of a grain elevator chute. (See Exercise 62, page 839.)

IN CAREERS
There are many careers that use topics in analytic geometry in three dimensions. Several are listed below.

- Architect
  Exercise 77, page 816
- Geographer
  Exercise 78, page 816
- Cyclist
  Exercises 61 and 62, page 830
- Consumer Research Analyst
  Exercise 61, page 839
The Three-Dimensional Coordinate System

Recall that the Cartesian plane is determined by two perpendicular number lines called the \( x \)-axis and the \( y \)-axis. These axes, together with their point of intersection (the origin), allow you to develop a two-dimensional coordinate system for identifying points in a plane. To identify a point in space, you must introduce a third dimension to the model. The geometry of this three-dimensional model is called solid analytic geometry.

You can construct a three-dimensional coordinate system by passing a \( z \)-axis perpendicular to both the \( x \)- and \( y \)-axes at the origin. Figure 11.1 shows the positive portion of each coordinate axis. Taken as pairs, the axes determine three coordinate planes: the \( xy \)-plane, the \( xz \)-plane, and the \( yz \)-plane. These three coordinate planes separate the three-dimensional coordinate system into eight octants. The first octant is the one in which all three coordinates are positive. In this three-dimensional system, a point \( P \) in space is determined by an ordered triple \((x, y, z)\), where \( x \), \( y \), and \( z \) are as follows.

\[
\begin{align*}
x &= \text{directed distance from } yz\text{-plane to } P \\
y &= \text{directed distance from } xz\text{-plane to } P \\
z &= \text{directed distance from } xy\text{-plane to } P
\end{align*}
\]

A three-dimensional coordinate system can have either a left-handed or a right-handed orientation. In this text, you will work exclusively with right-handed systems, as illustrated in Figure 11.2. In a right-handed system, Octants II, III, and IV are found by rotating counterclockwise around the positive \( z \)-axis. Octant V is vertically below Octant I. Octants VI, VII, and VIII are then found by rotating counterclockwise around the negative \( z \)-axis. See Figure 11.3.
Section 11.1 The Three-Dimensional Coordinate System

Plotting Points in Space

Plot each point in space.

\[ a. \quad (2, -3, 3) \quad b. \quad (-2, 6, 2) \quad c. \quad (1, 4, 0) \quad d. \quad (2, 2, -3) \]

Solution

To plot the point notice that \( x = 2, y = -3, \) and \( z = 3. \) To help visualize the point, locate the point in the \( xy \)-plane (denoted by a cross in Figure 11.4). The point \((2, -3, 3)\) lies three units above the cross. The other three points are also shown in Figure 11.4.

Now try Exercise 13.

The Distance and Midpoint Formulas

Many of the formulas established for the two-dimensional coordinate system can be extended to three dimensions. For example, to find the distance between two points in space, you can use the Pythagorean Theorem twice, as shown in Figure 11.5. Note that

\[
(\text{a}) \quad a = x_2 - x_1, \quad b = y_2 - y_1, \quad \text{and} \quad c = z_2 - z_1.
\]

Distance Formula in Space

The distance between the points \((x_1, y_1, z_1)\) and \((x_2, y_2, z_2)\) given by the Distance Formula in Space is

\[
d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}.
\]

Example 2 Finding the Distance Between Two Points in Space

Find the distance between \((1, 0, 2)\) and \((2, 4, -3)\).

Solution

\[
d = \sqrt{(2 - 1)^2 + (4 - 0)^2 + (-3 - 2)^2} \quad \text{Distance Formula in Space}
\]

\[
= \sqrt{1 + 16 + 25} \quad \text{Substitute.}
\]

\[
= \sqrt{42} \quad \text{Simplify.}
\]

Now try Exercise 27.

Notice the similarity between the Distance Formulas in the plane and in space. The Midpoint Formulas in the plane and in space are also similar.

Midpoint Formula in Space

The midpoint of the line segment joining the points \((x_1, y_1, z_1)\) and \((x_2, y_2, z_2)\) given by the Midpoint Formula in Space is

\[
\left( \frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2} \right).
\]
Example 3  Using the Midpoint Formula in Space

Find the midpoint of the line segment joining \((5, -2, 3)\) and \((0, 4, 4)\).

Solution

Using the Midpoint Formula in Space, the midpoint is

\[
\left( \frac{5 + 0}{2}, \frac{-2 + 4}{2}, \frac{3 + 4}{2} \right) = \left( \frac{5}{2}, 1, \frac{7}{2} \right)
\]

as shown in Figure 11.6.

The Equation of a Sphere

A sphere with center \((h, k, j)\) and radius \(r\) is defined as the set of all points \((x, y, z)\) such that the distance between \((x, y, z)\) and \((h, k, j)\) is \(r\), as shown in Figure 11.7. Using the Distance Formula, this condition can be written as

\[
\sqrt{(x - h)^2 + (y - k)^2 + (z - j)^2} = r.
\]

By squaring each side of this equation, you obtain the standard equation of a sphere.

Standard Equation of a Sphere

The standard equation of a sphere with center \((h, k, j)\) and radius \(r\) is given by

\[
(x - h)^2 + (y - k)^2 + (z - j)^2 = r^2.
\]

Notice the similarity of this formula to the equation of a circle in the plane.

\[
(x - h)^2 + (y - k)^2 + (z - j)^2 = r^2 \quad \text{Equation of sphere in space}
\]

\[
(x - h)^2 + (y - k)^2 = r^2 \quad \text{Equation of circle in the plane}
\]

As is true with the equation of a circle, the equation of a sphere is simplified when the center lies at the origin. In this case, the equation is

\[
x^2 + y^2 + z^2 = r^2. \quad \text{Sphere with center at origin}
\]
Section 11.1  The Three-Dimensional Coordinate System 813

[Example 4] Finding the Equation of a Sphere

Find the standard equation of the sphere with center (2, 4, 3) and radius 3. Does this sphere intersect the xy-plane?

Solution

\[(x - h)^2 + (y - k)^2 + (z - j)^2 = r^2\] Standard equation
\[(x - 2)^2 + (y - 4)^2 + (z - 3)^2 = 3^2\] Substitute.

From the graph shown in Figure 11.8, you can see that the center of the sphere lies three units above the xy-plane. Because the sphere has a radius of 3, you can conclude that it does intersect the xy-plane—at the point (2, 4, 0).

[Example 5] Finding the Center and Radius of a Sphere

Find the center and radius of the sphere given by

\[x^2 + y^2 + z^2 - 2x + 4y - 6z + 8 = 0.\]

Solution

To obtain the standard equation of this sphere, complete the square as follows.

\[
\begin{align*}
&x^2 - 2x + \underline{1} + y^2 + 4y + \underline{4} + z^2 - 6z + \underline{9} = 8 \\
&(x - 1)^2 + (y + 2)^2 + (z - 3)^2 = \sqrt{6}^2
\end{align*}
\]

So, the center of the sphere is (1, -2, 3), and its radius is \(\sqrt{6}\). See Figure 11.9.

[CHECK Point] Now try Exercise 63.

Note in Example 5 that the points satisfying the equation of the sphere are “surface points,” not “interior points.” In general, the collection of points satisfying an equation involving \(x, y,\) and \(z\) is called a surface in space.
Finding the intersection of a surface with one of the three coordinate planes (or with a plane parallel to one of the three coordinate planes) helps one visualize the surface. Such an intersection is called a trace of the surface. For example, the xy-trace of a surface consists of all points that are common to both the surface and the xy-plane. Similarly, the xz-trace of a surface consists of all points that are common to both the surface and the xz-plane.

**Example 6** Finding a Trace of a Surface

Sketch the xy-trace of the sphere given by \((x - 3)^2 + (y - 2)^2 + (z + 4)^2 = 5^2\).

**Solution**

To find the xy-trace of this surface, use the fact that every point in the xy-plane has a z-coordinate of zero. By substituting \(z = 0\) into the original equation, the resulting equation will represent the intersection of the surface with the xy-plane.

\[
(x - 3)^2 + (y - 2)^2 + (0 + 4)^2 = 5^2
\]

Write original equation.

\[
(x - 3)^2 + (y - 2)^2 + 16 = 25
\]

Substitute 0 for \(z\).

\[
(x - 3)^2 + (y - 2)^2 = 9
\]

Simplify.

\[
(x - 3)^2 + (y - 2)^2 = 3^2
\]

Subtract 16 from each side.

You can see that the xy-trace is a circle of radius 3, as shown in Figure 11.10.

**CHECKPOINT** Now try Exercise 71.

---

**TECHNOLOGY**

Most three-dimensional graphing utilities and computer algebra systems represent surfaces by sketching several traces of the surface. The traces are usually taken in equally spaced parallel planes. To graph an equation involving \(x\), \(y\), and \(z\) with a three-dimensional “function grapher,” you must first set the graphing mode to three-dimensional and solve the equation for \(z\). After entering the equation, you need to specify a rectangular viewing cube (the three-dimensional analog of a viewing window). For instance, to graph the top half of the sphere from Example 6, solve the equation for \(z\) to obtain the solutions \(z = -4 \pm \sqrt{25 - (x - 3)^2 - (y - 2)^2}\). The equation \(z = -4 + \sqrt{25 - (x - 3)^2 - (y - 2)^2}\) represents the top half of the sphere. Enter this equation, as shown in Figure 11.11. Next, use the viewing cube shown in Figure 11.12. Finally, you can display the graph, as shown in Figure 11.13.
11.1  EXERCISES

VOCABULARY: Fill in the blanks.

1. A _______ coordinate system can be formed by passing a z-axis perpendicular to both the x-axis and the y-axis at the origin.
2. The three coordinate planes of a three-dimensional coordinate system are the _______ , the _______ , and the _______.
3. The coordinate planes of a three-dimensional coordinate system separate the coordinate system into eight _______.
4. The distance between the points \((x_1, y_1, z_1)\) and \((x_2, y_2, z_2)\) can be found using the _______ _______ in Space.
5. The midpoint of the line segment joining the points \((x_1, y_1, z_1)\) and \((x_2, y_2, z_2)\) given by the Midpoint Formula in Space is _______.
6. A _______ in _______ is the collection of points satisfying an equation involving \(x\), \(y\), and \(z\).
7. A _______ in _______ is the collection of points satisfying an equation involving \(x\), \(y\), and \(z\).
8. The intersection of a surface with one of the three coordinate planes is called a _______ of the surface.

SKILLS AND APPLICATIONS

In Exercises 9 and 10, approximate the coordinates of the points.

9. [Diagram 1]
10. [Diagram 2]

In Exercises 11–16, plot each point in the same three-dimensional coordinate system.

11. (a) \((2, 1, 3)\)  
   (b) \((-1, -1, 2)\)
12. (a) \((3, 0, 0)\)  
   (b) \((-3, -2, -1)\)
13. (a) \((3, -1, 0)\)  
   (b) \((-4, 2, 2)\)
14. (a) \((0, 4, -3)\)  
   (b) \((4, 0, 4)\)
15. (a) \((3, -2, 5)\)  
   (b) \((\frac{1}{2}, 4, -2)\)
16. (a) \((5, -2, 2)\)  
   (b) \((5, -2, -2)\)

In Exercises 17–20, find the coordinates of the point.

17. The point is located three units behind the yz-plane, four units to the right of the xz-plane, and five units above the xy-plane.
18. The point is located seven units in front of the yz-plane, two units to the left of the xz-plane, and one unit below the xy-plane.
19. The point is located on the x-axis, eight units in front of the yz-plane.
20. The point is located in the yz-plane, one unit to the right of the xz-plane, and six units above the xy-plane.

In Exercises 21–26, determine the octant(s) in which \((x, y, z)\) is located so that the condition(s) is (are) satisfied.

21. \(x > 0, y < 0, z > 0\)  
   \(y < 0, z < 0\)
22. \(x < 0, y > 0, z < 0\)
23. \(z > 0\)
24. \(y < 0\)
25. \(xy < 0\)
26. \(yz > 0\)

In Exercises 27–36, find the distance between the points.

27. \((0, 0, 0), (5, 2, 6)\)
28. \((1, 0, 0), (7, 0, 4)\)
29. \((3, 2, 5), (7, 4, 8)\)
30. \((4, 1, 5), (8, 2, 6)\)
31. \((-1, 4, -2), (6, 0, -9)\)
32. \((1, 1, -7), (-2, -3, -7)\)
33. \((0, -3, 0), (1, 0, -10)\)
34. \((2, -4, 0), (0, 6, -3)\)
35. \((6, -9, 1), (-2, -1, 5)\)
36. \((4, 0, -6), (8, 8, 20)\)

In Exercises 37–40, find the lengths of the sides of the right triangle with the indicated vertices. Show that these lengths satisfy the Pythagorean Theorem.

37. \((0, 0, 2), (-2, 5, 2), (0, 4, 0)\)
38. \((2, -1, 2), (-4, 4, 1), (-2, 5, 0)\)
39. \((0, 0, 0), (2, 2, 1), (2, -4, 4)\)
40. \((1, 0, 1), (1, 3, 1), (1, 0, 3)\)

In Exercises 41–44, find the lengths of the sides of the triangle with the indicated vertices, and determine whether the triangle is a right triangle, an isosceles triangle, or neither.

41. \((-1, 3, -2), (5, -1, 2), (-1, 1, 2)\)
42. \((5, 3, 4), (7, 1, 3), (3, 5, 3)\)
43. \((4, -1, -2), (8, 1, 2), (2, 3, 2)\)
44. \((-1, 2, -1), (3, 0, 0), (3, -6, 3)\)
In Exercises 45–52, find the midpoint of the line segment joining the points.
45. (0, 0, 0), (3, −2, 4)
46. (1, 5, −1), (2, 2, 2)
47. (3, −6, 10), (−3, 4, 4)
48. (−1, 5, −3), (3, 7, −1)
49. (−5, −2, 5), (6, 3, −7)
50. (0, −2, 5), (4, 2, 7)
51. (−2, 8, 10), (7, −4, 2)
52. (9, −5, 1), (9, −2, −4)

In Exercises 53–60, find the standard form of the equation of the sphere with the given characteristics.
53. Center: (3, 2, 4); radius: 4
54. Center: (−3, 4, 3); radius: 2
55. Center: (5, 0, −2); radius: 6
56. Center: (4, −1, 1); radius: 5
57. Center: (−3, 7, 5); diameter: 10
58. Center: (0, 5, −9); diameter: 8
59. Endpoints of a diameter: (3, 0, 0), (0, 0, 6)
60. Endpoints of a diameter: (1, 0, 0), (0, 5, 0)

In Exercises 61–70, find the center and radius of the sphere.
61. \(x^2 + y^2 + z^2 - 6x = 0\)
62. \(x^2 + y^2 + z^2 - 9x = 0\)
63. \(x^2 + y^2 + z^2 - 4x + 2y - 6z + 10 = 0\)
64. \(x^2 + y^2 + z^2 - 6x + 4y + 9 = 0\)
65. \(x^2 + y^2 + z^2 + 4x - 8z + 19 = 0\)
66. \(x^2 + y^2 + z^2 - 8y - 6z + 13 = 0\)
67. \(9x^2 + 9y^2 + 9z^2 - 18x - 6y - 72z + 73 = 0\)
68. \(2x^2 + 2y^2 + 2z^2 - 2x - 6y - 4z + 5 = 0\)
69. \(9x^2 + 9y^2 + 9z^2 - 6x + 18y + 1 = 0\)
70. \(4x^2 + 4y^2 + 4z^2 - 4x - 32y + 8z + 33 = 0\)

In Exercises 71–74, sketch the graph of the equation and sketch the specified trace.
71. \((x - 1)^2 + y^2 + z^2 = 36\); \(xz\)-trace
72. \(x^2 + (y + 3)^2 + z^2 = 25\); \(yz\)-trace
73. \((x + 2)^2 + (y - 3)^2 + z^2 = 9\); \(yz\)-trace
74. \(x^2 + (y - 1)^2 + (z + 1)^2 = 4\); \(xy\)-trace

In Exercises 75 and 76, use a three-dimensional graphing utility to graph the sphere.
75. \(x^2 + y^2 + z^2 - 6x - 8y - 10z + 46 = 0\)
76. \(x^2 + y^2 + z^2 + 6y - 8z + 21 = 0\)

77. ARCHITECTURE A spherical building has a diameter of 205 feet. The center of the building is placed at the origin of a three-dimensional coordinate system. What is the equation of the sphere?
78. GEOGRAPHY Assume that Earth is a sphere with a radius of 4000 miles. The center of Earth is placed at the origin of a three-dimensional coordinate system.
   (a) What is the equation of the sphere?
   (b) Lines of longitude that run north-south could be represented by what trace(s)? What shape would each of these traces form?
   (c) Lines of latitude that run east-west could be represented by what trace(s)? What shape would each of these traces form?

EXPLORATION

TRUE OR FALSE? In Exercises 79 and 80, determine whether the statement is true or false. Justify your answer.
79. In the ordered triple \((x, y, z)\) that represents point \(P\) in space, \(x\) is the directed distance from the \(xy\)-plane to \(P\).
80. The surface consisting of all points \((x, y, z)\) in space that are the same distance \(r\) from the point \((h, j, k)\) has a circle as its \(xy\)-trace.

81. THINK ABOUT IT What is the \(z\)-coordinate of any point in the \(xy\)-plane? What is the \(y\)-coordinate of any point in the \(xz\)-plane? What is the \(x\)-coordinate of any point in the \(yz\)-plane?

82. CAPSTONE Find the equation of the sphere that has the points \((3, −2, 6)\) and \((-1, 4, 2)\) as endpoints of a diameter. Explain how this problem gives you a chance to use these formulas: the Distance Formula in Space, the Midpoint Formula in Space, and the standard equation of a sphere.

83. A sphere intersects the \(yz\)-plane. Describe the trace.
84. A plane intersects the \(xy\)-plane. Describe the trace.
85. A line segment has \((x_1, y_1, z_1)\) as one endpoint and \((x_m, y_m, z_m)\) as its midpoint. Find the other endpoint \((x_2, y_2, z_2)\) of the line segment in terms of \(x_1, y_1, z_1, x_m, y_m, \) and \(z_m\).
86. Use the result of Exercise 85 to find the coordinates of the endpoint of a line segment if the coordinates of the other endpoint and the midpoint are \((3, 0, 2)\) and \((5, 8, 7)\), respectively.
11.2 VECTORS IN SPACE

What you should learn

• Find the component forms of the unit vectors in the same direction of, the magnitudes of, the dot products of, and the angles between vectors in space.
• Determine whether vectors in space are parallel or orthogonal.
• Use vectors in space to solve real-life problems.

Why you should learn it

Vectors in space can be used to represent many physical forces, such as tension in the cables used to support auditorium lights, as shown in Exercise 60 on page 823.

VECTORS IN SPACE

Vectors in Space

Physical forces and velocities are not confined to the plane, so it is natural to extend the concept of vectors from two-dimensional space to three-dimensional space. In space, vectors are denoted by ordered triples

\[ \mathbf{v} = (v_1, v_2, v_3). \]

Component form

The zero vector is denoted by \( \mathbf{0} = (0, 0, 0) \). Using the unit vectors \( \mathbf{i} = (1, 0, 0) \), \( \mathbf{j} = (0, 1, 0) \), and \( \mathbf{k} = (0, 0, 1) \) in the direction of the positive z-axis, the standard unit vector notation for \( \mathbf{v} \) is

\[ \mathbf{v} = v_i \mathbf{i} + v_j \mathbf{j} + v_k \mathbf{k} \]

Unit vector form

as shown in Figure 11.14. If \( \mathbf{v} \) is represented by the directed line segment from \( P(p_1, p_2, p_3) \) to \( Q(q_1, q_2, q_3) \), as shown in Figure 11.15, the component form of \( \mathbf{v} \) is produced by subtracting the coordinates of the initial point from the corresponding coordinates of the terminal point

\[ \mathbf{v} = (v_1, v_2, v_3) = (q_1 - p_1, q_2 - p_2, q_3 - p_3). \]

Vectors in Space

1. Two vectors are equal if and only if their corresponding components are equal.
2. The magnitude (or length) of \( \mathbf{u} = (u_1, u_2, u_3) \) is

\[ ||\mathbf{u}|| = \sqrt{u_1^2 + u_2^2 + u_3^2}. \]

3. A unit vector \( \mathbf{u} \) in the direction of \( \mathbf{v} \) is

\[ \mathbf{u} = \frac{\mathbf{v}}{||\mathbf{v}||}, \quad \mathbf{v} \neq \mathbf{0}. \]

4. The sum of \( \mathbf{u} = (u_1, u_2, u_3) \) and \( \mathbf{v} = (v_1, v_2, v_3) \) is

\[ \mathbf{u} + \mathbf{v} = (u_1 + v_1, u_2 + v_2, u_3 + v_3). \]

Vector addition

5. The scalar multiple of the real number \( c \) and \( \mathbf{u} = (u_1, u_2, u_3) \) is

\[ c \mathbf{u} = (cu_1, cu_2, cu_3). \]

Scalar multiplication

6. The dot product of \( \mathbf{u} = (u_1, u_2, u_3) \) and \( \mathbf{v} = (v_1, v_2, v_3) \) is

\[ \mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3. \]

Dot product
Chapter 11 Analytic Geometry in Three Dimensions

Angle Between Two Vectors

If \( \theta \) is the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), then \( \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} \).

If the dot product of two nonzero vectors is zero, the angle between the vectors is 90° (recall that \( \cos 90° = 0 \)). Such vectors are called \textit{orthogonal}. For instance, the standard unit vectors \( \mathbf{i}, \mathbf{j}, \) and \( \mathbf{k} \) are orthogonal to each other.

Example 1  Finding the Component Form of a Vector

Find the component form and magnitude of the vector \( \mathbf{v} \) having initial point \((3, 4, 2)\) and terminal point \((3, 6, 4)\). Then find a unit vector in the direction of \( \mathbf{v} \).

Solution

The component form of \( \mathbf{v} \) is

\[ \mathbf{v} = (3 - 3, 6 - 4, 4 - 2) = (0, 2, 2) \]

which implies that its magnitude is

\[ \| \mathbf{v} \| = \sqrt{0^2 + 2^2 + 2^2} = \sqrt{8} = 2\sqrt{2}. \]

The unit vector in the direction of \( \mathbf{v} \) is

\[ \mathbf{u} = \frac{\mathbf{v}}{\| \mathbf{v} \|} = \frac{1}{2\sqrt{2}} (0, 2, 2) = \left( 0, \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right) = \left( 0, \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \right). \]

Now try Exercise 9.

Example 2  Finding the Dot Product of Two Vectors

Find the dot product of \( (0, 3, -2) \) and \( (4, -2, 3) \).

Solution

\[ (0, 3, -2) \cdot (4, -2, 3) = 0(4) + 3(-2) + (-2)(3) \]

\[ = 0 - 6 - 6 = -12 \]

Note that the dot product of two vectors is a real number, not a vector.

Now try Exercise 31.

As was discussed in Section 6.4, the \textit{angle between two nonzero vectors} is the angle \( \theta \), \( 0 \leq \theta \leq \pi \), between their respective standard position vectors, as shown in Figure 11.16. This angle can be found using the dot product. (Note that the angle between the zero vector and another vector is not defined.)

\[ \mathbf{v} - \mathbf{u} \]

\[ \theta \]

\[ \text{Origin} \]

\[ \mathbf{v} \]

\[ \mathbf{u} \]

FIGURE 11.16

Angle Between Two Vectors

If \( \theta \) is the angle between two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \), then \( \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} \).
Finding the Angle Between Two Vectors

Find the angle between \( \mathbf{u} = (1, 0, 2) \) and \( \mathbf{v} = (3, 1, 0) \).

**Solution**

\[
\cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|} = \frac{(1, 0, 2) \cdot (3, 1, 0)}{\| (1, 0, 2) \| \| (3, 1, 0) \|} = \frac{3}{\sqrt{50}}
\]

This implies that the angle between the two vectors is

\[
\theta = \arccos \left( \frac{3}{\sqrt{50}} \right)
\]

\[\approx 64.9^\circ\]

as shown in Figure 11.17.

**CheckPoint** Now try Exercise 35.

**Parallel Vectors**

Recall from the definition of scalar multiplication that positive scalar multiples of a nonzero vector \( \mathbf{v} \) have the same direction as \( \mathbf{v} \), whereas negative multiples have the direction opposite that of \( \mathbf{v} \). In general, two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \) are parallel if there is some scalar \( c \) such that \( \mathbf{u} = c\mathbf{v} \). For example, in Figure 11.18, the vectors \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \) are parallel because \( \mathbf{u} = 2\mathbf{v} \) and \( \mathbf{w} = -\mathbf{v} \).

**Example 4** Parallel Vectors

Vector \( \mathbf{w} \) has initial point \((1, -2, 0)\) and terminal point \((3, 2, 1)\). Which of the following vectors is parallel to \( \mathbf{w} \)?

**a.** \( \mathbf{u} = (4, 8, 2) \)

**b.** \( \mathbf{v} = (4, 8, 4) \)

**Solution**

Begin by writing \( \mathbf{w} \) in component form.

\[
\mathbf{w} = (3 - 1, 2 - (-2), 1 - 0) = (2, 4, 1)
\]

**a.** Because

\[
\mathbf{u} = (4, 8, 2)
\]

\[= 2(2, 4, 1)\]

\[= 2\mathbf{w}\]

you can conclude that \( \mathbf{u} \) is parallel to \( \mathbf{w} \).

**b.** In this case, you need to find a scalar \( c \) such that

\[
(4, 8, 4) = c(2, 4, 1).
\]

However, equating corresponding components produces \( c = 2 \) for the first two components and \( c = 4 \) for the third. So, the equation has no solution, and the vectors \( \mathbf{v} \) and \( \mathbf{w} \) are not parallel.

**CheckPoint** Now try Exercise 39.
You can use vectors to determine whether three points are collinear (lie on the same line). The points \( P, Q, \) and \( R \) are \textit{collinear} if and only if the vectors \( \overrightarrow{PQ} \) and \( \overrightarrow{PR} \) are parallel.

\section*{Example 5 Using Vectors to Determine Collinear Points}

Determine whether the points \( P(2, -1, 4), Q(5, 4, 6), \) and \( R(-4, -11, 0) \) are collinear.

\textbf{Solution}

The component forms of \( \overrightarrow{PQ} \) and \( \overrightarrow{PR} \) are

\[ \overrightarrow{PQ} = (5 - 2, 4 - (-1), 6 - 4) = (3, 5, 2) \]

and

\[ \overrightarrow{PR} = (-4 - 2, -11 - (-1), 0 - 4) = (-6, -10, -4). \]

Because \( \overrightarrow{PR} = 2 \overrightarrow{PQ} \), you can conclude that they are parallel. Therefore, the points \( P, Q, \) and \( R \) lie on the same line, as shown in Figure 11.19.

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure11_19}

\end{figure}

\section*{Example 6 Finding the Terminal Point of a Vector}

The initial point of the vector \( v = (4, 2, -1) \) is \( P(3, -1, 6). \) What is the terminal point of this vector?

\textbf{Solution}

Using the component form of the vector whose initial point is \( P(3, -1, 6) \) and whose terminal point is \( Q(q_1, q_2, q_3), \) you can write

\[ \overrightarrow{PQ} = (q_1 - 3, q_2 - (-1), q_3 - 6) \]

\[ = (q_1 - 3, q_2 + 1, q_3 - 6) = (4, 2, -1). \]

This implies that \( q_1 - 3 = 4, q_2 + 1 = 2, \) and \( q_3 - 6 = -1. \) The solutions of these three equations are \( q_1 = 7, q_2 = 1, \) and \( q_3 = 5. \) So, the terminal point is \( Q(7, 1, 5). \)

\section*{Checkpoint}

Now try Exercise 51.
Application

In Section 6.3, you saw how to use vectors to solve an equilibrium problem in a plane. The next example shows how to use vectors to solve an equilibrium problem in space.

Example 7 Solving an Equilibrium Problem

A weight of 480 pounds is supported by three ropes. As shown in Figure 11.20, the weight is located at $S(0, 2, -1)$. The ropes are tied to the points $P(2, 0, 0)$, $Q(0, 4, 0)$, and $R(-2, 0, 0)$. Find the force (or tension) on each rope.

Solution

The (downward) force of the weight is represented by the vector

$$w = (0, 0, -480).$$

The force vectors corresponding to the ropes are as follows.

$$u = \|u\| \frac{\overrightarrow{SP}}{\|\overrightarrow{SP}\|} = \|u\| \left(\frac{2 - 0, 0 - 2, 0 - (-1)}{3}\right) = \|u\| \left(\frac{2}{3}, -\frac{2}{3}, \frac{1}{3}\right)$$

$$v = \|v\| \frac{\overrightarrow{SQ}}{\|\overrightarrow{SQ}\|} = \|v\| \left(\frac{0 - 0, 4 - 2, 0 - (-1)}{\sqrt{5}}\right) = \|v\| \left(\frac{2}{\sqrt{5}}, \frac{1}{\sqrt{5}}\right)$$

$$z = \|z\| \frac{\overrightarrow{SR}}{\|\overrightarrow{SR}\|} = \|z\| \left(\frac{-2 - 0, 0 - 2, 0 - (-1)}{3}\right) = \|z\| \left(\frac{-2}{3}, -\frac{2}{3}, \frac{1}{3}\right)$$

For the system to be in equilibrium, it must be true that

$$u + v + z + w = 0 \quad \text{or} \quad u + v + z = -w.$$

This yields the following system of linear equations.

$$\frac{2}{3}\|u\| - \frac{2}{3}\|z\| = 0$$

$$-\frac{2}{3}\|u\| + \frac{2}{\sqrt{5}}\|v\| - \frac{2}{3}\|z\| = 0$$

$$\frac{1}{3}\|u\| + \frac{1}{\sqrt{5}}\|v\| + \frac{1}{3}\|z\| = 480$$

Using the techniques demonstrated in Chapter 7, you can find the solution of the system to be

$$\|u\| = 360.0$$

$$\|v\| \approx 536.7$$

$$\|z\| = 360.0.$$

So, the rope attached at point $P$ has 360 pounds of tension, the rope attached at point $Q$ has about 536.7 pounds of tension, and the rope attached at point $R$ has 360 pounds of tension.

CHECKPOINT Now try Exercise 59.
11.2 EXERCISES

VOCABULARY: Fill in the blanks.

1. The _______ vector is denoted by \( \mathbf{0} = (0,0,0) \).

2. The standard unit vector notation for a vector \( \mathbf{v} \) is given by _______.

3. The _______ _______ of a vector \( \mathbf{v} \) is produced by subtracting the coordinates of the initial point from the corresponding coordinates of the terminal point.

4. If the dot product of two nonzero vectors is zero, the angle between the vectors is _______ and the vectors are called _______.

5. Two nonzero vectors \( \mathbf{u} \) and \( \mathbf{v} \) are _______ if there is some scalar \( c \) such that \( \mathbf{u} = c\mathbf{v} \).

6. The points \( P, Q, \) and \( R \) are _______ if and only if the vectors \( \overrightarrow{PQ} \) and \( \overrightarrow{PR} \) are parallel.

SKILLS AND APPLICATIONS

In Exercises 7 and 8, (a) find the component form of the vector \( \mathbf{v} \) and (b) sketch the vector with its initial point at the origin.

7. Initial point: \( (2,0,1) \)
   Terminal point: \( (0,3,2) \)

8. Initial point: \( (1,0,4) \)
   Terminal point: \( (1,4,0) \)

In Exercises 9 and 10, (a) write the component form of the vector \( \mathbf{v} \), (b) find the magnitude of \( \mathbf{v} \), and (c) find a unit vector in the direction of \( \mathbf{v} \).

9. Initial point: \( (-6,4,-2) \)
   Terminal point: \( (1,-1,3) \)

10. Initial point: \( (-7,3,5) \)
    Terminal point: \( (0,0,2) \)

In Exercises 11–14, sketch each scalar multiple of \( \mathbf{v} \).

11. \( \mathbf{v} = (1,1,3) \)  
    (a) \( 2\mathbf{v} \)  
    (b) \( -\mathbf{v} \)  
    (c) \( \frac{2}{3}\mathbf{v} \)  
    (d) \( 0\mathbf{v} \)

12. \( \mathbf{v} = (-1,2,2) \)  
    (a) \( -\mathbf{v} \)  
    (b) \( 2\mathbf{v} \)  
    (c) \( \frac{1}{2}\mathbf{v} \)  
    (d) \( \frac{5}{2}\mathbf{v} \)

13. \( \mathbf{v} = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k} \)  
    (a) \( 2\mathbf{v} \)  
    (b) \( -\mathbf{v} \)  
    (c) \( \frac{5}{2}\mathbf{v} \)  
    (d) \( 0\mathbf{v} \)

14. \( \mathbf{v} = \mathbf{i} - 2\mathbf{j} + \mathbf{k} \)  
    (a) \( 4\mathbf{v} \)  
    (b) \( -2\mathbf{v} \)  
    (c) \( \frac{1}{2}\mathbf{v} \)  
    (d) \( 0\mathbf{v} \)

In Exercises 15–18, find the vector \( \mathbf{z} \), given \( \mathbf{u} = \langle -1,3,2 \rangle \), \( \mathbf{v} = \langle 1,-2,-2 \rangle \), and \( \mathbf{w} = \langle 5,0,-5 \rangle \).

15. \( \mathbf{z} = \mathbf{u} - 2\mathbf{v} \)

16. \( \mathbf{z} = 7\mathbf{u} + \mathbf{v} - \frac{1}{2}\mathbf{w} \)

17. \( 2\mathbf{z} - 4\mathbf{u} = \mathbf{w} \)

18. \( \mathbf{u} + \mathbf{v} + \mathbf{z} = 0 \)

In Exercises 19–28, find the magnitude of \( \mathbf{v} \).

19. \( \mathbf{v} = \langle 7,8,7 \rangle \)

20. \( \mathbf{v} = \langle -2,0,-5 \rangle \)

21. \( \mathbf{v} = \langle 1,-2,4 \rangle \)

22. \( \mathbf{v} = \langle -1,0,3 \rangle \)

23. \( \mathbf{v} = \mathbf{i} + 3\mathbf{j} - \mathbf{k} \)

24. \( \mathbf{v} = -\mathbf{i} - 4\mathbf{j} + 3\mathbf{k} \)

25. \( \mathbf{v} = 4\mathbf{i} - 3\mathbf{j} - 7\mathbf{k} \)

26. \( \mathbf{v} = 2\mathbf{i} - \mathbf{j} + 6\mathbf{k} \)

27. Initial point: \( (1,-3,4) \)
   Terminal point: \( (1,0,-1) \)

28. Initial point: \( (0,-1,0) \)
   Terminal point: \( (1,2,-2) \)

In Exercises 29 and 30, find a unit vector (a) in the direction of \( \mathbf{u} \) and (b) in the direction opposite of \( \mathbf{u} \).

29. \( \mathbf{u} = 8\mathbf{i} + 3\mathbf{j} - \mathbf{k} \)

30. \( \mathbf{u} = -3\mathbf{i} + 5\mathbf{j} + 10\mathbf{k} \)

In Exercises 31–34, find the dot product of \( \mathbf{u} \) and \( \mathbf{v} \).

31. \( \mathbf{u} = \langle 4,4,-1 \rangle \)
   \( \mathbf{v} = \langle 2,-5,-8 \rangle \)

32. \( \mathbf{u} = \langle 3,-1,6 \rangle \)
   \( \mathbf{v} = \langle 4,-10,1 \rangle \)

33. \( \mathbf{u} = 2\mathbf{i} - 5\mathbf{j} + 3\mathbf{k} \)
   \( \mathbf{v} = 9\mathbf{i} + 3\mathbf{j} - \mathbf{k} \)

34. \( \mathbf{u} = 3\mathbf{j} - 6\mathbf{k} \)
   \( \mathbf{v} = 6\mathbf{i} - 4\mathbf{j} - 2\mathbf{k} \)
In Exercises 35–38, find the angle $\theta$ between the vectors.

35. $u = (0, 2, 2)$  
   $v = (3, 0, -4)$

36. $u = (-1, 3, 0)$  
   $v = (1, 2, -1)$

37. $u = 10\mathbf{i} + 40\mathbf{j}$  
   $v = -3\mathbf{j} + 8\mathbf{k}$

38. $u = 8\mathbf{j} - 20\mathbf{k}$  
   $v = 10\mathbf{i} - 5\mathbf{k}$

In Exercises 39–46, determine whether $u$ and $v$ are orthogonal, parallel, or neither.

39. $u = (-12, 6, 15)$  
   $v = (8, -4, -10)$

40. $u = (-1, 3, -1)$  
   $v = (2, -1, 5)$

41. $u = (0, 1, 6)$  
   $v = (1, -2, -1)$

42. $u = (0, 4, -1)$  
   $v = (1, 0, 0)$

43. $u = \frac{1}{2}\mathbf{i} - \frac{1}{2}\mathbf{j} + 2\mathbf{k}$
   $v = 4\mathbf{i} + 10\mathbf{j} + \mathbf{k}$

44. $u = -\mathbf{i} + \frac{1}{2}\mathbf{j} - \mathbf{k}$
   $v = 8\mathbf{i} - 4\mathbf{j} + 8\mathbf{k}$

45. $u = -2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$
   $v = 2\mathbf{i} - \mathbf{j} - \mathbf{k}$

In Exercises 47–50, use vectors to determine whether the points are collinear.

47. $(5, 4, 1), (7, 3, -1), (4, 5, 3)$

48. $(-2, 7, 4), (-4, 8, 1), (0, 6, 7)$

49. $(1, 3, 2), (-1, 2, 5), (3, 4, -1)$

50. $(0, 4, 4), (-1, 5, 6), (-2, 6, 7)$

In Exercises 51–54, the vector $v$ and its initial point are given. Find the terminal point.

51. $v = (2, -4, 7)$  
   Initial point: $(1, 5, 0)$

52. $v = (4, -1, -1)$  
   Initial point: $(6, -4, 3)$

53. $v = (4, \frac{1}{2}, -\frac{3}{2})$  
   Initial point: $(2, 1, -\frac{1}{2})$

54. $v = (\frac{3}{2}, -\frac{1}{2}, 4)$  
   Initial point: $(3, 2, -\frac{1}{2})$

55. Determine the values of $c$ such that $\|cu\| = 3$, where $u = 1 + 2\mathbf{j} + 3\mathbf{k}$.

56. Determine the values of $c$ such that $\|cu\| = 12$, where $u = -2\mathbf{i} + 2\mathbf{j} - 4\mathbf{k}$.

In Exercises 57 and 58, write the component form of $v$.

57. $v$ lies in the $yz$-plane, has magnitude 4, and makes an angle of $45^\circ$ with the positive $y$-axis.

58. $v$ lies in the $xz$-plane, has magnitude 10, and makes an angle of $60^\circ$ with the positive $z$-axis.

59. **TENSION** The weight of a crate is 500 newtons. Find the tension in each of the supporting cables shown in the figure.

![Figure 59](image)

60. **TENSION** The lights in an auditorium are 24-pound disks of radius 18 inches. Each disk is supported by three equally spaced cables that are $L$ inches long (see figure).

(a) Write the tension $T$ in each cable as a function of $L$. Determine the domain of the function.

(b) Use the function from part (a) to complete the table.

<table>
<thead>
<tr>
<th>$L$</th>
<th>20</th>
<th>25</th>
<th>30</th>
<th>35</th>
<th>40</th>
<th>45</th>
<th>50</th>
</tr>
</thead>
<tbody>
<tr>
<td>$T$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(c) Use a graphing utility to graph the function in part (a). What are the asymptotes of the graph? Interpret their meaning in the context of the problem.

(d) Determine the minimum length of each cable if a cable can carry a maximum load of 10 pounds.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 61 and 62, determine whether the statement is true or false. Justify your answer.

61. If the dot product of two nonzero vectors is zero, then the angle between the vectors is a right angle.

62. If $AB$ and $AC$ are parallel vectors, then points $A$, $B$, and $C$ are collinear.

63. What is known about the nonzero vectors $u$ and $v$ if $u \cdot v < 0$? Explain.

64. **CAPSTONE** Consider the two nonzero vectors $u$ and $v$.

   Describe the geometric figure generated by the terminal points of the vectors $sv$, $u + rv$, and $su + tv$

   where $s$ and $t$ represent real numbers.
The Cross Product

Many applications in physics, engineering, and geometry involve finding a vector in space that is orthogonal to two given vectors. In this section, you will study a product that will yield such a vector. It is called the cross product, and it is conveniently defined and calculated using the standard unit vector form.

A convenient way to calculate is to use the following determinant form with cofactor expansion. (This determinant form is used simply to help remember the formula for the cross product—it is technically not a determinant because the entries of the corresponding matrix are not all real numbers.)

\[
\begin{vmatrix}
  i & j & k \\
  u_1 & u_2 & u_3 \\
  v_1 & v_2 & v_3 \\
\end{vmatrix}
\]

It is important to note that this definition applies only to three-dimensional vectors. The cross product is not defined for two-dimensional vectors.

A convenient way to calculate \( \mathbf{u} \times \mathbf{v} \) is to use the following determinant form with cofactor expansion. (This \( 3 \times 3 \) determinant form is used simply to help remember the formula for the cross product—it is technically not a determinant because the entries of the corresponding matrix are not all real numbers.)

\[
\begin{vmatrix}
  i & j & k \\
  u_1 & u_2 & u_3 \\
  v_1 & v_2 & v_3 \\
\end{vmatrix}
= (u_2v_3 - u_3v_2)i - (u_1v_3 - u_3v_1)j + (u_1v_2 - u_2v_1)k
\]

Note the minus sign in front of the \( j \)-component. Recall from Section 8.4 that each of the three \( 2 \times 2 \) determinants can be evaluated by using the following pattern.

\[
\begin{vmatrix}
  a_1 & b_1 \\
  a_2 & b_2 \\
\end{vmatrix}
= a_1b_2 - a_2b_1
\]
Example 1  Finding Cross Products

Given \( \mathbf{u} = i + 2j + k \) and \( \mathbf{v} = 3i + j + 2k \), find each cross product.

a. \( \mathbf{u} \times \mathbf{v} \)  

b. \( \mathbf{v} \times \mathbf{u} \)  

c. \( \mathbf{v} \times \mathbf{v} \)

Solution

a. \( \mathbf{u} \times \mathbf{v} = \begin{vmatrix} i & j & k \\ 1 & 2 & 1 \\ 3 & 1 & 2 \end{vmatrix} = \begin{vmatrix} 2 & 1 \\ 1 & 2 \end{vmatrix}i - \begin{vmatrix} 1 & 1 \\ 3 & 2 \end{vmatrix}j + \begin{vmatrix} 1 & 2 \\ 3 & 1 \end{vmatrix}k = (4 - 1)i - (2 - 3)j + (1 - 6)k = 3i + j - 5k 

b. \( \mathbf{v} \times \mathbf{u} = \begin{vmatrix} i & j & k \\ 3 & 1 & 2 \\ 1 & 2 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 2 \\ 2 & 1 \end{vmatrix}i - \begin{vmatrix} 3 & 2 \\ 1 & 1 \end{vmatrix}j + \begin{vmatrix} 1 & 2 \\ 1 & 2 \end{vmatrix}k = (1 - 4)i - (3 - 2)j + (6 - 1)k = -3i - j + 5k 

c. \( \mathbf{v} \times \mathbf{v} = \begin{vmatrix} i & j & k \\ 3 & 1 & 2 \\ 3 & 1 & 2 \end{vmatrix} = 0 

Now try Exercise 25.

The results obtained in Example 1 suggest some interesting algebraic properties of the cross product. For instance,

\[ \mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u}) \quad \text{and} \quad \mathbf{v} \times \mathbf{v} = 0. \]

These properties, and several others, are summarized in the following list.

### Algebraic Properties of the Cross Product

Let \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) be vectors in space and let \( c \) be a scalar.

1. \( \mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u}) \)
2. \( \mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w}) \)
3. \( c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v}) \)
4. \( \mathbf{u} \times \mathbf{0} = \mathbf{0} \times \mathbf{u} = \mathbf{0} \)
5. \( \mathbf{u} \times \mathbf{u} = \mathbf{0} \)
6. \( \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} \)

For proofs of the Algebraic Properties of the Cross Product, see Proofs in Mathematics on page 845.
Geometric Properties of the Cross Product

The first property listed on the preceding page indicates that the cross product is not commutative. In particular, this property indicates that the vectors \( \mathbf{u} \times \mathbf{v} \) and \( \mathbf{v} \times \mathbf{u} \) have equal lengths but opposite directions. The following list gives some other geometric properties of the cross product of two vectors.

**Geometric Properties of the Cross Product**

Let \( \mathbf{u} \) and \( \mathbf{v} \) be nonzero vectors in space, and let \( \theta \) be the angle between \( \mathbf{u} \) and \( \mathbf{v} \).

1. \( \mathbf{u} \times \mathbf{v} \) is orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \).
2. \( \|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\|\|\mathbf{v}\| \sin \theta \)
3. \( \mathbf{u} \times \mathbf{v} = \mathbf{0} \) if and only if \( \mathbf{u} \) and \( \mathbf{v} \) are scalar multiples of each other.
4. \( \|\mathbf{u} \times \mathbf{v}\| = \) area of parallelogram having \( \mathbf{u} \) and \( \mathbf{v} \) as adjacent sides.

For proofs of the Geometric Properties of the Cross Product, see Proofs in Mathematics on page 846.

Both \( \mathbf{u} \times \mathbf{v} \) and \( \mathbf{v} \times \mathbf{u} \) are perpendicular to the plane determined by \( \mathbf{u} \) and \( \mathbf{v} \). One way to remember the orientations of the vectors \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{k} = \mathbf{i} \times \mathbf{j} \), as shown in Figure 11.21. The three vectors \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{u} \times \mathbf{v} \) form a right-handed system.

**Example 2** Using the Cross Product

Find a unit vector that is orthogonal to both

\[ \mathbf{u} = 3\mathbf{i} - 4\mathbf{j} + \mathbf{k} \quad \text{and} \quad \mathbf{v} = -3\mathbf{i} + 6\mathbf{j}. \]

**Solution**

The cross product \( \mathbf{u} \times \mathbf{v} \), as shown in Figure 11.22, is orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \).

\[
\begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
3 & -4 & 1 \\
-3 & 6 & 0
\end{vmatrix}
= -6\mathbf{i} - 3\mathbf{j} + 6\mathbf{k}
\]

Because

\[
\|\mathbf{u} \times \mathbf{v}\| = \sqrt{(-6)^2 + (-3)^2 + 6^2}
= \sqrt{81}
= 9
\]

a unit vector orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \) is

\[
\frac{\mathbf{u} \times \mathbf{v}}{\|\mathbf{u} \times \mathbf{v}\|} = \frac{2}{3}\mathbf{i} - \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k}.
\]

**Checkpoint** Now try Exercise 31.
In Example 2, note that you could have used the cross product \( \mathbf{v} \times \mathbf{u} \) to form a unit vector that is orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \). With that choice, you would have obtained the negative of the unit vector found in the example.

The fourth geometric property of the cross product states that \( \| \mathbf{u} \times \mathbf{v} \| \) is the area of the parallelogram that has \( \mathbf{u} \) and \( \mathbf{v} \) as adjacent sides. A simple example of this is given by the unit square with adjacent sides of \( \mathbf{i} \) and \( \mathbf{j} \). Because \( \mathbf{i} \times \mathbf{j} = \mathbf{k} \) and \( \| \mathbf{k} \| = 1 \), it follows that the square has an area of 1. This geometric property of the cross product is illustrated further in the next example.

### Example 3 Geometric Application of the Cross Product

Show that the quadrilateral with vertices at the following points is a parallelogram. Then find the area of the parallelogram. Is the parallelogram a rectangle?

\[ A(5, 2, 0), \quad B(2, 6, 1), \quad C(2, 4, 7), \quad D(5, 0, 6) \]

**Solution**

From Figure 11.23 you can see that the sides of the quadrilateral correspond to the following four vectors.

\[
\begin{align*}
\overrightarrow{AB} &= -3\mathbf{i} + 4\mathbf{j} + \mathbf{k} \\
\overrightarrow{CD} &= 3\mathbf{i} - 4\mathbf{j} - \mathbf{k} = -\overrightarrow{AB} \\
\overrightarrow{AD} &= 0\mathbf{i} - 2\mathbf{j} + 6\mathbf{k} \\
\overrightarrow{BC} &= 0\mathbf{i} + 2\mathbf{j} - 6\mathbf{k} = -\overrightarrow{AD}
\end{align*}
\]

Because \( \overrightarrow{CD} = -\overrightarrow{AB} \) and \( \overrightarrow{BC} = -\overrightarrow{AD} \), you can conclude that \( \overrightarrow{AB} \) is parallel to \( \overrightarrow{CD} \) and \( \overrightarrow{AD} \) is parallel to \( \overrightarrow{BC} \). It follows that the quadrilateral is a parallelogram with \( \overrightarrow{AB} \) and \( \overrightarrow{AD} \) as adjacent sides. Moreover, because

\[
\overrightarrow{AB} \times \overrightarrow{AD} = \begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
-3 & 4 & 1 \\
0 & -2 & 6
\end{vmatrix} = 26\mathbf{i} + 18\mathbf{j} + 6\mathbf{k}
\]

the area of the parallelogram is

\[
\| \overrightarrow{AB} \times \overrightarrow{AD} \| = \sqrt{26^2 + 18^2 + 6^2} = \sqrt{1036} = 32.19.
\]

You can tell whether the parallelogram is a rectangle by finding the angle between the vectors \( \overrightarrow{AB} \) and \( \overrightarrow{AD} \).

\[
\sin \theta = \frac{\| \overrightarrow{AB} \times \overrightarrow{AD} \|}{\| \overrightarrow{AB} \| \| \overrightarrow{AD} \|}
\]

\[
\sin \theta = \frac{\sqrt{1036}}{\sqrt{26} \sqrt{40}}
\]

\[
\sin \theta = 0.998
\]

\[
\theta = \arcsin 0.998
\]

\[
\theta = 86.4^\circ
\]

Because \( \theta \neq 90^\circ \), the parallelogram is not a rectangle.

**Check Point** Now try Exercise 43.
The Triple Scalar Product

For the vectors \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \) in space, the dot product of \( \mathbf{u} \) and \( \mathbf{v} \times \mathbf{w} \) is called the triple scalar product of \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \).

### The Triple Scalar Product

For \( \mathbf{u} = u_1 \mathbf{i} + u_2 \mathbf{j} + u_3 \mathbf{k} \), \( \mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j} + v_3 \mathbf{k} \), and \( \mathbf{w} = w_1 \mathbf{i} + w_2 \mathbf{j} + w_3 \mathbf{k} \), the **triple scalar product** is given by

\[
\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix}
  u_1 & u_2 & u_3 \\
  v_1 & v_2 & v_3 \\
  w_1 & w_2 & w_3 
\end{vmatrix}.
\]

If the vectors \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \) do not lie in the same plane, the triple scalar product \( \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) \) can be used to determine the volume of the parallelepiped (a polyhedron, all of whose faces are parallelograms) with \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \) as adjacent edges, as shown in Figure 11.24.

### Geometric Property of the Triple Scalar Product

The volume \( V \) of a parallelepiped with vectors \( \mathbf{u} \), \( \mathbf{v} \), and \( \mathbf{w} \) as adjacent edges is given by

\[
V = |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|.
\]

### Example 4  Volume by the Triple Scalar Product

Find the volume of the parallelepiped having

\[
\mathbf{u} = 3\mathbf{i} - 5\mathbf{j} + \mathbf{k}, \quad \mathbf{v} = 2\mathbf{j} - 2\mathbf{k}, \quad \text{and} \quad \mathbf{w} = 3\mathbf{i} + \mathbf{j} + \mathbf{k}
\]
as adjacent edges, as shown in Figure 11.25.

**Solution**

The value of the triple scalar product is

\[
\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix}
  3 & -5 & 1 \\
  0 & 2 & -2 \\
  3 & 1 & 1 
\end{vmatrix} = 3[2 \ -2 \ \ ] - 5[0 \ -2 \ \ ] + 1[0 \ 2 \ \ ]
\]

\[
= 3(4) + 5(-6) + 1(-6)
\]

\[
= 36.
\]

So, the volume of the parallelepiped is

\[
|\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})| = |36| = 36.
\]

Now try Exercise 57.
**11.3 EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. To find a vector in space that is orthogonal to two given vectors, find the ______ of the two vectors.
2. \( u \times u = \) ______
3. \( \|u \times v\| = \) ______
4. The dot product of \( u \) and \( v \times w \) is called the ______ ______ ______ of \( u \), \( v \), and \( w \).

**SKILLS AND APPLICATIONS**

In Exercises 5–10, find the cross product of the unit vectors and sketch the result.

5. \( j \times i \)  
6. \( i \times j \)  
7. \( i \times k \)  
8. \( k \times i \)  
9. \( j \times k \)  
10. \( k \times j \)  

In Exercises 11–20, use the vectors \( u \) and \( v \) to find each expression.

\[ u = 3i - j + 4k \]  
\[ v = 2i + 2j - k \]  

11. \( u \times v \)  
12. \( v \times u \)  
13. \( v \times v \)  
14. \( v \times (u \times u) \)  
15. \( (3u) \times v \)  
16. \( u \times (2v) \)  
17. \( u \times (-v) \)  
18. \( (-2u) \times v \)  
19. \( u \cdot (u \times v) \)  
20. \( v \cdot (v \times u) \)  

In Exercises 21–30, find \( u \times v \) and show that it is orthogonal to both \( u \) and \( v \).

21. \( u = (2, -3, 4) \)  
22. \( u = (6, 8, 3) \)  
23. \( v = (0, -1, 1) \)  
24. \( v = (5, -2, -5) \)  
25. \( u = (-10, 0, 6) \)  
26. \( u = (-7, 1, 12) \)  
27. \( v = (7, 0, 0) \)  
28. \( v = (2, 2, 3) \)  
29. \( u = 6i + 2j + k \)  
30. \( u = i + 3j + k \)  
31. \( v = i + 3j - 2k \)  
32. \( v = \frac{1}{2}i + \frac{3}{2}j + \frac{1}{2}k \)  
33. \( u = -i + 3j + k \)  
34. \( u = -i + 2j - k \)  
35. \( v = -i + 3j + k \)  
36. \( v = -i + 2j - k \)  
37. \( u = k \)  
38. \( u = i + 2j + 2k \)  
39. \( v = i + k \)  
40. \( u = 4i + 3j + 7k \)  
41. \( v = 2i - 4j + 6k \)  
42. \( u = (4, 3, 2) \)  
43. \( v = (0, 4, 6) \)  

In Exercises 43–46, (a) verify that the points are the vertices of a parallelogram, (b) find its area, and (c) determine whether the parallelogram is a rectangle.

43. \( A(2, -1, 4), B(3, 1, 2), C(0, 5, 6), D(-1, 3, 8) \)  
44. \( A(1, 1, 1), B(2, 3, 4), C(6, 5, 2), D(7, 7, 5) \)  
45. \( A(3, 2, -1), B(-2, 2, -3), C(3, 5, -2), D(-2, 5, -4) \)  
46. \( A(2, 1, 1), B(2, 3, 1), C(-2, 4, 1), D(-2, 6, 1) \)  

In Exercises 47–50, find the area of the triangle with the given vertices. (The area \( A \) of the triangle having \( u \) and \( v \) as adjacent sides is given by \( A = \frac{1}{2}\|u \times v\| \)).

47. \( (0, 0, 0), (1, 2, 3), (-3, 0, 0) \)  
48. \( (1, -4, 3), (2, 0, 2), (-2, 2, 0) \)  
49. \( (2, 3, -5), (-2, -2, 0), (3, 0, 6) \)  
50. \( (2, 4, 0), (-2, -4, 0), (0, 0, 4) \)  

In Exercises 51–54, find the triple scalar product.

51. \( u = (3, 4, 4), v = (2, 3, 0), w = (0, 0, 6) \)  
52. \( u = (4, 0, 1), v = (0, 5, 0), w = (0, 0, 1) \)  
53. \( u = 2i + 3j + k, v = i - j, w = 4i + 3j + k \)  
54. \( u = i + 4j - 7k, v = 2i + 4k, w = -3j + 6k \)  

In Exercises 55–58, use the triple scalar product to find the volume of the parallelepiped having adjacent edges \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w}. \)

55. \( \mathbf{u} = \mathbf{i} + \mathbf{j} \)
   \( \mathbf{v} = \mathbf{j} + \mathbf{k} \)
   \( \mathbf{w} = \mathbf{i} + \mathbf{k} \)

56. \( \mathbf{u} = \mathbf{i} + \mathbf{j} + 3\mathbf{k} \)
   \( \mathbf{v} = 3\mathbf{j} + 3\mathbf{k} \)
   \( \mathbf{w} = 3\mathbf{i} + 3\mathbf{k} \)

57. \( \mathbf{u} = (0, 2, 2) \)
   \( \mathbf{v} = (0, 0, -2) \)
   \( \mathbf{w} = (3, 0, 2) \)

58. \( \mathbf{u} = (1, 2, -1) \)
   \( \mathbf{v} = (-1, 2, 2) \)
   \( \mathbf{w} = (2, 0, 1) \)

In Exercises 59 and 60, find the volume of the parallelepiped with the given vertices.

59. \( A(0, 0, 0), B(4, 0, 0), C(4, -2, 3), D(0, -2, 3), \)
   \( E(4, 5, 3), F(0, 5, 3), G(0, 3, 6), H(4, 3, 6) \)

60. \( A(0, 0, 0), B(1, 1, 0), C(1, 0, 2), D(0, 1, 1), \)
   \( E(2, 1, 2), F(1, 1, 3), G(1, 2, 1), H(2, 2, 3) \)

61. **TORQUE** The brakes on a bicycle are applied by using a downward force of \( p \) pounds on the pedal when the six-inch crank makes a \( 40^\circ \) angle with the horizontal (see figure). Vectors representing the position of the crank and the force are \( \mathbf{V} = \frac{1}{2}(-\cos 40^\circ \mathbf{j} - \sin 40^\circ \mathbf{k}) \) and \( \mathbf{F} = -p\mathbf{k}, \) respectively.

(a) The magnitude of the torque on the crank is given by \( ||\mathbf{V} \times \mathbf{F}||. \) Using the given information, write the torque \( T \) on the crank as a function of \( p. \)

(b) Use the function from part (a) to complete the table.

<table>
<thead>
<tr>
<th>( p )</th>
<th>15</th>
<th>20</th>
<th>25</th>
<th>30</th>
<th>35</th>
<th>40</th>
<th>45</th>

</tbody>
</table>

62. **TORQUE** Both the magnitude and direction of the force on a crankshaft change as the crankshaft rotates. Use the technique given in Exercise 61 to find the magnitude of the torque on the crankshaft using the position and data shown in the figure.

---

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 63 and 64, determine whether the statement is true or false. Justify your answer.

63. The cross product is not defined for vectors in the plane.

64. If \( \mathbf{u} \) and \( \mathbf{v} \) are vectors in space that are nonzero and nonparallel, then \( \mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}. \)

65. **THINK ABOUT IT** Calculate \( \mathbf{u} \times \mathbf{v} \) and \( - (\mathbf{v} \times \mathbf{u}) \) for several values of \( \mathbf{u} \) and \( \mathbf{v}. \) What do your results imply? Interpret your results geometrically.

66. **THINK ABOUT IT** If the magnitudes of two vectors are doubled, how will the magnitude of the cross product of the vectors change?

67. **THINK ABOUT IT** If you connect the terminal points of two vectors \( \mathbf{u} \) and \( \mathbf{v} \) that have the same initial points, a triangle is formed. Is it possible to use the cross product \( \mathbf{u} \times \mathbf{v} \) to determine the area of the triangle? Explain. Verify your conclusion using two vectors from Example 3.

68. **CAPSTONE** Define the cross product of two vectors in space, \( \mathbf{u} \) and \( \mathbf{v}, \) where \( \mathbf{u} = u_1 \mathbf{i} + u_2 \mathbf{j} + u_3 \mathbf{k} \) and \( \mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j} + v_3 \mathbf{k}. \) Explain, in your own words, what the cross product \( \mathbf{u} \times \mathbf{v} \) represents. What does it mean when \( \mathbf{u} \times \mathbf{v} = 0? \)

69. **PROOF** Consider the vectors \( \mathbf{u} = (\cos \alpha, \sin \alpha, 0) \) and \( \mathbf{v} = (\cos \beta, \sin \beta, 0), \) where \( \alpha > \beta. \) Find the cross product of the vectors and use the result to prove the identity \( \sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta. \)
### Lines in Space

In the plane, *slope* is used to determine an equation of a line. In space, it is more convenient to use *vectors* to determine the equation of a line.

In Figure 11.26, consider the line $L$ through the point $P(x_1, y_1, z_1)$ and parallel to the vector $v = (a, b, c)$.

The vector $v$ is the **direction vector** for the line $L$, and $a$, $b$, and $c$ are the **direction numbers**. One way of describing the line $L$ is to say that it consists of all points $Q(x, y, z)$ for which the vector $\overrightarrow{PQ}$ is parallel to $v$. This means that $\overrightarrow{PQ}$ is a scalar multiple of $v$, and you can write $\overrightarrow{PQ} = tv$, where $t$ is a scalar.

$$\overrightarrow{PQ} = \langle x - x_1, y - y_1, z - z_1 \rangle$$

$$= \langle at, bt, ct \rangle$$

$$= tv$$

By equating corresponding components, you can obtain the **parametric equations of a line in space**.

#### Parametric Equations of a Line in Space

A line $L$ parallel to the vector $v = (a, b, c)$ and passing through the point $P(x_1, y_1, z_1)$ is represented by the parametric equations

$$x = x_1 + at, \quad y = y_1 + bt, \quad \text{and} \quad z = z_1 + ct.$$  

If the direction numbers $a$, $b$, and $c$ are all nonzero, you can eliminate the parameter $t$ to obtain the **symmetric equations** of a line.

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} \quad \text{Symmetric equations}$$
Finding Parametric and Symmetric Equations

Find parametric and symmetric equations of the line that passes through the point \((1, -2, 4)\) and is parallel to \(v = (2, 4, -4)\).

**Solution**

To find a set of parametric equations of the line, use the coordinates \(x_1 = 1, y_1 = -2,\) and \(z_1 = 4\) and direction numbers \(a = 2, b = 4,\) and \(c = -4\) (see Figure 11.27).

\[
\begin{align*}
\frac{x - 1}{2} &= \frac{y + 2}{4} = \frac{z - 4}{-4}.
\end{align*}
\]

Because \(a, b,\) and \(c\) are all nonzero, a set of symmetric equations is

**Example 2** Parametric and Symmetric Equations of a Line Through Two Points

Find a set of parametric and symmetric equations of the line that passes through the points \((-2, 1, 0)\) and \((1, 3, 5)\).

**Solution**

Begin by letting \(P = (-2, 1, 0)\) and \(Q = (1, 3, 5)\). Then a direction vector for the line passing through \(P\) and \(Q\) is

\[
v = PQ = (1 - (-2), 3 - 1, 5 - 0) = (3, 2, 5).
\]

Using the direction numbers \(a = 3, b = 2,\) and \(c = 5\) with the initial point \(P(-2, 1, 0)\), you can obtain the parametric equations

\[
\begin{align*}
 x &= -2 + 3t, \quad y = 1 + 2t, \quad \text{and} \quad z = 5t. \\
\end{align*}
\]

Because \(a, b,\) and \(c\) are all nonzero, a set of symmetric equations is

\[
\begin{align*}
\frac{x + 2}{3} &= \frac{y - 1}{2} = \frac{z}{5}.
\end{align*}
\]
Planes in Space

You have seen how an equation of a line in space can be obtained from a point on the line and a vector parallel to it. You will now see that an equation of a plane in space can be obtained from a point in the plane and a vector normal (perpendicular) to the plane.

Consider the plane containing the point having a nonzero normal vector as shown in Figure 11.28. This plane consists of all points for which the vector is orthogonal to Using the dot product, you can write

\[ \mathbf{n} \cdot \mathbf{PQ} = 0 \]

The third equation of the plane is said to be in standard form.

Regrouping terms yields the general form of the equation of a plane in space

\[ ax + by + cz + d = 0. \]

Given the general form of the equation of a plane, it is easy to find a normal vector to the plane. Use the coefficients of \( x, y, \) and \( z \) to write \( \mathbf{n} = \langle a, b, c \rangle. \)
Finding an Equation of a Plane in Three-Space

Find the general form of the equation of the plane passing through the points \((2, 1, 1)\), \((0, 4, 1)\), and \((-2, 1, 4)\).

**Solution**

To find the equation of the plane, you need a point in the plane and a vector that is normal to the plane. There are three choices for the point, but no normal vector is given. To obtain a normal vector, use the cross product of vectors \(u\) and \(v\) extending from the point \((2, 1, 1)\) to the points \((0, 4, 1)\) and \((-2, 1, 4)\), as shown in Figure 11.29. The component forms of \(u\) and \(v\) are

\[
(u) = \langle 0 - 2, 4 - 1, 1 - 1 \rangle = \langle -2, 3, 0 \rangle
\]

\[
(v) = \langle -2 - 2, 1 - 1, 4 - 1 \rangle = \langle -4, 0, 3 \rangle
\]

and it follows that

\[
\mathbf{n} = \mathbf{u} \times \mathbf{v} = \begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
-2 & 3 & 0 \\
-4 & 0 & 3
\end{vmatrix} = 9\mathbf{i} + 6\mathbf{j} + 12\mathbf{k}
\]

\[
= \langle a, b, c \rangle
\]

is normal to the given plane. Using the direction numbers for \(\mathbf{n}\) and the initial point \((x_1, y_1, z_1) = (2, 1, 1)\), you can determine an equation of the plane to be

\[
a(x - x_1) + b(y - y_1) + c(z - z_1) = 0
\]

\[
9(x - 2) + 6(y - 1) + 12(z - 1) = 0 \quad \text{Standard form}
\]

\[
9x + 6y + 12z - 36 = 0
\]

\[
3x + 2y + 4z - 12 = 0 \quad \text{General form}
\]

Check that each of the three points satisfies the equation \(3x + 2y + 4z - 12 = 0\).

**Example 3** Finding an Equation of a Plane in Three-Space

Two distinct planes in three-space either are parallel or intersect in a line. If they intersect, you can determine the angle \(\theta\) \((0 \leq \theta \leq 90^\circ)\) between them from the angle between their normal vectors, as shown in Figure 11.30. Specifically, if vectors \(\mathbf{n}_1\) and \(\mathbf{n}_2\) are normal to two intersecting planes, the angle \(\theta\) between the normal vectors is equal to the **angle between the two planes** and is given by

\[
\cos \theta = \frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{\| \mathbf{n}_1 \| \| \mathbf{n}_2 \|}
\]

\[
\text{Angle between two planes}
\]

Consequently, two planes with normal vectors \(\mathbf{n}_1\) and \(\mathbf{n}_2\) are

1. **perpendicular** if \(\mathbf{n}_1 \cdot \mathbf{n}_2 = 0\).
2. **parallel** if \(\mathbf{n}_1\) is a scalar multiple of \(\mathbf{n}_2\). 

**Checkpoint** Now try Exercise 29.
Finding the Line of Intersection of Two Planes

Find the angle between the two planes given by

\[ x - 2y + z = 0 \quad \text{Equation for plane 1} \]
\[ 2x + 3y - 2z = 0 \quad \text{Equation for plane 2} \]

and find parametric equations of their line of intersection (see Figure 11.31).

Solution

The normal vectors for the planes are \( \mathbf{n}_1 = \langle 1, -2, 1 \rangle \) and \( \mathbf{n}_2 = \langle 2, 3, -2 \rangle \). Consequently, the angle between the two planes is determined as follows.

\[
\cos \theta = \frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{\|\mathbf{n}_1\| \|\mathbf{n}_2\|} = \frac{|-6|}{\sqrt{6} \sqrt{17}} = \frac{6}{\sqrt{102}} \approx 0.59409.
\]

This implies that the angle between the two planes is \( \theta \approx 53.55^\circ \). You can find the line of intersection of the two planes by simultaneously solving the two linear equations representing the planes. One way to do this is to multiply the first equation by \(-2\) and add the result to the second equation.

\[
\begin{align*}
2x + 3y - 2z &= 0 \\
-2x + 4y - 2z &= 0
\end{align*}
\]

\[ 7y - 4z = 0 \quad \Rightarrow \quad y = \frac{4z}{7} \]

Substituting \( y = \frac{4z}{7} \) back into one of the original equations, you can determine that \( x = \frac{z}{7} \). Finally, by letting \( t = \frac{z}{7} \), you obtain the parametric equations

\[
\begin{align*}
x &= t = x_1 + at \quad \text{Parametric equation for } x \\
y &= 4t = y_1 + bt \quad \text{Parametric equation for } y \\
z &= 7t = z_1 + ct \quad \text{Parametric equation for } z
\end{align*}
\]

Because \( (x_1, y_1, z_1) = (0, 0, 0) \) lies in both planes, you can substitute for \( x_1, y_1, \) and \( z_1 \) in these parametric equations, which indicates that \( a = 1, b = 4, \) and \( c = 7 \) are direction numbers for the line of intersection.

Check Point

Now try Exercise 47.

Note that the direction numbers in Example 4 can also be obtained from the cross product of the two normal vectors as follows.

\[
\mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix}
i & j & k \\
1 & -2 & 1 \\
2 & 3 & -2 \\
\end{vmatrix} = \begin{vmatrix}
-2 & 1 & 1 \\
-2 & 2 & -2 \\
3 & -2 & 2 \\
\end{vmatrix} \mathbf{i} + \begin{vmatrix}
1 & 1 & 1 \\
-2 & 2 & -2 \\
-2 & 3 & 2 \\
\end{vmatrix} \mathbf{j} + \begin{vmatrix}
1 & 1 & 1 \\
-2 & 2 & -2 \\
3 & -2 & 2 \\
\end{vmatrix} \mathbf{k}
\]

\[ = \mathbf{i} + 4\mathbf{j} + 7\mathbf{k} \]

This means that the line of intersection of the two planes is parallel to the cross product of their normal vectors.
Sketching Planes in Space

As discussed in Section 11.1, if a plane in space intersects one of the coordinate planes, the line of intersection is called the trace of the given plane in the coordinate plane. To sketch a plane in space, it is helpful to find its points of intersection with the coordinate axes and its traces in the coordinate planes. For example, consider the plane

\[ 3x + 2y + 4z = 12. \]

Equation of plane

You can find the xy-trace by letting \( z = 0 \) and sketching the line

\[ 3x + 2y = 12 \]

\( xy \)-trace

in the \( xy \)-plane. This line intersects the \( x \)-axis at \((4, 0, 0)\) and the \( y \)-axis at \((0, 6, 0)\). In Figure 11.32, this process is continued by finding the \( yz \)-trace and the \( xz \)-trace and then shading the triangular region lying in the first octant.

![Figure 11.32](image)

If the equation of a plane has a missing variable, such as \( 2x + z = 1 \), the plane must be parallel to the axis represented by the missing variable, as shown in Figure 11.33. If two variables are missing from the equation of a plane, then it is parallel to the coordinate plane represented by the missing variables, as shown in Figure 11.34.

![Figure 11.33](image)

![Figure 11.34](image)

**TECHNOLOGY**

Most three-dimensional graphing utilities and computer algebra systems can graph a plane in space. Consult the user's guide for your utility for specific instructions.

Chapter 11 Analytic Geometry in Three Dimensions
Distance Between a Point and a Plane

The distance $D$ between a point $Q$ and a plane is the length of the shortest line segment connecting $Q$ to the plane, as shown in Figure 11.35. If $P$ is any point in the plane, you can find this distance by projecting the vector $\overrightarrow{PQ}$ onto the normal vector $\mathbf{n}$. The length of this projection is the desired distance.

Distance Between a Point and a Plane

The distance between a plane and a point $Q$ (not in the plane) is

$$D = \|\text{proj}_n \overrightarrow{PQ}\|$$

$$= \frac{|\overrightarrow{PQ} \cdot \mathbf{n}|}{\|\mathbf{n}\|}$$

where $P$ is a point in the plane and $\mathbf{n}$ is normal to the plane.

To find a point in the plane given by $ax + by + cz + d = 0$, where $a \neq 0$, let $y = 0$ and $z = 0$. Then, from the equation $ax + d = 0$, you can conclude that the point $(-d/a, 0, 0)$ lies in the plane.

Example 5 Finding the Distance Between a Point and a Plane

Find the distance between the point $Q(1, 5, -4)$ and the plane $3x - y + 2z = 6$.

Solution

You know that $\mathbf{n} = \langle 3, -1, 2 \rangle$ is normal to the given plane. To find a point in the plane, let $y = 0$ and $z = 0$, and obtain the point $P(2, 0, 0)$. The vector from $P$ to $Q$ is

$$\overrightarrow{PQ} = \langle 1 - 2, 5 - 0, -4 - 0 \rangle$$

$$= \langle -1, 5, -4 \rangle.$$

The formula for the distance between a point and a plane produces

$$D = \frac{|\overrightarrow{PQ} \cdot \mathbf{n}|}{\|\mathbf{n}\|}$$

$$= \frac{|\langle -1, 5, -4 \rangle \cdot \langle 3, -1, 2 \rangle|}{\sqrt{9 + 1 + 4}}$$

$$= \frac{|-3 - 5 - 8|}{\sqrt{14}}$$

$$= \frac{16}{\sqrt{14}}.$$

CHECK POINT Now try Exercise 59.

The choice of the point $P$ in Example 5 is arbitrary. Try choosing a different point to verify that you obtain the same distance.
11.4 **EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. The _____ vector for a line \( L \) is given by \( \mathbf{v} = ______ \).
2. The _____ of a line in space are given by \( x = x_1 + at, y = y_1 + bt, \) and \( z = z_1 + ct \).
3. If the direction numbers \( a, b, \) and \( c \) of the vector \( \mathbf{v} = (a, b, c) \) are all nonzero, you can eliminate the parameter to obtain the _____ _____ of a line.
4. A vector that is perpendicular to a plane is called ______.

**SKILLS AND APPLICATIONS**

In Exercises 5–10, find a set of (a) parametric equations and (b) symmetric equations for the line through the point and parallel to the specified vector or line. (For each line, write the direction numbers as integers.)

<table>
<thead>
<tr>
<th>Point</th>
<th>Parallel to</th>
</tr>
</thead>
<tbody>
<tr>
<td>5. ( (0, 0, 0) )</td>
<td>( \mathbf{v} = (1, 2, 3) )</td>
</tr>
<tr>
<td>6. ( (3, -5, 1) )</td>
<td>( \mathbf{v} = (3, -7, -10) )</td>
</tr>
<tr>
<td>7. ( (-4, 1, 0) )</td>
<td>( \mathbf{v} = \frac{1}{2}i + \frac{3}{2}j - k )</td>
</tr>
<tr>
<td>8. ( (-2, 0, 3) )</td>
<td>( \mathbf{v} = 2i + 4j - 2k )</td>
</tr>
<tr>
<td>9. ( (2, -3, 5) )</td>
<td>( x = 5 + 2t, y = 7 - 3t, z = -2 + t )</td>
</tr>
<tr>
<td>10. ( (1, 0, 1) )</td>
<td>( x = 3 + 3t, y = 5 - 2t, z = -7 + t )</td>
</tr>
</tbody>
</table>

In Exercises 11–18, find (a) a set of parametric equations and (b) if possible, a set of symmetric equations of the line that passes through the given points. (For each line, write the direction numbers as integers.)

| 11. \( (2, 0, 2), (1, 4, -3) \) | 12. \( (2, 3, 0), (10, 8, 12) \) |
| 13. \( (-3, 8, 15), (1, -2, 16) \) | 14. \( (2, 3, -1), (1, -5, 3) \) |
| 15. \( (3, 1, 2), (-1, 1, 5) \) | 16. \( (2, -1, 5), (2, 1, -3) \) |
| 17. \( (-\frac{1}{2}, 2, \frac{1}{2}), (1, -\frac{1}{2}, 0) \) | 18. \( (-\frac{3}{2}, \frac{3}{2}, 2), (3, -5, -4) \) |

In Exercises 19 and 20, sketch a graph of the line.

19. \( x = 2t, y = 2 + t, \) \( z = 1 + \frac{3}{2}t \)  
20. \( x = 5 - 2t, y = 1 + t, \) \( z = 5 - \frac{3}{2}t \) 

In Exercises 21–26, find the general form of the equation of the plane passing through the point and perpendicular to the specified vector or line.

<table>
<thead>
<tr>
<th>Point</th>
<th>Perpendicular to</th>
</tr>
</thead>
<tbody>
<tr>
<td>21. ( (2, 1, 2) )</td>
<td>( \mathbf{n} = i )</td>
</tr>
<tr>
<td>22. ( (1, 0, -3) )</td>
<td>( \mathbf{n} = k )</td>
</tr>
<tr>
<td>23. ( (5, 6, 3) )</td>
<td>( \mathbf{n} = -2i + j - 2k )</td>
</tr>
<tr>
<td>24. ( (0, 0, 0) )</td>
<td>( \mathbf{n} = -3j + 5k )</td>

<tr>
<td>25. ( (2, 0, 0) )</td>
<td>( x = 3 - t, y = 2 - 2t, z = 4 + t )</td>
</tr>
<tr>
<td>26. ( (0, 0, 6) )</td>
<td>( x = 1 - t, y = 2 + t, z = 4 - 2t )</td>
</tr>
</tbody>
</table>

In Exercises 27–30, find the general form of the equation of the plane passing through the three points.

27. \( (0, 0, 0), (1, 2, 3), (-2, 3, 3) \) 
28. \( (4, -1, 3), (2, 5, 1), (-1, 2, 1) \) 
29. \( (2, 3, -2), (3, 4, 2), (1, -1, 0) \) 
30. \( (5, -1, 4), (1, -1, 2), (2, 1, -3) \) 

In Exercises 31–36, find the general form of the equation of the plane with the given characteristics.

31. Passes through \( (2, 5, 3) \) and is parallel to the \( xz \)-plane 
32. Passes through \( (1, 2, 3) \) and is parallel to the \( yz \)-plane 
33. Passes through \( (0, 2, 4) \) and \( (-1, -2, 0) \) and is perpendicular to the \( yz \)-plane 
34. Passes through \( (1, -2, 4) \) and \( (4, 0, -1) \) and is perpendicular to the \( xz \)-plane 
35. Passes through \( (2, 2, 1) \) and \( (-1, 1, -1) \) and is perpendicular to \( 2x - 3y + z = 3 \) 
36. Passes through \( (1, 2, 0) \) and \( (-1, -1, 2) \) and is perpendicular to \( 2x - 3y + z = 6 \) 

In Exercises 37–40, determine whether the planes are parallel, orthogonal, or neither. If they are neither parallel nor orthogonal, find the angle of intersection.

37. \( 5x - 3y + z = 4 \) 38. \( 3x + y - 4z = 3 \) 
\( x + 4y + 7z = 1 \)  \( -9x - 3y + 12z = 4 \) 
39. \( 2x - z = 1 \) 40. \( x - 5y - z = 1 \) 
\( 4x + y + 8z = 10 \) \( 5x - 25y - 5z = -3 \) 

In Exercises 41–46, find a set of parametric equations of the line. (There are many correct answers.)

41. Passes through \( (2, 3, 4) \) and is parallel to the \( xz \)-plane and the \( yz \)-plane 
42. Passes through \( (-4, 5, 2) \) and is parallel to the \( xy \)-plane and the \( yz \)-plane 
43. Passes through \( (2, 3, 4) \) and is perpendicular to \( 3x + 2y - z = 6 \) 

44. Passes through \((-4, 5, 2)\) and is perpendicular to \(-x + 2y + z = 5\)
45. Passes through \((5, -3, -4)\) and is parallel to \(v = (2, -1, 3)\)
46. Passes through \((-1, 4, -3)\) and is parallel to \(v = 5i - j\)

In Exercises 47–50, (a) find the angle between the two planes and (b) find parametric equations of their line of intersection.

47. \(3x - 4y + 5z = 6\) \hspace{1cm} 48. \(x - 3y + z = -2\) \hspace{1cm} \(x + y - z = 2\)
49. \(x + y - z = 0\) \hspace{1cm} 50. \(2x + 4y - 2z = 1\) \hspace{1cm} \(2x - 5y - z = 1\)

51. \(x + 2y + 3z = 6\) \hspace{1cm} 52. \(2x - y + 4z = 4\)
53. \(x + 2y = 4\) \hspace{1cm} 54. \(y + z = 5\)
55. \(3x + 2y - z = 6\) \hspace{1cm} 56. \(x - 3z = 6\)

In Exercises 57–60, find the distance between the point and the plane.

57. \((0, 0, 0)\) \hspace{1cm} 58. \((3, 2, 1)\)

\[ 8x - 4y + z = 8 \hspace{1cm} x - y + 2z = 4 \]

59. \((4, -2, -2)\) \hspace{1cm} 60. \((-1, 2, 5)\)

\[ 2x - y + z = 4 \hspace{1cm} 2x + 3y + z = 12 \]

61. **DATA ANALYSIS: BEVERAGE CONSUMPTION**

The table shows the per capita consumption (in gallons) of different types of beverages sold by a company from 2006 through 2010. Consumption of energy drinks, soft drinks, and bottled water are represented by the variables \(x\), \(y\), and \(z\), respectively.

<table>
<thead>
<tr>
<th>Year</th>
<th>(x)</th>

</tbody>
</table>

A model for the data is given by \(1.54x - 0.32y - z = -1.45\).

(a) Complete a fifth column in the table using the model to approximate \(z\) for the given values of \(x\) and \(y\).
(b) Compare the approximations from part (a) with the actual values of \(z\).

(c) According to this model, any increases or decreases in consumption of two types of beverages will have what effect on the consumption of the third type of beverage?

62. **MECHANICAL DESIGN**

A chute at the top of a grain elevator of a combine funnels the grain into a bin, as shown in the figure. Find the angle between two adjacent sides.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 63 and 64, determine whether the statement is true or false. Justify your answer.

63. Every two lines in space are either intersecting or parallel.  
64. Two nonparallel planes in space will always intersect.

65. The direction numbers of two distinct lines in space are 10, 20, and 27. What is the relationship between the lines? Explain.

66. Consider the following four planes.

\[ 2x + 3y - z = 2 \]
\[ 4x + 6y - 2z = 5 \]
\[-2x - 3y + z = -2 \]
\[ -6x - 9y + 3z = 11 \]

What are the normal vectors for each plane? What can you say about the relative positions of these planes in space?

67. (a) Describe and find an equation for the surface generated by all points \((x, y, z)\) that are two units from the point \((4, -1, 1)\).

(b) Describe and find an equation for the surface generated by all points \((x, y, z)\) that are two units from the plane \(4x - 3y + z = 10\).

68. **CAPSTONE**

Give the parametric equations and the symmetric equations of a line in space. Describe what is required to find these equations.

| **Find distances between points and planes in space** *(p. 837)* | **Distance Between a Point and a Plane**<br>The distance between a plane and a point \( Q \) (not in the plane) is<br><br>\[
D = \left\| \text{proj}_n \mathbf{PQ} \right\| = \frac{\left| \mathbf{PQ} \cdot \mathbf{n} \right|}{\left\| \mathbf{n} \right\|}
\]
where \( P \) is a point in the plane and \( \mathbf{n} \) is normal to the plane. | 71–74 |
11.1 In Exercises 1 and 2, plot each point in the same three-dimensional coordinate system.

1. (a) (5, −1, 2) (b) (−3, 3, 0)
2. (a) (2, 4, −3) (b) (0, 0, 5)

3. Find the coordinates of the point located on the -axis and seven units to the left of the -plane.
4. Find the coordinates of the point located on the -axis and seven units to the left of the -plane.

5. In Exercises 5–8, find the distance between the points.
5. (4, 0, 7), (5, 2, 1) 6. (2, 3, −4), (−1, −3, 0)
7. (−7, −5, 6), (1, 1, 6) 8. (0, 0, 0), (4, 4, 4)

In Exercises 9 and 10, find the lengths of the sides of the right triangle. Show that these lengths satisfy the Pythagorean Theorem.

9. 
10. 

In Exercises 11–14, find the midpoint of the line segment joining the points.
11. (8, −2, 3), (5, 6, 7) 12. (7, 1, −4), (1, −1, 2)
13. (10, 6, −12), (−8, −2, −6) 14. (−5, −3, 1), (−7, −9, −5)

In Exercises 15–20, find the standard form of the equation of the sphere with the given characteristics.
15. Center: (2, 3, 5); radius: 1
16. Center: (3, −2, 4); radius: 4
17. Center: (1, 5, 2); diameter: 12
18. Center: (0, 4, −1); diameter: 15
19. Endpoints of a diameter: (−2, −2, −2), (2, 2, 2)
20. Endpoints of a diameter: (4, −1, −3), (−2, 5, 3)

In Exercises 21–24, find the center and radius of the sphere.
21. \( x^2 + y^2 + z^2 - 8z = 0 \)
22. \( x^2 + y^2 + z^2 - 4x - 6y + 4 = 0 \)
23. \( x^2 + y^2 + z^2 - 10x + 6y - 4z + 34 = 0 \)
24. \( 2x^2 + 2y^2 + 2z^2 + 2x + 2y + 2z + 1 = 0 \)

In Exercises 25 and 26, sketch the graph of the equation and sketch the specified trace.
25. \( x^2 + (y - 3)^2 + z^2 = 16 \)
(a) \( xz\)-trace (b) \( yz\)-trace
26. \( (x + 2)^2 + (y - 1)^2 + z^2 = 9 \)
(a) \( xy\)-trace (b) \( yz\)-trace

In Exercises 27–30, (a) write the component form of the vector \( \mathbf{v} \), (b) find the magnitude of \( \mathbf{v} \), and (c) find a unit vector in the direction of \( \mathbf{v} \).
27. Initial point: (3, −2, 1) Terminal point: (4, 4, 0)
28. Initial point: (2, −1, 2) Terminal point: (−3, 2, 3)
29. Initial point: (7, −4, 3) Terminal point: (−3, 2, 10)
30. Initial point: (0, 3, −1) Terminal point: (5, −8, 6)

In Exercises 31–34, find the dot product of \( \mathbf{u} \) and \( \mathbf{v} \).
31. \( \mathbf{u} = (-1, 4, 3) \) 32. \( \mathbf{u} = (8, -4, 2) \)
\( \mathbf{v} = (0, -6, 5) \) \( \mathbf{v} = (2, 5, 2) \)
33. \( \mathbf{u} = 2i - j + k \) 34. \( \mathbf{u} = 2i + j - 2k \)
\( \mathbf{v} = i - k \) \( \mathbf{v} = i - 3j + 2k \)

In Exercises 35 and 36, find the angle \( \theta \) between the vectors.
35. \( \mathbf{u} = (2, -1, 0) \) 36. \( \mathbf{u} = (3, 1, -1) \)
\( \mathbf{v} = (1, 2, 1) \) \( \mathbf{v} = (4, 5, 2) \)

In Exercises 37–40, determine whether \( \mathbf{u} \) and \( \mathbf{v} \) are orthogonal, parallel, or neither.
37. \( \mathbf{u} = (39, -12, 21) \) 38. \( \mathbf{u} = (8, 5, -8) \)
\( \mathbf{v} = (-26, 8, -14) \) \( \mathbf{v} = (-2, 4, \frac{1}{2}) \)
39. \( \mathbf{u} = 6i + 5j + 9k \) 40. \( \mathbf{u} = 3j + 2k \)
\( \mathbf{v} = 5i + 3j - 5k \) \( \mathbf{v} = 12i - 18k \)
In Exercises 41–44, use vectors to determine whether the points are collinear.

41. (6, 3, −1), (5, 8, 3), (7, −2, −5)
42. (5, 2, 0), (2, 6, 1), (2, 4, 7)
43. (5, −4, 7), (8, −5, 5), (11, 6, 3)
44. (3, 4, −1), (−1, 6, 9), (5, 3, −6)

45. TENSION A load of 300 pounds is supported by three cables, as shown in the figure. Find the tension in each of the supporting cables.

46. TENSION Determine the tension in each of the supporting cables in Exercise 45 if the load is 200 pounds.

In Exercises 47–50, find \(\mathbf{u} \times \mathbf{v}\).

47. \(\mathbf{u} = (-2, 8, 2)\) \(\mathbf{v} = (1, 1, -1)\)
48. \(\mathbf{u} = (10, 15, 5)\) \(\mathbf{v} = (5, -3, 0)\)
49. \(\mathbf{u} = 2\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}\) \(\mathbf{v} = 3\mathbf{i} + \mathbf{j} + 2\mathbf{k}\)
50. \(\mathbf{u} = -\mathbf{i} + 2\mathbf{j} - 2\mathbf{k}\) \(\mathbf{v} = \mathbf{i}\)

In Exercises 51–54, find a unit vector orthogonal to \(\mathbf{u}\) and \(\mathbf{v}\).

51. \(\mathbf{u} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}\) \(\mathbf{v} = -\mathbf{i} + \mathbf{j} - 2\mathbf{k}\)
52. \(\mathbf{u} = \mathbf{j} + 4\mathbf{k}\) \(\mathbf{v} = -\mathbf{i} + 3\mathbf{j}\)
53. \(\mathbf{u} = -3\mathbf{i} + 2\mathbf{j} - 5\mathbf{k}\) \(\mathbf{v} = 10\mathbf{i} - 15\mathbf{j} + 2\mathbf{k}\)
54. \(\mathbf{u} = 4\mathbf{k}\) \(\mathbf{v} = \mathbf{i} + 12\mathbf{k}\)

In Exercises 55 and 56, verify that the points are the vertices of a parallelogram and find its area.

55. (2, −1, 1), (5, 1, 4), (0, 1, 1), (3, 3, 4)
56. (0, 4, 0), (1, 4, 1), (0, 6, 0), (1, 6, 1)

In Exercises 57 and 58, find the volume of the parallelepiped with the given vertices.

57. \(A(0, 0, 0), B(3, 0, 0), C(0, 5, 1), D(3, 5, 1), E(2, 0, 5), F(5, 0, 5), G(2, 5, 6), H(5, 5, 6)\)
58. \(A(0, 0, 0), B(2, 0, 0), C(2, 4, 0), D(0, 4, 0), E(0, 0, 6), F(2, 0, 6), G(2, 4, 6), H(0, 4, 6)\)

11.4 In Exercises 59–62, find a set of (a) parametric equations and (b) symmetric equations for the specified line.

59. Passes through \((-1, 3, 5)\) and \((3, 6, -1)\)
60. Passes through \((0, -10, 3)\) and \((5, 10, 0)\)
61. Passes through \((0, 0, 0)\) and is parallel to \(\mathbf{v} = \langle -2, \frac{3}{2}, 1 \rangle\)
62. Passes through \((3, 2, 1)\) and is parallel to the line given by \(x = y = z\)

In Exercises 63–66, find the general form of the equation of the specified plane.

63. Passes through \((0, 0, 0), (5, 0, 2), \) and \((2, 3, 8)\)
64. Passes through \((-1, 3, 4), (4, -2, 2), \) and \((2, 8, 6)\)
65. Passes through \((5, 3, 2)\) and is parallel to the \(xy\)-plane
66. Passes through \((0, 0, 6)\) and is perpendicular to the line given by \(x = 1 - t, y = 2 + t, \) and \(z = 4 - 2t\)

In Exercises 67–70, plot the intercepts and sketch a graph of the plane.

67. \(3x - 2y + 3z = 6\)
68. \(5x - y - 5z = 5\)
69. \(2x - 3z = 6\)
70. \(4y - 3z = 12\)

In Exercises 71–74, find the distance between the point and the plane.

71. \((1, 2, 3)\)
72. \((2, 3, 10)\)
\[2x - y + z = 4\]
\[x - 10y + 3z = 3\]
73. \((0, 0, 0)\)
74. \((0, 0, 0)\)
\[2x + 3y + z = 12\]
\[x - 10y + 3z = 2\]

EXPLORATION

TRUE OR FALSE? In Exercises 75 and 76, determine whether the statement is true or false. Justify your answer.

75. The cross product is commutative.
76. The triple scalar product of three vectors in space is a scalar.

In Exercises 77 and 78, let \(\mathbf{u} = \langle u_1, u_2, u_3 \rangle, \mathbf{v} = \langle v_1, v_2, v_3 \rangle, \) and \(\mathbf{w} = \langle w_1, w_2, w_3 \rangle.\)

77. Show that \(\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}.\)
78. Show that \(\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w}).\)
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

1. Plot each point in the same three-dimensional coordinate system.
   (a) (3, −7, 2)
   (b) (2, 2, −1)

In Exercises 2–4, use the points A(8, −2, 5), B(6, 4, −1), and C(−4, 3, 0), to solve the problem.

2. Consider the triangle with vertices A, B, and C. Is it a right triangle? Explain.
3. Find the coordinates of the midpoint of the line segment joining points A and B.
4. Find the standard form of the equation of the sphere for which A and B are the endpoints of a diameter. Sketch the sphere and its xz-trace.

In Exercises 5–9, let u and v be the vectors from A(8, −2, 5) to B(6, 4, −1) and from A to C(−4, 3, 0), respectively.

5. Write u and v in component form.
6. Find (a) u · v and (b) u × v.
7. Find (a) a unit vector in the direction of u and (b) a unit vector in the direction of v.
8. Find the angle between u and v.
9. Find a set of (a) parametric equations and (b) symmetric equations for the line through points A and B.

In Exercises 10–12, determine whether u and v are orthogonal, parallel, or neither.

10. u = i − 2j − k
11. u = −3i + 2j − k
12. u = <4, −1, 6>
   v = j + 6k
   v = i + j − k
   v = <−2, 1, −3>

13. Verify that the points A(2, −3, 1), B(6, 5, −1), C(3, −6, 4), and D(7, 2, 2) are the vertices of a parallelogram, and find its area.
14. Find the volume of the parallelepiped at the left with the given vertices.
   A(0, 0, 5), B(0, 10, 5), C(4, 10, 5), D(4, 0, 5),
   E(0, 1, 0), F(0, 11, 0), G(4, 11, 0), H(4, 1, 0)

In Exercises 15 and 16, plot the intercepts and sketch a graph of the plane.

15. 3x + 6y + 2z = 18
16. 5x − y − 2z = 10

17. Find the general form of the equation of the plane passing through the points
   (−3, −4, 2), (−3, 4, 1), and (1, 1, −2).
18. Find the distance between the point (2, −1, 6) and the plane 3x − 2y + z = 6.
19. A tractor fuel tank has the shape and dimensions shown in the figure. In fabricating
the tank, it is necessary to know the angle between two adjacent sides. Find this
angle.
The system was a departure from a system to represent physical quantities called vector analysis. The system was a departure from William Hamilton’s theory of quaternions.

### Notation for Dot and Cross Products

The notation for the dot product and the cross product of vectors was first introduced by the American physicist Josiah Willard Gibbs (1839–1903). In the early 1880s, Gibbs built a system to represent physical quantities as vectors in space and let $c$ be a scalar.

1. $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$
2. $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w})$
3. $c(\mathbf{u} \times \mathbf{v}) = (cu) \times \mathbf{v} = c(\mathbf{u} \times \mathbf{v})$
4. $\mathbf{u} \times 0 = 0 \times \mathbf{u} = 0$
5. $\mathbf{u} \times \mathbf{u} = 0$
6. $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$

### Algebraic Properties of the Cross Product (p. 825)

Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors in space and let $c$ be a scalar.

1. $\mathbf{u} \times \mathbf{v} = (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}$
2. $\mathbf{v} \times \mathbf{u} = (v_2u_3 - v_3u_2)\mathbf{i} - (v_1u_3 - v_3u_1)\mathbf{j} + (v_1u_2 - v_2u_1)\mathbf{k}$

So, this implies $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$.

2. $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = [u_2(v_3 + w_3) - u_3(v_2 + w_2)]\mathbf{i} - [u_1(v_3 + w_3) - u_3(v_1 + w_1)]\mathbf{j} + [u_1(v_2 + w_2) - u_2(v_1 + w_1)]\mathbf{k}$

3. $(cu) \times \mathbf{v} = (cu_2v_3 - cu_3v_2)\mathbf{i} - (cu_1v_3 - cu_3v_1)\mathbf{j} + (cu_1v_2 - cu_2v_1)\mathbf{k}$

4. $\mathbf{u} \times 0 = (u_2 \cdot 0 - u_3 \cdot 0)\mathbf{i} - (u_1 \cdot 0 - u_3 \cdot 0)\mathbf{j} + (u_1 \cdot 0 - u_2 \cdot 0)\mathbf{k}$

So, this implies $\mathbf{u} \times 0 = 0 \times \mathbf{u} = 0$.

5. $\mathbf{u} \times \mathbf{u} = (u_2u_3 - u_3u_2)\mathbf{i} - (u_1u_3 - u_3u_1)\mathbf{j} + (u_1u_2 - u_2u_1)\mathbf{k} = 0$

6. $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \det \begin{bmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{bmatrix}$

$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = u_1(v_2w_3 - w_2v_3) - u_2(v_1w_3 - w_1v_3) + u_3(v_1w_2 - w_1v_2)$

$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = u_1v_2w_3 - u_2v_1w_3 + u_3v_1w_2 - u_3v_2w_1$

$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = u_2v_1w_3 - u_3v_1w_2 + u_3v_2w_1 - u_2v_2w_3$

$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = w_1(u_2v_3 - v_2u_3) - w_2(u_1v_3 - v_1u_3) + w_3(u_1v_2 - v_2u_1)$

$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$
Geometric Properties of the Cross Product  (p. 826)

Let \( \mathbf{u} \) and \( \mathbf{v} \) be nonzero vectors in space, and let \( \theta \) be the angle between \( \mathbf{u} \) and \( \mathbf{v} \).

1. \( \mathbf{u} \times \mathbf{v} \) is orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \).
2. \( \|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta \)
3. \( \mathbf{u} \times \mathbf{v} = \mathbf{0} \) if and only if \( \mathbf{u} \) and \( \mathbf{v} \) are scalar multiples of each other.
4. \( \|\mathbf{u} \times \mathbf{v}\| = \) area of parallelogram having \( \mathbf{u} \) and \( \mathbf{v} \) as adjacent sides.

Proof

Let \( \mathbf{u} = u_1 \mathbf{i} + u_2 \mathbf{j} + u_3 \mathbf{k} \), \( \mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j} + v_3 \mathbf{k} \), and \( \mathbf{0} = 0 \mathbf{i} + 0 \mathbf{j} + 0 \mathbf{k} \).

1. \( \mathbf{u} \times \mathbf{v} = (u_2 v_3 - u_3 v_2) \mathbf{i} - (u_1 v_3 - u_3 v_1) \mathbf{j} + (u_1 v_2 - u_2 v_1) \mathbf{k} \)

\[ (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{u} = (u_2 v_3 - u_3 v_2) u_1 - (u_1 v_3 - u_3 v_1) u_2 + (u_1 v_2 - u_2 v_1) u_3 \]
\[ = u_1 u_2 v_3 - u_1 u_3 v_2 - u_1 u_3 v_3 + u_2 u_3 v_1 + u_1 u_3 v_2 - u_2 u_3 v_1 = 0 \]

\( \mathbf{u} \times \mathbf{v} \times \mathbf{v} = (u_2 v_3 - u_3 v_2) v_1 - (u_1 v_3 - u_3 v_1) v_2 + (u_1 v_2 - u_2 v_1) v_3 \]
\[ = u_2 v_3 v_1 - u_3 v_2 v_1 + u_1 v_3 v_2 - u_2 v_1 v_3 = 0 \]

Because two vectors are orthogonal if their dot product is zero, it follows that \( \mathbf{u} \times \mathbf{v} \) is orthogonal to both \( \mathbf{u} \) and \( \mathbf{v} \).

2. Note that \( \cos \theta = \frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|} \). So,
\[ \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta = \|\mathbf{u}\| \|\mathbf{v}\| \sqrt{1 - \cos^2 \theta} \]
\[ = \|\mathbf{u}\| \|\mathbf{v}\| \sqrt{1 - \left(\frac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\| \|\mathbf{v}\|}\right)^2} \]
\[ = \sqrt{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2} \]
\[ = \sqrt{(u_1^2 + u_2^2 + u_3^2)(v_1^2 + v_2^2 + v_3^2) - (u_1 v_1 + u_2 v_2 + u_3 v_3)^2} \]
\[ = \sqrt{(u_1 v_3 - u_3 v_1)^2 + (u_1 v_2 - u_2 v_1)^2 + (u_2 v_3 - u_3 v_2)^2} = \|\mathbf{u} \times \mathbf{v}\| \]

3. If \( \mathbf{u} \) and \( \mathbf{v} \) are scalar multiples of each other, then \( \mathbf{u} = c \mathbf{v} \) for some scalar \( c \).
\[ \mathbf{u} \times \mathbf{v} = (c \mathbf{v}) \times \mathbf{v} = c(\mathbf{v} \times \mathbf{v}) = c(\mathbf{0}) = \mathbf{0} \]

If \( \mathbf{u} \times \mathbf{v} = \mathbf{0} \), then \( \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta = 0 \). (Assume \( \mathbf{u} \neq \mathbf{0} \) and \( \mathbf{v} \neq \mathbf{0} \).) So, \( \sin \theta = 0 \), and \( \theta = 0 \) or \( \theta = \pi \). In either case, because \( \theta \) is the angle between the vectors, \( \mathbf{u} \) and \( \mathbf{v} \) are parallel. So, \( \mathbf{u} = c \mathbf{v} \) for some scalar \( c \).

4. The figure at the left is a parallelogram having \( \mathbf{v} \) and \( \mathbf{u} \) as adjacent sides. Because the height of the parallelogram is \( \|\mathbf{v}\| \sin \theta \), the area is
\[ \text{Area} = (\text{base})(\text{height}) \]
\[ = \|\mathbf{u}\| \|\mathbf{v}\| \sin \theta \]
\[ = \|\mathbf{u} \times \mathbf{v}\|. \]
PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. Let \( \mathbf{u} = i + j, \mathbf{v} = j + k, \) and \( \mathbf{w} = a\mathbf{u} + b\mathbf{v}. \)
   (a) Sketch \( \mathbf{u} \) and \( \mathbf{v}. \)
   (b) If \( \mathbf{w} = 0, \) show that \( a \) and \( b \) must both be zero.
   (c) Find \( a \) and \( b \) such that \( \mathbf{w} = i + 2j + k. \)
   (d) Show that no choice of \( a \) and \( b \) yields \( \mathbf{w} = i + 2j + 3k. \)

2. The initial and terminal points of \( \mathbf{v} \) are \( (x_1, y_1, z_1) \) and \( (x, y, z), \) respectively. Describe the set of all points \( (x, y, z) \) such that \( ||\mathbf{v}|| = 4. \)

3. You are given the component forms of the vectors \( \mathbf{u} \) and \( \mathbf{v}. \) Write a program for a graphing utility in which the output is \( \mathbf{a) \; the \; component \; form \; of \; \mathbf{u + v}, \mathbf{b) \; ||\mathbf{u} + \mathbf{v}||, \mathbf{c) \; ||\mathbf{u}||, \mathbf{d) \; ||\mathbf{v}||.} \)

4. Run the program you wrote in Exercise 3 for the vectors \( \mathbf{u} = \langle -1, 3, 4 \rangle \) and \( \mathbf{v} = \langle 5, 4.5, -6 \rangle. \)

5. The vertices of a triangle are given. Determine whether the triangle is an acute triangle, an obtuse triangle, or a right triangle. Explain your reasoning.
   (a) \( (1, 2, 0), (0, 0, 0), (-2, 1, 0) \)
   (b) \( (-3, 0, 0), (0, 0, 0), (1, 2, 3) \)
   (c) \( (2, -3, 4), (0, 1, 2), (-1, 2, 0) \)
   (d) \( (2, -7, 3), (-1, 5, 8), (4, 6, -1) \)

6. A television camera weighing 120 pounds is supported by a tripod (see figure). Represent the force exerted on each leg of the tripod as a vector.

7. A precast concrete wall is temporarily kept in its vertical position by ropes (see figure). Find the total force exerted on the pin at position \( A. \) The tensions in \( AB \) and \( AC \) are 420 pounds and 650 pounds, respectively.

8. Prove \( ||\mathbf{u} \times \mathbf{v}|| = ||\mathbf{u}|| ||\mathbf{v}|| \) if \( \mathbf{u} \) and \( \mathbf{v} \) are orthogonal.

9. Prove \( \mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w}. \)

10. Prove that the triple scalar product of \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) is given by
    \[
    \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix}
        u_1 & u_2 & u_3 \\
        v_1 & v_2 & v_3 \\
        w_1 & w_2 & w_3
    \end{vmatrix}.
    \]

11. Prove that the volume \( V \) of a parallelepiped with vectors \( \mathbf{u}, \mathbf{v}, \) and \( \mathbf{w} \) as adjacent edges is given by
    \[V = ||\mathbf{u} \times (\mathbf{v} \times \mathbf{w})||.\]

12. In physics, the cross product can be used to measure torque, or the moment \( \mathbf{M} \) of a force \( \mathbf{F} \) about a point \( P. \) If the point of application of the force is \( Q, \) the moment of \( \mathbf{F} \) about \( P \) is given by \( \mathbf{M} = \overrightarrow{PQ} \times \mathbf{F}. \) A force of 60 pounds acts on the pipe wrench shown in the figure.

   (a) Find the magnitude of the moment about \( O. \) Use a graphing utility to graph the resulting function of \( \theta. \)
   (b) Use the result of part (a) to determine the magnitude of the moment when \( \theta = 45^\circ. \)
   (c) Use the result of part (a) to determine the angle \( \theta \) when the magnitude of the moment is maximum. Is the answer what you expected? Why or why not?
13. A force of 200 pounds acts on the bracket shown in the figure.

(a) Determine the vector $\overrightarrow{AB}$ and the vector $\mathbf{F}$ representing the force. ($\mathbf{F}$ will be in terms of $\theta$.)

(b) Find the magnitude of the moment (torque) about $A$ by evaluating $|\overrightarrow{AB} \times \mathbf{F}|$. Use a graphing utility to graph the resulting function of $\theta$ for $0^\circ \leq \theta \leq 180^\circ$.

(c) Use the result of part (b) to determine the magnitude of the moment when $\theta = 30^\circ$.

(d) Use the result of part (b) to determine the angle $\theta$ when the magnitude of the moment is maximum.

(e) Use the graph in part (b) to approximate the zero of the function. Interpret the meaning of the zero in the context of the problem.

14. Using vectors, prove the Law of Sines: If $\mathbf{a}$, $\mathbf{b}$, and $\mathbf{c}$ are three sides of the triangle shown in the figure, then

$$\sin A = \frac{\sin B}{|\mathbf{b}|} = \frac{\sin C}{|\mathbf{c}|}.$$

15. Two insects are crawling along different lines in three-space. At time $t$ (in minutes), the first insect is at the point $(x, y, z)$ on the line given by

$$x = 6 + t, \ y = 8 - t, \ z = 3 + t.$$

Also, at time $t$, the second insect is at the point $(x, y, z)$ on the line given by

$$x = 1 + t, \ y = 2 + t, \ z = 2t.$$

Assume distances are given in inches.

(a) Find the distance between the two insects at time $t = 0$.

(b) Use a graphing utility to graph the distance between the insects from $t = 0$ to $t = 10$.

(c) Using the graph from part (b), what can you conclude about the distance between the insects?

(d) Using the graph from part (b), determine how close the insects get to each other.

16. The distance between a point $Q$ and a line in space is given by

$$D = \frac{|\overrightarrow{PQ} \times \mathbf{u}|}{|\mathbf{u}|}$$

where $\mathbf{u}$ is a direction vector for the line and $P$ is a point on the line. Find the distance between the point and the line given by each set of parametric equations.

(a) $(1, 5, -2)$

$$x = -2 + 4t, \ y = 3, \ z = 1 - t$$

(b) $(1, -2, 4)$

$$x = 2t, \ y = -3 + t, \ z = 2 + 2t$$

17. Use the formula given in Exercise 16.

(a) Find the shortest distance between the point $Q(2, 0, 0)$ and the line determined by the points $P_1(0, 0, 1)$ and $P_2(0, 1, 2)$.

(b) Find the shortest distance between the point $Q(2, 0, 0)$ and the line segment joining the points $P_1(0, 0, 1)$ and $P_2(0, 1, 2)$.

18. Consider the line given by the parametric equations

$$x = -t + 3, \ y = \frac{1}{2}t + 1, \ z = 2t - 1$$

and the point $(4, 3, s)$ for any real number $s$.

(a) Write the distance between the point and the line as a function of $s$. (Hint: Use the formula given in Exercise 16.)

(b) Use a graphing utility to graph the function from part (a). Use the graph to find the value of $s$ such that the distance between the point and the line is a minimum.

(c) Use the zoom feature of the graphing utility to zoom out several times on the graph in part (b). Does it appear that the graph has slant asymptotes? Explain. If it appears to have slant asymptotes, find them.
In Mathematics

If a function becomes arbitrarily close to a unique number \( L \) as \( x \) approaches \( c \) from either side, the limit of the function as \( x \) approaches \( c \) is \( L \).

In Real Life

The fundamental concept of integral calculus is the calculation of the area of a plane region bounded by the graph of a function. For instance, in surveying, a civil engineer uses integration to estimate the areas of irregular plots of real estate. (See Exercises 49 and 50, page 897.)

IN CAREERS

There are many careers that use limit concepts. Several are listed below.

- Market Researcher
  Exercise 74, page 880

- Aquatic Biologist
  Exercise 53, page 888

- Business Economist
  Exercises 55 and 56, page 888

- Data Analyst
  Exercises 57 and 58, pages 888 and 889
The Limit Concept

The notion of a limit is a fundamental concept of calculus. In this chapter, you will learn how to evaluate limits and how they are used in the two basic problems of calculus: the tangent line problem and the area problem.

Example 1 Finding a Rectangle of Maximum Area

You are given 24 inches of wire and are asked to form a rectangle whose area is as large as possible. Determine the dimensions of the rectangle that will produce a maximum area.

Solution

Let \( w \) represent the width of the rectangle and let \( l \) represent the length of the rectangle. Because

\[ 2w + 2l = 24 \]

Perimeter is 24.

it follows that \( l = 12 - w \), as shown in Figure 12.1. So, the area of the rectangle is

\[ A = lw \]

Formula for area

\[ = (12 - w)w \]

Substitute \( 12 - w \) for \( l \).

\[ = 12w - w^2 \]

Simplify.

Using this model for area, you can experiment with different values of \( w \) to see how to obtain the maximum area. After trying several values, it appears that the maximum area occurs when \( w = 6 \), as shown in the table.

<table>
<thead>
<tr>
<th>Width, ( w )</th>
<th>5.0</th>
<th>5.5</th>
<th>5.9</th>
<th>6.0</th>
<th>6.1</th>
<th>6.5</th>
<th>7.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area, ( A )</td>
<td>35.00</td>
<td>35.75</td>
<td>35.99</td>
<td>36.00</td>
<td>35.99</td>
<td>35.75</td>
<td>35.00</td>
</tr>
</tbody>
</table>

In limit terminology, you can say that “the limit of \( A \) as \( w \) approaches 6 is 36.” This is written as

\[ \lim_{w \to 6} A = \lim_{w \to 6} (12w - w^2) = 36. \]

Now try Exercise 5.
Definition of Limit

If \( f(x) \) becomes arbitrarily close to a unique number \( L \) as \( x \) approaches \( c \) from either side, the limit of \( f(x) \) as \( x \) approaches \( c \) is \( L \). This is written as

\[
\lim_{{x \to c}} f(x) = L.
\]

Example 2  
Estimating a Limit Numerically

Use a table to estimate numerically the limit: \( \lim_{{x \to 2}} (3x - 2) \).

Solution

Let \( f(x) = 3x - 2 \). Then construct a table that shows values of \( f(x) \) for two sets of \( x \)-values—one set that approaches 2 from the left and one that approaches 2 from the right.

<table>
<thead>
<tr>
<th>( x )</th>
<th>1.9</th>
<th>1.99</th>
<th>1.999</th>
<th>2.0</th>
<th>2.001</th>
<th>2.01</th>
<th>2.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>3.700</td>
<td>3.970</td>
<td>3.997</td>
<td>?</td>
<td>4.003</td>
<td>4.030</td>
<td>4.300</td>
</tr>
</tbody>
</table>

From the table, it appears that the closer \( x \) gets to 2, the closer \( f(x) \) gets to 4. So, you can estimate the limit to be 4. Figure 12.2 adds further support for this conclusion.

Example 3  
Estimating a Limit Numerically

Use a table to estimate numerically the limit: \( \lim_{{x \to 0}} \frac{x}{\sqrt{x + 1} - 1} \).

Solution

Let \( f(x) = x/(\sqrt{x + 1} - 1) \). Then construct a table that shows values of \( f(x) \) for two sets of \( x \)-values—one set that approaches 0 from the left and one that approaches 0 from the right.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-0.01</th>
<th>-0.001</th>
<th>-0.0001</th>
<th>0</th>
<th>0.0001</th>
<th>0.001</th>
<th>0.01</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>1.99499</td>
<td>1.99949</td>
<td>1.99995</td>
<td>?</td>
<td>2.00005</td>
<td>2.00050</td>
<td>2.00499</td>
</tr>
</tbody>
</table>

From the table, it appears that the limit is 2. The graph shown in Figure 12.3 verifies that the limit is 2.
In Example 3, note that \( f(x) \) has a limit when \( x \to 0 \) even though the function is not defined when \( x = 0 \). This often happens, and it is important to realize that the existence or nonexistence of \( f(x) \) at \( x = c \) has no bearing on the existence of the limit of \( f(x) \) as \( x \) approaches \( c \).

**Example 4**

**Estimating a Limit**

Estimate the limit: \( \lim_{x \to 1} \frac{x^3 - x^2 + x - 1}{x - 1} \).

**Numerical Solution**

Let \( f(x) = \frac{x^3 - x^2 + x - 1}{x - 1} \). Then construct a table that shows values of \( f(x) \) for two sets of \( x \)-values—one set that approaches 1 from the left and one that approaches 1 from the right.

<table>
<thead>
<tr>
<th>( x )</th>
<th>0.9</th>
<th>0.99</th>
<th>0.999</th>
<th>1.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>1.8100</td>
<td>1.9801</td>
<td>1.9980</td>
<td>?</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>( x )</th>
<th>1.0</th>
<th>1.001</th>
<th>1.01</th>
<th>1.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>?</td>
<td>2.0020</td>
<td>2.0201</td>
<td>2.2100</td>
</tr>
</tbody>
</table>

From the tables, it appears that the limit is 2.

**Graphical Solution**

Let \( f(x) = \frac{x^3 - x^2 + x - 1}{x - 1} \). Then sketch a graph of the function, as shown in Figure 12.4. From the graph, it appears that as \( x \) approaches 1 from either side, \( f(x) \) approaches 2. So, you can estimate the limit to be 2.

**Example 5**

**Using a Graph to Find a Limit**

Find the limit of \( f(x) \) as \( x \) approaches 3, where \( f \) is defined as

\[
 f(x) = \begin{cases} 
 2, & x \neq 3 \\
 0, & x = 3
\end{cases}
\]

**Solution**

Because \( f(x) = 2 \) for all \( x \) other than \( x = 3 \) and because the value of \( f(3) \) is immaterial, it follows that the limit is 2 (see Figure 12.5). So, you can write

\[
 \lim_{x \to 3} f(x) = 2.
\]

The fact that \( f(3) = 0 \) has no bearing on the existence or value of the limit as \( x \) approaches 3. For instance, if the function were defined as

\[
 f(x) = \begin{cases} 
 2, & x \neq 3 \\
 4, & x = 3
\end{cases}
\]

the limit as \( x \) approaches 3 would be the same.
Limits That Fail to Exist

Next, you will examine some functions for which limits do not exist.

\[ \lim_{x \to 0} \frac{|x|}{x} \]

**Solution**

Consider the graph of the function given by \( f(x) = \frac{|x|}{x} \). From Figure 12.6, you can see that for positive \( x \)-values

\[
\frac{|x|}{x} = 1, \quad x > 0
\]

and for negative \( x \)-values

\[
\frac{|x|}{x} = -1, \quad x < 0.
\]

This means that no matter how close \( x \) gets to 0, there will be both positive and negative \( x \)-values that yield \( f(x) = 1 \) and \( f(x) = -1 \). This implies that the limit does not exist.

**Example 6** Comparing Left and Right Behavior

Show that the limit does not exist.

**Example 7** Unbounded Behavior

Discuss the existence of the limit.

\[ \lim_{x \to 0} \frac{1}{x^2} \]

**Solution**

Let \( f(x) = 1/x^2 \). In Figure 12.7, note that as \( x \) approaches 0 from either the right or the left, \( f(x) \) increases without bound. This means that by choosing \( x \) close enough to 0, you can force \( f(x) \) to be as large as you want. For instance, \( f(x) \) will be larger than 100 if you choose \( x \) that is within \( \frac{1}{10} \) of 0. That is,

\[
0 < |x| < \frac{1}{10} \quad \Rightarrow \quad f(x) = \frac{1}{x^2} > 100.
\]

Similarly, you can force \( f(x) \) to be larger than 1,000,000, as follows.

\[
0 < |x| < \frac{1}{1000} \quad \Rightarrow \quad f(x) = \frac{1}{x^2} > 1,000,000
\]

Because \( f(x) \) is not approaching a unique real number \( L \) as \( x \) approaches 0, you can conclude that the limit does not exist.
**Example 8 Oscillating Behavior**

Discuss the existence of the limit.

\[
\lim_{x \to 0} \frac{\sin 1}{x}
\]

**Solution**

Let \( f(x) = \sin(1/x) \). In Figure 12.8, you can see that as \( x \) approaches 0, \( f(x) \) oscillates between \(-1\) and \(1\). Therefore, the limit does not exist because no matter how close you are to 0, it is possible to choose values of \( x_1 \) and \( x_2 \) such that \( \sin(1/x_1) = 1 \) and \( \sin(1/x_2) = -1 \), as indicated in the table.

<table>
<thead>
<tr>
<th>( x )</th>
<th>(-\frac{2}{\pi})</th>
<th>(-\frac{2}{3\pi})</th>
<th>(-\frac{2}{5\pi})</th>
<th>0</th>
<th>( \frac{2}{5\pi})</th>
<th>( \frac{2}{3\pi})</th>
<th>( \frac{2}{\pi})</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sin \frac{1}{x} )</td>
<td>-1</td>
<td>1</td>
<td>-1</td>
<td>0</td>
<td>1</td>
<td>-1</td>
<td>1</td>
</tr>
</tbody>
</table>

**CHECK Point** Now try Exercise 35.

Examples 6, 7, and 8 show three of the most common types of behavior associated with the nonexistence of a limit.

**Conditions Under Which Limits Do Not Exist**

The limit of \( f(x) \) as \( x \to c \) does not exist if any of the following conditions are true.

1. \( f(x) \) approaches a different number from the right side of \( c \) than it approaches from the left side of \( c \).  
   Example 6
2. \( f(x) \) increases or decreases without bound as \( x \) approaches \( c \).  
   Example 7
3. \( f(x) \) oscillates between two fixed values as \( x \) approaches \( c \).  
   Example 8

**TECHNOLOGY**

A graphing utility can help you discover the behavior of a function near the \( x \)-value at which you are trying to evaluate a limit. When you do this, however, you should realize that you can’t always trust the graphs that graphing utilities display. For instance, if you use a graphing utility to graph the function in Example 8 over an interval containing 0, you will most likely obtain an incorrect graph, as shown in Figure 12.9. The reason that a graphing utility can’t show the correct graph is that the graph has infinitely many oscillations over any interval that contains 0.
Properties of Limits and Direct Substitution

You have seen that sometimes the limit of \( f(x) \) as \( x \to c \) is simply \( f(c) \), as shown in Example 2. In such cases, it is said that the limit can be evaluated by **direct substitution**. That is,

\[
\lim_{x \to c} f(x) = f(c). \quad \text{Substitute } c \text{ for } x.
\]

There are many “well-behaved” functions, such as polynomial functions and rational functions with nonzero denominators, that have this property. Some of the basic ones are included in the following list.

### Basic Limits

Let \( b \) and \( c \) be real numbers and let \( n \) be a positive integer.

1. \[ \lim_{x \to c} b = b \] **Limit of a constant function**
2. \[ \lim_{x \to c} x = c \] **Limit of the identity function**
3. \[ \lim_{x \to c} x^n = c^n \] **Limit of a power function**
4. \[ \lim_{x \to c} \sqrt[n]{x} = \sqrt[n]{c}, \quad \text{for } n \text{ even and } c > 0 \] **Limit of a radical function**

For a proof of the limit of a power function, see Proofs in Mathematics on page 906.

Trigonometric functions can also be included in this list. For instance,

\[
\lim_{x \to 0} \sin x = \sin \pi = 0
\]

and

\[
\lim_{x \to 0} \cos x = \cos 0 = 1.
\]

By combining the basic limits with the following operations, you can find limits for a wide variety of functions.

### Properties of Limits

Let \( b \) and \( c \) be real numbers, let \( n \) be a positive integer, and let \( f \) and \( g \) be functions with the following limits.

\[
\lim_{x \to c} f(x) = L \quad \text{and} \quad \lim_{x \to c} g(x) = K
\]

1. **Scalar multiple:** \[
\lim_{x \to c} [bf(x)] = bL
\]
2. **Sum or difference:** \[
\lim_{x \to c} [f(x) \pm g(x)] = L \pm K
\]
3. **Product:** \[
\lim_{x \to c} [f(x)g(x)] = LK
\]
4. **Quotient:** \[
\lim_{x \to c} \frac{f(x)}{g(x)} = \frac{L}{K}, \quad \text{provided } K \neq 0
\]
5. **Power:** \[
\lim_{x \to c} [f(x)]^n = L^n
\]
Find each limit.

\( a. \lim_{x \to 4} x^2 \quad b. \lim_{x \to 4} 5x \quad c. \lim_{x \to \pi} \frac{\tan x}{x} \quad d. \lim_{x \to 9} \sqrt{x} \quad e. \lim_{x \to \pi} (x \cos x) \quad f. \lim_{x \to 3} (x + 4)^2 \)

**Solution**

You can use the properties of limits and direct substitution to evaluate each limit.

\( a. \lim_{x \to 4} x^2 = (4)^2 = 16 \)

\( b. \lim_{x \to 4} 5x = 5 \lim_{x \to 4} x = 5(4) = 20 \)  

\( c. \lim_{x \to \pi} \frac{\tan x}{x} = \frac{\lim_{x \to \pi} \tan x}{\lim_{x \to \pi} x} = \frac{0}{\pi} = 0 \)  

\( d. \lim_{x \to 9} \sqrt{x} = \sqrt{9} = 3 \)

\( e. \lim_{x \to \pi} (x \cos x) = (\lim_{x \to \pi} x)(\lim_{x \to \pi} \cos x) = \pi(\cos \pi) = -\pi \)

\( f. \lim_{x \to 3} (x + 4)^2 = \left[ (\lim_{x \to 3} x) + (\lim_{x \to 3} 4) \right]^2 = (3 + 4)^2 = 7^2 = 49 \)

**Checkpoint**  Now try Exercise 47.

When evaluating limits, remember that there are several ways to solve most problems. Often, a problem can be solved numerically, graphically, or algebraically. The limits in Example 9 were found algebraically. You can verify the solutions numerically and/or graphically. For instance, to verify the limit in Example 9(a) numerically, create a table that shows values of \( x^2 \) for two sets of \( x \)-values—one set that approaches 4 from the left and one that approaches 4 from the right, as shown below. From the table, you can see that the limit as \( x \) approaches 4 is 16. Now, to verify the limit graphically, sketch the graph of \( y = x^2 \). From the graph shown in Figure 12.10, you can determine that the limit as \( x \) approaches 4 is 16.

<table>
<thead>
<tr>
<th>( x )</th>
<th>3.9</th>
<th>3.99</th>
<th>3.999</th>
<th>4.0</th>
<th>4.001</th>
<th>4.01</th>
<th>4.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( x^2 )</td>
<td>15.2100</td>
<td>15.9201</td>
<td>15.9920</td>
<td>?</td>
<td>16.0080</td>
<td>16.0801</td>
<td>16.8100</td>
</tr>
</tbody>
</table>
The results of using direct substitution to evaluate limits of polynomial and rational functions are summarized as follows.

**Limits of Polynomial and Rational Functions**

1. If \( p \) is a polynomial function and \( c \) is a real number, then
   \[
   \lim_{x \to c} p(x) = p(c).
   \]

2. If \( r \) is a rational function given by \( r(x) = \frac{p(x)}{q(x)} \), and \( c \) is a real number such that \( q(c) \neq 0 \), then
   \[
   \lim_{x \to c} r(x) = r(c) = \frac{p(c)}{q(c)}.
   \]

For a proof of the limit of a polynomial function, see Proofs in Mathematics on page 906.

**Example 10** Evaluating Limits by Direct Substitution

Find each limit.

a. \( \lim_{x \to -1} (x^2 + x - 6) \)

b. \( \lim_{x \to -1} \frac{x^2 + x - 6}{x + 3} \)

**Solution**

The first function is a polynomial function and the second is a rational function (with a nonzero denominator at \( x = -1 \)). So, you can evaluate the limits by direct substitution.

a. \[
\lim_{x \to -1} (x^2 + x - 6) = (-1)^2 + (-1) - 6 = -6
\]

b. \[
\lim_{x \to -1} \frac{x^2 + x - 6}{x + 3} = \frac{(-1)^2 + (-1) - 6}{-1 + 3} = \frac{-6}{2} = -3
\]

**CHECK POINT** Now try Exercise 51.

**CLASSROOM DISCUSSION**

**Graphs with Holes** Sketch the graph of each function. Then find the limits of each function as \( x \) approaches 1 and as \( x \) approaches 2. What conclusions can you make?

a. \( f(x) = x + 1 \)

b. \( g(x) = \frac{x^2 - 1}{x - 1} \)

c. \( h(x) = \frac{x^3 - 2x^2 - x + 2}{x^2 - 3x + 2} \)

Use a graphing utility to graph each function above. Does the graphing utility distinguish among the three graphs? Write a short explanation of your findings.
12.1 EXERCISES

VOCABULARY: Fill in the blanks.
1. If \( f(x) \) becomes arbitrarily close to a unique number \( L \) as \( x \) approaches \( c \) from either side, the ______ of \( f(x) \) as \( x \) approaches \( c \) is \( L \).
2. An alternative notation for \( \lim_{x \to c} f(x) = L \) is \( f(x) \to L \) as \( x \to c \), which is read as “\( f(x) \) ______ \( L \) as \( x \) ______.”
3. The limit of \( f(x) \) as \( x \to c \) does not exist if ______ between two fixed values.
4. To evaluate the limit of a polynomial function, use ______ ______.

SKILLS AND APPLICATIONS

5. GEOMETRY You create an open box from a square piece of material 24 centimeters on a side. You cut equal squares from the corners and turn up the sides.
   (a) Draw and label a diagram that represents the box.
   (b) Verify that the volume \( V \) of the box is given by
   \[ V = 4(x(12 - x))^2. \]
   (c) The box has a maximum volume when \( x = 4 \). Use a graphing utility to complete the table and observe the behavior of the function as \( x \) approaches 4. Use the table to find \( \lim_{x \to 4} V \).
<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>

   (d) Use a graphing utility to graph the volume function. Verify that the volume is maximum when \( x = 4 \).

6. GEOMETRY You are given wire and are asked to form a right triangle with a hypotenuse of \( \sqrt{18} \) inches whose area is as large as possible.
   (a) Draw and label a diagram that shows the base \( x \) and height \( y \) of the triangle.
   (b) Verify that the area \( A \) of the triangle is given by
   \[ A = \frac{1}{2}x\sqrt{18-x^2}. \]
   (c) The triangle has a maximum area when \( x = 3 \) inches. Use a graphing utility to complete the table and observe the behavior of the function as \( x \) approaches 3. Use the table to find \( \lim_{x \to 3} A \).

In Exercises 13–26, create a table of values for the function and use the result to estimate the limit numerically. Use a graphing utility to graph the corresponding function to confirm your result graphically.

13. \( \lim_{x \to 1} \frac{x - 1}{x^2 + 2x - 3} \)
14. \( \lim_{x \to 2} \frac{x + 2}{2x^2 + 5x + 6} \)
15. \( \lim_{x \to 0} \frac{\sqrt{x + 5} - \sqrt{5}}{x} \)
16. \( \lim_{x \to -3} \frac{\sqrt{1-x} - 2}{x + 3} \)
17. \( \lim_{x \to -4} \frac{x}{x + 2} - \frac{2}{x + 4} \)
18. \( \lim_{x \to 2} \frac{1}{x + 2} - \frac{1}{4} \)
19. \( \lim_{x \to 0} \frac{\sin x}{x} \)
20. \( \lim_{x \to 0} \frac{\cos x - 1}{x} \)
21. \( \lim_{x \to 0} \frac{\sin^2 x}{x} \)
22. \( \lim_{x \to 0} \frac{2x}{\tan 4x} \)
23. \( \lim_{x \to 0} \frac{e^{2x} - 1}{2x} \)
24. \( \lim_{x \to 0} \frac{1 - e^{-4x}}{x} \)
25. \( \lim_{x \to 1} \frac{\ln(2x - 1)}{x - 1} \)
26. \( \lim_{x \to 1} \frac{\ln(x^2)}{x - 1} \)

In Exercises 27 and 28, graph the function and find the limit (if it exists) as \( x \) approaches 2.

27. \( f(x) = \begin{cases} 2x + 1, & x < 2 \\ x + 3, & x \geq 2 \end{cases} \)
28. \( f(x) = \begin{cases} -2x, & x \leq 2 \\ x^2 - 4x + 1, & x > 2 \end{cases} \)

In Exercises 29–36, use the graph to find the limit (if it exists). If the limit does not exist, explain why.

29. \( \lim_{x \to 1} (x^2 - 3) \)
30. \( \lim_{x \to 2} \frac{3x^2 - 12}{x - 2} \)

31. \( \lim_{x \to -2} \frac{|x + 2|}{x + 2} \)
32. \( \lim_{x \to 1} \frac{|x - 1|}{x - 1} \)
33. \( \lim_{x \to -2} \frac{x - 2}{x^2 - 4} \)
34. \( \lim_{x \to -1} \frac{1}{x - 1} \)
35. \( \lim_{x \to 0} 2 \cos \frac{\pi}{x} \)
36. \( \lim_{x \to 0} \frac{\pi x}{2} \)

In Exercises 37–44, use a graphing utility to graph the function and use the graph to determine whether the limit exists. If the limit does not exist, explain why.

37. \( f(x) = \frac{5}{2 + e^{1/x}} \) \( \lim_{x \to 0} f(x) \)
38. \( f(x) = \ln(7 - x), \lim_{x \to 1} f(x) \)
39. \( f(x) = \cos \frac{1}{x}, \lim_{x \to 0} f(x) \)
40. \( f(x) = \sin \pi x, \lim_{x \to 1} f(x) \)
41. \( f(x) = \frac{\sqrt{x + 3} - 1}{x - 4}, \lim_{x \to 4} f(x) \)
42. \( f(x) = \frac{\sqrt{x + 5} - 4}{x - 2}, \lim_{x \to 2} f(x) \)
43. \( f(x) = \frac{x - 1}{x^2 - 4x + 3}, \lim_{x \to 1} f(x) \)
44. \( f(x) = \frac{7}{x - 3}, \lim_{x \to 3} f(x) \)
In Exercises 45 and 46, use the given information to evaluate each limit.

45. \( \lim_{x \to c} f(x) = 3, \) \( \lim_{x \to c} g(x) = 6 \)
    (a) \( \lim_{x \to c} [-2g(x)] \)
    (b) \( \lim_{x \to c} [f(x) + g(x)] \)
    (c) \( \lim_{x \to c} \frac{f(x)}{g(x)} \)
    (d) \( \lim_{x \to c} \sqrt{f(x)} \)

46. \( \lim_{x \to c} f(x) = 5, \) \( \lim_{x \to c} g(x) = -2 \)
    (a) \( \lim_{x \to c} [f(x) + g(x)]^2 \)
    (b) \( \lim_{x \to c} [6f(x)g(x)] \)
    (c) \( \lim_{x \to c} \frac{5g(x)}{4f(x)} \)
    (d) \( \lim_{x \to c} \frac{1}{f(x)} \)

In Exercises 47 and 48, find (a) \( \lim_{x \to 2} f(x), \) (b) \( \lim_{x \to 2} g(x), \)
(c) \( \lim_{x \to 2} [f(x)g(x)], \) and (d) \( \lim_{x \to 2} [g(x) - f(x)]. \)

47. \( f(x) = x^3, \) \( g(x) = \frac{\sqrt{x^2 + 5}}{2x^2} \)
48. \( f(x) = \frac{x}{3 - x}, \) \( g(x) = \sin \pi x \)

In Exercises 49–68, find the limit by direct substitution.

49. \( \lim_{x \to 3} (10 - x^2) \)
50. \( \lim_{x \to 2} (\frac{1}{2}x^3 - 5x) \)
51. \( \lim_{x \to -3} (2x^2 + 4x + 1) \)
52. \( \lim_{x \to -2} (x^3 - 6x + 5) \)
53. \( \lim_{x \to 3} \left( \frac{-9}{x} \right) \)
54. \( \lim_{x \to -5} \frac{6}{x + 2} \)
55. \( \lim_{x \to -3} \frac{3x}{x^2 + 1} \)
56. \( \lim_{x \to 4} \frac{x - 1}{x^2 + 2x + 3} \)
57. \( \lim_{x \to -2} \frac{5x}{2x - 9} \)
58. \( \lim_{x \to -3} \frac{x^2 + 1}{x} \)
59. \( \lim_{x \to -1} \sqrt{x + 2} \)
60. \( \lim_{x \to -1} \sqrt{x^2 - 1} \)
61. \( \lim_{x \to 0} \frac{5x}{\sqrt{x + 2}} \)
62. \( \lim_{x \to 0} \frac{\sqrt{x + 1}}{x - 4} \)
63. \( \lim_{x \to 3} e^x \)
64. \( \lim_{x \to -\infty} \ln x \)
65. \( \lim_{x \to \pi} \sin 2x \)
66. \( \lim_{x \to \pi} \tan x \)
67. \( \lim_{x \to \frac{1}{2}} \arcsin x \)
68. \( \lim_{x \to 2} \arccos \frac{x}{2} \)

70. The limit of the product of two functions is equal to the product of the limits of the two functions.

71. **THINK ABOUT IT**  From Exercises 7–12, select a limit that can be reached and one that cannot be reached.

    (a) Use a graphing utility to graph the corresponding functions using a standard viewing window. Do the graphs reveal whether or not the limit can be reached? Explain.

    (b) Use a graphing utility to graph the corresponding functions using a **decimal** setting. Do the graphs reveal whether or not the limit can be reached? Explain.

72. **THINK ABOUT IT**  Use the results of Exercise 71 to draw a conclusion as to whether or not you can use the graph generated by a graphing utility to determine reliably if a limit can be reached.

73. **THINK ABOUT IT**

    (a) If \( f(2) = 4, \) can you conclude anything about \( \lim_{x \to 2} f(x)? \) Explain your reasoning.

    (b) If \( \lim_{x \to 2} f(x) = 4, \) can you conclude anything about \( f(2)? \) Explain your reasoning.

74. **WRITING**  Write a brief description of the meaning of the notation \( \lim_{x \to 5} f(x) = 12. \)

75. **THINK ABOUT IT**  Use a graphing utility to graph the tangent function. What are \( \lim_{x \to \pi/2} \tan x \) and \( \lim_{x \to \pi/4} \tan x? \) What can you say about the existence of the limit \( \lim_{x \to \pi/2} \tan x? \)

76. **CAPSTONE**  Use the graph of the function \( f \) to decide whether the value of the given quantity exists. If it does, find it. If not, explain why.

    (a) \( f(0) \)
    (b) \( \lim_{x \to 0} f(x) \)
    (c) \( f(2) \)
    (d) \( \lim_{x \to 2} f(x) \)

77. **WRITING**  Use a graphing utility to graph the function given by \( f(x) = \frac{x^2 - 3x - 10}{x - 5}. \) Use the **trace** feature to approximate \( \lim_{x \to 4} f(x). \) What do you think \( \lim_{x \to 4} f(x) \) equals? Is \( f \) defined at \( x = 5? \) Does this affect the existence of the limit as \( x \) approaches 5?
12.2 Techniques for Evaluating Limits

What you should learn
- Use the dividing out technique to evaluate limits of functions.
- Use the rationalizing technique to evaluate limits of functions.
- Approximate limits of functions graphically and numerically.
- Evaluate one-sided limits of functions.
- Evaluate limits of difference quotients from calculus.

Why you should learn it
Limits can be applied in real-life situations. For instance, in Exercise 84 on page 870, you will determine limits involving the costs of making photocopies.

Dividing Out Technique

In Section 12.1, you studied several types of functions whose limits can be evaluated by direct substitution. In this section, you will study several techniques for evaluating limits of functions for which direct substitution fails.

Suppose you were asked to find the following limit.

\[ \lim \limits_{x \to -3} \frac{x^2 + x - 6}{x + 3} \]

Direct substitution produces 0 in both the numerator and denominator.

\[ (-3)^2 + (-3) - 6 = 0 \]
\[ -3 + 3 = 0 \]

The resulting fraction, \( \frac{0}{0} \), has no meaning as a real number. It is called an indeterminate form because you cannot, from the form alone, determine the limit. By using a table, however, it appears that the limit of the function as \( x \to -3 \) is \( -5 \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>3.01</th>
<th>3.001</th>
<th>3.0001</th>
<th>3</th>
<th>-2.9999</th>
<th>-2.999</th>
<th>-2.99</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{x^2 + x - 6}{x + 3} )</td>
<td>5.01</td>
<td>5.001</td>
<td>5.0001</td>
<td>?</td>
<td>-4.9999</td>
<td>-4.999</td>
<td>-4.99</td>
</tr>
</tbody>
</table>

When you try to evaluate a limit of a rational function by direct substitution and encounter the indeterminate form \( \frac{0}{0} \), you can conclude that the numerator and denominator must have a common factor. After factoring and dividing out, you should try direct substitution again. Example 1 shows how you can use the dividing out technique to evaluate limits of these types of functions.

Example 1

Dividing Out Technique

Find the limit: \( \lim \limits_{x \to -3} \frac{x^2 + x - 6}{x + 3} \)

Solution

From the discussion above, you know that direct substitution fails. So, begin by factoring the numerator and dividing out any common factors.

\[
\lim \limits_{x \to -3} \frac{x^2 + x - 6}{x + 3} = \lim \limits_{x \to -3} \frac{(x - 2)(x + 3)}{x + 3} \\
= \lim \limits_{x \to -3} \frac{(x - 2)}{x + 3} \quad \text{Factor numerator.} \\
= \lim \limits_{x \to -3} \frac{(x - 2)}{x + 3} \quad \text{Divide out common factor.} \\
= \lim \limits_{x \to -3} (x - 2) \quad \text{Simplify.} \\
= -3 - 2 = -5 \quad \text{Direct substitution and simplify.}
\]

Check Point
Now try Exercise 11.
The validity of the dividing out technique stems from the fact that if two functions agree at all but a single number \( c \), they must have identical limit behavior at \( x = c \). In Example 1, the functions given by

\[
f(x) = \frac{x^2 + x - 6}{x + 3} \quad \text{and} \quad g(x) = x - 2
\]

agree at all values of \( x \) other than \( x = -3 \). So, you can use \( g(x) \) to find the limit of \( f(x) \).

### Example 2 Dividing Out Technique

Find the limit.

\[
\lim_{x \to 1} \frac{x - 1}{x^3 - x^2 + x - 1}
\]

**Solution**

Begin by substituting \( x = 1 \) into the numerator and denominator.

\[
1 - 1 = 0 \quad \text{Numerator is 0 when } x = 1.
\]

\[
1^3 - 1^2 + 1 - 1 = 0 \quad \text{Denominator is 0 when } x = 1.
\]

Because both the numerator and denominator are zero when \( x = 1 \), direct substitution will not yield the limit. To find the limit, you should factor the numerator and denominator, divide out any common factors, and then try direct substitution again.

\[
\lim_{x \to 1} \frac{x - 1}{x^3 - x^2 + x - 1} = \lim_{x \to 1} \frac{x - 1}{(x - 1)(x^2 + 1)}
\]

\[
= \lim_{x \to 1} \frac{x - 1}{x^2 + 1}
\]

\[
= \frac{1}{1^2 + 1}
\]

\[
= \frac{1}{2}
\]

This result is shown graphically in Figure 12.11.

In Example 2, the factorization of the denominator can be obtained by dividing by \( (x - 1) \) or by grouping as follows.

\[
x^3 - x^2 + x - 1 = x^2(x - 1) + (x - 1)
\]

\[
= (x - 1)(x^2 + 1)
\]
Rationalizing Technique

Another way to find the limits of some functions is first to rationalize the numerator of the function. This is called the **rationalizing technique**. Recall that rationalizing the numerator means multiplying the numerator and denominator by the conjugate of the numerator. For instance, the conjugate of $\sqrt{x} + 4$ is $\sqrt{x} - 4$.

### Example 3  
**Rationalizing Technique**

Find the limit: \( \lim_{x \to 0} \frac{\sqrt{x+1} - 1}{x} \)

**Solution**

By direct substitution, you obtain the indeterminate form \( \frac{0}{0} \).

\[
\lim_{x \to 0} \frac{\sqrt{x+1} - 1}{x} = \frac{\sqrt{0+1} - 1}{0} = \frac{0}{0} \quad \text{Indeterminate form}
\]

In this case, you can rewrite the fraction by rationalizing the numerator.

\[
\frac{\sqrt{x+1} - 1}{x} = \left( \frac{\sqrt{x+1} - 1}{x} \right) \left( \frac{\sqrt{x+1} + 1}{\sqrt{x+1} + 1} \right)
\]

\[
= \frac{(x+1) - 1}{x(\sqrt{x+1} + 1)} \quad \text{Multiply.}
\]

\[
= \frac{x}{x(\sqrt{x+1} + 1)} \quad \text{Simplify.}
\]

\[
= \frac{x}{\sqrt{x+1} + 1} \quad \text{Divide out common factor.}
\]

\[
= \frac{1}{\sqrt{x+1} + 1}, \quad x \neq 0 \quad \text{Simplify.}
\]

Now you can evaluate the limit by direct substitution.

\[
\lim_{x \to 0} \frac{\sqrt{x+1} - 1}{x} = \lim_{x \to 0} \frac{1}{\sqrt{x+1} + 1} = \frac{1}{1 + 1} = \frac{1}{2}
\]

You can reinforce your conclusion that the limit is \( \frac{1}{2} \) by constructing a table, as shown below, or by sketching a graph, as shown in Figure 12.12.

<table>
<thead>
<tr>
<th>( x )</th>
<th>-0.1</th>
<th>-0.01</th>
<th>-0.001</th>
<th>0</th>
<th>0.001</th>
<th>0.01</th>
<th>0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td>0.5132</td>
<td>0.5013</td>
<td>0.5001</td>
<td>?</td>
<td>0.4999</td>
<td>0.4988</td>
<td>0.4881</td>
</tr>
</tbody>
</table>

**Figure 12.12**

You can review the techniques for rationalizing numerators and denominators in Appendix A.2.
Using Technology
The dividing out and rationalizing techniques may not work well for finding limits of nonalgebraic functions. You often need to use more sophisticated analytic techniques to find limits of these types of functions.

Example 4  Approximating a Limit

Approximate the limit: \( \lim_{x \to 0} (1 + x)^{1/4} \).

**Numerical Solution**
Let \( f(x) = (1 + x)^{1/4} \). Because you are finding the limit when \( x = 0 \), use the table feature of a graphing utility to create a table that shows the values of \( f \) for \( x \) starting at \( x = -0.01 \) and has a step of 0.001, as shown in Figure 12.13. Because 0 is halfway between −0.001 and 0.001, use the average of the values of \( f \) at these two \( x \)-coordinates to estimate the limit, as follows.

\[
\lim_{x \to 0} (1 + x)^{1/4} \approx \frac{2.7196 + 2.7169}{2} = 2.71825
\]

The actual limit can be found algebraically to be \( e \approx 2.71828 \).

**Graphical Solution**
To approximate the limit graphically, graph the function \( f(x) = (1 + x)^{1/4} \), as shown in Figure 12.14. Using the zoom and trace features of the graphing utility, choose two points on the graph of \( f \), such as

\((-0.00017, 2.7185) \) and \((0.00017, 2.7181)\)

as shown in Figure 12.15. Because the \( x \)-coordinates of these two points are equidistant from 0, you can approximate the limit to be the average of the \( y \)-coordinates. That is,

\[
\lim_{x \to 0} (1 + x)^{1/4} \approx \frac{2.7185 + 2.7181}{2} = 2.7183.
\]

The actual limit can be found algebraically to be \( e \approx 2.71828 \).

Now try Exercise 37.

Example 5  Approximating a Limit Graphically

Approximate the limit: \( \lim_{x \to 0} \frac{\sin x}{x} \).

**Solution**
Direct substitution produces the indeterminate form \( \frac{0}{0} \). To approximate the limit, begin by using a graphing utility to graph \( f(x) = \frac{\sin x}{x} \), as shown in Figure 12.16. Then use the zoom and trace features of the graphing utility to choose a point on each side of 0, such as \((-0.0012467, 0.9999997)\) and \((0.0012467, 0.9999997)\). Finally, approximate the limit as the average of the \( y \)-coordinates of these two points, \( \lim_{x \to 0} \frac{\sin x}{x} \approx 0.9999997 \). It can be shown algebraically that this limit is exactly 1.

Now try Exercise 41.
One-Sided Limits

In Section 12.1, you saw that one way in which a limit can fail to exist is when a function approaches a different value from the left side of than it approaches from the right side of . This type of behavior can be described more concisely with the concept of a one-sided limit.

\[ \lim_{x \to c^-} f(x) = L_1 \quad \text{or} \quad f(x) \to L_1 \text{ as } x \to c^- \]

Limit from the left

\[ \lim_{x \to c^+} f(x) = L_2 \quad \text{or} \quad f(x) \to L_2 \text{ as } x \to c^+ \]

Limit from the right

**Example 6** Evaluating One-Sided Limits

Find the limit as \( x \to 0 \) from the left and the limit as \( x \to 0 \) from the right for \( f(x) = \frac{|2x|}{x} \).

**Solution**

From the graph of \( f \), shown in Figure 12.17, you can see that \( f(x) = -2 \) for all \( x < 0 \). Therefore, the limit from the left is

\[ \lim_{x \to 0^-} \frac{|2x|}{x} = -2. \quad \text{Limit from the left: } f(x) \to -2 \text{ as } x \to 0^- \]

Because \( f(x) = 2 \) for all \( x > 0 \), the limit from the right is

\[ \lim_{x \to 0^+} \frac{|2x|}{x} = 2. \quad \text{Limit from the right: } f(x) \to 2 \text{ as } x \to 0^+ \]

Now try Exercise 55.

In Example 6, note that the function approaches different limits from the left and from the right. In such cases, the limit of \( f(x) \) as \( x \to c \) does not exist. For the limit of a function to exist as \( x \to c \), it must be true that both one-sided limits exist and are equal.

**Existence of a Limit**

If \( f \) is a function and \( c \) and \( L \) are real numbers, then

\[ \lim_{x \to c} f(x) = L \]

if and only if both the left and right limits exist and are equal to \( L \).
Example 7  Finding One-Sided Limits

Find the limit of \( f(x) \) as \( x \) approaches 1.

\[
f(x) = \begin{cases} 
4 - x, & x < 1 \\
4x - x^2, & x > 1
\end{cases}
\]

Solution

Remember that you are concerned about the value of \( f \) near \( x = 1 \) rather than at \( x = 1 \). So, for \( x < 1 \), \( f(x) \) is given by \( 4 - x \), and you can use direct substitution to obtain

\[
\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} (4 - x) = 4 - 1 = 3.
\]

For \( x > 1 \), \( f(x) \) is given by \( 4x - x^2 \), and you can use direct substitution to obtain

\[
\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (4x - x^2) = 4(1) - 1^2 = 3.
\]

Because the one-sided limits both exist and are equal to 3, it follows that

\[
\lim_{x \to 1} f(x) = 3.
\]

The graph in Figure 12.18 confirms this conclusion.

Now try Exercise 59.

Example 8  Comparing Limits from the Left and Right

To ship a package overnight, a delivery service charges $18 for the first pound and $2 for each additional pound or portion of a pound. Let \( x \) represent the weight of a package and let \( f(x) \) represent the shipping cost. Show that the limit of \( f(x) \) as \( x \to 2 \) does not exist.

\[
f(x) = \begin{cases} 
$18, & 0 < x \leq 1 \\
$20, & 1 < x \leq 2 \\
$22, & 2 < x \leq 3
\end{cases}
\]

Solution

The graph of \( f \) is shown in Figure 12.19. The limit of \( f(x) \) as \( x \) approaches 2 from the left is

\[
\lim_{x \to 2^-} f(x) = 20
\]

whereas the limit of \( f(x) \) as \( x \) approaches 2 from the right is

\[
\lim_{x \to 2^+} f(x) = 22.
\]

Because these one-sided limits are not equal, the limit of \( f(x) \) as \( x \to 2 \) does not exist.

Now try Exercise 81.
A Limit from Calculus

In the next section, you will study an important type of limit from calculus—the limit of a difference quotient.

Example 9 Evaluating a Limit from Calculus

For the function given by \( f(x) = x^2 - 1 \), find

\[
\lim_{h \to 0} \frac{f(3 + h) - f(3)}{h}.
\]

Solution

Direct substitution produces an indeterminate form.

\[
\lim_{h \to 0} \frac{f(3 + h) - f(3)}{h} = \lim_{h \to 0} \frac{[(3 + h)^2 - 1] - [(3)^2 - 1]}{h}
\]

\[
= \lim_{h \to 0} \frac{9 + 6h + h^2 - 1 - 9 + 1}{h}
\]

\[
= \lim_{h \to 0} \frac{6h + h^2}{h}
\]

\[
= \lim_{h \to 0} \frac{6h + h^2}{h} = \lim_{h \to 0} \frac{h(6 + h)}{h}
\]

\[
= \lim_{h \to 0} (6 + h)
\]

\[
= 6 + 0 = 6
\]

By factoring and dividing out, you obtain the following.

\[
\lim_{h \to 0} \frac{f(3 + h) - f(3)}{h} = \lim_{h \to 0} \frac{6h + h^2}{h} = \lim_{h \to 0} \frac{h(6 + h)}{h}
\]

\[
= \lim_{h \to 0} (6 + h)
\]

\[
= 6 + 0 = 6
\]

So, the limit is 6.

Now try Exercise 75.

For a review of evaluating difference quotients, refer to Section 1.4.
12.2 EXERCISES

VOCABULARY: Fill in the blanks.

1. To evaluate the limit of a rational function that has common factors in its numerator and denominator, use the _______ _______.

2. The fraction \( \frac{0}{0} \) has no meaning as a real number and therefore is called an _______ _______.

3. The limit \( \lim_{x \to a} f(x) = L \) is an example of a _______ _______.

4. The limit of a _______ _______ is an expression of the form \( \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \).

SKILLS AND APPLICATIONS

In Exercises 5–8, use the graph to determine each limit visually (if it exists). Then identify another function that agrees with the given function at all but one point.

5. \( g(x) = \frac{-2x^2 + x}{x} \)

6. \( h(x) = \frac{x^2 - 3x}{x} \)

(a) \( \lim_{x \to 0} g(x) \)
(b) \( \lim_{x \to 1} g(x) \)
(c) \( \lim_{x \to 2} g(x) \)

7. \( g(x) = \frac{x^3 - x}{x - 1} \)

8. \( f(x) = \frac{x^2 - 1}{x + 1} \)

(a) \( \lim_{x \to 0} g(x) \)
(b) \( \lim_{x \to 0} f(x) \)
(c) \( \lim_{x \to 1} f(x) \)

In Exercises 9–36, find the limit (if it exists). Use a graphing utility to verify your result graphically.

9. \( \lim_{x \to 0} \frac{x - 6}{x^2 - 36} \)

10. \( \lim_{x \to 7} \frac{7 - x}{x^2 - 49} \)

11. \( \lim_{x \to 1} \frac{x^2 + 2x - 3}{x - 1} \)

12. \( \lim_{x \to -2} \frac{x^2 + 6x + 8}{x + 2} \)

13. \( \lim_{x \to 1} \frac{1 - 2x - 3x^2}{1 + x} \)

14. \( \lim_{x \to 3} \frac{2x^2 + 5x - 3}{x + 3} \)

15. \( \lim_{t \to 2} \frac{1}{t - 2} \)

16. \( \lim_{a \to 4} \frac{a^3 + 64}{a + 4} \)

17. \( \lim_{x \to 0} \frac{x^3 - 32}{x} \)

18. \( \lim_{x \to 1} \frac{x^4 - 1}{x - 1} \)

19. \( \lim_{x \to 1} \frac{x^2 + x - 2}{x^2 - 3x + 2} \)

20. \( \lim_{x \to 4} \frac{x^2 - 2x - 8}{x^2 - 3x - 4} \)

21. \( \lim_{y \to \sqrt{3}} \frac{\sqrt{3} + y - \sqrt{3}}{y} \)

22. \( \lim_{z \to \sqrt{2}} \frac{\sqrt{7} + z - \sqrt{7}}{z} \)

23. \( \lim_{x \to 0} \frac{\sqrt{x + 3} - \sqrt{3}}{x} \)

24. \( \lim_{x \to 0} \frac{\sqrt{x + 4} - 2}{x} \)

25. \( \lim_{x \to 0} \frac{2x + 1 - 1}{x} \)

26. \( \lim_{x \to 9} \frac{3 - \sqrt{x}}{x - 9} \)

27. \( \lim_{x \to 3} \frac{\sqrt{x + 7} - 2}{x + 3} \)

28. \( \lim_{x \to 2} \frac{4 - \sqrt{18 - x}}{x - 2} \)

29. \( \lim_{x \to 0} \frac{1}{x + 1} - \frac{1}{x} \)

30. \( \lim_{x \to 0} \frac{1}{x} + \frac{1}{x} \)

31. \( \lim_{x \to 0} \frac{1}{x + 4} - \frac{1}{4} \)

32. \( \lim_{x \to 0} \frac{1}{2 + x} - \frac{1}{2} \)

33. \( \lim_{x \to 0} \ \sec x \)

34. \( \lim_{x \to 0} \ \csc x \)

35. \( \lim_{x \to \pi/2} \frac{1 - \sin x}{\cos x} \)

36. \( \lim_{x \to \pi/2} \ \frac{\cos x - 1}{\sin x} \)
In Exercises 37–48, use a graphing utility to graph the function and approximate the limit accurate to three decimal places.

37. \(\lim_{x \to 0} \frac{e^{2x} - 1}{x}\)
38. \(\lim_{x \to 0} \frac{1 - e^{-x}}{x}\)
39. \(\lim_{x \to 0} (x \ln x)\)
40. \(\lim_{x \to 0} (x^2 \ln x)\)
41. \(\lim_{x \to 0} \frac{\sin 2x}{x}\)
42. \(\lim_{x \to 0} \frac{\sin 3x}{x}\)
43. \(\lim_{x \to 0} \frac{\tan x}{x}\)
44. \(\lim_{x \to 0} \frac{1 - \cos 2x}{x}\)
45. \(\lim_{x \to 0} \frac{1 - \sqrt{x}}{1 - x}\)
46. \(\lim_{x \to 0} \frac{\sqrt{x} - x}{x - 1}\)
47. \(\lim_{x \to 0} (1 - x)^{2/x}\)
48. \(\lim_{x \to 0} (1 + 2x)^{1/x}\)

**GRAPHICAL, NUMERICAL, AND ALGEBRAIC ANALYSIS**

In Exercises 49–54, (a) graphically approximate the limit (if it exists) by using a graphing utility to graph the function, (b) numerically approximate the limit (if it exists) by using the table feature of a graphing utility to create a table, and (c) algebraically evaluate the limit (if it exists) by the appropriate technique(s).

49. \(\lim_{x \to 1} \frac{x - 1}{x^2 - 1}\)
50. \(\lim_{x \to 3} \frac{5 - x}{25 - x^2}\)
51. \(\lim_{x \to 2} \frac{x^4 - 1}{x^4 - 3x^2 - 4}\)
52. \(\lim_{x \to 2} \frac{x^4 - 2x^2 - 8}{x^4 - 6x^2 + 8}\)
53. \(\lim_{x \to 16} \frac{4 - \sqrt{x}}{x - 16}\)
54. \(\lim_{x \to 0} \frac{\sqrt{x + 2} - \sqrt{2}}{x}\)

In Exercises 55–62, graph the function. Determine the limit (if it exists) by evaluating the corresponding one-sided limits.

55. \(\lim_{x \to 6} \frac{|x - 6|}{x - 6}\)
56. \(\lim_{x \to 2} \frac{|x - 2|}{x - 2}\)
57. \(\lim_{x \to 1} \frac{1}{x^2 + 1}\)
58. \(\lim_{x \to 2} \frac{1}{x^2 - 1}\)
59. \(\lim_{x \to 2} f(x) \text{ where } f(x) = \begin{cases} x - 1, & x \leq 2 \\ 2x - 3, & x > 2 \end{cases}\)
60. \(\lim_{x \to 1} f(x) \text{ where } f(x) = \begin{cases} 2x + 1, & x < 1 \\ 4 - x^2, & x \geq 1 \end{cases}\)
61. \(\lim_{x \to 1} f(x) \text{ where } f(x) = \begin{cases} 4 - x^2, & x < 1 \\ 3 - x, & x \geq 1 \end{cases}\)
62. \(\lim_{x \to 0} f(x) \text{ where } f(x) = \begin{cases} 4 - x^2, & x \leq 0 \\ x + 4, & x > 0 \end{cases}\)

In Exercises 63–68, use a graphing utility to graph the function and the equations \(y = x\) and \(y = -x\) in the same viewing window. Use the graph to find \(\lim_{x \to 0} f(x)\).

63. \(f(x) = x \cos x\)
64. \(f(x) = |x \sin x|\)
65. \(f(x) = |x| \sin x\)
66. \(f(x) = |x| \cos x\)
67. \(f(x) = x \sin \frac{1}{x}\)
68. \(f(x) = x \cos \frac{1}{x}\)

In Exercises 69 and 70, state which limit can be evaluated by using direct substitution. Then evaluate or approximate each limit.

69. (a) \(\lim_{x \to 0} x^2 \sin x^2\)
(b) \(\lim_{x \to 0} \frac{\sin x^2}{x^2}\)
70. (a) \(\lim_{x \to 0} \frac{x}{\cos x}\)
(b) \(\lim_{x \to 0} \frac{1 - \cos x}{x}\)

In Exercises 71–78, find \(\lim_{h \to 0} \frac{f(x + h) - f(x)}{h}\).

71. \(f(x) = 2x + 1\)
72. \(f(x) = 3 - 4x\)
73. \(f(x) = \sqrt{x}\)
74. \(f(x) = \sqrt{x - 2}\)
75. \(f(x) = x^2 - 3x\)
76. \(f(x) = 4 - 2x - x^2\)
77. \(f(x) = \frac{1}{x + 2}\)
78. \(f(x) = \frac{1}{x - 1}\)

**FREE-FALLING OBJECT**

In Exercises 79 and 80, use the position function
\(s(t) = -16t^2 + 256\)
which gives the height (in feet) of a free-falling object. The velocity at time \(t = a\) seconds is given by \(\lim_{t \to a} [s(a) - s(t)]/(a - t)\).

79. Find the velocity when \(t = 1\) second.
80. Find the velocity when \(t = 2\) seconds.
81. **SALARY CONTRACT** A union contract guarantees an 8% salary increase yearly for 3 years. For a current salary of $30,000, the salaries \( f(t) \) (in thousands of dollars) for the next 3 years are given by

\[
f(t) = \begin{cases} 
30.000, & 0 < t \leq 1 \\
32.400, & 1 < t \leq 2 \\
34.992, & 2 < t \leq 3 
\end{cases}
\]

where \( t \) represents the time in years. Show that the limit of \( f \) as \( t \to 2 \) does not exist.

82. **CONSUMER AWARENESS** The cost of sending a package overnight is $15 for the first pound and $1.30 for each additional pound or portion of a pound. A plastic mailing bag can hold up to 3 pounds. The cost of sending a package in a plastic mailing bag is given by

\[
f(x) = \begin{cases} 
15.00, & 0 < x \leq 1 \\
16.30, & 1 < x \leq 2 \\
17.60, & 2 < x \leq 3 
\end{cases}
\]

where \( x \) represents the weight of the package (in pounds). Show that the limit of \( f \) as \( x \to 1 \) does not exist.

83. **CONSUMER AWARENESS** The cost of hooking up and towing a car is $85 for the first mile and $5 for each additional mile or portion of a mile. A model for the cost \( C \) (in dollars) is \( C(x) = 85 - 5\lfloor x - 1 \rfloor \), where \( x \) is the distance in miles. (Recall from Section 1.6 that \( \lfloor x \rfloor \) is the greatest integer less than or equal to \( x \).)

(a) Use a graphing utility to graph \( C \) for \( 0 < x \leq 10 \).

(b) Complete the table and observe the behavior of \( C \) as \( x \) approaches 5.5. Use the graph from part (a) and the table to find \( \lim_{x \to 5.5} C(x) \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>5</th>
<th>5.3</th>
<th>5.4</th>
<th>5.5</th>
<th>5.6</th>
<th>5.7</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>( C )</td>
<td>?</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(c) Complete the table and observe the behavior of \( C \) as \( x \) approaches 5. Does the limit of \( C(x) \) as \( x \) approaches 5 exist? Explain.

<table>
<thead>
<tr>
<th>( x )</th>
<th>4</th>
<th>4.5</th>
<th>4.9</th>
<th>5</th>
<th>5.1</th>
<th>5.5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>( C )</td>
<td>?</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

84. **CONSUMER AWARENESS** The cost \( C \) (in dollars) of making \( x \) photocopies at a copy shop is given by the function

\[
C(x) = \begin{cases} 
0.15x, & 0 < x \leq 25 \\
0.10x, & 25 < x \leq 100 \\
0.07x, & 100 < x \leq 500 \\
0.05x, & x > 500 
\end{cases}
\]

(a) Sketch a graph of the function.

(b) Find each limit and interpret your result in the context of the situation.

(i) \( \lim_{x \to 15} C(x) \)  
(ii) \( \lim_{x \to 99} C(x) \)  
(iii) \( \lim_{x \to 500} C(x) \)

(c) Create a table of values to show numerically that each limit does not exist.

(i) \( \lim_{x \to 25} C(x) \)  
(ii) \( \lim_{x \to 100} C(x) \)  
(iii) \( \lim_{x \to 500} C(x) \)

(d) Explain how you can use the graph in part (a) to verify that the limits in part (c) do not exist.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 85 and 86, determine whether the statement is true or false. Justify your answer.

85. When your attempt to find the limit of a rational function yields the indeterminate form \( \frac{0}{0} \), the rational function's numerator and denominator have a common factor.

86. If \( f(c) = L \), then \( \lim_{x \to c} f(x) = L \).

87. **THINK ABOUT IT**

(a) Sketch the graph of a function for which \( f(2) \) is defined but for which the limit of \( f(x) \) as \( x \) approaches 2 does not exist.

(b) Sketch the graph of a function for which the limit of \( f(x) \) as \( x \) approaches 1 is 4 but for which \( f(1) \neq 4 \).

88. **CAPSTONE** Given

\[
f(x) = \begin{cases} 
2x, & x \leq 0 \\
x^2 + 1, & x > 0 
\end{cases}
\]

find each of the following limits. If the limit does not exist, explain why.

(a) \( \lim_{x \to 0^-} f(x) \)  
(b) \( \lim_{x \to 0^+} f(x) \)  
(c) \( \lim_{x \to 0} f(x) \)

89. **WRITING** Consider the limit of the rational function given by \( \frac{p(x)}{q(x)} \). What conclusion can you make if direct substitution produces each expression? Write a short paragraph explaining your reasoning.

(a) \( \lim_{x \to c} \frac{p(x)}{q(x)} = 0 \)  
(b) \( \lim_{x \to c} \frac{p(x)}{q(x)} = \frac{1}{0} \)  
(c) \( \lim_{x \to c} \frac{p(x)}{q(x)} = \frac{1}{0} \)  
(d) \( \lim_{x \to c} \frac{p(x)}{q(x)} = 0 \)
Chapter 12.3 The Tangent Line Problem

What you should learn

• Use a tangent line to approximate the slope of a graph at a point.
• Use the limit definition of slope to find exact slopes of graphs.
• Find derivatives of functions and use derivatives to find slopes of graphs.

Why you should learn it

The slope of the graph of a function can be used to analyze rates of change at particular points on the graph. For instance, in Exercise 74 on page 880, the slope of the graph is used to analyze the rate of change in book sales for particular selling prices.

Tangent Line to a Graph

*Calculus* is a branch of mathematics that studies rates of change of functions. If you go on to take a course in calculus, you will learn that rates of change have many applications in real life.

Earlier in the text, you learned how the slope of a line indicates the rate at which a line rises or falls. For a line, this rate (or slope) is the same at every point on the line. For graphs other than lines, the rate at which the graph rises or falls changes from point to point. For instance, in Figure 12.20, the parabola is rising more quickly at the point \((x_1, y_1)\) than it is at the point \((x_2, y_2)\). At the vertex \((x_3, y_3)\), the graph levels off, and at the point \((x_4, y_4)\), the graph is falling.

To determine the rate at which a graph rises or falls at a single point, you can find the slope of the tangent line at that point. In simple terms, the **tangent line** to the graph of a function \(f\) at a point \(P(x_1, y_1)\) is the line that best approximates the slope of the graph at the point. Figure 12.21 shows other examples of tangent lines.

From geometry, you know that a line is tangent to a circle if the line intersects the circle at only one point. Tangent lines to noncircular graphs, however, can intersect the graph at more than one point. For instance, in the first graph in Figure 12.21, if the tangent line were extended, it would intersect the graph at a point other than the point of tangency.
Slope of a Graph

Because a tangent line approximates the slope of the graph at a point, the problem of finding the slope of a graph at a point is the same as finding the slope of the tangent line at the point.

Example 1  Visually Approximating the Slope of a Graph

Use the graph in Figure 12.22 to approximate the slope of the graph of \( f(x) = x^2 \) at the point \( (1, 1) \).

Solution

From the graph of \( f(x) = x^2 \), you can see that the tangent line at \((1, 1)\) rises approximately two units for each unit change in \( x \). So, you can estimate the slope of the tangent line at \((1, 1)\) to be

\[
\text{Slope} = \frac{\text{change in } y}{\text{change in } x} \approx \frac{2}{1} = 2.
\]

Because the tangent line at the point \((1, 1)\) has a slope of about 2, you can conclude that the graph of \( f \) has a slope of about 2 at the point \((1, 1)\).

Check Point  Now try Exercise 5.

When you are visually approximating the slope of a graph, remember that the scales on the horizontal and vertical axes may differ. When this happens (as it frequently does in applications), the slope of the tangent line is distorted, and you must be careful to account for the difference in scales.

Example 2  Approximating the Slope of a Graph

Figure 12.23 graphically depicts the monthly normal temperatures (in degrees Fahrenheit) for Dallas, Texas. Approximate the slope of this graph at the indicated point and give a physical interpretation of the result.  (Source: National Climatic Data Center)

Solution

From the graph, you can see that the tangent line at the given point falls approximately 16 units for each two-unit change in \( x \). So, you can estimate the slope at the given point to be

\[
\text{Slope} = \frac{\text{change in } y}{\text{change in } x} \approx -\frac{16}{2} = -8.
\]

This means that you can expect the monthly normal temperature in November to be about 8 degrees lower than the normal temperature in October.

Check Point  Now try Exercise 7.
Slope and the Limit Process

In Examples 1 and 2, you approximated the slope of a graph at a point by creating a graph and then “eyeballing” the tangent line at the point of tangency. A more precise method of approximating tangent lines makes use of a secant line through the point of tangency and a second point on the graph, as shown in Figure 12.24. If \((x, f(x))\) is the point of tangency and \((x + h, f(x + h))\) is a second point on the graph of \(f\), the slope of the secant line through the two points is given by

\[
\text{Slope of secant line} = \frac{\text{change in } y}{\text{change in } x} = \frac{f(x + h) - f(x)}{h}.
\]

The right side of this equation is called the difference quotient. The denominator \(h\) is the change in \(x\), and the numerator is the change in \(y\). The beauty of this procedure is that you obtain more and more accurate approximations of the slope of the tangent line by choosing points closer and closer to the point of tangency, as shown in Figure 12.25.

As \(h\) approaches 0, the secant line approaches the tangent line.

Using the limit process, you can find the exact slope of the tangent line at \((x, f(x))\).

**Definition of the Slope of a Graph**

The slope \(m\) of the graph of \(f\) at the point \((x, f(x))\) is equal to the slope of its tangent line at \((x, f(x))\), and is given by

\[
m = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}
\]

provided this limit exists.

From the definition above and from Section 12.2, you can see that the difference quotient is used frequently in calculus. Using the difference quotient to find the slope of a tangent line to a graph is a major concept of calculus.
Example 3  Finding the Slope of a Graph

Find the slope of the graph of \( f(x) = x^2 \) at the point \((-2, 4)\).

Solution

Find an expression that represents the slope of a secant line at \((-2, 4)\).

\[
m_{\text{sec}} = \frac{f(-2 + h) - f(-2)}{h} \quad \text{Set up difference quotient.}
\]

\[
= \frac{(-2 + h)^2 - (-2)^2}{h} \quad \text{Substitute } f(x) = x^2.
\]

\[
= \frac{4 - 4h + h^2 - 4}{h} \quad \text{Expand terms.}
\]

\[
= -4h + h^2 \quad \text{Simplify.}
\]

\[
= \frac{h(-4 + h)}{h} \quad \text{Factor and divide out.}
\]

\[
= -4 + h, \quad h \neq 0 \quad \text{Simplify.}
\]

Next, take the limit of \( m_{\text{sec}} \) as \( h \) approaches 0.

\[
m = \lim_{h \to 0} m_{\text{sec}} = \lim_{h \to 0} (-4 + h) = -4
\]

The graph has a slope of \(-4\) at the point \((-2, 4)\), as shown in Figure 12.26.

CHECKPOINT  Now try Exercise 9.

Example 4  Finding the Slope of a Graph

Find the slope of \( f(x) = -2x + 4 \).

Solution

\[
m = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \quad \text{Set up difference quotient.}
\]

\[
= \lim_{h \to 0} \frac{[-2(x + h) + 4] - (-2x + 4)}{h} \quad \text{Substitute } f(x) = -2x + 4.
\]

\[
= \lim_{h \to 0} \frac{-2x - 2h + 4 + 2x - 4}{h} \quad \text{Expand terms.}
\]

\[
= \lim_{h \to 0} \frac{-2h}{h} \quad \text{Divide out.}
\]

\[
= -2 \quad \text{Simplify.}
\]

You know from your study of linear functions that the line given by \( f(x) = -2x + 4 \) has a slope of \(-2\), as shown in Figure 12.27. This conclusion is consistent with that obtained by the limit definition of slope, as shown above.

CHECKPOINT  Now try Exercise 11.
It is important that you see the difference between the ways the difference quotients were set up in Examples 3 and 4. In Example 3, you were finding the slope of a graph at a specific point \( (c, f(c)) \). To find the slope in such a case, you can use the following form of the difference quotient.

\[
m = \lim_{h \to 0} \frac{f(c + h) - f(c)}{h}
\]

**Slope at specific point**

In Example 4, however, you were finding a formula for the slope at any point on the graph. In such cases, you should use \( x \), rather than \( c \), in the difference quotient.

\[
m = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}
\]

**Formula for slope**

Except for linear functions, this form will always produce a function of \( x \), which can then be evaluated to find the slope at any desired point.

**Example 5** Finding a Formula for the Slope of a Graph

Find a formula for the slope of the graph of \( f(x) = x^2 + 1 \). What are the slopes at the points \((-1, 2)\) and \((2, 5)\)?

**Solution**

\[
m_{sec} = \frac{f(x + h) - f(x)}{h}
\]

Set up difference quotient.

\[
= \frac{[(x + h)^2 + 1] - (x^2 + 1)}{h}
\]

Substitute in \( f(x) = x^2 + 1 \).

\[
= \frac{x^2 + 2xh + h^2 + 1 - x^2 - 1}{h}
\]

Expand terms.

\[
= \frac{2xh + h^2}{h}
\]

Simplify.

\[
= \frac{h(2x + h)}{h}
\]

Factor and divide out.

\[
= 2x + h, \quad h \neq 0
\]

Simplify.

Next, take the limit of \( m_{sec} \) as \( h \) approaches 0.

\[
m = \lim_{h \to 0} m_{sec} = \lim_{h \to 0} (2x + h) = 2x
\]

**Formula for finding slope**

Using the formula \( m = 2x \) for the slope at \((x, f(x))\), you can find the slope at the specified points. At \((-1, 2)\), the slope is

\[
m = 2(-1) = -2
\]

and at \((2, 5)\), the slope is

\[
m = 2(2) = 4.
\]

The graph of \( f \) is shown in Figure 12.28.

Now try Exercise 17.
The Derivative of a Function

In Example 5, you started with the function \( f(x) = x^2 + 1 \) and used the limit process to derive another function, \( m = 2x \), that represents the slope of the graph of \( f \) at the point \((x, f(x))\). This derived function is called the derivative of \( f \) at \( x \). It is denoted by \( f'(x) \), which is read as “\( f \) prime of \( x \).”

Definition of Derivative

The derivative of \( f \) at \( x \) is given by

\[
f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}
\]

provided this limit exists.

Remember that the derivative \( f'(x) \) is a formula for the slope of the tangent line to the graph of \( f \) at the point \((x, f(x))\).

Example 6 Finding a Derivative

Find the derivative of \( f(x) = 3x^2 - 2x \).

Solution

\[
f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}
= \lim_{h \to 0} \frac{[3(x + h)^2 - 2(x + h)] - (3x^2 - 2x)}{h}
= \lim_{h \to 0} \frac{3x^2 + 6xh + 3h^2 - 2x - 2h - 3x^2 + 2x}{h}
= \lim_{h \to 0} \frac{6xh + 3h^2 - 2h}{h}
= \lim_{h \to 0} \frac{h(6x + 3h - 2)}{h}
= \lim_{h \to 0} (6x + 3h - 2)
= 6x - 2
\]

So, the derivative of \( f(x) = 3x^2 - 2x \) is

\( f'(x) = 6x - 2 \).

CHECK Point Now try Exercise 33.

Note that in addition to \( f'(x) \), other notations can be used to denote the derivative of \( y = f(x) \). The most common are

\[
\frac{dy}{dx}, \quad y', \quad \frac{d}{dx}[f(x)], \quad \text{and} \quad D_t[y].
\]
Example 7 Using the Derivative

Find \( f'(x) \) for \( f(x) = \sqrt{x} \). Then find the slopes of the graph of \( f \) at the points (1, 1) and (4, 2).

Solution

\[
\frac{f(x)}{1} = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} = \lim_{h \to 0} \frac{\sqrt{x + h} - \sqrt{x}}{h}.
\]

Because direct substitution yields the indeterminate form \( \frac{0}{0} \), you should use the rationalizing technique discussed in Section 12.2 to find the limit.

\[
\begin{align*}
\lim_{h \to 0} \frac{\sqrt{x + h} - \sqrt{x}}{h} &= \lim_{h \to 0} \frac{(\sqrt{x + h} - \sqrt{x})(\sqrt{x + h} + \sqrt{x})}{h(\sqrt{x + h} + \sqrt{x})} \\
&= \lim_{h \to 0} \frac{(x + h) - x}{h(\sqrt{x + h} + \sqrt{x})} \\
&= \lim_{h \to 0} \frac{h}{h(\sqrt{x + h} + \sqrt{x})} \\
&= \lim_{h \to 0} \frac{1}{\sqrt{x + h} + \sqrt{x}} = \frac{1}{2\sqrt{x}}.
\end{align*}
\]

At the point (1, 1), the slope is

\[ f'(1) = \frac{1}{2\sqrt{1}} = \frac{1}{2}. \]

At the point (4, 2), the slope is

\[ f'(4) = \frac{1}{2\sqrt{4}} = \frac{1}{4}. \]

The graph of \( f \) is shown in Figure 12.29.

CHECK POINT Now try Exercise 43.

Classroom Discussion

Using a Derivative to Find Slope In many applications, it is convenient to use a variable other than \( x \) as the independent variable. Complete the following limit process to find the derivative of \( f(t) = 3/t \). Then use the result to find the slope of the graph of \( f(t) = 3/t \) at the point (3, 1).

\[
f'(t) = \lim_{h \to 0} \frac{f(t + h) - f(t)}{h} = \lim_{h \to 0} \frac{\frac{3}{t + h} - \frac{3}{t}}{h} = \ldots
\]

Write a short paragraph summarizing your findings.
12.3

EXERCISES

VOCABULARY: Fill in the blanks.
1. _______ is the study of the rates of change of functions.
2. The _______ _______ to the graph of a function at a point is the line that best approximates the slope of the graph at the point.
3. A _______ _______ is a line through the point of tangency and a second point on the graph.
4. The slope of the tangent line to a graph at $f(x)$ is given by _______.

SKILLS AND APPLICATIONS

In Exercises 5–8, use the figure to approximate the slope of the curve at the point $(x, y)$.

5. $\begin{align*} y & \quad 4 \quad 3 \quad 2 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \\ x & \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8 \end{align*}$

6. $\begin{align*} y & \quad 4 \quad 3 \quad 2 \quad 1 \quad 0 \quad -1 \quad -2 \quad -3 \\ x & \quad 1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6 \quad 7 \quad 8 \end{align*}$

In Exercises 9–16, use the limit process to find the slope of the graph of the function at the specified point. Use a graphing utility to confirm your result.
9. $g(x) = x^2 - 4x$, $(3, -3)$
10. $f(x) = 10x - 2x^2$, $(3, 12)$
11. $g(x) = 5 - 2x$, $(1, 3)$
12. $h(x) = 2x + 3$, $(-1, 3)$
13. $g(x) = \frac{4}{x}$, $(2, 2)$
14. $g(x) = \frac{1}{x - 2}$, $(4, \frac{1}{2})$
15. $h(x) = \frac{1}{x}$, $(9, 3)$
16. $h(x) = \frac{1}{x + 10}$, $(-1, 3)$

In Exercises 17–22, find a formula for the slope of the graph of $f$ at the point $(x, f(x))$. Then use it to find the slope at the two given points.
17. $f(x) = 4 - x^2$
   a. $(0, 4)$
   b. $(-1, 3)$
18. $f(x) = x^3$
   a. $(1, 1)$
   b. $(-2, -8)$

19. $f(x) = \frac{1}{x + 4}$
   a. $\left(\frac{1}{4}, \frac{1}{2}\right)$
   b. $(-2, \frac{1}{2})$
20. $f(x) = \frac{1}{x + 2}$
   a. $\left(\frac{1}{4}, \frac{1}{2}\right)$
   b. $(-1, 1)$
21. $f(x) = \sqrt{x} - 1$
   a. $(5, 2)$
   b. $(10, 3)$
22. $f(x) = \sqrt{x} - 4$
   a. $(5, 1)$
   b. $(8, 2)$

In Exercises 23–28, sketch a graph of the function and the tangent line at the point $(1, f(1))$. Use the graph to approximate the slope of the tangent line.
23. $f(x) = x^2 - 2$
24. $f(x) = x^2 - 2x + 1$
25. $f(x) = \sqrt{2 - x}$
26. $f(x) = \sqrt{x} + 3$
27. $f(x) = \frac{4}{x + 1}$
28. $f(x) = \frac{3}{2 - x}$

In Exercises 29–42, find the derivative of the function.
29. $f(x) = 5$
30. $f(x) = -1$
31. $g(x) = 9 - \frac{1}{x}$
32. $f(x) = -5x + 2$
33. $f(x) = 4 - 3x^2$
34. $f(x) = x^2 - 3x + 4$
35. $f(x) = \frac{1}{x^2}$
36. $f(x) = \frac{1}{x^4}$
37. $f(x) = \sqrt{x} - 11$
38. $f(x) = \sqrt{x} + 8$
39. $f(x) = \frac{1}{x + 6}$
40. $f(x) = \frac{1}{x - 5}$
41. $f(x) = \frac{1}{x - 9}$
42. $h(x) = \frac{1}{x^2 + 2}$

In Exercises 43–50, (a) find the slope of the graph of $f$ at the given point, (b) use the result of part (a) to find an equation of the tangent line to the graph at the point, and (c) graph the function and the tangent line.
43. $f(x) = x^2 - 1$, $(2, 3)$
44. $f(x) = 4 - x^2$, $(1, 3)$
45. $f(x) = x^3 - 2x$, $(1, -1)$
46. $f(x) = x^3 - x$, $(2, 6)$
47. \( f(x) = \sqrt{x} + 1 \), \((3, 2)\)  
48. \( f(x) = \sqrt{x - 2} \), \((3, 1)\)  
49. \( f(x) = \frac{1}{x + 5} \), \((-4, 1)\)  
50. \( f(x) = \frac{1}{x - 3} \), \((4, 1)\)

In Exercises 51–54, use a graphing utility to graph \( f \) over the interval \([-2, 2]\) and complete the table. Compare the value of the first derivative with a visual approximation of the slope of the graph.

(a) Use the regression feature of a graphing utility to find a quadratic model for the data.

(b) Use a graphing utility to graph the model found in part (a). Estimate the slopes of the graph when \( p = $15 \) and \( p = $30 \).

(c) Use a graphing utility to graph the tangent lines to the model when \( p = $15 \) and \( p = $30 \). Compare the slopes given by the graphing utility with your estimates in part (b).

(d) The slopes of the tangent lines at \( p = $15 \) and \( p = $30 \) are not the same. Explain what this means to the company selling the books.

EXPLORATION

TRUE OR FALSE? In Exercises 75 and 76, determine whether the statement is true or false. Justify your answer.

75. The slope of the graph of \( y = x^2 \) is different at every point on the graph of \( f \).

76. A tangent line to a graph can intersect the graph only at the point of tangency.

In Exercises 77–80, match the function with the graph of its derivative. It is not necessary to find the derivative of the function. (The graphs are labeled (a), (b), (c), and (d).)

77. \( f(x) = \sqrt{x} \)  
78. \( f(x) = \frac{1}{x} \)  
79. \( f(x) = |x| \)  
80. \( f(x) = x^3 \)

81. THINK ABOUT IT Sketch the graph of a function whose derivative is always positive.

82. THINK ABOUT IT Sketch the graph of a function whose derivative is always negative.

83. THINK ABOUT IT Sketch the graph of a function for which \( f'(x) < 0 \) for \( x < 1 \), \( f'(x) \geq 0 \) for \( x > 1 \), and \( f'(1) = 0 \).

84. CONJECTURE Consider the functions \( f(x) = x^2 \) and \( g(x) = x^3 \).

(a) Sketch the graphs of \( f \) and \( f' \) on the same set of coordinate axes.

(b) Sketch the graphs of \( g \) and \( g' \) on the same set of coordinate axes.

(c) Identify any pattern between the functions \( f \) and \( g \) and their respective derivatives. Use the pattern to make a conjecture about \( h'(x) \) if \( h(x) = x^n \), where \( n \) is an integer and \( n \geq 2 \).

85. Consider the function \( f(x) = 3x^2 - 2x \).

(a) Use a graphing utility to graph the function.

(b) Use the trace feature to approximate the coordinates of the vertex of this parabola.

(c) Use the derivative of \( f(x) = 3x^2 - 2x \) to find the slope of the tangent line at the vertex.

(d) Make a conjecture about the slope of the tangent line at the vertex of an arbitrary parabola.

86. CAPSTONE Explain how the slope of the secant line is used to derive the slope of the tangent line and the definition of the derivative of a function \( f \) at a point \((x, f(x))\). Include diagrams or sketches as necessary.

Chapter 12.4

**Limits at Infinity and Limits of Sequences**

### What you should learn
- Evaluate limits of functions at infinity.
- Find limits of sequences.

### Why you should learn it
Finding limits at infinity is useful in many types of real-life applications. For instance, in Exercise 58 on page 889, you are asked to find a limit at infinity to determine the number of military reserve personnel in the future.

### Definition of Limits at Infinity
If $f$ is a function and $L_1$ and $L_2$ are real numbers, the statements

\[ \lim_{x \to -\infty} f(x) = L_1 \quad \text{Limit as } x \text{ approaches } -\infty \]

and

\[ \lim_{x \to \infty} f(x) = L_2 \quad \text{Limit as } x \text{ approaches } \infty \]

denote the **limits at infinity**. The first statement is read “the limit of $f(x)$ as $x$ approaches $-\infty$ is $L_1$,” and the second is read “the limit of $f(x)$ as $x$ approaches $\infty$ is $L_2$.”

### Limits at Infinity and Horizontal Asymptotes
As pointed out at the beginning of this chapter, there are two basic problems in calculus: finding **tangent lines** and finding the area of a region. In Section 12.3, you saw how limits can be used to solve the tangent line problem. In this section and the next, you will see how a different type of limit, a **limit at infinity**, can be used to solve the area problem. To get an idea of what is meant by a limit at infinity, consider the function given by

\[ f(x) = \frac{x + 1}{2x} \]

The graph of $f$ is shown in Figure 12.30. From earlier work, you know that $y = \frac{1}{2}$ is a horizontal asymptote of the graph of this function. Using limit notation, this can be written as follows.

\[ \lim_{x \to -\infty} f(x) = \frac{1}{2} \quad \text{Horizontal asymptote to the left} \]

\[ \lim_{x \to \infty} f(x) = \frac{1}{2} \quad \text{Horizontal asymptote to the right} \]

These limits mean that the value of $f(x)$ gets arbitrarily close to $\frac{1}{2}$ as $x$ decreases or increases without bound.

### Algebra Help
The function $f(x) = \frac{x + 1}{2x}$ is a rational function. You can review rational functions in Section 2.6.

---

*By this point in the text, the reader should have a clear understanding of how limits at infinity and horizontal asymptotes are used to solve problems in calculus.*

---

*Figure 12.30: Graph of the function $f(x) = \frac{x + 1}{2x}$ showing horizontal asymptote $y = \frac{1}{2}$.)*
To help evaluate limits at infinity, you can use the following definition.

### Limits at Infinity

If \( r \) is a positive real number, then

\[
\lim_{x \to \infty} \frac{1}{x^r} = 0. \quad \text{Limit toward the right}
\]

Furthermore, if \( x^r \) is defined when \( x < 0 \), then

\[
\lim_{x \to -\infty} \frac{1}{x^r} = 0. \quad \text{Limit toward the left}
\]

Limits at infinity share many of the properties of limits listed in Section 12.1. Some of these properties are demonstrated in the next example.

#### Example 1  Evaluating a Limit at Infinity

Find the limit.

\[
\lim_{x \to \infty} \left( 4 - \frac{3}{x^2} \right)
\]

**Algebraic Solution**

Use the properties of limits listed in Section 12.1.

\[
\lim_{x \to \infty} \left( 4 - \frac{3}{x^2} \right) = \lim_{x \to \infty} 4 - \lim_{x \to \infty} \frac{3}{x^2}
\]

\[
= \lim_{x \to \infty} 4 - 3 \left( \lim_{x \to \infty} \frac{1}{x^2} \right)
\]

\[
= 4 - 3(0)
\]

\[
= 4
\]

So, the limit of \( f(x) = 4 - \frac{3}{x^2} \) as \( x \) approaches \( \infty \) is 4.

**Graphical Solution**

Use a graphing utility to graph \( y = 4 - \frac{3}{x^2} \). Then use the *trace* feature to determine that as \( x \) gets larger and larger, \( y \) gets closer and closer to 4, as shown in Figure 12.31. Note that the line \( y = 4 \) is a horizontal asymptote to the right.

![Figure 12.31](image)

In Figure 12.31, it appears that the line \( y = 4 \) is also a horizontal asymptote *to the left*. You can verify this by showing that

\[
\lim_{x \to -\infty} \left( 4 - \frac{3}{x^2} \right) = 4.
\]

The graph of a rational function need not have a horizontal asymptote. If it does, however, its left and right horizontal asymptotes must be the same.

When evaluating limits at infinity for more complicated rational functions, divide the numerator and denominator by the *highest-powered term* in the denominator. This enables you to evaluate each limit using the limits at infinity at the top of this page.
Section 12.4  Limits at Infinity and Limits of Sequences

Example 2  Comparing Limits at Infinity

Find the limit as $x$ approaches $\infty$ for each function.

a. $f(x) = \frac{-2x + 3}{3x^2 + 1}$

b. $f(x) = \frac{-2x^2 + 3}{3x^2 + 1}$

c. $f(x) = \frac{-2x^3 + 3}{3x^2 + 1}$

Solution

In each case, begin by dividing both the numerator and denominator by $x^2$, the highest-powered term in the denominator.

a. $\lim_{{x \to \infty}} \frac{-2x + 3}{3x^2 + 1} = \lim_{{x \to \infty}} \frac{-2 + \frac{3}{x^2}}{3 + \frac{1}{x^2}}$

$= \frac{-0 + 0}{3 + 0}$

$= 0$

b. $\lim_{{x \to \infty}} \frac{-2x^2 + 3}{3x^2 + 1} = \lim_{{x \to \infty}} \frac{-2 + \frac{3}{x^2}}{3 + \frac{1}{x^2}}$

$= \frac{-2 + 0}{3 + 0}$

$= \frac{2}{3}$

c. $\lim_{{x \to \infty}} \frac{-2x^3 + 3}{3x^2 + 1} = \lim_{{x \to \infty}} \frac{-2x + \frac{3}{x^2}}{3 + \frac{1}{x^2}}$

In this case, you can conclude that the limit does not exist because the numerator decreases without bound as the denominator approaches $3$.

Now try Exercise 19.

In Example 2, observe that when the degree of the numerator is less than the degree of the denominator, as in part (a), the limit is $0$. When the degrees of the numerator and denominator are equal, as in part (b), the limit is the ratio of the coefficients of the highest-powered terms. When the degree of the numerator is greater than the degree of the denominator, as in part (c), the limit does not exist.

This result seems reasonable when you realize that for large values of $x$, the highest-powered term of a polynomial is the most “influential” term. That is, a polynomial tends to behave as its highest-powered term behaves as $x$ approaches positive or negative infinity.
Chapter 12  Limits and an Introduction to Calculus

Finding the Average Cost

You are manufacturing greeting cards that cost $0.50 per card to produce. Your initial investment is $5000, which implies that the total cost of producing cards is given by

\[ C = 0.50x + 5000. \]

The average cost per card is given by

\[ \bar{C} = \frac{C}{x} = \frac{0.50x + 5000}{x}. \]

Find the average cost per card when (a) \( x = 1000 \), (b) \( x = 10,000 \), and (c) \( x = 100,000 \).

(d) What is the limit of \( \bar{C} \) as \( x \) approaches infinity?

Solution

a. When \( x = 1000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(1000) + 5000}{1000} = \frac{5500}{1000} = 5.50. \]

b. When \( x = 10,000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(10,000) + 5000}{10,000} = \frac{5500}{10,000} = 0.55. \]

c. When \( x = 100,000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(100,000) + 5000}{100,000} = \frac{5500}{100,000} = 0.055. \]

d. As \( x \) approaches infinity, the limit of \( \bar{C} \) is

\[ \lim_{x \to \infty} \frac{0.50x + 5000}{x} = \lim_{x \to \infty} \left( \frac{0.50x}{x} + \frac{5000}{x} \right) = 0.50 + \lim_{x \to \infty} \frac{5000}{x} = 0.50. \]

The graph of \( \bar{C} \) is shown in Figure 12.32.

Example 3  Finding the Average Cost

You are manufacturing greeting cards that cost $0.50 per card to produce. Your initial investment is $5000, which implies that the total cost \( C \) of producing \( x \) cards is given by \( C = 0.50x + 5000 \). The average cost \( \bar{C} \) per card is given by

\[ \bar{C} = \frac{C}{x} = \frac{0.50x + 5000}{x}. \]

Find the average cost per card when (a) \( x = 1000 \), (b) \( x = 10,000 \), and (c) \( x = 100,000 \).

(d) What is the limit of \( \bar{C} \) as \( x \) approaches infinity?

Solution

a. When \( x = 1000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(1000) + 5000}{1000} = \frac{5500}{1000} = 5.50. \]

b. When \( x = 10,000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(10,000) + 5000}{10,000} = \frac{5500}{10,000} = 0.55. \]

c. When \( x = 100,000 \), the average cost per card is

\[ \bar{C} = \frac{0.50(100,000) + 5000}{100,000} = \frac{5500}{100,000} = 0.055. \]

d. As \( x \) approaches infinity, the limit of \( \bar{C} \) is

\[ \lim_{x \to \infty} \frac{0.50x + 5000}{x} = \lim_{x \to \infty} \left( \frac{0.50x}{x} + \frac{5000}{x} \right) = 0.50 + \lim_{x \to \infty} \frac{5000}{x} = 0.50. \]

The graph of \( \bar{C} \) is shown in Figure 12.32.

CHECKPOINT  Now try Exercise 55.
Limits of Sequences

Limits of sequences have many of the same properties as limits of functions. For instance, consider the sequence whose nth term is \( a_n = \frac{1}{2^n} \).

\[
\begin{array}{cccccc}
1 & 1 & 1 & 1 & 1 & \\
2 & 4 & 8 & 16 & 32 & \\
\end{array}
\]

As \( n \) increases without bound, the terms of this sequence get closer and closer to 0, and the sequence is said to converge to 0. Using limit notation, you can write

\[
\lim_{n \to \infty} \frac{1}{2^n} = 0.
\]

The following relationship shows how limits of functions of \( x \) can be used to evaluate the limit of a sequence.

\[
\lim_{x \to \infty} f(x) = L.
\]

If \( \{a_n\} \) is a sequence such that \( f(n) = a_n \) for every positive integer \( n \), then

\[
\lim_{n \to \infty} a_n = L.
\]

A sequence that does not converge is said to diverge. For instance, the terms of the sequence 1, −1, 1, −1, 1, . . . , oscillate between 1 and −1. Therefore, the sequence diverges because it does not approach a unique number.

Example 4  Finding the Limit of a Sequence

Find the limit of each sequence. (Assume \( n \) begins with 1.)

a. \( a_n = \frac{2n + 1}{n + 4} \)

b. \( b_n = \frac{2n + 1}{n^2 + 4} \)

c. \( c_n = \frac{2n^2 + 1}{4n^2} \)

Solution

a. \( \lim_{n \to \infty} \frac{2n + 1}{n + 4} = 2 \)

b. \( \lim_{n \to \infty} \frac{2n + 1}{n^2 + 4} = 0 \)

c. \( \lim_{n \to \infty} \frac{2n^2 + 1}{4n^2} = \frac{1}{2} \)

You can use the definition of limits at infinity for rational functions on page 884 to verify the limits of the sequences in Example 4.
In the next section, you will encounter limits of sequences such as that shown in Example 5. A strategy for evaluating such limits is to begin by writing the \( n \)th term in standard rational function form. Then you can determine the limit by comparing the degrees of the numerator and denominator, as shown on page 884.

**Example 5**  \textbf{Finding the Limit of a Sequence}

Find the limit of the sequence whose \( n \)th term is

\[
a_n = \frac{8 \left[ n(n + 1)(2n + 1) \right]}{n^3}.
\]

**Algebraic Solution**

Begin by writing the \( n \)th term in standard rational function form—as the ratio of two polynomials.

\[
a_n = \frac{8 \left[ n(n + 1)(2n + 1) \right]}{n^3} \quad \text{Write original \( n \)th term.}
\]

\[
= \frac{8n(n + 1)(2n + 1)}{6n^3} \quad \text{Multiply fractions.}
\]

\[
= \frac{8n^3 + 12n^2 + 4n}{3n^3} \quad \text{Write in standard rational form.}
\]

From this form, you can see that the degree of the numerator is equal to the degree of the denominator. So, the limit of the sequence is the ratio of the coefficients of the highest-powered terms.

\[
\lim_{n \to \infty} \frac{8n^3 + 12n^2 + 4n}{3n^3} = \frac{8}{3}
\]

**CHECKPoint**  Now try Exercise 49.

**Numerical Solution**

Construct a table that shows the value of \( a_n \) as \( n \) becomes larger and larger, as shown below.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( a_n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>8</td>
</tr>
<tr>
<td>10</td>
<td>3.08</td>
</tr>
<tr>
<td>100</td>
<td>2.707</td>
</tr>
<tr>
<td>1000</td>
<td>2.671</td>
</tr>
<tr>
<td>10,000</td>
<td>2.667</td>
</tr>
</tbody>
</table>

From the table, you can estimate that as \( n \) approaches \( \infty \), \( a_n \) gets closer and closer to \( 2.667 \approx \frac{8}{3} \).

**CLASSROOM DISCUSSION**

**Comparing Rates of Convergence**  In the table in Example 5 above, the value of \( a_n \) approaches its limit of \( \frac{8}{3} \) rather slowly. (The first term to be accurate to three decimal places is \( a_{1801} \approx 2.667 \).) Each of the following sequences converges to 0. Which converges the quickest? Which converges the slowest? Why? Write a short paragraph discussing your conclusions.

- a. \( a_n = \frac{1}{n} \)
- b. \( b_n = \frac{1}{n^2} \)
- c. \( c_n = \frac{1}{2^n} \)
- d. \( d_n = \frac{1}{n!} \)
- e. \( h_n = \frac{2^n}{n!} \)
12.4 **EXERCISES**

**VOCABULARY:** Fill in the blanks.

1. A ______ at ______ can be used to solve the area problem in calculus.

2. When evaluating limits at infinity for complicated rational functions, you can divide the numerator and denominator by the ______ term in the denominator.

3. A sequence that has a limit is said to ______.

4. A sequence that does not have a limit is said to ______.

**SKILLS AND APPLICATIONS**

In Exercises 5–8, match the function with its graph, using horizontal asymptotes as aids. [The graphs are labeled (a), (b), (c), and (d).]

(a) ![Graph A](image)

(b) ![Graph B](image)

(c) ![Graph C](image)

(d) ![Graph D](image)

5. \( f(x) = \frac{4x^2}{x^2 + 1} \)

6. \( f(x) = \frac{x^2}{x^2 + 1} \)

7. \( f(x) = 4 - \frac{1}{x^2} \)

8. \( f(x) = x + \frac{1}{x} \)

In Exercises 9–28, find the limit (if it exists). If the limit does not exist, explain why. Use a graphing utility to verify your result graphically.

9. \( \lim_{x \to \infty} \left( \frac{3}{x^2} + 1 \right) \)

10. \( \lim_{x \to \infty} \left( \frac{4}{3x} - 5 \right) \)

11. \( \lim_{x \to \infty} \left( \frac{1 - x}{1 + x} \right) \)

12. \( \lim_{x \to \infty} \left( \frac{1 + 5x}{1 - 4x} \right) \)

13. \( \lim_{x \to -\infty} \left( \frac{4x - 3}{2x + 1} \right) \)

14. \( \lim_{x \to -\infty} \left( \frac{1 - 2x}{x + 2} \right) \)

15. \( \lim_{x \to -\infty} \left( \frac{3x^2 - 4}{1 - x^2} \right) \)

16. \( \lim_{x \to -\infty} \left( \frac{3x^2 + 1}{4x^2 - 5} \right) \)

17. \( \lim_{x \to \infty} \left( \frac{t^2}{t + 3} \right) \)

18. \( \lim_{y \to \infty} \left( \frac{4y^4}{y^2 + 3} \right) \)

19. \( \lim_{x \to \infty} \left( \frac{-4t^2 - 2t + 1}{-3t^2 + 2t + 2} \right) \)

20. \( \lim_{y \to \infty} \left( \frac{2x^2 - 5x - 12}{1 - 6x - 8x^2} \right) \)

21. \( \lim_{x \to \infty} \left( \frac{-x^2}{(x - 1)^2} \right) \)

22. \( \lim_{y \to \infty} \left( \frac{-x^2}{(x + 3)^2} \right) \)

23. \( \lim_{x \to \infty} \left( \frac{x}{(x + 1)^2} - 4 \right) \)

24. \( \lim_{y \to \infty} \left( \frac{1}{2x^2 - \frac{4x}{x^2}} \right) \)

25. \( \lim_{x \to \infty} \left( \frac{1}{3x^2 - \frac{5x}{x + 2}} \right) \)

26. \( \lim_{y \to \infty} \left( \frac{x}{2x + 1} + \frac{3x^2}{(x - 3)^2} \right) \)

27. In Exercises 29–34, use a graphing utility to graph the function and verify that the horizontal asymptote corresponds to the limit at infinity.

29. \( y = \frac{3x}{1 - x} \)

30. \( y = \frac{x^2}{x^2 + 4} \)

31. \( y = \frac{2x}{1 - x^2} \)

32. \( y = \frac{2x + 1}{x^2 - 1} \)

33. \( y = 1 - \frac{3}{x^2} \)

34. \( y = 2 + \frac{1}{x} \)

**NUMERICAL AND GRAPHICAL ANALYSIS** In Exercises 35–38, (a) complete the table and numerically estimate the limit as \( x \) approaches infinity, and (b) use a graphing utility to graph the function and estimate the limit graphically.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( 10^0 )</th>
<th>( 10^1 )</th>
<th>( 10^2 )</th>
<th>( 10^3 )</th>
<th>( 10^4 )</th>
<th>( 10^5 )</th>
<th>( 10^6 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( f(x) )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

35. \( f(x) = x - \sqrt{x^2 + 2} \)

36. \( f(x) = 3x - \sqrt{9x^2 + 1} \)

37. \( f(x) = 3(2x - \sqrt{4x^2 + x}) \)

38. \( f(x) = 4(4x - \sqrt{16x^2 - x}) \)
In Exercises 39–48, write the first five terms of the sequence and find the limit of the sequence (if it exists). If the limit does not exist, explain why. Assume \( n \) begins with 1.

39. \( a_n = \frac{n + 1}{n^2 + 1} \)  
40. \( a_n = \frac{3n}{n^2 + 2} \)  
41. \( a_n = \frac{n}{2n + 1} \)  
42. \( a_n = \frac{4n - 1}{n + 3} \)  
43. \( a_n = \frac{n^2}{2n + 3} \)  
44. \( a_n = \frac{4n^2 + 1}{2n} \)  
45. \( a_n = \frac{(n + 1)!}{n!} \)  
46. \( a_n = \frac{(3n - 1)!}{(3n + 1)!} \)  
47. \( a_n = \frac{(-1)^n}{n^2} \)  
48. \( a_n = \frac{(-1)^{n+1}}{n^2} \)

In Exercises 49–52, find the limit of the sequence. Then verify the limit numerically by using a graphing utility to complete the table.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( 10^0 )</th>
<th>( 10^1 )</th>
<th>( 10^2 )</th>
<th>( 10^3 )</th>
<th>( 10^4 )</th>
<th>( 10^6 )</th>
</tr>

49. \( a_n = \frac{1}{n}\left[ n + \frac{n(n + 1)}{2} \right] \)  
50. \( a_n = \frac{4}{n} + \frac{4}{n^2} \frac{(n + 1)}{2} \)  
51. \( a_n = \frac{16}{n^3} \frac{n(n + 1)(2n + 1)}{6} \)  
52. \( a_n = \frac{n(n + 1)}{n^2} - \frac{1}{n^2} \frac{n(n + 1)^2}{2} \)

53. **OXYGEN LEVEL** Suppose that \( f(t) \) measures the level of oxygen in a pond, where \( f(t) = 1 \) is the normal (unpolluted) level and the time \( t \) is measured in weeks. When \( t = 0 \), organic waste is dumped into the pond, and as the waste material oxidizes, the level of oxygen in the pond is given by

\[
f(t) = \frac{t^2 - t + 1}{t^2 + 1}.
\]

(a) What is the limit of \( f \) as \( t \) approaches infinity?  
(b) Use a graphing utility to graph the function and verify the result of part (a).  
(c) Explain the meaning of the limit in the context of the problem.

54. **TYPING SPEED** The average typing speed \( S \) (in words per minute) for a student after \( t \) weeks of lessons is given by

\[
S = \frac{100t^2}{65 + t^2}, \quad t > 0.
\]

(a) What is the limit of \( S \) as \( t \) approaches infinity?  
(b) Use a graphing utility to graph the function and verify the result of part (a).  
(c) Explain the meaning of the limit in the context of the problem.

55. **AVERAGE COST** The cost function for a certain model of personal digital assistant (PDA) is given by \( C = 13.50x + 45,750 \), where \( C \) is measured in dollars and \( x \) is the number of PDAs produced.

(a) Write a model for the average cost per unit produced.  
(b) Find the average costs per unit when \( x = 100 \) and \( x = 1000 \).  
(c) Determine the limit of the average cost function as \( x \) approaches infinity. Explain the meaning of the limit in the context of the problem.

56. **AVERAGE COST** The cost function for a company to recycle \( x \) tons of material is given by \( C = 1.25x + 10,500 \), where \( C \) is measured in dollars.

(a) Write a model for the average cost per ton of material recycled.  
(b) Find the average costs of recycling 100 tons of material and 1000 tons of material.  
(c) Determine the limit of the average cost function as \( x \) approaches infinity. Explain the meaning of the limit in the context of the problem.

57. **DATA ANALYSIS: SOCIAL SECURITY** The table shows the average monthly Social Security benefits \( B \) (in dollars) for retired workers aged 62 or over from 2001 through 2007.  
(Source: U.S. Social Security Administration)

<table>
<thead>
<tr>
<th>Year</th>
<th>Benefit, ( B )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001</td>
<td>874</td>
</tr>
<tr>
<td>2002</td>

</tr>
<tr>
<td>2006</td>
<td>1044</td>
</tr>
<tr>
<td>2007</td>
<td>1079</td>
</tr>
</tbody>
</table>

A model for the data is given by

\[
B = \frac{867.3 + 707.56t}{1.0 + 0.83t - 0.030t^2}, \quad 1 \leq t \leq 7
\]

where \( t \) represents the year, with \( t = 1 \) corresponding to 2001.
(a) Use a graphing utility to create a scatter plot of the data and graph the model in the same viewing window. How well does the model fit the data?
(b) Use the model to predict the average monthly benefit in 2014.
(c) Discuss why this model should not be used for long-term predictions of average monthly Social Security benefits.

58. DATA ANALYSIS: MILITARY The table shows the numbers \( N \) (in thousands) of U.S. military reserve personnel for the years 2001 through 2007. (Source: U.S. Department of Defense)

<table>
<thead>
<tr>
<th>Year</th>
<th>Number, ( N )</th>

</tr>
<tr>
<td>2006</td>
<td>1120</td>
</tr>
<tr>
<td>2007</td>
<td>1110</td>
</tr>
</tbody>
</table>

A model for the data is given by
\[
N = \frac{1287.9 + 61.53t}{1.0 + 0.08t}, \quad 1 \leq t \leq 7
\]
where \( t \) represents the year, with \( t = 1 \) corresponding to 2001.
(a) Use a graphing utility to create a scatter plot of the data and graph the model in the same viewing window. How well does the model fit the data?
(b) Use the model to predict the number of military reserve personnel in 2014.
(c) What is the limit of the function as \( t \) approaches infinity? Explain the meaning of the limit in the context of the problem. Do you think the limit is realistic? Explain.

EXPLORATION

TRUE OR FALSE? In Exercises 59–62, determine whether the statement is true or false. Justify your answer.

59. Every rational function has a horizontal asymptote.
60. If \( f(x) \) increases without bound as \( x \) approaches \( c \), then the limit of \( f(x) \) exists.
61. If a sequence converges, then it has a limit.
62. When the degrees of the numerator and denominator of a rational function are equal, the limit does not exist.

63. THINK ABOUT IT Find the functions \( f \) and \( g \) such that both \( f(x) \) and \( g(x) \) increase without bound as \( x \) approaches \( c \), but \( \lim_{x \to c} [f(x) - g(x)] \) exists.

64. THINK ABOUT IT Use a graphing utility to graph the function given by
\[
f(x) = \frac{x}{\sqrt{x^2 + 1}}
\]
How many horizontal asymptotes does the function appear to have? What are the horizontal asymptotes?

In Exercises 65–68, create a scatter plot of the terms of the sequence. Determine whether the sequence converges or diverges. If it converges, estimate its limit.

65. 66. 67. 68.

69. Use a graphing utility to graph the two functions given by
\[
\begin{align*}
&y_1 = \frac{1}{\sqrt{x}} \quad \text{and} \quad y_2 = \frac{1}{x^{1/3}}
\end{align*}
\]
in the same viewing window. Why does \( y_1 \) not appear to the left of the \( y \)-axis? How does this relate to the statement at the top of page 882 about the infinite limit
\[
\lim_{x \to -\infty} \frac{1}{x^3}?
\]

70. CAPSTONE Use the graph to estimate (a) \( \lim_{x \to \infty} f(x) \), (b) \( \lim_{x \to -\infty} f(x) \), and (c) the horizontal asymptote of the graph of \( f \).

71. Use a graphing utility to complete the table below to verify that \( \lim_{x \to \infty} \frac{1}{x} = 0 \).

<table>
<thead>
<tr>
<th>( x )</th>

</thead>
<tbody>
<tr>
<td>( 1/x )</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Make a conjecture about \( \lim_{x \to 0} \frac{1}{x} \).
Limits of Summations

Earlier in the text, you used the concept of a limit to obtain a formula for the sum $S$ of an infinite geometric series

$$S = a_1 + a_1r + a_1r^2 + \cdots = \sum_{i=1}^{\infty} a_i r^{i-1} = \frac{a_1}{1-r}, \quad |r| < 1.$$  

Using limit notation, this sum can be written as

$$S = \lim_{n \to \infty} \sum_{i=1}^{n} a_i r^{i-1} = \lim_{n \to \infty} \frac{a_1(1 - r^n)}{1 - r} = \frac{a_1}{1 - r}. \quad \lim_{n \to \infty} r^n = 0 \text{ for } |r| < 1$$

The following summation formulas and properties are used to evaluate finite and infinite summations.

### Summation Formulas and Properties

1. $\sum_{i=1}^{n} c = cn$, $c$ is a constant.
2. $\sum_{i=1}^{n} i = \frac{n(n + 1)}{2}$
3. $\sum_{i=1}^{n} i^2 = \frac{n(n + 1)(2n + 1)}{6}$
4. $\sum_{i=1}^{n} i^3 = \frac{n^2(n + 1)^2}{4}$
5. $\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$
6. $\sum_{i=1}^{n} k a_i = k \sum_{i=1}^{n} a_i$, $k$ is a constant.

### Example 1 Evaluating a Summation

Evaluate the summation.

$$\sum_{i=1}^{200} i = 1 + 2 + 3 + 4 + \cdots + 200$$

**Solution**

Using the second summation formula with $n = 200$, you can write

$$\sum_{i=1}^{n} i = \frac{n(n + 1)}{2}$$

$$\sum_{i=1}^{200} i = \frac{200(200 + 1)}{2}$$

$$= \frac{40,200}{2}$$

$$= 20,100.$$
Evaluating a Summation

Evaluate the summation
\[ S = \sum_{i=1}^{n} \frac{i + 2}{n^2} = \frac{3}{n^2} + \frac{4}{n^2} + \frac{5}{n^2} + \cdots + \frac{n + 2}{n^2} \]
for \( n = 10, 100, 1000, \) and 10,000.

Solution

Begin by applying summation formulas and properties to simplify \( S. \) In the second line of the solution, note that \( \frac{1}{n^2} \) can be factored out of the sum because \( n \) is considered to be constant. You could not factor \( i \) out of the summation because \( i \) is the (variable) index of summation.

\[
S = \sum_{i=1}^{n} \frac{i + 2}{n^2} \quad \text{Write original form of summation.}
\]

\[
= \frac{1}{n^2} \sum_{i=1}^{n} (i + 2) \quad \text{Factor constant } \frac{1}{n^2} \text{ out of sum.}
\]

\[
= \frac{1}{n^2} \left( \sum_{i=1}^{n} i + \sum_{i=1}^{n} 2 \right) \quad \text{Write as two sums.}
\]

\[
= \frac{1}{n^2} \left( \frac{n(n + 1)}{2} + 2n \right) \quad \text{Apply Formulas 1 and 2.}
\]

\[
= \frac{1}{n^2} \left( \frac{n^2 + 5n}{2} \right) \quad \text{Add fractions.}
\]

\[
= \frac{n + 5}{2n} \quad \text{Simplify.}
\]

Now you can evaluate the sum by substituting the appropriate values of \( n, \) as shown in the following table.

<table>
<thead>
<tr>
<th>( n )</th>
<th>10</th>
<th>100</th>
<th>1000</th>
<th>10,000</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sum_{i=1}^{n} \frac{i + 2}{n^2} = \frac{n + 5}{2n} )</td>
<td>0.75</td>
<td>0.525</td>
<td>0.5025</td>
<td>0.50025</td>
</tr>
</tbody>
</table>

Example 2

Now try Exercise 15.

In Example 2, note that the sum appears to approach a limit as \( n \) increases. To find the limit of
\[
\frac{n + 5}{2n}
\]as \( n \) approaches infinity, you can use the techniques from Section 12.4 to write
\[
\lim_{n \to \infty} \frac{n + 5}{2n} = \frac{1}{2}.
\]
Be sure you notice the strategy used in Example 2. Rather than separately evaluating the sums
\[
\sum_{i=1}^{10} \frac{i + 2}{n^2}, \quad \sum_{i=1}^{100} \frac{i + 2}{n^2}, \quad \sum_{i=1}^{1000} \frac{i + 2}{n^2}, \quad \sum_{i=1}^{10,000} \frac{i + 2}{n^2}
\]
it was more efficient first to convert to rational form using the summation formulas and properties listed on page 890.

\[
S = \sum_{i=1}^{n} \frac{i + 2}{n^2} = \frac{n + 5}{2n}
\]

With this rational form, each sum can be evaluated by simply substituting appropriate values of \(n\).

**Example 3** Finding the Limit of a Summation

Find the limit of \(S(n)\) as \(n \to \infty\).

\[
S(n) = \sum_{i=1}^{n} \left(1 + \frac{i}{n}\right) \left(\frac{1}{n}\right)
\]

**Solution**

Begin by rewriting the summation in rational form.

\[
S(n) = \sum_{i=1}^{n} \left(1 + \frac{i}{n}\right) \left(\frac{1}{n}\right) = \frac{1}{n^2} \sum_{i=1}^{n} \left(n^2 + 2ni + i^2\right) = \frac{1}{n^2} \left(n^3 + 2n \left(\frac{n(n+1)}{2}\right) + \frac{n(n+1)(2n+1)}{6}\right) = \frac{14n^3 + 9n^2 + n}{6n^3}
\]

In this rational form, you can now find the limit as \(n \to \infty\).

\[
\lim_{n \to \infty} S(n) = \lim_{n \to \infty} \frac{14n^3 + 9n^2 + n}{6n^3} = \frac{14}{6} = \frac{7}{3}
\]

**CHECKPoint** Now try Exercise 17.
The Area Problem

You now have the tools needed to solve the second basic problem of calculus: the area problem. The problem is to find the area of the region $R$ bounded by the graph of a nonnegative, continuous function $f$, the $x$-axis, and the vertical lines $x = a$ and $x = b$, as shown in Figure 12.33.

If the region $R$ is a square, a triangle, a trapezoid, or a semicircle, you can find its area by using a geometric formula. For more general regions, however, you must use a different approach—one that involves the limit of a summation. The basic strategy is to use a collection of rectangles of equal width that approximates the region as illustrated in Example 4.

### Example 4  
**Approximating the Area of a Region**

Use the five rectangles in Figure 12.34 to approximate the area of the region bounded by the graph of $f(x) = 6 - x^2$, the $x$-axis, and the lines $x = 0$ and $x = 2$.

**Solution**

Because the length of the interval along the $x$-axis is 2 and there are five rectangles, the width of each rectangle is $\frac{2}{5}$. The height of each rectangle can be obtained by evaluating $f$ at the right endpoint of each interval. The five intervals are as follows.

$$[0, \frac{2}{5}], \ [\frac{2}{5}, \frac{4}{5}], \ [\frac{4}{5}, \frac{6}{5}], \ [\frac{6}{5}, \frac{8}{5}], \ [\frac{8}{5}, 2]$$

Notice that the right endpoint of each interval is $\frac{i}{2}$ for $i = 1, 2, 3, 4, 5$. The sum of the areas of the five rectangles is

$$\sum_{i=1}^{5} f\left(\frac{2i}{5}\right) \left(\frac{2}{5}\right) = \sum_{i=1}^{5} \left[6 - \left(\frac{2i}{5}\right)^2\right] \left(\frac{2}{5}\right)$$

$$= \frac{2}{5} \left(\sum_{i=1}^{5} 6 - \frac{4}{25} \sum_{i=1}^{5} i^2\right)$$

$$= \frac{2}{5} \left[6(5) - \frac{4}{25} \cdot \frac{5(5 + 1)(10 + 1)}{6}\right]$$

$$= \frac{2}{5} \left(30 - \frac{44}{5}\right)$$

$$= \frac{212}{25} = 8.48.$$

So, you can approximate the area of $R$ as 8.48 square units.

**Checkpoint**  Now try Exercise 23.

By increasing the number of rectangles used in Example 4, you can obtain closer and closer approximations of the area of the region. For instance, using 25 rectangles of width $\frac{2}{25}$ each, you can approximate the area to be $A \approx 9.17$ square units. The following table shows even better approximations.

<table>
<thead>
<tr>
<th>$n$</th>
<th>Approximate area</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>8.48</td>
</tr>
<tr>
<td>25</td>
<td>9.17</td>
</tr>
<tr>
<td>100</td>
<td>9.29</td>
</tr>
<tr>
<td>1000</td>
<td>9.33</td>
</tr>
<tr>
<td>5000</td>
<td>9.33</td>
</tr>
</tbody>
</table>
Based on the procedure illustrated in Example 4, the *exact area of a plane region* \( R \) is given by the limit of the sum of \( n \) rectangles as \( n \) approaches \( \infty \).

### Area of a Plane Region

Let \( f \) be continuous and nonnegative on the interval \([a, b]\). The area \( A \) of the region bounded by the graph of \( f \), the \( x \)-axis, and the vertical lines \( x = a \) and \( x = b \) is given by

\[
A = \lim_{n \to \infty} \sum_{i=1}^{n} f \left( a + \frac{(b-a)i}{n} \right) \left( \frac{b-a}{n} \right).
\]

**Example 5** Finding the Area of a Region

Find the area of the region bounded by the graph of \( f(x) = x^2 \) and the \( x \)-axis between \( x = 0 \) and \( x = 1 \), as shown in Figure 12.35.

**Solution**

Begin by finding the dimensions of the rectangles.

**Width:** \( \frac{b-a}{n} = \frac{1-0}{n} = \frac{1}{n} \)

**Height:** \( f \left( a + \frac{(b-a)i}{n} \right) = f \left( 0 + \frac{(1-0)i}{n} \right) = f \left( \frac{i}{n} \right) = \frac{i^2}{n^2} \)

Next, approximate the area as the sum of the areas of \( n \) rectangles.

\[
A \approx \sum_{i=1}^{n} f \left( a + \frac{(b-a)i}{n} \right) \left( \frac{b-a}{n} \right)
\]

\[
= \sum_{i=1}^{n} \left( \frac{i^2}{n^2} \right) \left( \frac{1}{n} \right) \quad \text{Summation form}
\]

\[
= \sum_{i=1}^{n} \frac{i^2}{n^3}
\]

\[
= \frac{1}{n^3} \sum_{i=1}^{n} i^2
\]

\[
= \frac{1}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} \quad \text{Rational form}
\]

\[
= \frac{2n^3 + 3n^2 + n}{6n^3}
\]

Finally, find the exact area by taking the limit as \( n \) approaches \( \infty \).

\[
A = \lim_{n \to \infty} \frac{2n^3 + 3n^2 + n}{6n^3} = \frac{1}{3}
\]

**Check Point** Now try Exercise 37.
Section 12.5  The Area Problem

895

Finding the Area of a Region

Find the area of the region bounded by the graph of \( f(x) = 3x - x^2 \) and the \( x \)-axis between \( x = 1 \) and \( x = 2 \), as shown in Figure 12.36.

Solution

Begin by finding the dimensions of the rectangles.

**Width:** \( \frac{b - a}{n} = \frac{2 - 1}{n} = \frac{1}{n} \)

**Height:** \( f\left(a + \frac{(b - a)i}{n}\right) = f\left(1 + \frac{i}{n}\right) \)

\[
= 3 \left(1 + \frac{i}{n}\right) - \left(1 + \frac{i^2}{n^2}\right)
\]

\[
= 3 + \frac{3i}{n} - \left(1 + \frac{2i}{n} + \frac{i^2}{n^2}\right)
\]

Next, approximate the area as the sum of the areas of \( n \) rectangles.

\[
A = \sum_{i=1}^{n} f\left(a + \frac{(b - a)i}{n}\right)\left(\frac{b - a}{n}\right)
\]

\[
= \sum_{i=1}^{n} \left(2 + \frac{i}{n} - \frac{i^2}{n^2}\right)\left(\frac{1}{n}\right)
\]

\[
= \frac{1}{n} \sum_{i=1}^{n} 2 + \frac{1}{n^2} \sum_{i=1}^{n} i - \frac{1}{n} \sum_{i=1}^{n} i^2
\]

\[
= \frac{1}{n} (2n) + \frac{1}{n^2} \left[\frac{n(n + 1)}{2}\right] - \frac{1}{n^3} \left[\frac{n(n + 1)(2n + 1)}{6}\right]
\]

\[
= 2 + \frac{n^2 + n}{2n^2} - \frac{2n^3 + 3n^2 + n}{6n^3}
\]

\[
= 2 + \frac{1}{2} + \frac{1}{2n} - \frac{1}{3} - \frac{1}{2n} - \frac{1}{6n^2}
\]

\[
= \frac{13}{6} - \frac{1}{6n^2}
\]

Finally, find the exact area by taking the limit as \( n \) approaches \( \infty \).

\[
A = \lim_{n \to \infty} \left(\frac{13}{6} - \frac{1}{6n^2}\right)
\]

\[
= \frac{13}{6}
\]

**Example 6** Finding the Area of a Region

Find the area of the region bounded by the graph of \( f(x) = 3x - x^2 \) and the \( x \)-axis between \( x = 1 \) and \( x = 2 \), as shown in Figure 12.36.

**Solution**

Begin by finding the dimensions of the rectangles.

\[
\text{Width}: \frac{b - a}{n} = \frac{2 - 1}{n} = \frac{1}{n}
\]

\[
\text{Height}: f\left(a + \frac{(b - a)i}{n}\right) = f\left(1 + \frac{i}{n}\right)
\]

\[
= 3 \left(1 + \frac{i}{n}\right) - \left(1 + \frac{i^2}{n^2}\right)
\]

\[
= 3 + \frac{3i}{n} - \left(1 + \frac{2i}{n} + \frac{i^2}{n^2}\right)
\]

\[
= 2 + \frac{i}{n} - \frac{i^2}{n^2}
\]

Next, approximate the area as the sum of the areas of \( n \) rectangles.

\[
A = \sum_{i=1}^{n} f\left(a + \frac{(b - a)i}{n}\right)\left(\frac{b - a}{n}\right)
\]

\[
= \sum_{i=1}^{n} \left(2 + \frac{i}{n} - \frac{i^2}{n^2}\right)\left(\frac{1}{n}\right)
\]

\[
= \frac{1}{n} \sum_{i=1}^{n} 2 + \frac{1}{n^2} \sum_{i=1}^{n} i - \frac{1}{n} \sum_{i=1}^{n} i^2
\]

\[
= \frac{1}{n} (2n) + \frac{1}{n^2} \left[\frac{n(n + 1)}{2}\right] - \frac{1}{n^3} \left[\frac{n(n + 1)(2n + 1)}{6}\right]
\]

\[
= 2 + \frac{n^2 + n}{2n^2} - \frac{2n^3 + 3n^2 + n}{6n^3}
\]

\[
= 2 + \frac{1}{2} + \frac{1}{2n} - \frac{1}{3} - \frac{1}{2n} - \frac{1}{6n^2}
\]

\[
= \frac{13}{6} - \frac{1}{6n^2}
\]

Finally, find the exact area by taking the limit as \( n \) approaches \( \infty \).

\[
A = \lim_{n \to \infty} \left(\frac{13}{6} - \frac{1}{6n^2}\right)
\]

\[
= \frac{13}{6}
\]

**CHECK Point** Now try Exercise 43.
### 12.5 EXERCISES

**VOCABULARY:** Fill in the blanks.

1. \( \sum_{i=1}^{n} c = \ldots \), \( c \) is a constant.
2. \( \sum_{i=1}^{n} i = \ldots \)
3. \( \sum_{i=1}^{n} i^3 = \ldots \)
4. The exact _______ of a plane region \( R \) is given by the limit of the sum of \( n \) rectangles as \( n \) approaches \( \infty \).

**SKILLS AND APPLICATIONS**

In Exercises 5–12, evaluate the sum using the summation formulas and properties.

5. \( \sum_{i=1}^{60} 7 \)
6. \( \sum_{i=1}^{45} 3 \)
7. \( \sum_{i=1}^{20} i^3 \)
8. \( \sum_{i=1}^{30} i^2 \)
9. \( \sum_{k=1}^{20} (k^3 + 2) \)
10. \( \sum_{k=1}^{10} (2k + 1) \)
11. \( \sum_{j=1}^{25} (j^2 + j) \)
12. \( \sum_{j=1}^{12} (j^3 - 3j^2) \)

In Exercises 13–20, (a) rewrite the sum as a rational function \( S(n) \), (b) use \( S(n) \) to complete the table, and (c) find \( \lim_{n \to \infty} S(n) \).

<table>
<thead>
<tr>
<th>( n )</th>
<th>( 10^0 )</th>
<th>( 10^1 )</th>
<th>( 10^2 )</th>
<th>( 10^3 )</th>
<th>( 10^4 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( S(n) )</td>
<td>\ldots</td>
<td>\ldots</td>
<td>\ldots</td>
<td>\ldots</td>
<td>\ldots</td>
</tr>
</tbody>
</table>

13. \( \sum_{j=1}^{n} \frac{i^3}{n^3} \)
14. \( \sum_{i=1}^{n} \frac{i}{n^2} \)
15. \( \sum_{i=1}^{n} \frac{3}{n^2}(1 + i^2) \)
16. \( \sum_{i=1}^{n} \frac{2i + 3}{n^2} \)
17. \( \sum_{i=1}^{n} \left(\frac{i^2}{n^2} + \frac{2}{n}\right) \left(\frac{1}{n}\right) \)
18. \( \sum_{i=1}^{n} \left[3 - 2\left(\frac{i}{n}\right)\right] \left(\frac{1}{n}\right) \)
19. \( \sum_{i=1}^{n} \left[1 - \left(\frac{i}{n}\right)^2\right] \left(\frac{1}{n}\right) \)
20. \( \sum_{i=1}^{n} \left[\frac{4}{n} + \left(\frac{2i}{n}\right)\right] \left(\frac{2i}{n}\right) \)

In Exercises 21–24, approximate the area of the region using the indicated number of rectangles of equal width.

21. \( f(x) = x + 4 \)
22. \( f(x) = 2 - x^2 \)

23. \( f(x) = \frac{1}{2}x^3 \)
24. \( f(x) = \frac{1}{3}(x - 1)^3 \)

In Exercises 25–28, complete the table showing the approximate area of the region in the graph using \( n \) rectangles of equal width.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( 4 )</th>
<th>( 8 )</th>
<th>( 20 )</th>
<th>( 50 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{Approximate area} )</td>
<td>\ldots</td>
<td>\ldots</td>
<td>\ldots</td>
<td>\ldots</td>
</tr>
</tbody>
</table>

25. \( f(x) = -\frac{1}{5x} + 4 \)
26. \( f(x) = 9 - x^2 \)

27. \( f(x) = \frac{1}{3}x^3 \)
28. \( f(x) = 3 - \frac{1}{2}x^3 \)
In Exercises 29–36, complete the table using the function \( f(x) \), over the specified interval \([a, b]\), to approximate the area of the region bounded by the graph of \( y = f(x) \), the \( x \)-axis, and the vertical lines \( x = a \) and \( x = b \) using the indicated number of rectangles. Then find the exact area as \( n \to \infty \).

<table>
<thead>
<tr>
<th>Function ( f(x) )</th>

(a) Use the regression feature of a graphing utility to find a model of the form \( y = ax^3 + bx^2 + cx + d \).

(b) Use a graphing utility to plot the data and graph the model in the same viewing window.

(c) Use the model in part (a) to estimate the area of the lot.

**EXPLORATION**

**TRUE OR FALSE?** In Exercises 51 and 52, determine whether the statement is true or false. Justify your answer.

51. The sum of the first \( n \) positive integers is \( n(n + 1)/2 \).

52. The exact area of a region is given by the limit of the sum of \( n \) rectangles as \( n \) approaches 0.

53. **THINK ABOUT IT** Determine which value best approximates the area of the region shown in the graph. (Make your selection on the basis of the sketch of the region and not by performing any calculations.)

(a) \(-2\) (b) \(1\) (c) \(4\) (d) \(6\) (e) \(9\)

54. **CAPSTONE** Describe the process of finding the area of a region bounded by the graph of a nonnegative, continuous function \( f \), the \( x \)-axis, and the vertical lines \( x = a \) and \( x = b \).

In Exercises 5–8, use the graph to find the limit (if it exists). If the limit does not exist, explain why.

5. \( \lim_{x \to 1} (3 - x) \)

6. \( \lim_{x \to 2} \frac{1}{x - 2} \)

7. \( \lim_{x \to 1} \frac{x^2 - 1}{x - 1} \)

8. \( \lim_{x \to -1} (2x^2 + 1) \)

In Exercises 9 and 10, use the given information to evaluate each limit.

9. \( \lim_{x \to c} f(x) = 4 \), \( \lim_{x \to c} g(x) = 5 \)

   (a) \( \lim_{x \to c} [f(x)]^3 \)
   (b) \( \lim_{x \to c} [3f(x) - g(x)] \)
   (c) \( \lim_{x \to c} [f(x)g(x)] \)
   (d) \( \lim_{x \to c} \frac{f(x)}{g(x)} \)

10. \( \lim_{x \to c} f(x) = 27 \), \( \lim_{x \to c} g(x) = 12 \)

   (a) \( \lim_{x \to c} \sqrt[3]{f(x)} \)
   (b) \( \lim_{x \to c} \frac{f(x)}{18} \)
   (c) \( \lim_{x \to c} [f(x)g(x)] \)
   (d) \( \lim_{x \to c} [f(x) - 2g(x)] \)

In Exercises 11–24, find the limit by direct substitution.

11. \( \lim_{x \to 4} \frac{1}{4} x + 3 \)

12. \( \lim_{x \to a} \sqrt{5 - x} \)

13. \( \lim_{x \to c} \frac{x^2 - 1}{x^3 + 2} \)

14. \( \lim_{x \to c} 7 \)

15. \( \lim_{x \to -\pi} \sin 3x \)

16. \( \lim_{x \to c} \tan x \)

17. \( \lim_{x \to 5} 5x - 4 \)

18. \( \lim_{x \to -2} (5 - 2x - x^2) \)

19. \( \lim_{x \to 2} \frac{5x - 3}{3x + 5} \)

20. \( \lim_{x \to -2} \frac{1}{\sqrt[4]{4x}} \)

21. \( \lim_{t \to c} \frac{t^2 + 1}{t} \)

22. \( \lim_{c \to 3} \frac{3x + 5}{5x - 3} \)

23. \( \lim_{x \to -1} \frac{2}{e^x} \)

24. \( \lim_{x \to 0} \arctan x \)

In Exercises 25–36, find the limit (if it exists). Use a graphing utility to verify your result graphically.

25. \( \lim_{x \to -2} \frac{t + 2}{t^2 - 4} \)

26. \( \lim_{x \to 5} \frac{5 - x}{x^2 - 25} \)

27. \( \lim_{x \to 2} \frac{x - 5}{x^2 + 5x - 50} \)

28. \( \lim_{x \to -1} \frac{x + 1}{x^2 - 5x - 6} \)

29. \( \lim_{x \to -2} \frac{x^2 - 4}{x^2 + 8} \)

30. \( \lim_{t \to 3} \frac{t^3 + 27}{t + 3} \)

31. \( \lim_{x \to -1} \frac{x + 2}{x + 1} \)

32. \( \lim_{x \to 0} \frac{1}{x + 1} - \frac{1}{x} \)

33. \( \lim_{u \to 0} \frac{\sqrt{4 + u} - 2}{u} \)

34. \( \lim_{v \to 0} \frac{\sqrt{v} + 9 - 3}{v} \)

35. \( \lim_{x \to -5} \frac{\sqrt{x - 1} - 2}{x - 5} \)

36. \( \lim_{x \to 1} \frac{\sqrt{3} - \sqrt{x} + 2}{1 - x} \)
In Exercises 37–44, (a) graphically approximate the limit (if it exists) by using a graphing utility to graph the function, and (b) numerically approximate the limit (if it exists) by using the table feature of a graphing utility to create a table.

37. \[ \lim_{x \to 3} \frac{x - 3}{x^2 - 9} \]
38. \[ \lim_{x \to 4} \frac{4 - x}{16 - x^2} \]
39. \[ \lim_{x \to 0} e^{-2x} \]
40. \[ \lim_{x \to 0} e^{-4/x^2} \]
41. \[ \lim_{x \to 0} \frac{\sin 4x}{2x} \]
42. \[ \lim_{x \to 0} \frac{\tan 2x}{x} \]
43. \[ \lim_{x \to 1} \frac{\sqrt{2x + 1} - \sqrt{3}}{x - 1} \]
44. \[ \lim_{x \to 1} \frac{1 - \sqrt{x}}{x - 1} \]

In Exercises 45–52, graph the function. Determine the limit (if it exists) by evaluating the corresponding one-sided limits.

45. \[ \lim_{x \to -3} \frac{|x - 3|}{x - 3} \]
46. \[ \lim_{x \to -8} \frac{|8 - x|}{8 - x} \]
47. \[ \lim_{x \to 2} \frac{x - 2}{x^2 - 4} \]
48. \[ \lim_{x \to 3} \frac{1}{x^3 + 9} \]
49. \[ \lim_{x \to -5} \frac{|x - 5|}{x - 5} \]
50. \[ \lim_{x \to -2} \frac{|x + 2|}{x + 2} \]
51. \[ \lim_{x \to 2} f(x) \text{ where } f(x) = \begin{cases} 5 - x, & x \leq 2 \\ x^2 - 3, & x > 2 \end{cases} \]
52. \[ \lim_{x \to 0} f(x) \text{ where } f(x) = \begin{cases} x - 6, & x < 0 \\ x^2 - 4, & x > 0 \end{cases} \]

In Exercises 53–56, find \[ \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \].

53. \[ f(x) = 4x + 3 \]
54. \[ f(x) = 11 - 2x \]
55. \[ f(x) = 3x - x^2 \]
56. \[ f(x) = x^3 - 5x - 2 \]

In Exercises 57 and 58, approximate the slope of the tangent line to the graph at the point \((x, y)\).

57.

58.

In Exercises 59–64, sketch a graph of the function and the tangent line at the point \((2, f(2))\). Use the graph to approximate the slope of the tangent line.

59. \[ f(x) = x^2 - 2x \]
60. \[ f(x) = 6 - x^2 \]
61. \[ f(x) = \sqrt{x + 2} \]
62. \[ f(x) = \sqrt{x^2 + 5} \]

63. \[ f(x) = \frac{6}{x - 4} \]
64. \[ f(x) = \frac{1}{3 - x} \]

In Exercises 65–68, find a formula for the slope of the graph of \(f\) at the point \((x, f(x))\). Then use it to find the slope at the two given points.

65. \[ f(x) = x^2 - 4x \]
   (a) \((0, 0)\) \hspace{1cm} (b) \((5, 5)\)
66. \[ f(x) = \frac{1}{4}x^4 \]
   (a) \((-2, 4)\) \hspace{1cm} (b) \((1, \frac{1}{2})\)
67. \[ f(x) = \frac{4}{x - 6} \]
   (a) \((7, 4)\) \hspace{1cm} (b) \((8, 2)\)
68. \[ f(x) = \sqrt{x} \]
   (a) \((1, 1)\) \hspace{1cm} (b) \((4, 2)\)

In Exercises 69–80, find the derivative of the function.

69. \[ f(x) = 5 \]
70. \[ g(x) = -3 \]
71. \[ h(x) = 5 - \frac{1}{2}x \]
72. \[ f(x) = 3x \]
73. \[ g(x) = 2x^2 - 1 \]
74. \[ f(x) = -x^3 + 4x \]
75. \[ f(t) = \sqrt{t} + 5 \]
76. \[ g(t) = \sqrt{t} - 3 \]
77. \[ g(x) = \frac{4}{x + 5} \]
78. \[ g(t) = \frac{6}{5 - t} \]
79. \[ g(x) = \frac{1}{\sqrt{x} + 4} \]
80. \[ f(x) = \frac{1}{\sqrt{12 - x}} \]

In Exercises 81 and 82, (a) find the slope of the graph of \(f\) at the given point, (b) use the result of part (a) to find an equation of the tangent line to the graph at the point, and (c) graph the function and the tangent line.

81. \[ f(x) = 2x^2 - 1, \hspace{1cm} (0, -1) \]
82. \[ f(x) = x^2 + 10, \hspace{1cm} (2, 14) \]

In Exercises 83–92, find the limit (if it exists). If the limit does not exist, explain why. Use a graphing utility to verify your result graphically.

83. \[ \lim_{x \to \infty} \frac{4x}{2x - 3} \]
84. \[ \lim_{x \to \infty} \frac{7x}{14x + 2} \]
85. \[ \lim_{x \to \infty} \frac{3 + x}{3 - x} \]
86. \[ \lim_{x \to \infty} \frac{1 - 2x}{x + 2} \]
87. \[ \lim_{x \to \infty} \frac{2x}{x^2 - 25} \]
88. \[ \lim_{x \to \infty} \frac{3x}{(1 - x)^3} \]
89. \[ \lim_{x \to \infty} \frac{x}{2x + 3} \]
90. \[ \lim_{x \to \infty} \frac{3y^4}{y^2 + 1} \]
91. \[ \lim_{x \to \infty} \frac{\sqrt{x}}{(x - 2)^2 + 3} \]
92. \[ \lim_{x \to \infty} \left[ 2 - \frac{2x^2}{(x + 1)^2} \right] \]
In Exercises 93–98, write the first five terms of the sequence and find the limit of the sequence (if it exists). If the limit does not exist, explain why. Assume \( n \) begins with 1.

93. \( a_n = \frac{4n - 1}{3n + 1} \)  
94. \( a_n = \frac{n}{n^2 + 1} \) 
95. \( a_n = \frac{(-1)^n}{n^3} \)  
96. \( a_n = \frac{(-1)^{n+1}}{n} \) 
97. \( a_n = \frac{n^2}{3n + 2} \)  
98. \( a_n = \frac{1}{2n^2(3-2n(n+1))} \)

**EXPLORATION**

In Exercises 99 and 100, (a) use the summation formulas and properties to rewrite the sum as a rational function \( S(n) \), (b) use \( S(n) \) to complete the table, and (c) find \( \lim_{n \to \infty} S(n) \).

99. \( \sum_{i=1}^{n} \left( \frac{4i^2}{n^2} - \frac{i}{n} \right)(\frac{1}{n}) \)  
100. \( \sum_{i=1}^{n} \left[ 4 - \left( \frac{3i}{n} \right)^2 \right] \left( \frac{3i}{n^2} \right) \)

In Exercises 101 and 102, approximate the area of the region using the indicated number of rectangles of equal width.

101. \( f(x) = 4 - x \)  
102. \( f(x) = 4 - x^2 \)

In Exercises 103 and 104, complete the table to show the approximate area of the region in the graph using \( n \) rectangles of equal width.

<table>
<thead>
<tr>
<th>( n )</th>
<th>( 4 )</th>
<th>( 8 )</th>
<th>( 20 )</th>
<th>( 50 )</th>
<th>Approximate area</th>
</tr>
</thead>
</table>

103. \( f(x) = \frac{1}{4}x^2 \)  
104. \( f(x) = 4x - x^2 \)

In Exercises 105–112, use the limit process to find the area of the region between the graph of the function and the \( x \)-axis over the specified interval.

**Function**  
**Interval**

105. \( f(x) = 10 - x \)  
106. \( f(x) = 2x - 6 \)  
107. \( f(x) = x^2 + 4 \)  
108. \( f(x) = 8(x - x^2) \)  
109. \( f(x) = x^3 + 1 \)  
110. \( f(x) = 1 - x^3 \)  
111. \( f(x) = 2(x^2 - x^3) \)  
112. \( f(x) = 4 - (x - 2)^2 \)

**EXPLORATION**

113. **CIVIL ENGINEERING**  
The table shows the measurements (in feet) of a lot bounded by a stream and two straight roads that meet at right angles (see figure).

<table>
<thead>
<tr>
<th>( x )</th>
<th>0</th>
<th>100</th>
<th>200</th>

(a) Use the regression feature of a graphing utility to find a model of the form \( y = ax^3 + bx^2 + cx + d \).  
(b) Use a graphing utility to plot the data and graph the model in the same viewing window.  
(c) Use the model in part (a) to estimate the area of the lot.

**TRUE OR FALSE?**  
In Exercises 114 and 115, determine whether the statement is true or false. Justify your answer.

114. The limit of the sum of two functions is the sum of the limits of the two functions.

115. If the degree of the numerator \( N(x) \) of a rational function \( f(x) = N(x)/D(x) \) is greater than the degree of its denominator \( D(x) \), then the limit of the rational function as \( x \) approaches \( \infty \) is 0.

116. **WRITING**  
Write a paragraph explaining several reasons why the limit of a function may not exist.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1–3, sketch a graph of the function and approximate the limit (if it exists). Then find the limit (if it exists) algebraically by using appropriate techniques.

1. \( \lim_{x \to -2} \frac{x^2 - 1}{2x} \)
2. \( \lim_{x \to 1} \frac{-x^2 + 5x - 3}{1 - x} \)
3. \( \lim_{x \to 5} \frac{\sqrt{x} - 2}{x - 5} \)

In Exercises 4 and 5, use a graphing utility to graph the function and approximate the limit. Write an approximation that is accurate to four decimal places. Then create a table to verify your limit numerically.

4. \( \lim_{x \to 0} \frac{\sin 3x}{x} \)
5. \( \lim_{x \to 0} \frac{e^{2x} - 1}{x} \)

6. Find a formula for the slope of the graph of \( f \) at the point \((x, f(x))\). Then use the formula to find the slope at the given point.
   (a) \( f(x) = 3x^2 - 5x - 2, \quad (2, 0) \)
   (b) \( f(x) = 2x^3 + 6x, \quad (-1, -8) \)

In Exercises 7–9, find the derivative of the function.

7. \( f(x) = 5 - \frac{2}{5}x \)
8. \( f(x) = 2x^2 + 4x - 1 \)
9. \( f(x) = \frac{1}{x + 3} \)

In Exercises 10–12, find the limit (if it exists). If the limit does not exist, explain why. Use a graphing utility to verify your result graphically.

10. \( \lim_{x \to \infty} \frac{6}{5x - 1} \)
11. \( \lim_{x \to \infty} \frac{1 - 3x^2}{x^2 - 5} \)
12. \( \lim_{x \to -\infty} \frac{x^2}{3x + 2} \)

In Exercises 13 and 14, write the first five terms of the sequence and find the limit of the sequence (if it exists). If the limit does not exist, explain why. Assume \( n \) begins with 1.

13. \( a_n = \frac{n^2 + 3n - 4}{2n^2 + n - 2} \)
14. \( a_n = \frac{1 + (-1)^n}{n} \)

15. Approximate the area of the region bounded by the graph of \( f(x) = 8 - 2x^2 \) shown at the left using the indicated number of rectangles of equal width.

In Exercises 16 and 17, use the limit process to find the area of the region between the graph of the function and the \( x \)-axis over the specified interval.

16. \( f(x) = x + 2; \quad \text{interval: } [-2, 2] \)
17. \( f(x) = 3 - x^2; \quad \text{interval: } [-1, 1] \)

18. The table shows the altitude of a space shuttle during its first 5 seconds of motion.
   (a) Use the regression feature of a graphing utility to find a quadratic model \( y = ax^2 + bx + c \) for the data.
   (b) The value of the derivative of the model is the rate of change of altitude with respect to time, or the velocity, at that instant. Find the velocity of the shuttle after 5 seconds.
Take this test as you would take a test in class. When you are finished, check your work against the answers given in the back of the book.

In Exercises 1 and 2, identify the conic and sketch its graph.

1. \( \frac{(x - 2)^2}{4} + \frac{(y + 1)^2}{9} = 1 \)  
2. \( x^2 + y^2 - 2x - 4y + 1 = 0 \)

3. Find the standard form of the equation of the ellipse with vertices \((0, 0)\) and \((0, 4)\) and endpoints of the minor axis \((1, 2)\) and \((-1, 2)\).

4. Determine the number of degrees through which the axis must be rotated to eliminate the \(xy\)-term of the conic \(x^2 - 4xy + 2y^2 = 6\). Then graph the conic.

5. Sketch the curve represented by the parametric equations \(x = 4 \ln t\) and \(y = \frac{1}{2}t^2\). Then eliminate the parameter and write the corresponding rectangular equation whose graph represents the curve.

6. Plot the point \((-2, -3/4)\) and find three additional polar representations for \(-2 \pi < \theta < 2 \pi\).

7. Convert the rectangular equation \(-8x - 3y + 5 = 0\) to polar form.

8. Convert the polar equation \(r = \frac{2}{4 - 5 \cos \theta}\) to rectangular form.

In Exercises 9–11, sketch the graph of the polar equation. Identify the type of graph.

9. \( r = -\frac{\pi}{6} \)  
10. \( r = 3 - 2 \sin \theta \)  
11. \( r = 2 + 5 \cos \theta \)

In Exercises 12 and 13, find the coordinates of the point.

12. The point is located six units behind the \(yz\)-plane, one unit to the right of the \(xz\)-plane, and three units above the \(xy\)-plane.

13. The point is located on the \(y\)-axis, four units to the left of the \(xz\)-plane.

14. Find the distance between the points \((-2, 3, -6)\) and \((4, -5, 1)\).

15. Find the lengths of the sides of the right triangle at the left. Show that these lengths satisfy the Pythagorean Theorem.

16. Find the coordinates of the midpoint of the line segment joining \((3, 4, -1)\) and \((-5, 0, 2)\).

17. Find an equation of the sphere for which the endpoints of a diameter are \((0, 0, 0)\) and \((4, 4, 8)\).

18. Sketch the graph of the equation \((x - 2)^2 + (y + 1)^2 + z^2 = 4\), and sketch the \(xy\)-trace and the \(yz\)-trace.

19. For the vectors \(\mathbf{u} = \langle 2, -6, 0 \rangle\) and \(\mathbf{v} = \langle -4, 5, 3 \rangle\), find \(\mathbf{u} \cdot \mathbf{v}\) and \(\mathbf{u} \times \mathbf{v}\).

In Exercises 20–22, determine whether \(\mathbf{u}\) and \(\mathbf{v}\) are orthogonal, parallel, or neither.

20. \(\mathbf{u} = \langle 4, 4, 0 \rangle\)  
21. \(\mathbf{u} = \langle 4, -2, 10 \rangle\)  
22. \(\mathbf{u} = \langle -1, 6, -3 \rangle\)  
\(\mathbf{v} = \langle 0, -8, 6 \rangle\)  
\(\mathbf{v} = \langle -2, 6, 2 \rangle\)  
\(\mathbf{v} = \langle 3, -18, 9 \rangle\)

23. Find sets of (a) parametric equations and (b) symmetric equations for the line passing through the points \((-2, 3, 0)\) and \((5, 8, 25)\).

24. Find the parametric form of the equation of the line passing through the point \((-1, 2, 0)\) and perpendicular to \(2x - 4y + z = 8\).
25. Find an equation of the plane passing through the points \((0, 0, 0)\), \((-2, 3, 0)\), and \((5, 8, 25)\).
26. Sketch the graph and label the intercepts of the plane given by \(3x - 6y - 12z = 24\).
27. Find the distance between the point \((0, 0, 25)\) and the plane \(2x - 5y + z = 10\).
28. A plastic wastebasket has the shape and dimensions shown in the figure. In fabricating a mold for making the wastebasket, it is necessary to know the angle between two adjacent sides. Find the angle.

In Exercises 29–34, find the limit (if it exists). If the limit does not exist, explain why. Use a graphing utility to verify your result graphically.

29. \(\lim_{x \to 0} \frac{\sqrt{x} + 4 - 2}{x}\)
30. \(\lim_{x \to 4} \frac{|x - 4|}{x - 4}\)
31. \(\lim_{x \to 0} \sin\left(\frac{x}{x}\right)\)
32. \(\lim_{x \to 0} \frac{1}{x - 3} + \frac{1}{3}\)
33. \(\lim_{x \to 0} \frac{\sqrt{x + 16} - 4}{x}\)
34. \(\lim_{x \to 2} \frac{x - 2}{x^2 - 4}\)

In Exercises 35–38, find a formula for the slope of the graph of \(f\) at the point \((x, f(x))\). Then use the formula to find the slope at the given point.

35. \(f(x) = 4 - x^2\), \((-2, 0)\)
36. \(f(x) = \sqrt{x + 3}\), \((-2, 1)\)
37. \(f(x) = \frac{1}{x + 3}\), \((1, 1\frac{1}{4})\)
38. \(f(x) = x^2 - x\), \((1, 0)\)

In Exercises 39–44, find the limit (if it exists). If the limit does not exist, explain why. Use a graphing utility to verify your result graphically.

39. \(\lim_{x \to \infty} \frac{2x^4 - x^3 + 4}{x^2 - 9}\)
40. \(\lim_{x \to \infty} \frac{x^3}{x^2 - 9}\)
41. \(\lim_{x \to \infty} \frac{3 - 7x}{x + 4}\)
42. \(\lim_{x \to \infty} \frac{3x^2 + 1}{x^2 + 4}\)
43. \(\lim_{x \to \infty} \frac{2x}{x^2 + 3x - 2}\)
44. \(\lim_{x \to \infty} \frac{3 - x}{x^2 + 1}\)

In Exercises 45–47, evaluate the sum using the summation formulas and properties.

45. \(\sum_{i=1}^{50} (1 - i^2)\)
46. \(\sum_{k=1}^{20} (3k^2 - 2k)\)
47. \(\sum_{i=1}^{40} (12 + i^3)\)

In Exercises 48 and 49, approximate the area of the region using the indicated number of rectangles of equal width.

48. \(y = 2x\)
49. \(y = \frac{1}{x^2 + 1}\)

In Exercises 50–52, use the limit process to find the area of the region between the graph of the function and the \(x\)-axis over the specified interval.

50. \(f(x) = 1 - x^3\)  
   Interval: \([0, 1]\)
51. \(f(x) = x + 2\)  
   Interval: \([0, 1]\)
52. \(f(x) = 4 - x^2\)  
   Interval: \([0, 2]\)
Many of the proofs of the definitions and properties presented in this chapter are beyond the scope of this text. Included below are simple proofs for the limit of a power function and the limit of a polynomial function.

**Limit of a Power Function  \((p. 855)\)**

\[ \lim_{x \to c} x^n = c^n, \quad c \text{ is a real number and } n \text{ is a positive integer.} \]

**Proof**

\[
\lim_{x \to c} x^n = \lim_{x \to c} (x \cdot x \cdot \cdots \cdot x) \quad \text{n factors}
\]

\[
= \lim_{x \to c} x \cdot \lim_{x \to c} x \cdot \lim_{x \to c} \cdots \cdot \lim_{x \to c} x \\
= c \cdot c \cdot c \cdot \cdots \cdot c \quad \text{n factors}
\]

\[ = c^n \quad \text{Exponential form} \]

**Limit of a Polynomial Function  \((p. 857)\)**

If \(p\) is a polynomial function and \(c\) is a real number, then

\[ \lim_{x \to c} p(x) = p(c). \]

**Proof**

Let \(p\) be a polynomial function such that

\[ p(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0. \]

Because a polynomial function is the sum of monomial functions, you can write the following.

\[
\lim_{x \to c} p(x) = \lim_{x \to c} (a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0)
\]

\[
= \lim_{x \to c} a_n x^n + \lim_{x \to c} a_{n-1} x^{n-1} + \cdots + \lim_{x \to c} a_2 x^2 + \lim_{x \to c} a_1 x + \lim_{x \to c} a_0
\]

\[= a_n c^n + a_{n-1} c^{n-1} + \cdots + a_2 c^2 + a_1 c + a_0 \quad \text{Scalar Multiple Property of Limits and limit of a power function}
\]

\[= p(c) \quad p \text{ evaluated at } c \]
PROBLEM SOLVING

This collection of thought-provoking and challenging exercises further explores and expands upon concepts learned in this chapter.

1. Consider the graphs of the four functions \( g_1, g_2, g_3, \) and \( g_4. \)

![Graphs of four functions](image)

For each given condition of the function \( f, \) which of the graphs could be the graph of \( f? \)
(a) \( \lim_{x \to 2} f(x) = 3 \)
(b) \( \lim_{x \to 2} f(x) = 3 \)
(c) \( \lim_{x \to 2} f(x) = 3 \)

2. Sketch the graph of the function given by \( f(x) = [x] + [-x]. \)
(a) Evaluate \( f(1), f(0), f(\frac{1}{2}), \) and \( f(-2.7). \)
(b) Evaluate the following limits.
\[ \lim_{x \to 1^-} f(x), \lim_{x \to 1^+} f(x), \lim_{x \to 1} f(x) \]

3. Sketch the graph of the function given by \( f(x) = \left\lfloor \frac{1}{x} \right\rfloor. \)
(a) Evaluate \( f(\frac{1}{2}), f(3), \) and \( f(1). \)
(b) Evaluate the following limits.
\[ \lim_{x \to 1/2^-} f(x), \lim_{x \to 1/2^+} f(x), \lim_{x \to 1/2} f(x) \]

4. Let \( P(3, 4) \) be a point on the circle \( x^2 + y^2 = 25 \) (see figure).

![Circle with point P](image)

(a) What is the slope of the line joining \( P \) and \( O(0, 0)? \)
(b) Find an equation of the tangent line to the circle at \( P. \)
(c) Let \( Q(x, y) \) be another point on the circle in the first quadrant. Find the slope \( m_q \) of the line joining \( P \) and \( Q \) in terms of \( x. \)
(d) Evaluate \( \lim_{x \to 1} m_q. \) How does this number relate to your answer in part (b)?

5. Find the values of the constants \( a \) and \( b \) such that
\[ \lim_{x \to 0} \frac{\sqrt{a + bx} - \sqrt{3}}{x} = \sqrt{3}. \]
(a) Find the domain of \( f. \)
(b) Use a graphing utility to graph the function.
(c) Evaluate \( \lim_{x \to 27} f(x). \) Verify your result using the graph in part (b).
(d) Evaluate \( \lim_{x \to 3} f(x). \) Verify your result using the graph in part (b).

7. Let
\[ f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases} \]
and
\[ g(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ x, & \text{if } x \text{ is irrational} \end{cases} \]
Find (if possible) \( \lim_{x \to 0} f(x) \) and \( \lim_{x \to 0} g(x). \) Explain your reasoning.

8. Graph the two parabolas \( y = x^2 \) and \( y = -x^2 + 2x - 5 \) in the same coordinate plane. Find equations of the two lines that are simultaneously tangent to both parabolas.

9. Find a function of the form \( f(x) = ax + b\sqrt{x} \) that is tangent to the line \( 2y = 3x = 5 \) at the point \( (1, 4). \)

10. (a) Find an equation of the tangent line to the parabola \( y = x^2 \) at the point \( (2, 4). \)
(b) Find an equation of the normal line to \( y = x^2 \) at the point \( (2, 4). \) (The normal line is perpendicular to the tangent line.) Where does this line intersect the parabola a second time?
(c) Find equations of the tangent line and normal line to \( y = x^2 \) at the point \( (0, 0). \)
11. A line with slope \( m \) passes through the point \((0, 4)\).

(a) Recall that the distance \( d \) between a point \((x_1, y_1)\) and the line \( Ax + By + C = 0 \) is given by

\[
d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}.
\]

Write the distance \( d \) between the line and the point \((3, 1)\) as a function of \( m \).

(b) Use a graphing utility to graph the function from part (a).

(c) Find \( \lim_{m \to \infty} d(m) \) and \( \lim_{m \to -\infty} d(m) \). Give a geometric interpretation of the results.

12. A heat probe is attached to the heat exchanger of a heating system. The temperature \( T \) (in degrees Celsius) is recorded \( t \) seconds after the furnace is started. The results for the first 2 minutes are recorded in the table.

<table>
<thead>
<tr>
<th>( t ) (s)</th>
<th>( T ) (°C)</th>

<td>65.2°</td>
</tr>
</tbody>
</table>

(a) Use the regression feature of a graphing utility to find a model of the form \( T_i = at^2 + bt + c \) for the data.

(b) Use a graphing utility to graph \( T_i \) with the original data. How well does the model fit the data?

(c) A rational model for the data is given by

\[
T_2 = \frac{86t + 1451}{t + 58}.
\]

Use a graphing utility to graph \( T_2 \) with the original data. How well does the model fit the data?

(d) Evaluate \( T_1(0) \) and \( T_2(0) \).

(e) Find \( \lim_{t \to \infty} T_2 \). Verify your result using the graph in part (c).

(f) Interpret the result of part (e) in the context of the problem. Is it possible to do this type of analysis using \( T_1 \)? Explain your reasoning.

13. When using a graphing utility to generate a table to approximate

\[
limit_{x \to 0} \frac{\tan 2x}{x}
\]

a student concluded that the limit was 0.03491 rather than 2. Determine the probable cause of the error.

14. Let \( P(x, y) \) be a point on the parabola \( y = x^2 \) in the first quadrant. Consider the triangle formed by \( P \), \( A(0, 1) \), and the origin \( O(0, 0) \), and the triangle \( PBO \) formed by \( P, B(1, 0) \), and the origin (see figure).

(a) Write the perimeter of each triangle in terms of \( x \).

(b) Complete the table. Let \( r(x) \) be the ratio of the perimeters of the two triangles.

\[
r(x) = \frac{\text{Perimeter } \triangle PAO}{\text{Perimeter } \triangle PBO}
\]

<table>

(c) Find \( \lim_{x \to 0^+} r(x) \).

15. Archimedes showed that the area of a parabolic arch is equal to \( \frac{2}{3} \) the product of the base and the height (see figure).

(a) Graph the parabolic arch bounded by \( y = 9 - x^2 \) and the \( x \)-axis.

(b) Use the limit process to find the area of the parabolic arch.

(c) Find the base and height of the arch and verify Archimedes’ formula.
Real Numbers

Real numbers are used in everyday life to describe quantities such as age, miles per gallon, and population. Real numbers are represented by symbols such as \(5\), \(9\), \(0\), \(\frac{4}{3}\), \(0.666\ldots\), \(28.21\), \(\sqrt{2}\), \(\pi\), and \(\sqrt[3]{-32}\).

Here are some important subsets (each member of subset \(B\) is also a member of set \(A\)) of the real numbers. The three dots, called ellipsis points, indicate that the pattern continues indefinitely.

- Set of natural numbers: \(\{1, 2, 3, 4, \ldots\}\)
- Set of whole numbers: \(\{0, 1, 2, 3, 4, \ldots\}\)
- Set of integers: \(\{\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots\}\)

A real number is rational if it can be written as the ratio \(p/q\) of two integers, where \(q \neq 0\). For instance, the numbers

\[
\frac{1}{3} = 0.3333\ldots = 0.\overline{3}, \quad \frac{1}{8} = 0.125, \quad \text{and} \quad \frac{125}{111} = 1.126126\ldots = 1.\overline{126}
\]

are rational. The decimal representation of a rational number either repeats (as in \(\frac{123}{100} = 3.14\)) or terminates (as in \(\frac{1}{2} = 0.5\)). A real number that cannot be written as the ratio of two integers is called irrational. Irrational numbers have infinite nonrepeating decimal representations. For instance, the numbers

\[
\sqrt{2} = 1.4142135\ldots \approx 1.41 \quad \text{and} \quad \pi = 3.1415926\ldots \approx 3.14
\]

are irrational. (The symbol \(\approx\) means “is approximately equal to.”) Figure A.1 shows subsets of real numbers and their relationships to each other.

Example 1 Classifying Real Numbers

Determine which numbers in the set

\[
\left\{-13, -\sqrt{3}, -1, -\frac{1}{3}, 0, \frac{5}{8}, \sqrt{2}, \pi, 7\right\}
\]

are (a) natural numbers, (b) whole numbers, (c) integers, (d) rational numbers, and (e) irrational numbers.

Solution

a. Natural numbers: \(\{7\}\)

b. Whole numbers: \(\{0, 7\}\)

c. Integers: \(\{-13, -1, 0, 7\}\)

d. Rational numbers: \(\left\{-13, -1, -\frac{1}{3}, 0, \frac{5}{8}, 7\right\}\)

e. Irrational numbers: \(\{-\sqrt{3}, \sqrt{2}, \pi\}\)

Now try Exercise 11.
Real numbers are represented graphically on the **real number line**. When you draw a point on the real number line that corresponds to a real number, you are **plotting** the real number. The point 0 on the real number line is the **origin**. Numbers to the right of 0 are positive, and numbers to the left of 0 are negative, as shown in Figure A.2. The term **nonnegative** describes a number that is either positive or zero.

As illustrated in Figure A.3, there is a **one-to-one correspondence** between real numbers and points on the real number line.

### Example 2

**Plotting Points on the Real Number Line**

Plot the real numbers on the real number line.

a. $\frac{7}{4}$

b. 2.3

c. $\frac{2}{3}$

d. $-1.8$

**Solution**

All four points are shown in Figure A.4.

a. The point representing the real number $-\frac{7}{4} = -1.75$ lies between $-2$ and $-1$, but closer to $-2$, on the real number line.

b. The point representing the real number 2.3 lies between 2 and 3, but closer to 2, on the real number line.

c. The point representing the real number $\frac{2}{3} = 0.666\ldots$ lies between 0 and 1, but closer to 1, on the real number line.

d. The point representing the real number $-1.8$ lies between $-2$ and $-1$, but closer to $-2$, on the real number line. Note that the point representing $-1.8$ lies slightly to the left of the point representing $-\frac{7}{4}$.

**CHECK Point** Now try Exercise 17.
Ordering Real Numbers

One important property of real numbers is that they are ordered.

**Definition of Order on the Real Number Line**

If $a$ and $b$ are real numbers, $a$ is less than $b$ if $b - a$ is positive. The *order* of $a$ and $b$ is denoted by the inequality $a < b$. This relationship can also be described by saying that $b$ is greater than $a$ and writing $b > a$. The inequality $a \leq b$ means that $a$ is less than or equal to $b$, and the inequality $b \geq a$ means that $b$ is greater than or equal to $a$. The symbols $<$, $>$, and $\leq$, $\geq$ are inequality symbols.

Geometrically, this definition implies that $a < b$ if and only if $a$ lies to the left of $b$ on the real number line, as shown in Figure A.5.

**Example 3** Ordering Real Numbers

Place the appropriate inequality symbol ($<$ or $>$) between the pair of real numbers.

- a. $-3$, 0
- b. $-2$, $-4$
- c. $\frac{1}{4}$, $\frac{1}{3}$
- d. $-\frac{1}{5}$, $-\frac{1}{2}$

**Solution**

- a. Because $-3$ lies to the left of 0 on the real number line, as shown in Figure A.6, you can say that $-3$ is less than 0, and write $-3 < 0$.
- b. Because $-2$ lies to the right of $-4$ on the real number line, as shown in Figure A.7, you can say that $-2$ is greater than $-4$, and write $-2 > -4$.
- c. Because $\frac{1}{4}$ lies to the left of $\frac{1}{3}$ on the real number line, as shown in Figure A.8, you can say that $\frac{1}{4}$ is less than $\frac{1}{3}$, and write $\frac{1}{4} < \frac{1}{3}$.
- d. Because $-\frac{1}{2}$ lies to the right of $-\frac{1}{3}$ on the real number line, as shown in Figure A.9, you can say that $-\frac{1}{2}$ is greater than $-\frac{1}{3}$, and write $-\frac{1}{2} > -\frac{1}{3}$.

**Example 4** Interpreting Inequalities

Describe the subset of real numbers represented by each inequality.

- a. $x \leq 2$
- b. $-2 \leq x < 3$

**Solution**

- a. The inequality $x \leq 2$ denotes all real numbers less than or equal to 2, as shown in Figure A.10.
- b. The inequality $-2 \leq x < 3$ means that $x \geq -2$ and $x < 3$. This “double inequality” denotes all real numbers between $-2$ and 3, including $-2$ but not including 3, as shown in Figure A.11.
Inequalities can be used to describe subsets of real numbers called intervals. In the bounded intervals below, the real numbers $a$ and $b$ are the endpoints of each interval. The endpoints of a closed interval are included in the interval, whereas the endpoints of an open interval are not included in the interval.

### Bounded Intervals on the Real Number Line

<table>
<thead>
<tr>
<th>Notation</th>
<th>Interval Type</th>
<th>Inequality</th>
<th>Graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>$[a, b]$</td>
<td>Closed</td>
<td>$a \leq x \leq b$</td>
<td>![Graph of a closed interval]</td>
</tr>
<tr>
<td>$(a, b)$</td>
<td>Open</td>
<td>$a &lt; x &lt; b$</td>
<td>![Graph of an open interval]</td>
</tr>
<tr>
<td>$[a, b)$</td>
<td>Open</td>
<td>$a \leq x &lt; b$</td>
<td>![Graph of a half-open interval]</td>
</tr>
<tr>
<td>$(a, b]$</td>
<td>Open</td>
<td>$a &lt; x \leq b$</td>
<td>![Graph of a half-open interval]</td>
</tr>
</tbody>
</table>

The symbols $\infty$, positive infinity, and $-\infty$, negative infinity, do not represent real numbers. They are simply convenient symbols used to describe the unboundedness of an interval such as $(1, \infty)$ or $(-\infty, 3]$.

### Unbounded Intervals on the Real Number Line

<table>
<thead>
<tr>
<th>Notation</th>
<th>Interval Type</th>
<th>Inequality</th>
<th>Graph</th>
</tr>
</thead>
<tbody>
<tr>
<td>$[a, \infty)$</td>
<td>Closed</td>
<td>$x \geq a$</td>
<td>![Graph of a closed interval at $a$]</td>
</tr>
<tr>
<td>$(a, \infty)$</td>
<td>Open</td>
<td>$x &gt; a$</td>
<td>![Graph of an open interval at $a$]</td>
</tr>
<tr>
<td>$(-\infty, b]$</td>
<td>Open</td>
<td>$x \leq b$</td>
<td>![Graph of a half-open interval at $b$]</td>
</tr>
<tr>
<td>$(-\infty, \infty)$</td>
<td>Entire real line</td>
<td>$-\infty &lt; x &lt; \infty$</td>
<td>![Graph of the entire real line]</td>
</tr>
</tbody>
</table>

### Example 5 Using Inequalities to Represent Intervals

Use inequality notation to describe each of the following.

- $a$. $c$ is at most 2.
- $b$. $m$ is at least $-3$.
- $c$. All $x$ in the interval $(-3, 5]$

### Solution

- **a.** The statement “$c$ is at most 2” can be represented by $c \leq 2$.
- **b.** The statement “$m$ is at least $-3$” can be represented by $m \geq -3$.
- **c.** “All $x$ in the interval $(-3, 5]$” can be represented by $-3 < x \leq 5$.

**Checkpoint** Now try Exercise 45.
Example 6  Interpreting Intervals

Give a verbal description of each interval.

a. \((-1, 0)\)  
b. \([2, \infty)\)  
c. \((\infty, 0)\)

Solution

a. This interval consists of all real numbers that are greater than \(-1\) and less than 0.
b. This interval consists of all real numbers that are greater than or equal to 2.
c. This interval consists of all negative real numbers.

CHECKPOINT  Now try Exercise 41.

Absolute Value and Distance

The absolute value of a real number is its magnitude, or the distance between the origin and the point representing the real number on the real number line.

Definition of Absolute Value

If \(a\) is a real number, then the absolute value of \(a\) is

\[
|a| = \begin{cases} 
  a, & \text{if } a \geq 0 \\
  -a, & \text{if } a < 0.
\end{cases}
\]

Notice in this definition that the absolute value of a real number is never negative. For instance, if \(a = -5\), then \(|-5| = -(-5) = 5\). The absolute value of a real number is either positive or zero. Moreover, 0 is the only real number whose absolute value is 0. So, \(|0| = 0\).

Example 7  Finding Absolute Values

a. \(|-15| = 15\)  
b. \(\left|\frac{2}{3}\right| = \frac{2}{3}\)
c. \(|-4.3| = 4.3\)  
d. \(|-6| = -6\)

CHECKPOINT  Now try Exercise 51.

Example 8  Evaluating the Absolute Value of a Number

Evaluate \(\frac{|x|}{x}\) for (a) \(x > 0\) and (b) \(x < 0\).

Solution

a. If \(x > 0\), then \(|x| = x\) and \(\frac{|x|}{x} = \frac{x}{x} = 1\).
b. If \(x < 0\), then \(|x| = -x\) and \(\frac{|x|}{x} = \frac{-x}{x} = -1\).

CHECKPOINT  Now try Exercise 59.
The Law of Trichotomy states that for any two real numbers \( a \) and \( b \), precisely one of three relationships is possible: \( a = b \), \( a < b \), or \( a > b \). 

### Example 9 Comparing Real Numbers

Place the appropriate symbol \( (<, >, \text{ or } =) \) between the pair of real numbers.

a. \( |-4| \) \( |3| \)  
b. \( |-10| \) \( |10| \)  
c. \( |-7| \) \( |-7| \)

**Solution**

a. \( |-4| > |3| \) because \( |-4| = 4 \) and \( |3| = 3 \), and 4 is greater than 3.  

b. \( |-10| = |10| \) because \( |-10| = 10 \) and \( |10| = 10 \).  

c. \( |-7| < |-7| \) because \( |-7| = -7 \) and \( |-7| = 7 \), and -7 is less than 7. 

**Example 9** Now try Exercise 61.

**Properties of Absolute Values**

1. \( |a| \geq 0 \)  
2. \( |-a| = |a| \)  
3. \( |ab| = |a||b| \)  
4. \( \frac{|a|}{|b|} = \frac{|a|}{b} \), \( b \neq 0 \)

Absolute value can be used to define the distance between two points on the real number line. For instance, the distance between \(-3\) and 4 is

\[ |\ -3 - 4\ | = |-7| \]
\[ = 7 \]

as shown in Figure A.12.

**Distance Between Two Points on the Real Number Line**

Let \( a \) and \( b \) be real numbers. The distance between \( a \) and \( b \) is

\[ d(a, b) = |b - a| = |a - b| \]

### Example 10 Finding a Distance

Find the distance between \(-25\) and 13.

**Solution**

The distance between \(-25\) and 13 is given by

\[ |\ -25 - 13\ | = |-38| = 38 \]

Distance between \(-25\) and 13

The distance can also be found as follows.

\[ |13 - (-25)| = |38| = 38 \]

Distance between \(-25\) and 13

**Example 10** Now try Exercise 67.
Algebraic Expressions

One characteristic of algebra is the use of letters to represent numbers. The letters are variables, and combinations of letters and numbers are algebraic expressions. Here are a few examples of algebraic expressions.

\[ 5x, \quad 2x - 3, \quad \frac{4}{x^2 + 2}, \quad 7x + y \]

**Definition of an Algebraic Expression**

An algebraic expression is a collection of letters (variables) and real numbers (constants) combined using the operations of addition, subtraction, multiplication, division, and exponentiation.

The terms of an algebraic expression are those parts that are separated by addition. For example,

\[ x^2 - 5x + 8 = x^2 + (-5x) + 8 \]

has three terms: \( x^2 \) and \(-5x \) are the variable terms and 8 is the constant term. The numerical factor of a term is called the coefficient. For instance, the coefficient of \(-5x\) is \(-5\), and the coefficient of \( x^2 \) is 1.

**Example 11** Identifying Terms and Coefficients

<table>
<thead>
<tr>
<th>Algebraic Expression</th>
<th>Terms</th>
<th>Coefficients</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. ( 5x - \frac{1}{7} )</td>
<td>( 5x, -\frac{1}{7} )</td>
<td>5, (-\frac{1}{7})</td>
</tr>
<tr>
<td>b. ( 2x^2 - 6x + 9 )</td>
<td>( 2x^2, -6x, 9 )</td>
<td>2, (-6, 9)</td>
</tr>
<tr>
<td>c. ( \frac{3}{x} + \frac{1}{2}x^4 - y )</td>
<td>( \frac{3}{x}, \frac{1}{2}x^4, -y )</td>
<td>3, (\frac{1}{2}, -1)</td>
</tr>
</tbody>
</table>

**Example 12** Evaluating Algebraic Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Value of Variable</th>
<th>Substitute</th>
<th>Value of Expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. (-3x + 5)</td>
<td>( x = 3 )</td>
<td>(-3(3) + 5)</td>
<td>(-9 + 5 = -4)</td>
</tr>
<tr>
<td>b. (3x^2 + 2x - 1)</td>
<td>( x = -1 )</td>
<td>(3(-1)^2 + 2(-1) - 1)</td>
<td>(3 - 2 - 1 = 0)</td>
</tr>
<tr>
<td>c. (\frac{2x}{x + 1})</td>
<td>( x = -3 )</td>
<td>(\frac{2(-3)}{-3 + 1})</td>
<td>(\frac{-6}{-2} = 3)</td>
</tr>
</tbody>
</table>

Note that you must substitute the value for *each* occurrence of the variable.

When an algebraic expression is evaluated, the Substitution Principle is used. It states that “If \( a = b \), then \( a \) can be replaced by \( b \) in any expression involving \( a \).” In Example 12(a), for instance, 3 is *substituted* for \( x \) in the expression \(-3x + 5\).
## Basic Rules of Algebra

There are four arithmetic operations with real numbers: *addition*, *multiplication*, *subtraction*, and *division*, denoted by the symbols $+, \times$ or $\cdot$, $-$, and $\div$ or /. Of these, addition and multiplication are the two primary operations. Subtraction and division are the inverse operations of addition and multiplication, respectively.

### Definitions of Subtraction and Division

**Subtraction:** Add the opposite.  
**Division:** Multiply by the reciprocal.

$$a - b = a + (-b) \quad \text{If } b \neq 0, \text{ then } a/b = a \left(\frac{1}{b}\right) = \frac{a}{b}.$$  

In these definitions, $-b$ is the additive inverse (or opposite) of $b$, and $1/b$ is the multiplicative inverse (or reciprocal) of $b$. In the fractional form $a/b$, $a$ is the numerator of the fraction and $b$ is the denominator.

Because the properties of real numbers below are true for variables and algebraic expressions as well as for real numbers, they are often called the **Basic Rules of Algebra**. Try to formulate a verbal description of each property. For instance, the first property states that the order in which two real numbers are added does not affect their sum.

### Basic Rules of Algebra

Let $a$, $b$, and $c$ be real numbers, variables, or algebraic expressions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commutative Property of Addition: $a + b = b + a$</td>
<td>$4x + x^2 = x^2 + 4x$</td>
</tr>
<tr>
<td>Commutative Property of Multiplication: $ab = ba$</td>
<td>$(4 - x)x^2 = x^2(4 - x)$</td>
</tr>
<tr>
<td>Associative Property of Addition: $(a + b) + c = a + (b + c)$</td>
<td>$(x + 5) + x^2 = x + (5 + x^2)$</td>
</tr>
<tr>
<td>Associative Property of Multiplication: $(ab)c = a(bc)$</td>
<td>$(2x \cdot 3y)(8) = (2x)(3y \cdot 8)$</td>
</tr>
<tr>
<td>Distributive Properties: $a(b + c) = ab + ac$</td>
<td>$3(x + 5 + 2x) = 3x \cdot 5 + 3x \cdot 2x$</td>
</tr>
<tr>
<td>$(a + b)c = ac + bc$</td>
<td>$(y + 8)y = y \cdot y + 8 \cdot y$</td>
</tr>
<tr>
<td>Additive Identity Property: $a + 0 = a$</td>
<td>$5y^2 + 0 = 5y^2$</td>
</tr>
<tr>
<td>Multiplicative Identity Property: $a \cdot 1 = a$</td>
<td>$(4x^2)(1) = 4x^2$</td>
</tr>
<tr>
<td>Additive Inverse Property: $a + (-a) = 0$</td>
<td>$5x^3 + (-5x^3) = 0$</td>
</tr>
<tr>
<td>Multiplicative Inverse Property: $a \cdot \frac{1}{a} = 1, \ a \neq 0$</td>
<td>$(x^2 + 4) \left(\frac{1}{x^2 + 4}\right) = 1$</td>
</tr>
</tbody>
</table>

Because subtraction is defined as “adding the opposite,” the Distributive Properties are also true for subtraction. For instance, the “subtraction form” of $a(b + c) = ab + ac$ is $a(b - c) = ab - ac$. Note that the operations of subtraction and division are neither commutative nor associative. The examples

$$7 - 3 \neq 3 - 7 \quad \text{and} \quad 20 \div 4 \neq 4 \div 20$$

show that subtraction and division are not commutative. Similarly

$$5 - (3 - 2) \neq (5 - 3) - 2 \quad \text{and} \quad 16 \div (4 + 2) \neq (16 \div 4) \div 2$$

demonstrate that subtraction and division are not associative.
Identifying Rules of Algebra

Identify the rule of algebra illustrated by the statement.

a. \((5x^3)2 = 2(5x^3)\)

b. \(4x + \frac{1}{3} - \left(4x + \frac{1}{3}\right) = 0\)

c. \(7x \cdot \frac{1}{7x} = 1, \quad x \neq 0\)

d. \((2 + 5x^2) + x^2 = 2 + (5x^2 + x^2)\)

Solution

a. This statement illustrates the Commutative Property of Multiplication. In other words, you obtain the same result whether you multiply \(5x^3\) by 2, or 2 by \(5x^3\).

b. This statement illustrates the Additive Inverse Property. In terms of subtraction, this property simply states that when any expression is subtracted from itself the result is 0.

c. This statement illustrates the Multiplicative Inverse Property. Note that it is important that \(x\) be a nonzero number. If \(x\) were 0, the reciprocal of \(x\) would be undefined.

d. This statement illustrates the Associative Property of Addition. In other words, to form the sum

\[2 + 5x^2 + x^2\]

it does not matter whether 2 and \(5x^2\), or \(5x^2\) and \(x^2\) are added first.

Example 13  Identifying Rules of Algebra

Identify the rule of algebra illustrated by the statement.

Let \(a\), \(b\), and \(c\) be real numbers, variables, or algebraic expressions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ((-1)a = -a)</td>
<td>((-1)7 = -7)</td>
</tr>
<tr>
<td>2. (-(-a) = a)</td>
<td>(-(-6) = 6)</td>
</tr>
<tr>
<td>3. ((-a)b = -(ab) = a(-b))</td>
<td>((-5)3 = -(5 \cdot 3) = 5(-3))</td>
</tr>
<tr>
<td>4. (-(a)(-b) = ab)</td>
<td>((-2)(-x) = 2x)</td>
</tr>
<tr>
<td>5. (-(-a + b) = (-a) + (-b))</td>
<td>(-(-x + 8) = (-x) + (-8))</td>
</tr>
<tr>
<td>(\quad = -x - 8)</td>
<td></td>
</tr>
<tr>
<td>6. If (a = b), then (a \pm c = b \pm c).</td>
<td>(\frac{1}{2} + 3 = 0.5 + 3)</td>
</tr>
<tr>
<td>7. If (a = b), then (ac = bc).</td>
<td>(4^2 \cdot 2 = 16 \cdot 2)</td>
</tr>
<tr>
<td>8. If (a \pm c = b \pm c), then (a = b).</td>
<td>(1.4 - 1 = \frac{7}{5} - 1 \Rightarrow 1.4 = \frac{7}{5})</td>
</tr>
<tr>
<td>9. If (ac = bc) and (c \neq 0), then (a = b).</td>
<td>(3x = 3 \cdot 4 \Rightarrow x = 4)</td>
</tr>
</tbody>
</table>

Notice the difference between the opposite of a number and a negative number. If \(a\) is already negative, then its opposite, \(-a\), is positive. For instance, if \(a = -5\), then

\[-a = -(-5) = 5.\]
### Study Tip

The “or” in the Zero-Factor Property includes the possibility that either or both factors may be zero. This is an inclusive or, and it is the way the word “or” is generally used in mathematics.

### Properties of Zero

Let $a$ and $b$ be real numbers, variables, or algebraic expressions.

1. $a + 0 = a$ and $a - 0 = a$
2. $a \cdot 0 = 0$
3. $0/a = 0$, $a \neq 0$
4. $a/b = 0$, $b \neq 0$
5. Zero-Factor Property: If $ab = 0$, then $a = 0$ or $b = 0$.

### Properties and Operations of Fractions

Let $a$, $b$, $c$, and $d$ be real numbers, variables, or algebraic expressions such that $b \neq 0$ and $d \neq 0$.

1. Equivalent Fractions: $a/b = c/d$ if and only if $ad = bc$.
2. Rules of Signs: $-a/b = -a/b = a/b$ and $-a/b = a/b$
3. Generate Equivalent Fractions: $a/b = ac/bc$, $c \neq 0$
4. Add or Subtract with Like Denominators: $a/b \pm c/b = a \pm c/b$
5. Add or Subtract with Unlike Denominators: $a/b \pm c/d = ad \pm bc/bd$
6. Multiply Fractions: $a/b \cdot c/d = ac/bd$
7. Divide Fractions: $a/b \div c/d = a/b \cdot d/c = ad/bc$, $c \neq 0$

### Example 14

Properties and Operations of Fractions

a. Equivalent fractions: $x/5 = 3x/3 \cdot 5 = 3x/15$

b. Divide fractions: $7/x \div 3/2 = 7 \cdot 2/3 \cdot x = 14/3x$

c. Add fractions with unlike denominators: $x/3 + 2x/5 = 5 \cdot x + 3 \cdot 2x/3 \cdot 5 = 11x/15$

### Checkpoint

Now try Exercise 119.

If $a$, $b$, and $c$ are integers such that $ab = c$, then $a$ and $b$ are factors or divisors of $c$. A prime number is an integer that has exactly two positive factors—itself and 1—such as 2, 3, 5, 7, and 11. The numbers 4, 6, 8, 9, and 10 are composite because each can be written as the product of two or more prime numbers. The number 1 is neither prime nor composite. The Fundamental Theorem of Arithmetic states that every positive integer greater than 1 can be written as the product of prime numbers in precisely one way (disregarding order). For instance, the prime factorization of 24 is $24 = 2 \cdot 2 \cdot 2 \cdot 3$. 
VOCABULARY: Fill in the blanks.

1. A real number is ____ __if it can be written as the ratio \( \frac{p}{q} \) of two integers, where \( q \neq 0 \).

2. ____ ____ numbers have infinite nonrepeating decimal representations.

3. The point 0 on the real number line is called the ____ __.

4. The distance between the origin and a point representing a real number on the real number line is the ____ ____ of the real number.

5. A number that can be written as the product of two or more prime numbers is called a ____ ____ number.

6. An integer that has exactly two positive factors, the integer itself and 1, is called a ____ ____ number.

7. An algebraic expression is a collection of letters called ____ ____ and real numbers called ____ ____.

8. The ____ ____ of an algebraic expression are those parts separated by addition.

9. The numerical factor of a variable term is the ____ ____ of the variable term.

10. The ____ ____ ____ states that if \( ab = 0 \), then \( a = 0 \) or \( b = 0 \).

SKILLS AND APPLICATIONS

In Exercises 11–16, determine which numbers in the set are (a) natural numbers, (b) whole numbers, (c) integers, (d) rational numbers, and (e) irrational numbers.

11. \( \{-9, -\frac{7}{2}, 5, \frac{7}{3}, \sqrt{2}, 0, 1, -4, 2, -11\} \)

12. \( \{\sqrt{5}, -7, -\frac{5}{2}, 0, 3.12, \frac{5}{2}, -3, 12, 5\} \)

13. \( \{2.01, 0.666 \ldots, -13, 0.010110111 \ldots, 1, -6\} \)

14. \( \{2.3030030003 \ldots, 0.7575, -4.63, \sqrt{10}, -75, 4\} \)

15. \( \{-\pi, -\frac{1}{3}, \frac{8}{3}, \sqrt{2}, -7.5, -1, 8, -12\} \)

16. \( \{25, -17, -\frac{12}{5}, \sqrt{5}, 3.12, \frac{1}{2} \pi, 7, -11.1, 13\} \)

In Exercises 17 and 18, plot the real numbers on the real number line.

17. (a) \( 3 \) (b) \( \frac{7}{2} \) (c) \( -\frac{5}{2} \) (d) \( -5.2 \)

18. (a) \( 8.5 \) (b) \( \frac{4}{3} \) (c) \( -4.75 \) (d) \( -\frac{8}{3} \)

In Exercises 19–22, use a calculator to find the decimal form of the rational number. If it is a nonterminating decimal, write the repeating pattern.

19. \( \frac{5}{8} \)

20. \( \frac{1}{7} \)

21. \( \frac{41}{337} \)

22. \( \frac{6}{11} \)

In Exercises 23 and 24, approximate the numbers and place the correct symbol (< or >) between them.

23. \( -3 \quad -2 \quad -1 \quad 0 \quad 1 \quad 2 \quad 3 \)

24. \( -7 \quad -6 \quad -5 \quad -4 \quad -3 \quad -2 \quad -1 \quad 0 \)

In Exercises 25–30, plot the two real numbers on the real number line. Then place the appropriate inequality symbol (< or >) between them.

25. \( -4, -8 \)

26. \( -3.5, 1 \)

27. \( \frac{3}{7}, 7 \)

28. \( 1, \frac{10}{3} \)

29. \( \frac{5}{6}, \frac{2}{3} \)

30. \( -\frac{8}{7}, -\frac{3}{7} \)

In Exercises 31–42, (a) give a verbal description of the subset of real numbers represented by the inequality or the interval, (b) sketch the subset on the real number line, and (c) state whether the interval is bounded or unbounded.

31. \( x \leq 5 \)

32. \( x \geq -2 \)

33. \( x < 0 \)

34. \( x > 3 \)

35. \( [4, \infty) \)

36. \( (-\infty, 2) \)

37. \( -2 < x < 2 \)

38. \( 0 \leq x \leq 5 \)

39. \( -1 \leq x < 0 \)

40. \( 0 < x \leq 6 \)

41. \( [-2, 5) \)

42. \( (-1, 2] \)

In Exercises 43–50, use inequality notation and interval notation to describe the set.

43. \( y \) is nonnegative.

44. \( y \) is no more than 25.

45. \( x \) is greater than \(-2\) and at most 4.

46. \( y \) is at least \(-6\) and less than 0.

47. \( r \) is at least 10 and at most 22.

48. \( k \) is less than 5 but no less than \(-3\).

49. The dog’s weight \( W \) is more than 65 pounds.

50. The annual rate of inflation \( r \) is expected to be at least 2.5% but no more than 5%.
In Exercises 51–60, evaluate the expression.

51. \(|−10|
52. |0|
53. \([3 − 8|
54. \(|4 − 1|
55. \(|−1| − |−2|
56. −3 − |−3|
57. \(−5\)
58. \(−3|−3|
59. \(\frac{|x + 2|}{x + 2} \quad x < −2
60. \(\frac{|x − 1|}{x − 1} \quad x > 1

In Exercises 61–66, place the correct symbol (<, >, or =) between the two real numbers.

61. |−3| \(\quad|−3|
62. |−4| \(\quad|4|
63. −5 \(\quad−5|
64. −|−6| \(\quad|−6|
65. −|−2| \(\quad−|−2|
66. −(−2) \(\quad−(−2)

In Exercises 67–72, find the distance between \(a\) and \(b\).

67. \(a = 126, b = 75\)
68. \(a = −126, b = −75\)
69. \(a = \frac{−5}{2}, b = 0\)
70. \(a = \frac{1}{3}, b = \frac{11}{4}\)
71. \(a = \frac{11}{3}, b = \frac{112}{15}\)
72. \(a = 9.34, b = −5.65\)

In Exercises 73–78, use absolute value notation to describe the situation.

73. The distance between \(x\) and 5 is no more than 3.
74. The distance between \(x\) and −10 is at least 6.
75. \(y\) is at least six units from 0.
76. \(y\) is at most two units from \(a\).
77. While traveling on the Pennsylvania Turnpike, you pass milepost 57 near Pittsburgh, then milepost 236 near Gettysburg. How many miles do you travel during that time period?
78. The temperature in Bismarck, North Dakota was 60°F at noon, then 23°F at midnight. What was the change in temperature over the 12-hour period?

**BUDGET VARIANCE** In Exercises 79–82, the accounting department of a sports drink bottling company is checking to see whether the actual expenses of a department differ from the budgeted expenses by more than $500 or by more than 5%. Fill in the missing parts of the table, and determine whether each actual expense passes the “budget variance test.”

| Budgeted Expense, \(b\) | Actual Expense, \(a\) | \(|a − b|\) | 0.05\(b\) |
|------------------------|----------------------|----------|--------|
| 79. Wages $112,700    | $113,356             |
| 80. Utilities $9,400   | $9,772               |
| 81. Taxes $37,640      | $37,335              |
| 82. Insurance $2,575   | $2,613               |

**FEDERAL DEFICIT** In Exercises 83–88, use the bar graph, which shows the receipts of the federal government (in billions of dollars) for selected years from 1996 through 2006. In each exercise you are given the expenditures of the federal government. Find the magnitude of the surplus or deficit for the year. *(Source: U.S. Office of Management and Budget)*

<table>
<thead>
<tr>
<th>Year</th>

83. 1996 $1560.6 billion
84. 1998 $1652.7 billion
85. 2000 $1789.2 billion
86. 2002 $2011.2 billion
87. 2004 $2293.0 billion
88. 2006 $2655.4 billion

In Exercises 89–94, identify the terms. Then identify the coefficients of the variable terms of the expression.

89. \(7x + 4\)
90. \(6x^3 − 5x\)
91. \(\sqrt{3x^2} − 8x − 11\)
92. \(3\sqrt{3x^2} + 1\)
93. \(4x^3 + \frac{x}{2} − 5\)
94. \(3x^4 − \frac{x^2}{4}\)
In Exercises 95–100, evaluate the expression for each value of x. (If not possible, state the reason.)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>95. $4x - 6$</td>

<td>(a) $x = 1$</td>
</tr>
<tr>
<td>100. $\frac{x}{x + 2}$</td>
<td>(a) $x = 2$</td>
</tr>
</tbody>
</table>

In Exercises 101–112, identify the rule(s) of algebra illustrated by the statement.

101. $x + 9 = 9 + x$
102. $2(\frac{1}{2}) = 1$
103. $\frac{1}{h + 6}(h + 6) = 1, \ h \neq -6$
104. $(x + 3) - (x + 3) = 0$
105. $2(x + 3) = 2 \cdot x + 2 \cdot 3$
106. $(z - 2) + 0 = z - 2$
107. $1 \cdot (1 + x) = 1 + x$
108. $(z + 5)x = z \cdot x + 5 \cdot x$
109. $x + (y + 10) = (x + y) + 10$
110. $x(3y) = (x \cdot 3)y = (3x)y$
111. $3(t - 4) = 3 \cdot t - 3 \cdot 4$
112. $\frac{1}{2}(7 \cdot 12) = (\frac{1}{2} \cdot 7)12 = 1 \cdot 12 = 12$

In Exercises 113–120, perform the operation(s). (Write fractional answers in simplest form.)

113. $\frac{7}{10} + \frac{3}{10}$
114. $\frac{9}{5} - \frac{9}{5}$
115. $\frac{5}{8} - \frac{5}{12} + \frac{1}{6}$
116. $\frac{10}{11} + \frac{6}{33} - \frac{13}{88}$
117. $12 + \frac{1}{2}$
118. $-6 \cdot (\frac{2}{5})$
119. $\frac{2x}{3} - \frac{x}{4}$
120. $\frac{5x}{6} \cdot \frac{2}{9}$

**EXPLORATION**

In Exercises 121 and 122, use the real numbers $A$, $B$, and $C$ shown on the number line. Determine the sign of each expression.

121. (a) $-A$
    (b) $B - A$
122. (a) $-C$
    (b) $A - C$

**CONJECTURE**

(a) Use a calculator to complete the table.

<table>
<thead>
<tr>
<th>$n$</th>
<th>1</th>
<th>0.5</th>
<th>0.01</th>
<th>0.0001</th>
<th>0.000001</th>
</tr>
</thead>
<tbody>
<tr>
<td>$5/n$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Use the result from part (a) to make a conjecture about the value of $5/n$ as $n$ approaches 0.

**CONJECTURE**

(a) Use a calculator to complete the table.

<table>
<thead>
<tr>
<th>$n$</th>
<th>1</th>
<th>10</th>
<th>100</th>
<th>10,000</th>
<th>100,000</th>
</tr>
</thead>
<tbody>
<tr>
<td>$5/n$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) Use the result from part (a) to make a conjecture about the value of $5/n$ as $n$ increases without bound.

**TRUE OR FALSE?** In Exercises 125–128, determine whether the statement is true or false. Justify your answer.

125. If $a > 0$ and $b < 0$, then $a - b > 0$.
126. If $a > 0$ and $b < 0$, then $ab > 0$.
127. If $a < b$, then $\frac{1}{a} < \frac{1}{b}$ where $a \neq 0$ and $b \neq 0$.
128. Because $\frac{a + b}{c} = \frac{a}{c} + \frac{b}{c}$, then $\frac{c}{a + b} = \frac{c}{a} + \frac{c}{b}$.

**THINK ABOUT IT** Consider $|u + v|$ and $|u| + |v|$, where $u \neq 0$ and $v \neq 0$.

(a) Are the values of the expressions always equal? If not, under what conditions are they unequal?
(b) If the two expressions are not equal for certain values of $u$ and $v$, is one of the expressions always greater than the other? Explain.

**THINK ABOUT IT** Is there a difference between saying that a real number is positive and saying that a real number is nonnegative? Explain.

**THINK ABOUT IT** Because even every number is divisible by 2, is it possible that there exist any even prime numbers? Explain.

**THINK ABOUT IT** Is it possible for a real number to be both rational and irrational? Explain.

**WRITING** Can it ever be true that $|a| = -a$ for a real number $a$? Explain.

**CAPSTONE** Describe the differences among the sets of natural numbers, whole numbers, integers, rational numbers, and irrational numbers.
**Integer Exponents**

Repeated multiplication can be written in **exponential form**.

<table>
<thead>
<tr>
<th>Repeated Multiplication</th>
<th>Exponential Form</th>

<tr>
<td>$(2x)(2x)(2x)(2x)$</td>
<td>$(2x)^4$</td>
</tr>
</tbody>
</table>

**Exponential Notation**

If $a$ is a real number and $n$ is a positive integer, then

$$a^n = a \cdot a \cdot a \cdots a$$

where $n$ is the **exponent** and $a$ is the **base**. The expression $a^n$ is read “$a$ to the $n$th power.”

An exponent can also be negative. In Property 3 below, be sure you see how to use a negative exponent.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. $a^m a^n = a^{m+n}$</td>
<td>$3^2 \cdot 3^4 = 3^{2+4} = 3^6 = 729$</td>

<td>$(y^3)^{-4} = y^{3(-4)} = y^{-12} = \frac{1}{y^{12}}$</td>
</tr>
<tr>
<td>7. $\left(\frac{a}{b}\right)^m = \left(\frac{a}{b}\right)^m$</td>
<td>$\left(\frac{2}{x}\right)^3 = \frac{2^3}{x^3} = \frac{8}{x^3}$</td>
</tr>
<tr>
<td>8. $</td>
<td>a^2</td>
</tr>
</tbody>
</table>
It is important to recognize the difference between expressions such as \((-2)^4\) and \(-2^4\). In \((-2)^4\), the parentheses indicate that the exponent applies to the negative sign as well as to the 2, but in \(-2^4 = -(2^4)\), the exponent applies only to the 2. So, \((-2)^4 = 16\) and \(-2^4 = -16\).

The properties of exponents listed on the preceding page apply to all integers and not just to positive integers, as shown in the examples in this section.

### Example 1 — Evaluating Exponential Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Simplified</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-5)^2)</td>
<td>((-5)(-5) = 25)</td>
<td>Negative sign is part of the base.</td>
</tr>
<tr>
<td>(-5^2)</td>
<td>(-5(5) = -25)</td>
<td>Negative sign is not part of the base.</td>
</tr>
<tr>
<td>(2 \cdot 2^4)</td>
<td>(2^{1+4} = 2^5 = 32)</td>
<td>Property 1</td>
</tr>
<tr>
<td>(\frac{4^4}{4^6})</td>
<td>(4^{4-6} = 4^{-2} = \frac{1}{4^2} = \frac{1}{16})</td>
<td>Properties 2 and 3</td>
</tr>
</tbody>
</table>

Now try Exercise 11.

### Example 2 — Evaluating Algebraic Expressions

Evaluate each algebraic expression when \(x = 3\).

<table>
<thead>
<tr>
<th>Expression</th>
<th>Simplified</th>
</tr>
</thead>
<tbody>
<tr>
<td>(5x^{-2})</td>
<td>(\frac{5}{3^2} = \frac{5}{9})</td>
</tr>
<tr>
<td>(\frac{1}{3}(-x)^3)</td>
<td>(\frac{1}{3}(-3)^3 = \frac{1}{3}(-27) = -9)</td>
</tr>
</tbody>
</table>

Now try Exercise 23.

### Example 3 — Using Properties of Exponents

Use the properties of exponents to simplify each expression.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Simplified</th>
</tr>
</thead>
<tbody>
<tr>
<td>((-3ab^4)(4ab^{-3}))</td>
<td>((-3)(4)(a)(a)(b^4)(b^{-3}) = -12a^2b)</td>
</tr>
<tr>
<td>((2xy^2)^3)</td>
<td>(2^3(x^3)(y^6) = 8x^3y^6)</td>
</tr>
<tr>
<td>(3a(-4a^2)^0)</td>
<td>(3a(1) = 3a, \ a \neq 0)</td>
</tr>
<tr>
<td>(\left(\frac{5x^3}{y}\right)^2)</td>
<td>(\frac{5^2(x^3)^2}{y^2} = \frac{25x^6}{y^2})</td>
</tr>
</tbody>
</table>

Now try Exercise 31.
Rewriting with Positive Exponents

Rewrite each expression with positive exponents.

a. \( x^{-1} \)

b. \( \frac{1}{3x^{-2}} \)

c. \( \frac{12a^3b^{-4}}{4a^{-2}b} \)

d. \( \left( \frac{3x^2}{y} \right)^{-2} \)

Solution

a. \( x^{-1} = \frac{1}{x} \) 

b. \( \frac{1}{3x^{-2}} = \frac{1(x^2)}{3} = \frac{x^2}{3} \) 

The exponent \(-2\) does not apply to 3.

c. \( \frac{12a^3b^{-4}}{4a^{-2}b} = \frac{12a^3 \cdot a^2}{4b \cdot b^2} \) 

\( = \frac{3a^5}{b^5} \) 

Property 3

Property 1

d. \( \left( \frac{3x^2}{y} \right)^{-2} = \frac{3^{-2}(x^2)^{-2}}{y^{-2}} \) 

\( = \frac{3^{-2}x^{-4}}{y^{-2}} \) 

Properties 5 and 7

\( = \frac{y^2}{3^2x^4} \) 

Property 6

\( = \frac{y^2}{9x^4} \) 

Simplify.

Scientific Notation

Exponents provide an efficient way of writing and computing with very large (or very small) numbers. For instance, there are about 359 billion billion gallons of water on Earth—that is, 359 followed by 18 zeros.

\[ 359,000,000,000,000,000 \]

It is convenient to write such numbers in scientific notation. This notation has the form \( \pm c \times 10^n \), where \( 1 \leq c < 10 \) and \( n \) is an integer. So, the number of gallons of water on Earth can be written in scientific notation as

\[ 3.59 \times 10^{20} \]

The positive exponent 20 indicates that the number is large (10 or more) and that the decimal point has been moved 20 places. A negative exponent indicates that the number is small (less than 1). For instance, the mass (in grams) of one electron is approximately

\[ 9.0 \times 10^{-28} = 0.0000000000000000000000009. \]
Appendix A.2 Exponents and Radicals

Scientific Notation

Write each number in scientific notation.

a. \(0.0000782\)  
b. \(836,100,000\)

**Solution**

a. \(0.0000782 = 7.82 \times 10^{-5}\)

b. \(836,100,000 = 8.361 \times 10^8\)

CHECKPOINT Now try Exercise 45.

Decimal Notation

Write each number in decimal notation.

a. \(-9.36 \times 10^{-6}\)  
b. \(1.345 \times 10^2\)

**Solution**

a. \(-9.36 \times 10^{-6} = -0.0000936\)

b. \(1.345 \times 10^2 = 134.5\)

CHECKPOINT Now try Exercise 55.

TECHNOLOGY

Most calculators automatically switch to scientific notation when they are showing large (or small) numbers that exceed the display range. To enter numbers in scientific notation, your calculator should have an exponential entry key labeled EE or EXP. Consult the user’s guide for your calculator for instructions on keystrokes and how numbers in scientific notation are displayed.

Using Scientific Notation

Evaluate \(\frac{(2,400,000,000)(0.0000045)}{(0.00003)(1500)}\).

**Solution**

Begin by rewriting each number in scientific notation and simplifying.

\[
\frac{(2,400,000,000)(0.0000045)}{(0.00003)(1500)} = \frac{(2.4 \times 10^9)(4.5 \times 10^{-6})}{(3.0 \times 10^{-5})(1.5 \times 10^3)} = \frac{(2.4)(4.5)(10^3)}{(4.5)(10^{-2})} = (2.4)(10^5) = 240,000
\]

CHECKPOINT Now try Exercise 63(b).
Radicals and Their Properties

A **square root** of a number is one of its two equal factors. For example, 5 is a square root of 25 because 5 is one of the two equal factors of 25. In a similar way, a **cube root** of a number is one of its three equal factors, as in \(125 = 5^3\).

**Definition of \(n\)th Root of a Number**

Let \(a\) and \(b\) be real numbers and let \(n \geq 2\) be a positive integer. If

\[ a = b^n \]

then \(b\) is an \(n\)th root of \(a\). If \(n = 2\), the root is a square root. If \(n = 3\), the root is a cube root.

Some numbers have more than one \(n\)th root. For example, both 5 and \(-5\) are square roots of 25. The **principal square root** of 25, written as \(\sqrt{25}\), is the positive root, 5. The **principal \(n\)th root** of a number is defined as follows.

**Principal \(n\)th Root of a Number**

Let \(a\) be a real number that has at least one \(n\)th root. The **principal \(n\)th root of \(a\)** is the \(n\)th root that has the same sign as \(a\). It is denoted by a **radical symbol** \(\sqrt[n]{a}\).

The positive integer \(n\) is the **index** of the radical, and the number \(a\) is the **radicand**. If \(n = 2\), omit the index and write \(\sqrt{a}\) rather than \(\sqrt[2]{a}\). (The plural of index is **indices**.)

A common misunderstanding is that the square root sign implies both negative and positive roots. This is not correct. The square root sign implies only a positive root. When a negative root is needed, you must use the negative sign with the square root sign.

**Example 8** Evaluating Expressions Involving Radicals

a. \(\sqrt{36} = 6\) because \(6^2 = 36\).

b. \(-\sqrt{36} = -6\) because \(-\left(\sqrt{36}\right) = -\left(\sqrt{6^2}\right) = -(6) = -6\).

c. \(\sqrt[3]{\frac{125}{64}} = \frac{5}{4}\) because \(\left(\frac{5}{4}\right)^3 = \frac{125}{64}\).

d. \(\sqrt[4]{-32} = -2\) because \((-2)^4 = -32\).

e. \(\sqrt{-81}\) is not a real number because there is no real number that can be raised to the fourth power to produce \(-81\).

CHECKPOINT Now try Exercise 65.
Here are some generalizations about the $n$th roots of real numbers.

<table>
<thead>
<tr>
<th>Real Number $a$</th>
<th>Integer $n$</th>
<th>Root(s) of $a$</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>$a &gt; 0$</td>
<td>$n &gt; 0$, $n$ is even.</td>
<td>$\sqrt[n]{a}$, $-\sqrt[n]{a}$</td>
<td>$\sqrt[3]{8} = 2$, $-\sqrt[3]{8} = -2$</td>
</tr>
<tr>
<td>$a &gt; 0$ or $a &lt; 0$</td>
<td>$n$ is odd.</td>
<td>$\sqrt[n]{a}$</td>
<td>$\sqrt[3]{-8} = -2$</td>
</tr>
<tr>
<td>$a &lt; 0$</td>
<td>$n$ is even.</td>
<td>No real roots</td>
<td>$\sqrt[4]{-4}$ is not a real number.</td>
</tr>
<tr>
<td>$a = 0$</td>
<td>$n$ is even or odd.</td>
<td>$\sqrt[n]{0} = 0$</td>
<td>$\sqrt[3]{0} = 0$</td>
</tr>
</tbody>
</table>

Integers such as 1, 4, 9, 16, 25, and 36 are called **perfect squares** because they have integer square roots. Similarly, integers such as 1, 8, 27, 64, and 125 are called **perfect cubes** because they have integer cube roots.

### Properties of Radicals

Let $a$ and $b$ be real numbers, variables, or algebraic expressions such that the indicated roots are real numbers, and let $m$ and $n$ be positive integers.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. $\sqrt[n]{a^m} = (\sqrt[n]{a})^m$</td>
<td>$\sqrt[3]{8^2} = (\sqrt[3]{8})^2 = 2^2 = 4$</td>
</tr>
<tr>
<td>2. $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$</td>
<td>$\sqrt[3]{5} \cdot \sqrt[3]{7} = \sqrt[3]{35}$</td>
</tr>
<tr>
<td>3. $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$</td>
<td>$\sqrt[3]{27} \cdot \sqrt[3]{9} = \sqrt[3]{27 \cdot 9} = \sqrt[3]{27}$</td>
</tr>
<tr>
<td>4. $\sqrt[n]{a} = a^{1/n}$</td>
<td>$\sqrt[3]{10} = \sqrt[3]{10}$</td>
</tr>
<tr>
<td>5. $(\sqrt[n]{a})^m = a^{m/n}$</td>
<td>$(\sqrt{3})^2 = 3$</td>
</tr>
<tr>
<td>6. For $n$ even, $\sqrt[n]{a^m} =</td>
<td>a</td>
</tr>
</tbody>
</table>

A common special case of Property 6 is $\sqrt[n]{a^2} = |a|$.

### Example 9  Using Properties of Radicals

Use the properties of radicals to simplify each expression.

a. $\sqrt[3]{8} \cdot \sqrt[3]{2}$  
b. $(\sqrt[3]{5})^3$  
c. $\sqrt[3]{x^3}$  
d. $\sqrt[3]{y^6}$

**Solution**

a. $\sqrt[3]{8} \cdot \sqrt[3]{2} = \sqrt[3]{16} = 4$  
b. $(\sqrt[3]{5})^3 = 5$  
c. $\sqrt[3]{x^3} = x$  
d. $\sqrt[3]{y^6} = |y|$  

**Check Point** Now try Exercise 77.
Simplifying Radicals

An expression involving radicals is in simplest form when the following conditions are satisfied.

1. All possible factors have been removed from the radical.
2. All fractions have radical-free denominators (accomplished by a process called rationalizing the denominator).
3. The index of the radical is reduced.

To simplify a radical, factor the radicand into factors whose exponents are multiples of the index. The roots of these factors are written outside the radical, and the “leftover” factors make up the new radicand.

Example 10  Simplifying Even Roots

<table>
<thead>
<tr>
<th>Perfect 4th power</th>
<th>Leftover factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sqrt[4]{48} ) = ( \sqrt[4]{16} \cdot 3 ) = ( \sqrt[4]{2^4} \cdot 3 ) = 2( \sqrt[4]{3} )</td>
<td></td>
</tr>
</tbody>
</table>

Example 11  Simplifying Odd Roots

<table>
<thead>
<tr>
<th>Perfect cube</th>
<th>Leftover factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sqrt[3]{24} ) = ( \sqrt[3]{8} \cdot 3 ) = ( \sqrt[3]{2^3} \cdot 3 ) = 2( \sqrt[3]{3} )</td>
<td></td>
</tr>
</tbody>
</table>

Example 11  Simplifying Odd Roots

<table>
<thead>
<tr>
<th>Perfect cube</th>
<th>Leftover factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \sqrt[3]{-40x^6} ) = ( \sqrt[3]{-8x^6} \cdot 5 ) = ( \sqrt[3]{(-2x^2)^3} \cdot 5 ) = -2x^2( \sqrt[3]{5} )</td>
<td></td>
</tr>
</tbody>
</table>

CHECKPOINT  Now try Exercise 79(a).

CHECKPOINT  Now try Exercise 79(b).
Radical expressions can be combined (added or subtracted) if they are like radicals—that is, if they have the same index and radicand. For instance, $\sqrt{2}$, $3\sqrt{2}$, and $\frac{1}{2}\sqrt{2}$ are like radicals, but $\sqrt{3}$ and $\sqrt{2}$ are unlike radicals. To determine whether two radicals can be combined, you should first simplify each radical.

**Example 12** Combining Radicals

a. $2\sqrt{48} - 3\sqrt{27} = 2\sqrt{16 \cdot 3} - 3\sqrt{9 \cdot 3}$

   $= 8\sqrt{3} - 9\sqrt{3}$

   $= (8 - 9)\sqrt{3}$

   $= -\sqrt{3}$

b. $\frac{3}{16x} - \frac{\sqrt{54x^3}}{2}$

   $= \frac{\sqrt{8} \cdot 2x}{\sqrt{27} \cdot x^2 \cdot 2x}$

   $= 2\sqrt{2x} - 3x\sqrt{2x}$

   $= (2 - 3x)\sqrt{2x}$

**CHECK Point** Now try Exercise 87.

**Rationalizing Denominators and Numerators**

To rationalize a denominator or numerator of the form $a - b\sqrt{m}$ or $a + b\sqrt{m}$, multiply both numerator and denominator by a conjugate: $a + b\sqrt{m}$ and $a - b\sqrt{m}$ are conjugates of each other. If $a = 0$, then the rationalizing factor for $\sqrt{m}$ is itself, $\sqrt{m}$. For cube roots, choose a rationalizing factor that generates a perfect cube.

**Example 13** Rationalizing Single-Term Denominators

Rationalize the denominator of each expression.

a. $\frac{5}{2\sqrt{3}}$  

b. $\frac{2}{\sqrt{5}}$

**Solution**

a. $\frac{5}{2\sqrt{3}} = \frac{5 \cdot \sqrt{3}}{2\sqrt{3}} \cdot \frac{\sqrt{3}}{\sqrt{3}}$

   $\sqrt{3}$ is rationalizing factor.

   $= \frac{5\sqrt{3}}{2(3)}$

   $= \frac{5\sqrt{3}}{6}$

   Multiply.

   Simplify.

b. $\frac{2}{\sqrt{5}} = \frac{2 \cdot \sqrt{5}}{\sqrt{5}} \cdot \frac{\sqrt{5}}{\sqrt{5}}$

   $\sqrt{5}$ is rationalizing factor.

   $= \frac{2\sqrt{5}}{\sqrt{5}}$

   Multiply.

   $= \frac{2\sqrt{5}}{5}$

   Simplify.

**CHECK Point** Now try Exercise 95.
Appendix A Review of Fundamental Concepts of Algebra

Definition of Rational Exponents

If \( a \) is a real number and \( n \) is a positive integer such that the principal \( n \)th root of \( a \) exists, then \( a^{1/n} \) is defined as

\[
a^{1/n} = \sqrt[n]{a}, \quad \text{where } 1/n \text{ is the rational exponent of } a.
\]

Moreover, if \( m \) is a positive integer that has no common factor with \( n \), then

\[
a^{m/n} = (a^{1/n})^m = (\sqrt[n]{a})^m \quad \text{and} \quad a^{m/n} = (a^m)^{1/n} = \sqrt[n]{a^m}.
\]

The symbol \( \square \) indicates an example or exercise that highlights algebraic techniques specifically used in calculus.
Rational exponents can be tricky, and you must remember that the expression \( b^{m/n} \) is not defined unless \( \sqrt[n]{b} \) is a real number. This restriction produces some unusual-looking results. For instance, the number \((-8)^{1/3}\) is defined because \(\sqrt[3]{-8} = -2\), but the number \((-8)^{2/6}\) is undefined because \(\sqrt[6]{-8}\) is not a real number.

The numerator of a rational exponent denotes the power to which the base is raised, and the denominator denotes the index or the root to be taken.

\[
b^{m/n} = \left(\sqrt[n]{b}\right)^m = \sqrt[n]{b^m}
\]

When you are working with rational exponents, the properties of integer exponents still apply. For instance, \(2^{1/2}/2^{1/3} = 2^{(1/2)+(1/3)} = 2^{5/6}\).

**Example 16** Changing From Radical to Exponential Form

a. \(\sqrt[3]{3} = 3^{1/2}\)

b. \(\sqrt[3]{(3xy)^5} = \frac{\sqrt[3]{(3xy)^5}}{3xy} = (3xy)^{5/2}\)

c. \(2\sqrt[3]{x^3} = (2x)(x^{3/4}) = 2x^{1+(3/4)} = 2x^{7/4}\)

**CHECKPOINT** Now try Exercise 103.

**Example 17** Changing From Exponential to Radical Form

a. \((x^2 + y^2)^{3/2} = \left(\sqrt{x^2 + y^2}\right)^3 = \sqrt{(x^2 + y^2)^3}\)

b. \(2^{3/4} \cdot 2^{1/4} = 2^{(3/4)+(1/4)} = 2 \cdot 2^{1/2} = 2\sqrt{2}\)

c. \(a^{-3/2} = \frac{1}{a^{3/2}} = \frac{1}{\sqrt[3]{a}}\)

d. \(x^{0.2} = x^{1/5} = \sqrt[5]{x}\)

**CHECKPOINT** Now try Exercise 105.

Rational exponents are useful for evaluating roots of numbers on a calculator, for reducing the index of a radical, and for simplifying expressions in calculus.

**Example 18** Simplifying with Rational Exponents

a. \((-32)^{-4/5} = \left(\frac{1}{\sqrt[5]{-32}}\right)^4 = (-2)^{-4} = \frac{1}{(-2)^4} = \frac{1}{16}\)

b. \((-5x^{5/3})(3x^{-3/4}) = -15x^{5/3-(-3/4)} = -15x^{11/12}, \quad x \neq 0\)

c. \(\frac{2}{\sqrt[3]{a}} = a^{-1/3} = \sqrt[3]{a}\)

**CHECKPOINT** Now try Exercise 115.

The expression in Example 18(e) is not defined when \(x = \frac{1}{2}\) because \(\left(2 \cdot \frac{1}{2} - 1\right)^{-1/3} = (0)^{-1/3}\) is not a real number.
A.2  EXERCISES

VOCABULARY: Fill in the blanks.
1. In the exponential form $a^n$, $n$ is the ________ and $a$ is the ________.
2. A convenient way of writing very large or very small numbers is called ________ ________.
3. One of the two equal factors of a number is called a ________ ________ of the number.
4. The ________ ________ ________ of a number $a$ is the $n$th root that has the same sign as $a$, and is denoted by $\sqrt[n]{a}$.
5. In the radical form $\sqrt[n]{a}$, the positive integer $n$ is called the ________ of the radical and the number $a$ is called the ________.
6. When an expression involving radicals has all possible factors removed, radical-free denominators, and a reduced index, it is in ________ ________.
7. Radical expressions can be combined (added or subtracted) if they are ________ ________.
8. The expressions $a + b\sqrt{m}$ and $a - b\sqrt{m}$ are ________ of each other.
9. The process used to create a radical-free denominator is known as ________ the denominator.
10. In the expression $b^{m/n}$, $m$ denotes the ________ to which the base is raised and $n$ denotes the ________ or root to be taken.

SKILLS AND APPLICATIONS

In Exercises 11–18, evaluate each expression.
11. (a) $3^2 \cdot 3$  (b) $3 \cdot 3^3$
12. (a) $\frac{5^2}{8^2}$  (b) $\frac{3^2}{3^4}$
13. (a) $(3^3)^0$  (b) $-3^2$
14. (a) $(2^3 \cdot 3^2)^2$  (b) $\left(\frac{-2}{3}\right)^3(\frac{3}{5})^2$
15. (a) $\frac{3}{3}^2$  (b) $48(-4)^{-3}$
16. (a) $\frac{4 \cdot 3^2}{2^2 \cdot 3^{-1}}$  (b) $(-2)^0$
17. (a) $2^{-1} + 3^{-1}$  (b) $(2^{-1})^{-2}$
18. (a) $3^{-1} + 2^{-2}$  (b) $(3^{-2})^2$

In Exercises 19–22, use a calculator to evaluate the expression. (If necessary, round your answer to three decimal places.)
19. $(-4)^3(5^2)$  20. $(8^{-4})(10^3)$
21. $\frac{3^6}{7^3}$  22. $\frac{4^3}{3^4}$

In Exercises 23–30, evaluate the expression for the given value of $x$.
23. $-3x^2$, $x = 2$  24. $7x^{-2}$, $x = 4$
25. $6x^0$, $x = 10$  26. $5(-x)^3$, $x = 3$
27. $2x^3$, $x = -3$  28. $-3x^4$, $x = -2$
29. $-20x^2$, $x = -\frac{1}{2}$  30. $12(-x)^3$, $x = -\frac{1}{2}$

In Exercises 31–38, simplify each expression.
31. (a) $(-5)^3$  (b) $5x^4(x^3)$
32. (a) $(3x)^2$  (b) $(4x)^0$, $x \neq 0$
33. (a) $6y^2(2y^0)^2$  (b) $\frac{3x^5}{x^3}$
34. (a) $(-z)^3(3c^3)$  (b) $\frac{25y^8}{10y^4}$
35. (a) $\frac{7x^2}{x^3}$  (b) $\frac{12(x + y)^3}{9(x + y)}$
36. (a) $\frac{r^4}{r^5}$  (b) $\frac{\left(\frac{4}{y}\right)^3}{\left(\frac{3}{y}\right)^4}$
37. (a) $\left[(x^2y^{-2})^{-1}\right]^{-1}$  (b) $\left(\frac{a^{-2}}{b^3}\right)^3$
38. (a) $(6x^0)^0$, $x \neq 0$  (b) $(5x^2e^6)^4(5x^2e^6)^{-3}$

In Exercises 39–44, rewrite each expression with positive exponents and simplify.
39. (a) $(x + 5)^0$, $x \neq -5$  (b) $(2x^2)^{-2}$
40. (a) $(2x^0)^0$, $x \neq 0$  (b) $(z + 2)^{-3}(z + 2)^{-1}$
41. (a) $(-2x^2)^3(4x^3)^{-1}$  (b) $\left(\frac{x}{10}\right)^{-1}$
42. (a) $(4y^{-2})(8y^4)$  (b) $\frac{x^{-3}y^4}{5}$
43. (a) $3^p \cdot 3^{2n}$  (b) $\left(\frac{a^{-2}}{b^3}\right)^3$
44. (a) $\frac{x^2 \cdot x^6}{x^3 \cdot x^8}$  (b) $\left(\frac{a^{-2}}{b^3}\right)^3$
In Exercises 45–52, write the number in scientific notation.
45. 10,250.4
46. −7,280,000
47. −0.000125
48. 0.00052
49. Land area of Earth: 57,300,000 square miles
50. Light year: 9,460,000,000,000 kilometers
51. Relative density of hydrogen: 0.0000899 gram per cubic centimeter
52. One micron (millionth of a meter): 0.00003937 inch

In Exercises 53–60, write the number in decimal notation.
53. 1.25 × 10^5
54. −1.801 × 10^5
55. −2.718 × 10^{-3}
56. 3.14 × 10^{-4}
57. Interior temperature of the sun: 1.5 × 10^7 degrees Celsius
58. Charge of an electron: 1.6022 × 10^{-19} coulomb
59. Width of a human hair: 9.0 × 10^{-5} meter
60. Gross domestic product of the United States in 2007: 1,3743021 × 10^{13} dollars (Source: U.S. Department of Commerce)

In Exercises 61 and 62, evaluate each expression without using a calculator.
61. (a) (2.0 × 10^9)(3.4 × 10^{-4})
   (b) (1.2 × 10^7)(5.0 × 10^{-3})
62. (a) \( \frac{6.0 \times 10^8}{3.0 \times 10^{-3}} \)
   (b) \( \frac{2.5 \times 10^{-3}}{5.0 \times 10^2} \)

In Exercises 63 and 64, use a calculator to evaluate each expression. (Round your answer to three decimal places.)
63. (a) \( 750 \left(1 + \frac{0.11}{365}\right)^{365} \)
   (b) \( \frac{67,000,000 + 93,000,000}{0.0052} \)
64. (a) \( (9.3 \times 10^9)^3(6.1 \times 10^{-4}) \)
   (b) \( (2.414 \times 10^4)^6(1.68 \times 10^9)^3 \)

In Exercises 65–70, evaluate each expression without using a calculator.
65. (a) \( \sqrt{9} \)
   (b) \( \frac{\sqrt{27}}{4} \)
66. (a) \( 27^{1/3} \)
   (b) \( 36^{1/2} \)
67. (a) \( 32^{-3/5} \)
   (b) \( \left(\frac{16}{64}\right)^{-3/4} \)
68. (a) \( 100^{-3/2} \)
   (b) \( (\frac{9}{2})^{-1/2} \)
69. (a) \( \left(-\frac{1}{64}\right)^{-1/3} \)
   (b) \( \left(\frac{1}{32}\right)^{-2/5} \)
70. (a) \( \left(-\frac{125}{27}\right)^{-1/3} \)
   (b) \( -\left(\frac{1}{125}\right)^{-4/3} \)

In Exercises 71–76, use a calculator to approximate the number. (Round your answer to three decimal places.)
71. (a) \( \sqrt[3]{77} \)
   (b) \( \sqrt[3]{-277} \)
72. (a) \( \sqrt{45^2} \)
   (b) \( \sqrt{125} \)
73. (a) \( (-12.4)^{-1.8} \)
   (b) \( 5\sqrt{3}^{-2.5} \)
74. (a) \( \frac{7 - (4.1)^{-3.2}}{2} \)
   (b) \( \left(\frac{13}{3}\right)^{-3/2} - \left(-\frac{3}{2}\right)^{13/3} \)
75. (a) \( \sqrt{4.5 \times 10^9} \)
   (b) \( \sqrt{6.3 \times 10^6} \)
76. (a) \( 2.65 \times 10^{-4}^{1/3} \)
   (b) \( \sqrt[3]{9 \times 10^{-24}} \)

In Exercises 77 and 78, use the properties of radicals to simplify each expression.
77. (a) \( \left(\frac{\sqrt{2}}{3}\right)^3 \)
   (b) \( \sqrt[3]{96\sqrt{3}} \)
78. (a) \( \frac{\sqrt[4]{12} \cdot \sqrt[4]{3}}{\sqrt[4]{2}} \)
   (b) \( \sqrt[4]{3\sqrt{3}\sqrt[4]{3}} \)

In Exercises 79–90, simplify each radical expression.
79. (a) \( \sqrt{20} \)
   (b) \( \sqrt{28} \)
80. (a) \( \frac{\sqrt{15}}{\sqrt{27}} \)
   (b) \( \frac{\sqrt{27}}{\sqrt{3}} \)
81. (a) \( \sqrt[3]{72x^4} \)
   (b) \( \sqrt[3]{18z^2} \)
82. (a) \( \sqrt[3]{54xy^4} \)
   (b) \( \sqrt[3]{32a^6b^2} \)
83. (a) \( \frac{\sqrt[4]{16x^3}}{\sqrt[4]{75x^2y^{-4}}} \)
   (b) \( \sqrt[4]{160x^8y^{-4}} \)
84. (a) \( \sqrt[4]{3x^3y^2} \)
   (b) \( \sqrt[4]{160x^8y^2} \)
85. (a) \( 2\sqrt{50} + 12\sqrt{8} \)
   (b) \( 10\sqrt{32} - 6\sqrt{18} \)
86. (a) \( 4\sqrt{27} - \sqrt{75} \)
   (b) \( \sqrt{16} + 3\sqrt{54} \)
87. (a) \( 5\sqrt{5} - 3\sqrt{5} \)
   (b) \( -2\sqrt{9y} + 10\sqrt{y} \)
88. (a) \( 8\sqrt{49x} - 14\sqrt{100x} \)
   (b) \( -3\sqrt{48x^2} + 7\sqrt{75x^2} \)
89. (a) \( 3\sqrt{x + 1} + 10\sqrt{x + 1} \)
   (b) \( 7\sqrt{80x} - 2\sqrt{725x} \)
90. (a) \( -\sqrt{x^3} + 7 - 5\sqrt{x^5} - 7 \)
   (b) \( 11\sqrt{245x^3} - 9\sqrt{45x^3} \)

In Exercises 91–94, complete the statement with <, =, or >.
91. \( \sqrt{5} + \sqrt{3} \quad \square \quad \sqrt{5 + 3} \)
92. \( \sqrt[3]{\frac{3}{11}} \quad \square \quad \sqrt[5]{\frac{3}{11}} \)
93. \( 5 \quad \square \quad \sqrt{3^2 + 2^2} \)
94. \( 5 \quad \square \quad \sqrt{3^2 + 4^2} \)

In Exercises 95–98, rationalize the denominator of the expression. Then simplify your answer.
95. \( \frac{1}{\sqrt{3}} \quad \square \quad \frac{8}{\sqrt{5}} \)
96. \( \frac{5}{\sqrt{14} - 2} \quad \square \quad \frac{3}{\sqrt{5} + \sqrt{6}} \)
In Exercises 99–102, rationalize the numerator of the expression. Then simplify your answer.

99. \( \frac{\sqrt{8}}{2} \)  
100. \( \frac{\sqrt{3}}{3} \)

101. \( \frac{\sqrt{5} + \sqrt{3}}{3} \)  
102. \( \frac{\sqrt{7} - 3}{4} \)

In Exercises 103–110, fill in the missing form of the expression.

<table>

In Exercises 111–114, perform the operations and simplify.

111. \( \frac{(2x^2)^{3/2}}{2^{1/2}x^4} \)  
112. \( \frac{x^{4/3}y^{2/3}}{(xy)^{1/3}} \)

113. \( \frac{x^{-3} \cdot x^{1/2}}{x^{3/2} \cdot x^{-1}} \)  
114. \( \frac{5^{-1/2} \cdot 5x^{5/2}}{(5x)^{3/2}} \)

In Exercises 115 and 116, reduce the index of each radical.

115. (a) \( \sqrt[3]{3} \)  
116. (a) \( \sqrt[3]{3} \)  
(b) \( \sqrt[3]{x+1} \)

In Exercises 117 and 118, write each expression as a single radical. Then simplify your answer.

117. (a) \( \sqrt[3]{32} \)  
118. (a) \( \sqrt[3]{243(x+1)} \)  
(b) \( \sqrt[3]{2x^2} \)  
(b) \( \sqrt[3]{10a/b} \)

119. PERIOD OF A PENDULUM  The period \( T \) (in seconds) of a pendulum is \( T = 2\pi\sqrt{L/32} \), where \( L \) is the length of the pendulum (in feet). Find the period of a pendulum whose length is 2 feet.

120. EROSION  A stream of water moving at the rate of \( v \) feet per second can carry particles of size \( 0.03\sqrt{v} \) inches. Find the size of the largest particle that can be carried by a stream flowing at the rate of \( 3 \) foot per second.

121. MATHEMATICAL MODELING  A funnel is filled with water to a height of \( h \) centimeters. The formula

\[ t = 0.03\left[125^{1/2} - (12 - h)^{1/2}\right], \quad 0 \leq h \leq 12 \]

represents the amount of time \( t \) (in seconds) that it will take for the funnel to empty.

(a) Use the table feature of a graphing utility to find the times required for the funnel to empty for water heights of \( h = 0, h = 1, h = 2, \ldots, h = 12 \) centimeters.

(b) What value does \( t \) appear to be approaching as the height of the water becomes closer and closer to 12 centimeters?

122. SPEED OF LIGHT  The speed of light is approximately 11,180,000 miles per minute. The distance from the sun to Earth is approximately 93,000,000 miles. Find the time for light to travel from the sun to Earth.

EXPLORATION

TRUE OR FALSE? In Exercises 123 and 124, determine whether the statement is true or false. Justify your answer.

123. \( \frac{x^{k+1}}{x} = x^k \)  
124. \( (a^n)^k = a^{nk} \)

125. Verify that \( a^0 = 1, a \neq 0 \). (Hint: Use the property of exponents \( a^m/a^n = a^{m-n} \).)

126. Explain why each of the following pairs is not equal.
   (a) \( (3x)^{-1} \neq \frac{3}{x} \)  
   (b) \( y^3 \cdot y^2 \neq y^6 \)
   (c) \( (a^2b^3)^4 \neq a^6b^7 \)  
   (d) \( (a + b)^3 \neq a^3 + b^3 \)
   (e) \( \sqrt[3]{4x^2} \neq 2x \)  
   (f) \( \sqrt[3]{2} + \sqrt[3]{3} \neq \sqrt[3]{5} \)

127. THINK ABOUT IT  Is \( 527 \times 10^5 \) written in scientific notation? Why or why not?

128. List all possible digits that occur in the units place when \( 5 \) is written as a whole number.

129. THINK ABOUT IT  Square the real number \( 5/\sqrt{3} \) and note that the radical is eliminated from the denominator. Is this equivalent to rationalizing the denominator? Why or why not?

130. CAPSTONE
   (a) Explain how to simplify the expression \( (3x^3y^{-2})^{-2} \).
   (b) Is the expression \( \sqrt[3]{4/x} \) in simplest form? Why or why not?
Polynomials

The most common type of algebraic expression is the polynomial. Some examples are \(2x + 5\), \(3x^4 - 7x^2 + 2x + 4\), and \(5x^3y^2 - xy + 3\). The first two are polynomials in \(x\) and the third is a polynomial in \(x\) and \(y\). The terms of a polynomial in \(x\) have the form \(ax^k\), where \(a\) is the coefficient and \(k\) is the degree of the term. For instance, the polynomial

\[2x^3 - 5x^2 + 1 = 2x^3 + (-5)x^2 + (0)x + 1\]

has coefficients 2, -5, 0, and 1.

**Definition of a Polynomial in \(x\)**

Let \(a_0, a_1, a_2, \ldots, a_n\) be real numbers and let \(n\) be a nonnegative integer. A polynomial in \(x\) is an expression of the form

\[a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0\]

where \(a_n \neq 0\). The polynomial is of degree \(n\), \(a_n\) is the leading coefficient, and \(a_0\) is the constant term.

Polynomials with one, two, and three terms are called monomials, binomials, and trinomials, respectively. In standard form, a polynomial is written with descending powers of \(x\).

**Example 1**  
**Writing Polynomials in Standard Form**

<table>
<thead>
<tr>
<th>Polynomial</th>
<th>Standard Form</th>
<th>Degree</th>
<th>Leading Coefficient</th>
</tr>
</thead>
<tbody>
<tr>
<td>(4x^2 - 5x - 2 + 3x)</td>
<td>(-5x^2 + 4x^2 + 3x - 2)</td>
<td>7</td>
<td>-5</td>
</tr>
<tr>
<td>(4 - 9x^2)</td>
<td>(-9x^2 + 4)</td>
<td>2</td>
<td>-9</td>
</tr>
<tr>
<td>(8)</td>
<td>(8 = 8x^0)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

**CHECK POINT**  
Now try Exercise 19.

A polynomial that has all zero coefficients is called the zero polynomial, denoted by 0. No degree is assigned to this particular polynomial. For polynomials in more than one variable, the degree of a term is the sum of the exponents of the variables in the term. The degree of the polynomial is the highest degree of its terms. For instance, the degree of the polynomial \(-2x^3y^6 + 4xy - x^2y^4\) is 11 because the sum of the exponents in the last term is the greatest. The leading coefficient of the polynomial is the coefficient of the highest-degree term. Expressions are not polynomials if a variable is underneath a radical or if a polynomial expression (with degree greater than 0) is in the denominator of a term. The following expressions are not polynomials.

\[x^3 - \sqrt{3x} = x^3 - (3x)^{1/2}\]  
(a) The exponent “1/2” is not an integer.

\[x^2 + \frac{5}{x} = x^2 + 5x^{-1}\]  
(b) The exponent “-1” is not a nonnegative integer.
Operations with Polynomials

You can add and subtract polynomials in much the same way you add and subtract real numbers. Simply add or subtract the like terms (terms having the same variables to the same powers) by adding their coefficients. For instance, $-3xy^2$ and $5xy^2$ are like terms and their sum is

$$-3xy^2 + 5xy^2 = (-3 + 5)xy^2 = 2xy^2.$$ 

**Example 2** Sums and Differences of Polynomials

a. $(5x^3 - 7x^2 - 3) + (x^3 + 2x^2 - x + 8)$

$$= (5x^3 + x^3) + (-7x^2 + 2x^2) - x + (-3 + 8)$$

$$= 6x^3 - 5x^2 - x + 5$$

Group like terms.

Combine like terms.

b. $(7x^4 - x^2 - 4x + 2) - (3x^4 - 4x^2 + 3x)$

$$= 7x^4 - x^2 - 4x + 2 - 3x^4 + 4x^2 - 3x$$

Distributive Property

$$= (7x^4 - 3x^4) + (-x^2 + 4x^2) + (-4x - 3x) + 2$$

Group like terms.

Combine like terms.

$$= 4x^4 + 3x^2 - 7x + 2$$

CHECK Point Now try Exercise 41.

To find the product of two polynomials, use the left and right Distributive Properties. For example, if you treat $5x + 7$ as a single quantity, you can multiply $3x - 2$ by $5x + 7$ as follows.

$$(3x - 2)(5x + 7) = 3x(5x + 7) - 2(5x + 7)$$

$$= (3x)(5x) + (3x)(7) - 2(5x) - 2(7)$$

$$= 15x^2 + 21x - 10x - 14$$

Product of First terms

Product of Outer terms

Product of Inner terms

Product of Last terms

$$= 15x^2 + 11x - 14$$

Note in this FOIL Method (which can only be used to multiply two binomials) that the outer (O) and inner (I) terms are like terms and can be combined.

**Example 3** Finding a Product by the FOIL Method

Use the FOIL Method to find the product of $2x - 4$ and $x + 5$.

**Solution**

\[
\begin{array}{c|c|c|c}
F & O & I & L \\
(2x - 4)(x + 5) & = 2x^2 + 10x - 4x - 20 \\
& = 2x^2 + 6x - 20
\end{array}
\]

CHECK Point Now try Exercise 55.
Special Products

Some binomial products have special forms that occur frequently in algebra. You do not need to memorize these formulas because you can use the Distributive Property to multiply. However, becoming familiar with these formulas will enable you to manipulate the algebra more quickly.

### Example 4 Special Products

Find each product.

a. \((5x + 9)(5x - 9)\)

b. \((x + y - 2)(x + y + 2)\)

**Solution**

a. The product of a sum and a difference of the same two terms has no middle term and takes the form \((u + v)(u - v) = u^2 - v^2\).

\[
(5x + 9)(5x - 9) = (5x)^2 - 9^2 = 25x^2 - 81
\]

b. By grouping \(x + y\) in parentheses, you can write the product of the trinomials as a special product.

\[
(x + y - 2)(x + y + 2) = [(x + y) - 2][(x + y) + 2]
= (x + y)^2 - 2^2
= x^2 + 2xy + y^2 - 4
\]

**CHECKPOINT**

Now try Exercise 75.
Polynomials with Common Factors

The process of writing a polynomial as a product is called **factoring**. It is an important tool for solving equations and for simplifying rational expressions.

Unless noted otherwise, when you are asked to factor a polynomial, you can assume that you are looking for factors with integer coefficients. If a polynomial cannot be factored using integer coefficients, then it is prime or irreducible over the integers. For instance, the polynomial $x^2 - 3$ is irreducible over the integers. Over the real numbers, this polynomial can be factored as

$$x^2 - 3 = (x + \sqrt{3})(x - \sqrt{3}).$$

A polynomial is **completely factored** when each of its factors is prime. For instance

$$x^3 - x^2 + 4x - 4 = (x - 1)(x^2 + 4)$$

is completely factored, but

$$x^3 - x^2 - 4x + 4 = (x - 1)(x^2 - 4)$$

is not completely factored. Its complete factorization is

$$x^3 - x^2 - 4x + 4 = (x - 1)(x + 2)(x - 2).$$

The simplest type of factoring involves a polynomial that can be written as the product of a monomial and another polynomial. The technique used here is the Distributive Property, $a(b + c) = ab + ac$, in the reverse direction.

$$ab + ac = a(b + c)$$

$a$ is a common factor.

Removing (factoring out) any common factors is the first step in completely factoring a polynomial.

**Example 5**  
**Removing Common Factors**

Factor each expression.

a. $6x^3 - 4x$

b. $-4x^2 + 12x - 16$

c. $(x - 2)(2x) + (x - 2)(3)$

**Solution**

a. $6x^3 - 4x = 2x(3x^2) - 2x(2) = 2x(3x^2 - 2)$

2x is a common factor.

b. $-4x^2 + 12x - 16 = -4(x^2) + (-4)(-3x) + (-4)4 = -4(x^2 - 3x + 4)$

-4 is a common factor.

c. $(x - 2)(2x) + (x - 2)(3) = (x - 2)(2x + 3)$

$(x - 2)$ is a common factor.

**CHECK Point** Now try Exercise 99.
Factoring Special Polynomial Forms

Some polynomials have special forms that arise from the special product forms on page A29. You should learn to recognize these forms so that you can factor such polynomials easily.

### Factoring Special Polynomial Forms

<table>
<thead>
<tr>
<th>Form</th>
<th>Factored Form</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Difference of Two Squares</td>
<td>(u^2 - v^2 = (u + v)(u - v))</td>
<td>(9x^2 - 4 = (3x)^2 - 2^2 = (3x + 2)(3x - 2))</td>
</tr>
<tr>
<td>Perfect Square Trinomial</td>
<td>(u^2 + 2uv + v^2 = (u + v)^2)</td>
<td>(x^2 + 6x + 9 = x^2 + 2(x)(3) + 3^2 = (x + 3)^2)</td>
</tr>
<tr>
<td></td>
<td>(u^2 - 2uv + v^2 = (u - v)^2)</td>
<td>(x^2 - 6x + 9 = x^2 - 2(x)(3) + 3^2 = (x - 3)^2)</td>
</tr>
<tr>
<td>Sum or Difference of Two Cubes</td>
<td>(u^3 + v^3 = (u + v)(u^2 - uv + v^2))</td>
<td>(x^3 + 8 = x^3 + 2^3 = (x + 2)(x^2 - 2x + 4))</td>
</tr>
<tr>
<td></td>
<td>(u^3 - v^3 = (u - v)(u^2 + uv + v^2))</td>
<td>(27x^3 - 1 = (3x)^3 - 1^3 = (3x - 1)(9x^2 + 3x + 1))</td>
</tr>
</tbody>
</table>

One of the easiest special polynomial forms to factor is the difference of two squares. The factored form is always a set of conjugate pairs.

\[
\begin{align*}
\mathbf{u^2 - v^2} & = (u + v)(u - v) \quad \text{Conjugate pairs} \\
\text{Difference} & \quad \text{Opposite signs}
\end{align*}
\]

To recognize perfect square terms, look for coefficients that are squares of integers and variables raised to even powers.

### Example 6  Removing a Common Factor First

\[
\begin{align*}
3 - 12x^2 & = 3(1 - 4x^2) \\
& = 3[1^2 - (2x)^2] \\
& = 3(1 + 2x)(1 - 2x) \quad \text{Difference of two squares}
\end{align*}
\]

CHECKPOINT Now try Exercise 113.

### Example 7  Factoring the Difference of Two Squares

a. \((x + 2)^2 - y^2 = [(x + 2) + y][(x + 2) - y]\)  
   \[= (x + 2 + y)(x + 2 - y)\]

b. \(16x^4 - 81 = (4x^2)^2 - 9^2\)  
   \[= (4x^2 + 9)(4x^2 - 9) \quad \text{Difference of two squares}\]
   \[= (4x^2 + 9)[(2x)^2 - 3^2] \quad \text{Difference of two squares}\]
   \[= (4x^2 + 9)(2x + 3)(2x - 3) \quad \text{Difference of two squares}\]

CHECKPOINT Now try Exercise 117.
A perfect square trinomial is the square of a binomial, and it has the following form.

\[ u^2 + 2uv + v^2 = (u + v)^2 \quad \text{or} \quad u^2 - 2uv + v^2 = (u - v)^2 \]

Like signs

Note that the first and last terms are squares and the middle term is twice the product of \( u \) and \( v \).

**Example 8**  Factoring Perfect Square Trinomials

Factor each trinomial.

a. \( x^2 - 10x + 25 \)

b. \( 16x^2 + 24x + 9 \)

**Solution**

a. \( x^2 - 10x + 25 = x^2 - 2(x)(5) + 5^2 = (x - 5)^2 \)

b. \( 16x^2 + 24x + 9 = (4x)^2 + 2(4x)(3) + 3^2 = (4x + 3)^2 \)

**CHECKPOINT** Now try Exercise 123.

The next two formulas show the sums and differences of cubes. Pay special attention to the signs of the terms.

\[ u^3 + v^3 = (u + v)(u^2 - uv + v^2) \quad \text{Like signs} \]

\[ u^3 - v^3 = (u - v)(u^2 + uv + v^2) \quad \text{Unlike signs} \]

**Example 9**  Factoring the Difference of Cubes

Factor \( x^3 - 27 \).

**Solution**

\[ x^3 - 27 = x^3 - 3^3 \]

\[ = (x - 3)(x^2 + 3x + 9) \quad \text{Rewrite 27 as } 3^3. \]

**CHECKPOINT** Now try Exercise 133.

**Example 10**  Factoring the Sum of Cubes

a. \( y^3 + 8 = y^3 + 2^3 \)

\[ = (y + 2)(y^2 - 2y + 4) \quad \text{Rewrite 8 as } 2^3. \]

b. \( 3(x^3 + 64) = 3(x^3 + 4^3) \)

\[ = 3(x + 4)(x^2 - 4x + 16) \quad \text{Rewrite 64 as } 4^3. \]

**CHECKPOINT** Now try Exercise 135.
Trinomials with Binomial Factors

To factor a trinomial of the form \( ax^2 + bx + c \), use the following pattern.

\[
ax^2 + bx + c = (\underline{\text{ } x + \underline{\text{ } })(\underline{\text{ } x + \underline{\text{ } })}
\]

The goal is to find a combination of factors of \( a \) and \( c \) such that the outer and inner products add up to the middle term \( bx \). For instance, in the trinomial \( 6x^2 + 17x + 5 \), you can write all possible factorizations and determine which one has outer and inner products that add up to \( 17x \).

\[
(6x + 5)(x + 1), \ (6x + 1)(x + 5), \ (2x + 1)(3x + 5), \ (2x + 5)(3x + 1)
\]

You can see that \((2x + 5)(3x + 1)\) is the correct factorization because the outer (O) and inner (I) products add up to \( 17x \).

\[
F \ O \ I \ L \ O+I
\]

\[
(2x + 5)(3x + 1) = 6x^2 + 2x + 15x + 5 = 6x^2 + 17x + 5
\]

**Example 11**  Factoring a Trinomial: Leading Coefficient Is 1

Factor \( x^2 - 7x + 12 \).

**Solution**

The possible factorizations are

\[(x - 2)(x - 6), \ (x - 1)(x - 12), \text{ and } (x - 3)(x - 4).\]

Testing the middle term, you will find the correct factorization to be

\[x^2 - 7x + 12 = (x - 3)(x - 4).\]

**Example 12**  Factoring a Trinomial: Leading Coefficient Is Not 1

Factor \( 2x^2 + x - 15 \).

**Solution**

The eight possible factorizations are as follows.

\[
(2x - 1)(x + 15) \quad (2x + 1)(x - 15) \\
(2x - 3)(x + 5) \quad (2x + 3)(x - 5) \\
(2x - 5)(x + 3) \quad (2x + 5)(x - 3) \\
(2x - 15)(x + 1) \quad (2x + 15)(x - 1)
\]

Testing the middle term, you will find the correct factorization to be

\[2x^2 + x - 15 = (2x - 5)(x + 3). \quad O + I = 6x - 5x = x\]

**Study Tip**

Factoring a trinomial can involve trial and error. However, once you have produced the factored form, it is an easy matter to check your answer. For instance, you can verify the factorization in Example 11 by multiplying out the expression \((x - 3)(x - 4)\) to see that you obtain the original trinomial, \(x^2 - 7x + 12\).
Factoring by Grouping

Sometimes polynomials with more than three terms can be factored by a method called factoring by grouping. It is not always obvious which terms to group, and sometimes several different groupings will work.

Example 13 Factoring by Grouping

Use factoring by grouping to factor \(x^3 - 2x^2 - 3x + 6\).

Solution

\[
x^3 - 2x^2 - 3x + 6 = (x^3 - 2x^2) - (3x - 6) \quad \text{Group terms.}
\]

\[
= x^2(x - 2) - 3(x - 2) \quad \text{Factor each group.}
\]

\[
= (x - 2)(x^2 - 3) \quad \text{Distributive Property}
\]

CHECKPOINT Now try Exercise 161.

Factoring a trinomial can involve quite a bit of trial and error. Some of this trial and error can be lessened by using factoring by grouping. The key to this method of factoring is knowing how to rewrite the middle term. In general, to factor a trinomial \(ax^2 + bx + c\) by grouping, choose factors of the product \(ac\) that add up to \(b\) and use these factors to rewrite the middle term. This technique is illustrated in Example 14.

Example 14 Factoring a Trinomial by Grouping

Use factoring by grouping to factor \(2x^2 + 5x - 3\).

Solution

In the trinomial \(2x^2 + 5x - 3\), \(a = 2\) and \(c = -3\), which implies that the product \(ac\) is \(-6\). Now, \(-6\) factors as \((6)(-1)\) and \(6 - 1 = 5 = b\). So, you can rewrite the middle term as \(5x = 6x - x\). This produces the following.

\[
2x^2 + 5x - 3 = 2x^2 + 6x - x - 3 \quad \text{Rewrite middle term.}
\]

\[
= (2x^2 + 6x) - (x + 3) \quad \text{Group terms.}
\]

\[
= 2x(x + 3) - (x + 3) \quad \text{Factor groups.}
\]

\[
= (x + 3)(2x - 1) \quad \text{Distributive Property}
\]

So, the trinomial factors as \(2x^2 + 5x - 3 = (x + 3)(2x - 1)\).

CHECKPOINT Now try Exercise 167.

Guidelines for Factoring Polynomials

1. Factor out any common factors using the Distributive Property.
2. Factor according to one of the special polynomial forms.
3. Factor as \(ax^2 + bx + c = (mx + r)(nx + s)\).
4. Factor by grouping.
A.3 Exercises

Vocabulary: Fill in the blanks.

1. For the polynomial $a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$, $a_n \neq 0$, the degree is ________, the leading coefficient is ________, and the constant term is ________.

2. A polynomial in $x$ in standard form is written with ________ powers of $x$.

3. A polynomial with one term is called a ________, while a polynomial with two terms is called a ________, and a polynomial with three terms is called a ________.

4. To add or subtract polynomials, add or subtract the ________ ________ by adding their coefficients.

5. The letters in “FOIL” stand for the following.
   
   F ________ O ________ I ________ L ________

6. The process of writing a polynomial as a product is called ________.

7. A polynomial is ________ ________ when each of its factors is prime.

8. A polynomial $u^2 + 2uv + v^2$ is called a ________ ________ ________.

Skills and Applications

In Exercises 9–14, match the polynomial with its description. (The polynomials are labeled (a), (b), (c), (d), (e), and (f).)

(a) $3x^2$  
(b) $1 - 2x^3$

(c) $x^3 + 3x^2 + 3x + 1$  
(d) 12

(e) $-3x^3 + 2x^3 + x$  
(f) $\frac{3}{2}x^4 + x^2 + 10$

9. A polynomial of degree 0

10. A trinomial of degree 5

11. A binomial with leading coefficient −2

12. A monomial of positive degree

13. A trinomial with leading coefficient $\frac{2}{3}$

14. A third-degree polynomial with leading coefficient 1

In Exercises 15–18, write a polynomial that fits the description. (There are many correct answers.)

15. A third-degree polynomial with leading coefficient −2

16. A fifth-degree polynomial with leading coefficient 6

17. A fourth-degree binomial with a negative leading coefficient

18. A third-degree binomial with an even leading coefficient

In Exercises 19–30, (a) write the polynomial in standard form, (b) identify the degree and leading coefficient of the polynomial, and (c) state whether the polynomial is a monomial, a binomial, or a trinomial.

19. $14x - \frac{1}{2}x^3$

20. $2x^2 - x + 1$

21. $x^2 - 4 - 3x^4$

22. $7x$

23. $3 - x^6$

24. $-y + 25y^2 + 1$

25. 3

26. $-8 + t^2$

27. $1 + 6x^4 - 4x^5$

28. $3 + 2x$

29. $4x^3y$

30. $-x^2y + 2x^3y^2 + xy^4$

In Exercises 31–36, determine whether the expression is a polynomial. If so, write the polynomial in standard form.

31. $2x - 3x^3 + 8$

32. $5x^4 - 2x^2 + x^{-2}$

33. $\frac{3x + 4}{x}$

34. $\frac{x^3 + 2x - 3}{2}$

35. $y^2 - y^4 + y^3$

36. $y^4 - \sqrt{y}$

In Exercises 37–54, perform the operation and write the result in standard form.

37. $(6x + 5) - (8x + 15)$

38. $(2x^2 + 1) - (x^2 - 2x + 1)$

39. $-(t^2 - 1) + (6t^3 - 5t)$

40. $-(5x^2 - 1) - (-3x^2 + 5)$

41. $(15x^2 - 6) - (-8.3x^3 - 14.7x^2 - 17)$

42. $(15.6u^4 - 14w - 17.4) - (16.9u^4 - 9.2w + 13)$

43. $5z - [3z - (10z + 8)]$

44. $(y^3 + 1) - [(y^2 + 1) + (3y - 7)]$

45. $3(x^2 - 2x + 1)$

46. $y^2(4y^2 + 2y - 3)$

47. $-5z(3z - 1)$

48. $-(3x)(5x + 2)$

49. $(1 - x^3)(4x)$

50. $-4x(3 - x^3)$

51. $(1.5t^2 + 5)(-3t)$

52. $(2 - 3.5y)(2y^3)$

53. $-2x(0.1x + 17)$

54. $6y(5 - \frac{4}{x})$

In Exercises 55–92, multiply or find the special product.

55. $(x + 3)(x + 4)$

56. $(x - 5)(x + 10)$

57. $(3x - 5)(2x + 1)$

58. $(7x - 2)(4x - 3)$

59. $(x + 10)(x - 10)$

60. $(2x + 3)(2x - 3)$

61. $(x + 2y)(x - 2y)$

62. $(4a + 5b)(4a - 5b)$

63. $(2x + 3)^2$

64. $(5 - 8x)^2$
In Exercises 121–132, factor the perfect square trinomial.

121. \( x^2 - 4x + 4 \)  
122. \( x^2 + 10x + 25 \)
123. \( 4t^2 + 4t + 1 \)  
124. \( 9x^2 - 12x + 4 \)
125. \( 25y^2 - 10y + 1 \)  
126. \( 36y^2 - 108y + 81 \)
127. \( 9u^2 + 24uv + 16v^2 \)  
128. \( 4x^2 - 4xy + y^2 \)
129. \( x^2 - \frac{4}{3}x + \frac{4}{9} \)  
130. \( z^2 + z + \frac{1}{4} \)
131. \( 4x^2 - \frac{5}{3}x + \frac{1}{9} \)  
132. \( 9y^2 - \frac{3}{2}y + \frac{1}{16} \)

In Exercises 133–144, factor the sum or difference of cubes.

133. \( x^3 - 8 \)  
134. \( x^3 - 27 \)
135. \( y^3 + 64 \)  
136. \( z^3 + 216 \)
137. \( x^3 - \frac{8}{27} \)  
138. \( y^3 + \frac{8}{27} \)
139. \( 8x^3 - 1 \)  
140. \( 27x^3 + 8 \)
141. \( u^3 + 27v^3 \)  
142. \( 64x^3 - y^3 \)
143. \( (x + 2)^3 - y^3 \)  
144. \( (x - 3y)^3 - 8z^3 \)

In Exercises 145–158, factor the trinomial.

145. \( x^2 + x - 2 \)  
146. \( x^2 + 5x + 6 \)
147. \( s^2 - 5s + 6 \)  
148. \( t^2 - t + 6 \)
149. \( 20 - y - y^2 \)  
150. \( 24 + 5z - z^2 \)
151. \( x^2 - 30x + 200 \)  
152. \( x^2 - 13x + 42 \)
153. \( 3x^2 - 5x + 2 \)  
154. \( 2x^2 - x - 1 \)
155. \( 5x^2 + 26x + 5 \)  
156. \( 12x^2 + 7x + 1 \)
157. \( -9z^2 + 3z + 2 \)  
158. \( -5u^2 - 13u + 6 \)

In Exercises 159–166, factor by grouping.

159. \( x^3 - x^2 + 2x - 2 \)  
160. \( x^3 + 5x^2 - 5x - 25 \)
161. \( 2x^3 - x^2 - 6x + 3 \)  
162. \( 5x^3 - 10x^2 + 3x - 6 \)
163. \( 6 + 2x - 3x^2 + x^4 \)  
164. \( x^5 - 2x^3 + x^2 + 2 \)
165. \( 6x^3 - 2x + 3x^2 - 1 \)  
166. \( 8x^3 - 6x^2 + 12x^3 - 9 \)

In Exercises 167–172, factor the trinomial by grouping.

167. \( 3x^2 + 10x + 8 \)  
168. \( 2x^2 + 9x + 9 \)
169. \( 6x^2 - x - 2 \)  
170. \( 6x^2 - x - 15 \)
171. \( 15x^2 - 11x + 2 \)  
172. \( 12x^2 - 13x + 1 \)

In Exercises 173–206, completely factor the expression.

173. \( 6x^2 - 54 \)  
174. \( 12x^2 - 48 \)
175. \( x^3 - x^2 \)  
176. \( x^3 - 4x^2 \)
177. \( x^3 - 16x \)  
178. \( x^3 - 9x \)
179. \( x^2 - 2x + 1 \)  
180. \( 16 + 6x - x^2 \)
181. \( 1 - 4x + 4x^2 \)  
182. \( -9x^2 + 6x - 1 \)
183. \( 2x^2 + 4x - 2x^3 \)  
184. \( 13x + 6 + 5x^2 \)
185. \( \frac{1}{81}x^2 + \frac{2}{9}x - 8 \)  
186. \( \frac{1}{8}x^2 - \frac{1}{9}x - \frac{1}{16} \)
187. $3x^3 + x^2 + 15x + 5$
188. $5 - x + 5x^2 - x^3$
189. $x^4 - 4x^3 + x^2 - 4x$
190. $3x^3 + x^2 - 27x - 9$
191. $\frac{1}{2}x^3 + 3x^2 + \frac{3}{2}x + 9$
192. $\frac{1}{2}x^3 + x^2 - x - 5$
193. $(x - 1)^2 - 49$
194. $(x^2 + 1)^2 - 4x^2$
195. $(x^2 + 8)^2 - 36x^2$
196. $2^3 - 16$
197. $5x^3 + 40$
198. $4x(2x - 1) + (2x - 1)^2$
199. $(3 - 4x)^2 - 8(3 - 4x)(5x - 1)$
200. $2(x + 1)(x - 3)^2 - 3(x + 1)^2(x - 3)$
201. $7(3x + 2)^2(1 - x)^2 + (3x + 2)(1 - x)^3$
202. $7x(2)(x^2 + 1)(2x) - (x^2 + 1)^3(7)$
203. $3(x - 2)^2(x + 1)^4 + (x - 2)^3(4)(x + 1)^3$
204. $2x(x - 5)^4 - x^2(4)(x - 5)^3$
205. $5(x^6 + 1)^4(6x^5)(3x + 2)^3 + 3(3x + 2)(3)(x^6 + 1)^5$
206. $\frac{x^2}{2}(x^2 + 1)^4 - (x^2 + 1)^5$

In Exercises 207–212, completely factor the expression.

207. $x^4(4)(2x + 1)^3(2x) + (2x + 1)^4(4x^2)$
208. $x^4(3)(x^2 + 1)^2(2x) + (x^2 + 1)^3(3x^2)$
209. $(2x - 5)^4(3)(5x - 4)^2(5) + (5x - 4)^4(4)(2x - 5)^3(2)$
210. $(x^2 - 5)^3(2)(4x + 3)(4) + (4x + 3)^2(3)(x^2 - 5)^2(x^2)$
211. $\frac{(5x - 1)(3) - (3x + 1)(5)}{(5x - 1)^2}$
212. $\frac{(2x + 3)(4) - (4x - 1)(2)}{(2x + 3)^2}$

In Exercises 213–216, find all values of $b$ for which the trinomial can be factored.

213. $x^2 + bx - 15$
214. $x^2 + bx - 12$
215. $x^2 + bx + 50$
216. $x^2 + bx + 24$

In Exercises 217–220, find two integer values of $c$ such that the trinomial can be factored. (There are many correct answers.)

217. $2x^2 + 5x + c$
218. $3x^2 - 10x + c$
219. $3x^2 - x + c$
220. $2x^2 + 9x + c$

221. **COST, REVENUE, AND PROFIT** An electronics manufacturer can produce and sell $x$ MP3 players per week. The total cost $C$ (in dollars) of producing $x$ MP3 players is $C = 73x + 25,000$, and the total revenue $R$ (in dollars) is $R = 95x$.

(a) Find the profit $P$ in terms of $x$.
(b) Find the profit obtained by selling 5000 MP3 players per week.

222. **COMPOUND INTEREST** After 3 years, an investment of $1200$ compounded annually at an interest rate $r$ will yield an amount of $1200(1 + r)^3$.

(a) Write this polynomial in standard form.
(b) Use a calculator to evaluate the polynomial for the values of $r$ shown in the table.

<table>
<thead>
<tr>
<th>$r$</th>
<th>2%</th>
<th>3%</th>
<th>3 1/2%</th>
<th>4%</th>
<th>4 1/2%</th>
</tr>
</thead>
<tbody>
<tr>
<td>1200(1 + r)^3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(c) What conclusion can you make from the table?

223. **VOLUME OF A BOX** A take-out fast-food restaurant is constructing an open box by cutting squares from the corners of a piece of cardboard that is 18 centimeters by 26 centimeters (see figure). The edge of each cut-out square is $x$ centimeters.

![Diagram of a box]

(a) Find the volume of the box in terms of $x$.
(b) Find the volume when $x = 1$, $x = 2$, and $x = 3$.

224. **VOLUME OF A BOX** An overnight shipping company is designing a closed box by cutting along the solid lines and folding along the broken lines on the rectangular piece of corrugated cardboard shown in the figure. The length and width of the rectangle are 45 centimeters and 15 centimeters, respectively.

![Diagram of a shipping box]

(a) Find the volume of the shipping box in terms of $x$.
(b) Find the volume when $x = 3$, $x = 5$, and $x = 7$.

225. **GEOMETRY** Find a polynomial that represents the total number of square feet for the floor plan shown in the figure.

![Diagram of a floor plan]
226. **GEOMETRY** Find the area of the shaded region in each figure. Write your result as a polynomial in standard form.

(a) \[2x + 6\]

(b) \[x + 4\]

GEOMETRIC MODELING In Exercises 227–230, draw a "geometric factoring model" to represent the factorization. For instance, a factoring model for

\[2x^2 + 3x + 1 = (2x + 1)(x + 1)\]

is shown in the figure.

![Geometric model](image)

227. \[3x^2 + 7x + 2 = (3x + 1)(x + 2)\]
228. \[x^2 + 4x + 3 = (x + 3)(x + 1)\]
229. \[2x^2 + 7x + 3 = (2x + 1)(x + 3)\]
230. \[x^2 + 3x + 2 = (x + 2)(x + 1)\]

GEOMETRY In Exercises 231 and 232, write an expression in factored form for the area of the shaded portion of the figure.

231.

232.

233. **GEOMETRY** The cylindrical shell shown in the figure has a volume of \(V = \pi R^2 h - \pi r^2 h\).

(a) Factor the expression for the volume.
(b) From the result of part (a), show that the volume is \(2\pi (\text{average radius})(\text{thickness of the shell})h\).

234. **CHEMISTRY** The rate of change of an autocatalytic chemical reaction is \(kQx - kx^2\), where \(Q\) is the amount of the original substance, \(x\) is the amount of substance formed, and \(k\) is a constant of proportionality. Factor the expression.

EXPLORATION

TRUE OR FALSE? In Exercises 235–238, determine whether the statement is true or false. Justify your answer.

235. The product of two binomials is always a second-degree polynomial.
236. The sum of two binomials is always a binomial.
237. The difference of two perfect squares can be factored as the product of conjugate pairs.
238. The sum of two perfect squares can be factored as the binomial sum squared.
239. Find the degree of the product of two polynomials of degrees \(m\) and \(n\).
240. Find the degree of the sum of two polynomials of degrees \(m\) and \(n\) if \(m < n\).

241. THINK ABOUT IT When the polynomial \(-x^3 + 3x^2 + 2x - 1\) is subtracted from an unknown polynomial, the difference is \(5x^2 + 8\). If it is possible, find the unknown polynomial.

242. LOGICAL REASONING Verify that \((x + y)^2\) is not equal to \(x^2 + y^2\) by letting \(x = 3\) and \(y = 4\) and evaluating both expressions. Are there any values of \(x\) and \(y\) for which \((x + y)^2 = x^2 + y^2\)? Explain.

243. Factor \(x^{2n} - y^{2n}\) as completely as possible.
244. Factor \(x^{3n} + y^{3n}\) as completely as possible.
245. Give an example of a polynomial that is prime with respect to the integers.

246. **CAPSTONE** A third-degree polynomial and a fourth-degree polynomial are added.

(a) Can the sum be a fourth-degree polynomial? Explain or give an example.
(b) Can the sum be a second-degree polynomial? Explain or give an example.
(c) Can the sum be a seventh-degree polynomial? Explain or give an example.
(d) After adding the two polynomials and factoring the sum, you obtain a polynomial that is in factored form. Explain what is meant by saying that a polynomial is in factored form.
RATIONAL EXPRESSIONS

What you should learn
• Find domains of algebraic expressions.
• Simplify rational expressions.
• Add, subtract, multiply, and divide rational expressions.
• Simplify complex fractions and rewrite difference quotients.

Why you should learn it
Rational expressions can be used to solve real-life problems. For instance, in Exercise 102 on page A48, a rational expression is used to model the projected numbers of U.S. households banking and paying bills online from 2002 through 2007.

Domain of an Algebraic Expression
The set of real numbers for which an algebraic expression is defined is the domain of the expression. Two algebraic expressions are equivalent if they have the same domain and yield the same values for all numbers in their domain. For instance, 
\[(x + 1) + (x + 2) = x + 1 + x + 2 = x + x + 1 + 2 = 2x + 3.\]

Example 1 Finding the Domain of an Algebraic Expression

a. The domain of the polynomial

\[2x^3 + 3x + 4\]

is the set of all real numbers. In fact, the domain of any polynomial is the set of all real numbers, unless the domain is specifically restricted.

b. The domain of the radical expression

\[\sqrt{x - 2}\]

is the set of real numbers greater than or equal to 2, because the square root of a negative number is not a real number.

c. The domain of the expression

\[\frac{x + 2}{x - 3}\]

is the set of all real numbers except \(x = 3\), which would result in division by zero, which is undefined.

CHECKPOINT Now try Exercise 7.

The quotient of two algebraic expressions is a fractional expression. Moreover, the quotient of two polynomials such as

\[\frac{1}{x}, \quad \frac{2x - 1}{x + 1}, \quad \text{or} \quad \frac{x^2 - 1}{x^2 + 1}\]

is a rational expression.

Simplifying Rational Expressions
Recall that a fraction is in simplest form if its numerator and denominator have no factors in common aside from ±1. To write a fraction in simplest form, divide out common factors.

\[\frac{a \cdot c}{b \cdot c} = \frac{a}{b}, \quad c \neq 0\]
The key to success in simplifying rational expressions lies in your ability to factor polynomials. When simplifying rational expressions, be sure to factor each polynomial completely before concluding that the numerator and denominator have no factors in common.

**Example 2**  Simplifying a Rational Expression

Write \( \frac{x^2 + 4x - 12}{3x - 6} \) in simplest form.

**Solution**

\[
\frac{x^2 + 4x - 12}{3x - 6} = \frac{(x + 6)(x - 2)}{3(x - 2)}
\]

Factor completely.

\[
= \frac{x + 6}{3}, \quad x \neq 2
\]

Divide out common factors.

Note that the original expression is undefined when \( x = 2 \) (because division by zero is undefined). To make sure that the simplified expression is equivalent to the original expression, you must restrict the domain of the simplified expression by excluding the value \( x = 2 \).

**CHECKPOINT**  Now try Exercise 33.

Sometimes it may be necessary to change the sign of a factor by factoring out \(-1\) to simplify a rational expression, as shown in Example 3.

**Example 3**  Simplifying Rational Expressions

Write \( \frac{12 + x - x^2}{2x^2 - 9x + 4} \) in simplest form.

**Solution**

\[
\frac{12 + x - x^2}{2x^2 - 9x + 4} = \frac{(4 - x)(3 + x)}{(2x - 1)(x - 4)}
\]

Factor completely.

\[
= \frac{- (x - 4)(3 + x)}{(2x - 1)(x - 4)}
\]

\( (4 - x) = -(x - 4) \)

\[
= \frac{-3 + x}{2x - 1}, \quad x \neq 4
\]

Divide out common factors.

**CHECKPOINT**  Now try Exercise 39.

In this text, when a rational expression is written, the domain is usually not listed with the expression. It is implied that the real numbers that make the denominator zero are excluded from the expression. Also, when performing operations with rational expressions, this text follows the convention of listing by the simplified expression all values of \( x \) that must be specifically excluded from the domain in order to make the domains of the simplified and original expressions agree.

In Example 3, for instance, the restriction \( x \neq 4 \) is listed with the simplified expression to make the two domains agree. Note that the value \( x = \frac{1}{2} \) is excluded from both domains, so it is not necessary to list this value.
Operations with Rational Expressions

To multiply or divide rational expressions, use the properties of fractions discussed in Appendix A.1. Recall that to divide fractions, you invert the divisor and multiply.

**Example 4**  Multiplying Rational Expressions

\[
\frac{2x^2 + x - 6}{x^2 + 4x - 5} \cdot \frac{x^3 - 3x^2 + 2x}{4x^3 - 6x} = \frac{(2x-3)(x+2)}{(x+5)(x-1)} \cdot \frac{x(x-2)(x-1)}{2x(2x-3)}
\]

\[
= \frac{(x+2)(x-2)}{2(x+5)}, \quad x \neq 0, x \neq 1, x \neq \frac{3}{2}
\]

**CHECK Point**  Now try Exercise 53.

In Example 4, the restrictions \(x \neq 0, x \neq 1, \) and \(x \neq \frac{3}{2}\) are listed with the simplified expression in order to make the two domains agree. Note that the value \(x = -5\) is excluded from both domains, so it is not necessary to list this value.

**Example 5**  Dividing Rational Expressions

\[
\frac{x^3 - 8}{x^2 - 4} \div \frac{x^2 + 2x + 4}{x^3 + 8} = \frac{x^3 - 8}{x^2 - 4} \cdot \frac{x^3 + 8}{x^2 + 2x + 4}
\]

\[
= \frac{(x-2)(x^2 + 2x + 4)}{(x+2)(x-2)} \cdot \frac{(x+2)(x^2 - 2x + 4)}{(x^2 + 2x + 4)}
\]

\[
= x^2 - 2x + 4, \quad x \neq \pm 2
\]

**CHECK Point**  Now try Exercise 55.

To add or subtract rational expressions, you can use the LCD (least common denominator) method or the basic definition

\[
\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}, \quad b \neq 0, d \neq 0.
\]

Basic definition

This definition provides an efficient way of adding or subtracting two fractions that have no common factors in their denominators.

**Example 6**  Subtracting Rational Expressions

\[
\frac{x}{x - 3} - \frac{2}{3x + 4} = \frac{x(3x + 4) - 2(x - 3)}{(x - 3)(3x + 4)}
\]

\[
= \frac{3x^2 + 4x - 2x + 6}{(x - 3)(3x + 4)}
\]

\[
= \frac{3x^2 + 2x + 6}{(x - 3)(3x + 4)}
\]

**CHECK Point**  Now try Exercise 65.

**WARNING / CAUTION**

When subtracting rational expressions, remember to distribute the negative sign to all the terms in the quantity that is being subtracted.
For three or more fractions, or for fractions with a repeated factor in the denominators, the LCD method works well. Recall that the least common denominator of several fractions consists of the product of all prime factors in the denominators, with each factor given the highest power of its occurrence in any denominator. Here is a numerical example.

\[
\frac{1}{6} + \frac{3}{4} - \frac{2}{3} = \frac{1 \cdot 2}{6} + \frac{3 \cdot 3}{4 \cdot 3} - \frac{2 \cdot 4}{3 \cdot 4} \\
\text{The LCD is 12.}
\]

\[
= \frac{2}{12} + \frac{9}{12} - \frac{8}{12} \\
= \frac{3}{12} \\
= \frac{1}{4}
\]

Sometimes the numerator of the answer has a factor in common with the denominator. In such cases the answer should be simplified. For instance, in the example above, \( \frac{1}{12} \) was simplified to \( \frac{1}{4} \).

**Example 7** Combining Rational Expressions: The LCD Method

Perform the operations and simplify.

\[
\frac{3}{x - 1} - \frac{2}{x} + \frac{x + 3}{x^2 - 1}
\]

**Solution**

Using the factored denominators \((x - 1), x,\) and \((x + 1)(x - 1),\) you can see that the LCD is \(x(x + 1)(x - 1)\).

\[
\frac{3}{x - 1} - \frac{2}{x} + \frac{x + 3}{(x + 1)(x - 1)} \\
= \frac{3(x)(x + 1)}{x(x + 1)(x - 1)} - \frac{2(x + 1)(x - 1)}{x(x + 1)(x - 1)} + \frac{(x + 3)(x)}{x(x + 1)(x - 1)} \\
= \frac{3(x)(x + 1) - 2(x + 1)(x - 1) + (x + 3)(x)}{x(x + 1)(x - 1)} \\
= \frac{3x^2 + 3x - 2x^2 + 2 + x^2 + 3x + 3x}{x(x + 1)(x - 1)} \quad \text{Distributive Property} \\
= \frac{3x^2 - 2x^2 + x^2 + 3x + 3x + 2}{x(x + 1)(x - 1)} \quad \text{Group like terms.} \\
= \frac{2x^2 + 6x + 2}{x(x + 1)(x - 1)} \quad \text{Combine like terms.} \\
= \frac{2(x^2 + 3x + 1)}{x(x + 1)(x - 1)} \quad \text{Factor.}
\]

**CHECKPoint** Now try Exercise 67.
Complex Fractions and the Difference Quotient

Fractional expressions with separate fractions in the numerator, denominator, or both are called complex fractions. Here are two examples.

\[
\frac{\frac{1}{x}}{x^2 + 1} \quad \text{and} \quad \frac{\frac{1}{x}}{\frac{1}{x^2 + 1}}
\]

To simplify a complex fraction, combine the fractions in the numerator into a single fraction and then combine the fractions in the denominator into a single fraction. Then invert the denominator and multiply.

**Example 8** Simplifying a Complex Fraction

\[
\frac{\left(\frac{2}{x} - 3\right)}{\left(1 - \frac{1}{x - 1}\right)} = \frac{\frac{2 - 3(x)}{x}}{\frac{1(x - 1) - 1}{x - 1}}
\]

Combine fractions.

\[
= \frac{2 - 3x}{x}
\]

Simplify.

\[
= \frac{2 - 3x}{x - 1}
\]

Invert and multiply.

\[
= \frac{(2 - 3x)(x - 1)}{x(x - 2)}, \quad x \neq 1
\]

**CHECKPOINT** Now try Exercise 73.

Another way to simplify a complex fraction is to multiply its numerator and denominator by the LCD of all fractions in its numerator and denominator. This method is applied to the fraction in Example 8 as follows.

\[
\frac{\left(\frac{2}{x} - 3\right)}{\left(1 - \frac{1}{x - 1}\right)} = \frac{\frac{2}{x} - 3}{\frac{1}{x - 1}} \cdot \frac{x(x - 1)}{x(x - 1)} \quad \text{LCD is } x(x - 1).
\]

\[
= \frac{\frac{2 - 3x}{x}}{\frac{x - 2}{x - 1}} \cdot \frac{x(x - 1)}{x(x - 1)}
\]

\[
= \frac{(2 - 3x)(x - 1)}{x(x - 2)}, \quad x \neq 1
\]
The next three examples illustrate some methods for simplifying rational expressions involving negative exponents and radicals. These types of expressions occur frequently in calculus.

To simplify an expression with negative exponents, one method is to begin by factoring out the common factor with the smaller exponent. Remember that when factoring, you subtract exponents. For instance, in $3x^{-5/2} + 2x^{-3/2}$ the smaller exponent is $-\frac{3}{2}$ and the common factor is $x^{-5/2}$.

$$3x^{-5/2} + 2x^{-3/2} = x^{-5/2}\left[3(1) + 2x^{-3/2-(-5/2)}\right]$$
$$= x^{-5/2}(3 + 2x^{1})$$
$$= \frac{3 + 2x}{x^{3/2}}.$$

### Example 9  Simplifying an Expression

Simplify the following expression containing negative exponents.

$$x(1 - 2x)^{-3/2} + (1 - 2x)^{-1/2}$$

**Solution**

Begin by factoring out the common factor with the smaller exponent.

$$x(1 - 2x)^{-3/2} + (1 - 2x)^{-1/2} = (1 - 2x)^{-3/2}[x + (1 - 2x)(-1/2-(-3/2))]$$
$$= (1 - 2x)^{-3/2}[x + (1 - 2x)^{1}]$$
$$= \frac{1 - x}{(1 - 2x)^{3/2}}.$$

**CHECKPOINT** Now try Exercise 81.

A second method for simplifying an expression with negative exponents is shown in the next example.

### Example 10  Simplifying an Expression with Negative Exponents

$$\frac{(4 - x^2)^{1/2} + x^2(4 - x^2)^{-1/2}}{4 - x^2}$$

$$= \frac{(4 - x^2)^{1/2} + x^2(4 - x^2)^{-1/2}}{4 - x^2}$$

$$= \frac{(4 - x^2)^{1} + x^2(4 - x^2)^{0}}{(4 - x^2)^{3/2}}$$

$$= \frac{4 - x^2 + x^2}{(4 - x^2)^{3/2}}$$

$$= \frac{4}{(4 - x^2)^{3/2}}.$$

**CHECKPOINT** Now try Exercise 83.
Appendix A.4 Rational Expressions

Rewriting a Difference Quotient

The following expression from calculus is an example of a difference quotient.

\[
\frac{\sqrt{x + h} - \sqrt{x}}{h}
\]

Rewrite this expression by rationalizing its numerator.

**Solution**

\[
\frac{\sqrt{x + h} - \sqrt{x}}{h} = \frac{\sqrt{x + h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x + h} + \sqrt{x}}{\sqrt{x + h} + \sqrt{x}}
\]

\[
= \frac{(\sqrt{x + h})^2 - (\sqrt{x})^2}{h(\sqrt{x + h} + \sqrt{x})}
\]

\[
= \frac{h}{h(\sqrt{x + h} + \sqrt{x})}
\]

\[
= \frac{1}{\sqrt{x + h} + \sqrt{x}}, \quad h \neq 0
\]

Notice that the original expression is undefined when \( h = 0 \). So, you must exclude \( h = 0 \) from the domain of the simplified expression so that the expressions are equivalent.

**CHECK POINT** Now try Exercise 89.

Difference quotients, such as that in Example 11, occur frequently in calculus. Often, they need to be rewritten in an equivalent form that can be evaluated when \( h = 0 \). Note that the equivalent form is not simpler than the original form, but it has the advantage that it is defined when \( h = 0 \).

## A.4 EXERCISES

**VOCABULARY:** Fill in the blanks.

1. The set of real numbers for which an algebraic expression is defined is the _______ of the expression.
2. The quotient of two algebraic expressions is a fractional expression and the quotient of two polynomials is a _______ ________.
3. Fractional expressions with separate fractions in the numerator, denominator, or both are called _______ fractions.
4. To simplify an expression with negative exponents, it is possible to begin by factoring out the common factor with the _______ exponent.
5. Two algebraic expressions that have the same domain and yield the same values for all numbers in their domains are called _______.
6. An important rational expression, such as \( \frac{(x + h)^2 - x^2}{h} \), that occurs in calculus is called a _______ ________.
SKILLS AND APPLICATIONS

In Exercises 7–22, find the domain of the expression.

7. 3x^2 - 4x + 7
8. 2x^2 + 5x - 2
9. 4x^3 + 3, x ≥ 0
10. 6x^2 - 9, x > 0
11. \frac{1}{3 - x}
12. \frac{x + 6}{3x + 2}
13. \frac{x^2 - 1}{x^2 - 2x + 1}
14. \frac{x^2 - 5x + 6}{x^2 - 4}
15. \frac{x^2 - 2x - 3}{x^2 - 6x + 9}
16. \frac{x^2 - x - 12}{x^2 - 8x + 16}
17. \sqrt{x + 7}
18. \sqrt[4]{x - 5}
19. \sqrt[4]{x - 5}
20. \sqrt[4]{x + 5}
21. \frac{1}{\sqrt{x - 3}}
22. \frac{1}{\sqrt{x + 2}}

In Exercises 23 and 24, find the missing factor in the numerator such that the two fractions are equivalent.

23. \frac{5}{2x} = \frac{5}{6x^2}
24. \frac{3}{4} = \frac{3}{4(x + 1)}

In Exercises 25–42, write the rational expression in simplest form.

25. \frac{15x^2}{10x}
26. \frac{18y^2}{60y^5}
27. \frac{3xy}{xy + x}
28. \frac{2x^2y}{xy - y}
29. \frac{4y - 8y^2}{10y - 5}
30. \frac{9x^2 + 9x}{2x + 2}
31. \frac{x + 5}{10 - 2x}
32. \frac{12 - 4x}{x - 3}
33. \frac{y^2 - 16}{y + 4}
34. \frac{x^2 - 25}{5 - x}
35. \frac{x^3 + 5x^2 + 6x}{x^2 - 4}
36. \frac{x^2 + 8x - 20}{x^2 + 11x + 10}
37. \frac{y^2 - 7y + 12}{y^2 + 3y - 18}
38. \frac{x^2 - 7x + 6}{x^2 + 11x + 10}
39. \frac{2 - x + 2x^2 - x^3}{x^2 - 4}
40. \frac{x^2 - 9}{x^3 + x^2 - 9x - 9}
41. \frac{z^3 - 8}{z^2 + 2z + 4}
42. \frac{y^3 - 2y^2 - 3y}{y^3 + 1}

43. Error Analysis Describe the error.
\[ \frac{5x^2}{2x^3 + 4} = \frac{5x^3}{2x^4} \quad \frac{5}{2 + 4} = \frac{5}{6} \]

44. Error Analysis Describe the error.
\[ \frac{x^2 + 25x}{x^2 - 2x - 15} = \frac{x(x^2 + 25)}{(x - 5)(x + 3)} \]
\[ = \frac{x(x + 5)(x - 5)}{(x - 5)(x + 3)} = \frac{x(x + 5)}{x + 3} \]

In Exercises 45 and 46, complete the table. What can you conclude?

45.
<table>
<thead>
<tr>
<th>x</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>

GEOMETRY In Exercises 47 and 48, find the ratio of the area of the shaded portion of the figure to the total area of the figure.

47.

48.

In Exercises 49–56, perform the multiplication or division and simplify.

49. \[ \frac{5}{x - 1} \cdot \frac{x - 1}{25(x - 2)} \]
50. \[ \frac{x + 13}{x^3(3 - x)} \cdot \frac{x(x - 3)}{5} \]
51. \[ \frac{r}{r - 1} \div \frac{r^2}{r - 1} \]
52. \[ \frac{4y - 16}{5y + 15} \div \frac{4 - y}{2y + 6} \]
53. \[ \frac{r^2 - r - 6}{t + 3} \cdot \frac{t + 3}{t^2 + 6t + 9} \cdot \frac{t^2 - 4}{t^2 + 2} \]
54. \[ \frac{x^2 + xy - 2y^2}{x^3 + x^2y} \cdot \frac{x}{x^2 + 3xy + 2y^2} \]
55. \[ \frac{x^2 - 36}{x} \div \frac{x^3 - 6x^2}{x^2 + x} \]
56. \[ \frac{x^2 - 14x + 49}{x^2 - 49} \div \frac{3x - 21}{x + 7} \]
In Exercises 57–68, perform the addition or subtraction and simplify.

57. \( \frac{6 - \frac{5}{x + 3}}{x} \)
58. \( \frac{3}{x - 1} - 5 \)
59. \( \frac{5}{x - 1} + \frac{x}{x - 1} \)
60. \( \frac{2x - 1}{x + 3} + \frac{1 - x}{x + 3} \)
61. \( \frac{3}{x - 2} + \frac{5}{2 - x} \)
62. \( \frac{2x}{x - 5} - \frac{5}{5 - x} \)
63. \( \frac{4}{2x + 1} - \frac{x}{x + 2} \)
64. \( \frac{\frac{2}{x} + \frac{5x}{x - 3} + \frac{3x}{3x + 4}}{x} \)

65. \( \frac{1}{x^2 - x - 2} - \frac{x}{x^2 - 5x + 6} \)
66. \( \frac{2}{x^3 - x - 2} + \frac{10}{x^2 + 2x - 8} \)
67. \( \frac{1}{x} + \frac{2}{x^2 + 1} + \frac{1}{x^3 + x} \)
68. \( \frac{2}{x + 1} + \frac{2}{x - 1} + \frac{1}{x^2 - 1} \)

**ERROR ANALYSIS** In Exercises 69 and 70, describe the error.

69. \( \frac{x + 4}{x + 2} - \frac{3x - 8}{x + 2} = \frac{x + 4 - 3x - 8}{x + 2} = \frac{-2x - 4}{x + 2} = \frac{-2(x + 2)}{x + 2} = -2 \)

70. \( \frac{6 - x}{x(x + 2)} + \frac{x + 2}{x^2} + \frac{8}{x^4(x + 2)} = \frac{6x - x^2 + x^2 + 4 + 8}{x^4(x + 2)} = \frac{6x + 2}{x^2(x + 2)} \)

In Exercises 71–76, simplify the complex fraction.

71. \( \frac{\frac{x}{x - 1}}{x - 2} \)
72. \( \frac{(x - 4)}{\frac{x^2}{x - 4}} \)
73. \( \frac{\frac{x}{x + 1}^2}{\frac{x}{x + 1}^3} \)
74. \( \frac{\frac{x^2 - 1}{x}}{\frac{x}{x - 1}^2} \)
75. \( \frac{\sqrt{x} - \frac{1}{2\sqrt{x}}}{\sqrt{x}} \)
76. \( \frac{\frac{t^2}{\sqrt{t^2 + 1}} - \frac{\sqrt{t^2 + 1}}{t^2}}{t^2} \)

In Exercises 77–82, factor the expression by removing the common factor with the smaller exponent.

77. \( x^5 - 2x^2 \)
78. \( x^5 - 5x^{-3} \)
79. \( x^2(x^2 + 1)^{-5} - (x^2 + 1)^{-4} \)
80. \( 2x(x - 5)^{-3} - 4x^2(x - 5)^{-4} \)
81. \( 2x^2(x - 1)^{1/2} - 5(x - 1)^{-1/2} \)
82. \( 4x^3(2x - 1)^{3/2} - 2x(2x - 1)^{-1/2} \)

In Exercises 83 and 84, simplify the expression.

83. \( \frac{3x^{1/3} - x^{-2/3}}{3x^{-2/3}} \)
84. \( -x^3(1 - x^2)^{-1/2} - 2x(1 - x^2)^{1/2} \)

In Exercises 85–88, simplify the difference quotient.

85. \( \frac{\left(\frac{1}{x + h} - \frac{1}{x}\right)}{h} \)
86. \( \frac{\left(\frac{1}{(x + h)^2} - \frac{1}{x^2}\right)}{h} \)
87. \( \frac{\left(\frac{1}{x + h - 4} - \frac{1}{x - 4}\right)}{h} \)
88. \( \frac{\left(\frac{x + h}{x + h + 1} - \frac{x}{x + 1}\right)}{h} \)

In Exercises 89–94, simplify the difference quotient by rationalizing the numerator.

89. \( \frac{\sqrt{x + 2} - \sqrt{x}}{2} \)
90. \( \frac{\sqrt{x - 3} - \sqrt{3}}{3} \)
91. \( \frac{\sqrt{x} + 3 - \sqrt{3}}{x} \)
92. \( \frac{\sqrt{x} + 5 - \sqrt{5}}{x} \)
93. \( \frac{\sqrt{x + h} - 1 - \sqrt{x + 1}}{h} \)
94. \( \frac{\sqrt{x + h - 2} - \sqrt{x - 2}}{h} \)

**PROBABILITY** In Exercises 95 and 96, consider an experiment in which a marble is tossed into a box whose base is shown in the figure. The probability that the marble will come to rest in the shaded portion of the box is equal to the ratio of the shaded area to the total area of the figure. Find the probability.

95. \( \text{Diagram} \)
96. \( \text{Diagram} \)

97. **RATE** A digital copier copies in color at a rate of 50 pages per minute.

(a) Find the time required to copy one page.
(b) Find the time required to copy \( x \) pages.
(c) Find the time required to copy 120 pages.

98. RATE After working together for \( t \) hours on a common task, two workers have done fractional parts of the job equal to \( t/3 \) and \( t/5 \), respectively. What fractional part of the task has been completed?

FINANCE In Exercises 99 and 100, the formula that approximates the annual interest rate \( r \) of a monthly installment loan is given by

\[
r = \frac{24(NM - P)}{NT + \frac{NM}{12}}
\]

where \( N \) is the total number of payments, \( M \) is the monthly payment, and \( P \) is the amount financed.

99. (a) Approximate the annual interest rate for a four-year car loan of $20,000 that has monthly payments of $475.
(b) Simplify the expression for the annual interest rate \( r \), and then rework part (a).

100. (a) Approximate the annual interest rate for a five-year car loan of $28,000 that has monthly payments of $525.
(b) Simplify the expression for the annual interest rate \( r \), and then rework part (a).

101. REFRIGERATION When food (at room temperature) is placed in a refrigerator, the time required for the food to cool depends on the amount of food, the air circulation in the refrigerator, the original temperature of the food, and the temperature of the refrigerator. The model that gives the temperature of food that has an original temperature of \( 75^\circ \text{F} \) and is placed in a \( 40^\circ \text{F} \) refrigerator is

\[
T = 10 \left( \frac{4t^2 + 16t + 75}{t^2 + 4t + 10} \right)
\]

where \( T \) is the temperature (in degrees Fahrenheit) and \( t \) is the time (in hours).
(a) Complete the table.

<table>

<tr>
<td>2007</td>
<td>45.0</td>
<td>29.1</td>
</tr>
</tbody>
</table>

Mathematical models for these data are

Number banking online \[= -0.728r^2 + 23.81t - 0.3 - 0.049r^2 + 0.61t + 1.0 \]
and

Number paying bills online \[= \frac{4.39t^2 + 5.5}{0.002r^2 + 0.01t + 1.0} \]

where \( t \) represents the year, with \( t = 2 \) corresponding to 2002.
(a) Using the models, create a table to estimate the projected numbers of households banking online and the projected numbers of households paying bills online for the given years.
(b) Compare the values given by the models with the actual data.
(c) Determine a model for the ratio of the projected number of households paying bills online to the projected number of households banking online.
(d) Use the model from part (c) to find the ratios for the given years. Interpret your results.

EXPLORATION

TRUE OR FALSE? In Exercises 103 and 104, determine whether the statement is true or false. Justify your answer.

103. \[\frac{x^{2n} - 1}{x^n - 1} = x^n + 1^n \]

104. \[\frac{x^2 - 3x + 2}{x - 1} = x - 2, \text{ for all values of } x \]

105. THINK ABOUT IT How do you determine whether a rational expression is in simplest form?

106. CAPSTONE In your own words, explain how to divide rational expressions.
### SOLVING EQUATIONS

#### Equations and Solutions of Equations

An **equation** in \( x \) is a statement that two algebraic expressions are equal. For example

\[
3x - 5 = 7, \quad x^2 - x - 6 = 0, \quad \sqrt{2x} = 4
\]

are equations. To **solve** an equation in \( x \) means to find all values of \( x \) for which the equation is true. Such values are **solutions**. For instance, \( x = 4 \) is a solution of the equation

\[
3x - 5 = 7
\]

because \( 3(4) - 5 = 7 \) is a true statement.

The solutions of an equation depend on the kinds of numbers being considered. For instance, in the set of rational numbers, \( x^2 = 10 \) has no solution because there is no rational number whose square is 10. However, in the set of real numbers, the equation has the two solutions \( x = \sqrt{10} \) and \( x = -\sqrt{10} \).

An equation that is true for *every* real number in the *domain* of the variable is called an **identity**. The domain is the set of all real numbers for which the equation is defined. For example

\[
x^2 - 9 = (x + 3)(x - 3)
\]

is an identity because it is a true statement for any real value of \( x \). The equation

\[
\frac{x}{3x^2} = \frac{1}{3x}
\]

is an identity because it is true for any nonzero real value of \( x \).

An equation that is true for just some (or even none) of the real numbers in the domain of the variable is called a **conditional equation**. For example, the equation

\[
x^2 - 9 = 0
\]

is conditional because \( x = 3 \) and \( x = -3 \) are the only values in the domain that satisfy the equation. The equation \( 2x - 4 = 2x + 1 \) is conditional because there are no real values of \( x \) for which the equation is true.

#### Linear Equations in One Variable

**Definition of a Linear Equation**

A linear equation in one variable \( x \) is an equation that can be written in the standard form

\[
ax + b = 0
\]

where \( a \) and \( b \) are real numbers with \( a \neq 0 \).
A linear equation in one variable, written in standard form, always has exactly one solution. To see this, consider the following steps.

\[ ax + b = 0 \]  \hspace{1cm} \text{Original equation, with } a \neq 0

\[ ax = -b \]  \hspace{1cm} \text{Subtract } b \text{ from each side.}

\[ x = -\frac{b}{a} \]  \hspace{1cm} \text{Divide each side by } a.

To solve a conditional equation in isolate on one side of the equation by a sequence of equivalent (and usually simpler) equations, each having the same solution(s) as the original equation. The operations that yield equivalent equations come from the Substitution Principle (see Appendix A.1) and simplification techniques.

### Generating Equivalent Equations

An equation can be transformed into an equivalent equation by one or more of the following steps.

1. Remove symbols of grouping, combine like terms, or simplify fractions on one or both sides of the equation.

<table>
<thead>
<tr>
<th>Given Equation</th>
<th>Equivalent Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2x - x = 4)</td>
<td>(x = 4)</td>
</tr>
</tbody>
</table>

2. Add (or subtract) the same quantity to (from) each side of the equation.

<table>
<thead>
<tr>
<th>Given Equation</th>
<th>Equivalent Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>(x + 1 = 6)</td>
<td>(x = 5)</td>
</tr>
</tbody>
</table>

3. Multiply (or divide) each side of the equation by the same nonzero quantity.

<table>
<thead>
<tr>
<th>Given Equation</th>
<th>Equivalent Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2x = 6)</td>
<td>(x = 3)</td>
</tr>
</tbody>
</table>

4. Interchange the two sides of the equation.

<table>
<thead>
<tr>
<th>Given Equation</th>
<th>Equivalent Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2 = x)</td>
<td>(x = 2)</td>
</tr>
</tbody>
</table>

### Example 1  Solving a Linear Equation

**a.** \(3x - 6 = 0\)  
Original equation

\[3x = 6\]  \hspace{1cm} \text{Add 6 to each side.}

\[x = 2\]  \hspace{1cm} \text{Divide each side by 3.}

**b.** \(5x + 4 = 3x - 8\)  
Original equation

\[2x + 4 = -8\]  \hspace{1cm} \text{Subtract } 3x \text{ from each side.}

\[2x = -12\]  \hspace{1cm} \text{Subtract 4 from each side.}

\[x = -6\]  \hspace{1cm} \text{Divide each side by 2.}

### Checkpoint

Now try Exercise 15.
To solve an equation involving fractional expressions, find the least common denominator (LCD) of all terms and multiply every term by the LCD. This process will clear the original equation of fractions and produce a simpler equation.

**Example 2**  
**An Equation Involving Fractional Expressions**

Solve \( \frac{x}{3} + \frac{3x}{4} = 2 \).

**Solution**

\[
\frac{x}{3} + \frac{3x}{4} = 2
\]

Write original equation.

\[
(12)\frac{x}{3} + (12)\frac{3x}{4} = (12)2
\]

Multiply each term by the LCD of 12.

\[
4x + 9x = 24
\]

Divide out and multiply.

\[
13x = 24
\]

Combine like terms.

\[
x = \frac{24}{13}
\]

Divide each side by 13.

The solution is \( x = \frac{24}{13} \). Check this in the original equation.  

Now try Exercise 23.

When multiplying or dividing an equation by a variable quantity, it is possible to introduce an extraneous solution. An **extraneous solution** is one that does not satisfy the original equation. Therefore, it is essential that you check your solutions.

**Example 3**  
**An Equation with an Extraneous Solution**

Solve \( \frac{1}{x - 2} = \frac{3}{x + 2} - \frac{6x}{x^2 - 4} \).

**Solution**

The LCD is \( x^2 - 4 \), or \( (x + 2)(x - 2) \). Multiply each term by this LCD.

\[
\frac{1}{x - 2}(x + 2)(x - 2) = \frac{3}{x + 2}(x + 2)(x - 2) - \frac{6x}{x^2 - 4}(x + 2)(x - 2)
\]

\[
x + 2 = 3(x - 2) - 6x, \quad x \neq \pm 2
\]

\[
x + 2 = 3x - 6 - 6x
\]

\[
x + 2 = -3x - 6
\]

\[
4x = -8 \quad \Rightarrow \quad x = -2 \quad \text{Extraneous solution}
\]

In the original equation, \( x = -2 \) yields a denominator of zero. So, \( x = -2 \) is an extraneous solution, and the original equation has no solution.

Now try Exercise 35.
**Quadratic Equations**

A **quadratic equation** in \( x \) is an equation that can be written in the general form

\[
ax^2 + bx + c = 0
\]

where \( a, b, \) and \( c \) are real numbers, with \( a \neq 0 \). A quadratic equation in \( x \) is also known as a **second-degree polynomial equation** in \( x \).

You should be familiar with the following four methods of solving quadratic equations.

---

**Solving a Quadratic Equation**

**Factoring:** If \( ab = 0 \), then \( a = 0 \) or \( b = 0 \).

*Example:*  
\[
x^2 - x - 6 = 0 \\
(x - 3)(x + 2) = 0
\]

\[
x - 3 = 0 \quad \Rightarrow \quad x = 3 \\
x + 2 = 0 \quad \Rightarrow \quad x = -2
\]

**Square Root Principle:** If \( u^2 = c \), where \( c > 0 \), then \( u = \pm \sqrt{c} \).

*Example:*  
\[
(x + 3)^2 = 16 \\
x + 3 = \pm 4
\]

\[
x = -3 \pm 4
\]

\[
x = 1 \quad \text{or} \quad x = -7
\]

**Completing the Square:** If \( x^2 + bx = c \), then

\[
x^2 + bx + \left(\frac{b}{2}\right)^2 = c + \left(\frac{b}{2}\right)^2
\]

\[
\left(x + \frac{b}{2}\right)^2 = c + \frac{b^2}{4}
\]

*Example:*  
\[
x^2 + 6x = 5
\]

\[
x^2 + 6x + 3^2 = 5 + 3^2
\]

\[
(x + 3)^2 = 14
\]

\[
x = -3 \pm \sqrt{14}
\]

**Quadratic Formula:** If \( ax^2 + bx + c = 0 \), then

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

*Example:*  
\[
2x^2 + 3x - 1 = 0
\]

\[
x = \frac{-3 \pm \sqrt{3^2 - 4(2)(-1)}}{2(2)}
\]

\[
x = \frac{-3 \pm \sqrt{17}}{4}
\]
Appendix A.5 Solving Equations

Example 4 Solving a Quadratic Equation by Factoring

a. \(2x^2 + 9x + 7 = 3\)
   \(2x^2 + 9x + 4 = 0\)
   \((2x + 1)(x + 4) = 0\)
   \(2x + 1 = 0 \quad x = -\frac{1}{2}\)\]
   \(x + 4 = 0 \quad x = -4\)\]
   The solutions are \(x = -\frac{1}{2}\) and \(x = -4\). Check these in the original equation.

b. \(6x^2 - 3x = 0\)
   \(3x(2x - 1) = 0\)
   \(3x = 0 \quad x = 0\)
   \(2x - 1 = 0 \quad x = \frac{1}{2}\)
   The solutions are \(x = 0\) and \(x = \frac{1}{2}\). Check these in the original equation.

Now try Exercise 49.

Note that the method of solution in Example 4 is based on the Zero-Factor Property from Appendix A.1. Be sure you see that this property works only for equations written in general form (in which the right side of the equation is zero). So, all terms must be collected on one side before factoring. For instance, in the equation \((x - 5)(x + 2) = 8\), it is incorrect to set each factor equal to 8. Try to solve this equation correctly.

Example 5 Extracting Square Roots

Solve each equation by extracting square roots.

a. \(4x^2 = 12\)  
   b. \((x - 3)^2 = 7\)

Solution

a. \(4x^2 = 12\)
   \(x^2 = 3\)
   \(x = \pm \sqrt{3}\)
   When you take the square root of a variable expression, you must account for both positive and negative solutions. So, the solutions are \(x = \sqrt{3}\) and \(x = -\sqrt{3}\). Check these in the original equation.

b. \((x - 3)^2 = 7\)
   \(x - 3 = \pm \sqrt{7}\)
   \(x = 3 \pm \sqrt{7}\)
   The solutions are \(x = 3 \pm \sqrt{7}\). Check these in the original equation.

Now try Exercise 65.
When solving quadratic equations by completing the square, you must add \((b/2)^2\) to each side in order to maintain equality. If the leading coefficient is not 1, you must divide each side of the equation by the leading coefficient before completing the square, as shown in Example 7.

### Example 6  Completing the Square: Leading Coefficient Is 1

Solve \(x^2 + 2x - 6 = 0\) by completing the square.

**Solution**

\[
\begin{align*}
  x^2 + 2x - 6 &= 0 & \text{Write original equation.} \\
  x^2 + 2x &= 6 & \text{Add 6 to each side.} \\
  x^2 + 2x + 1^2 &= 6 + 1^2 & \text{Add 1}^2\text{ to each side.} \\
  (x + 1)^2 &= 7 & \text{Simplify.} \\
  x + 1 &= \pm \sqrt{7} & \text{Take square root of each side.} \\
  x &= -1 \pm \sqrt{7} & \text{Subtract 1 from each side.}
\end{align*}
\]

The solutions are \(x = -1 \pm \sqrt{7}\). Check these in the original equation.

**CHECKPOINT**  Now try Exercise 73.

### Example 7  Completing the Square: Leading Coefficient Is Not 1

\[
\begin{align*}
  3x^2 - 4x - 5 &= 0 & \text{Original equation} \\
  3x^2 - 4x &= 5 & \text{Add 5 to each side.} \\
  x^2 - \frac{4}{3}x &= \frac{5}{3} & \text{Divide each side by 3.} \\
  x^2 - \frac{4}{3}x + \left(-\frac{2}{3}\right)^2 &= \frac{5}{3} + \left(-\frac{2}{3}\right)^2 & \text{Add } \left(-\frac{2}{3}\right)^2 \text{ to each side.} \\
  \left(x - \frac{2}{3}\right)^2 &= \frac{19}{9} & \text{Simplify.} \\
  \left(x - \frac{2}{3}\right) &= \pm \frac{\sqrt{19}}{3} & \text{Perfect square trinomial} \\
  x &= \frac{2}{3} \pm \frac{\sqrt{19}}{3} & \text{Extract square roots.} \\
  x &= \frac{2}{3} \pm \frac{\sqrt{19}}{3} & \text{Solutions}
\end{align*}
\]

**CHECKPOINT**  Now try Exercise 77.
The Quadratic Formula: Two Distinct Solutions

Use the Quadratic Formula to solve \( x^2 + 3x = 9 \).

**Solution**

\[
x^2 + 3x = 9
\]

\[
x + 3x - 9 = 0
\]

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

Write original equation.
Write in general form.

\[
x = \frac{-3 \pm \sqrt{(3)^2 - 4(1)(-9)}}{2(1)}
\]

Quadratic Formula
Substitute \( a = 1 \), \( b = 3 \), and \( c = -9 \).

\[
x = \frac{-3 \pm \sqrt{45}}{2}
\]

Simplify.

\[
x = \frac{-3 \pm 3\sqrt{5}}{2}
\]

Simplify.

The equation has two solutions:

\[
x = \frac{-3 + 3\sqrt{5}}{2} \quad \text{and} \quad x = \frac{-3 - 3\sqrt{5}}{2}
\]

Check these in the original equation.

Now try Exercise 87.

**Example 9** The Quadratic Formula: One Solution

Use the Quadratic Formula to solve \( 8x^2 - 24x + 18 = 0 \).

**Solution**

\[
8x^2 - 24x + 18 = 0
\]

\[
4x^2 - 12x + 9 = 0
\]

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

Write original equation.
Divide out common factor of 2.

\[
x = \frac{-(-12) \pm \sqrt{(-12)^2 - 4(4)(9)}}{2(4)}
\]

Quadratic Formula
Substitute \( a = 4 \), \( b = -12 \), and \( c = 9 \).

\[
x = \frac{12 \pm \sqrt{0}}{8} = \frac{3}{2}
\]

Simplify.

This quadratic equation has only one solution: \( x = \frac{3}{2} \). Check this in the original equation.

Now try Exercise 91.

Note that Example 9 could have been solved without first dividing out a common factor of 2. Substituting \( a = 8 \), \( b = -24 \), and \( c = 18 \) into the Quadratic Formula produces the same result.
Polynomial Equations of Higher Degree

The methods used to solve quadratic equations can sometimes be extended to solve polynomial equations of higher degree.

**Example 10  Solving a Polynomial Equation by Factoring**

Solve $3x^4 = 48x^2$.

**Solution**

First write the polynomial equation in general form with zero on one side, factor the other side, and then set each factor equal to zero and solve.

\[
\begin{align*}
3x^4 &= 48x^2 \\
3x^4 - 48x^2 &= 0 \\
3x^2(x^2 - 16) &= 0 \\
x^2 - 4 &= 0, x = 0, x = 4
\end{align*}
\]

You can check these solutions by substituting in the original equation, as follows.

**Check**

\[
\begin{align*}
3(0)^4 &= 48(0)^2 & 0 \text{ checks.} \\
3(-4)^4 &= 48(-4)^2 & -4 \text{ checks.} \\
3(4)^4 &= 48(4)^2 & 4 \text{ checks.}
\end{align*}
\]

So, you can conclude that the solutions are $x = 0$, $x = -4$, and $x = 4$.

**Example 11  Solving a Polynomial Equation by Factoring**

Solve $x^3 - 3x^2 - 3x + 9 = 0$.

**Solution**

\[
\begin{align*}
x^3 - 3x^2 - 3x + 9 &= 0 \\
x^2(x - 3) - 3(x - 3) &= 0 \\
(x - 3)(x^2 - 3) &= 0 \\
x - 3 &= 0, x = 3 \\
x^2 - 3 &= 0, x = \pm \sqrt{3}
\end{align*}
\]

The solutions are $x = 3$, $x = \sqrt{3}$, and $x = -\sqrt{3}$. Check these in the original equation.

**CHECK POINT** Now try Exercise 119.
Equations Involving Radicals

Operations such as squaring each side of an equation, raising each side of an equation to a rational power, and multiplying each side of an equation by a variable quantity all can introduce extraneous solutions. So, when you use any of these operations, checking your solutions is crucial.

**Example 12** Solving Equations Involving Radicals

a. \(\sqrt{2x + 7} - x = 2\)

Original equation

\[\sqrt{2x + 7} = x + 2\]

Isolate radical.

\[2x + 7 = x^2 + 4x + 4\]

Square each side.

\[0 = x^2 + 2x - 3\]

Write in general form.

\[0 = (x + 3)(x - 1)\]

Factor.

\[x + 3 = 0 \quad \Rightarrow \quad x = -3\]

Set 1st factor equal to 0.

\[x - 1 = 0 \quad \Rightarrow \quad x = 1\]

Set 2nd factor equal to 0.

By checking these values, you can determine that the only solution is \(x = 1\).

b. \(\sqrt{2x - 5} - \sqrt{x - 3} = 1\)

Original equation

Isolate \(\sqrt{2x - 5}\).

\[2x - 5 = x - 3 + 2\sqrt{x - 3} + 1\]

Square each side.

\[2x - 5 = x - 2 + 2\sqrt{x - 3}\]

Combine like terms.

\[x - 3 = 2\sqrt{x - 3}\]

Isolate \(2\sqrt{x - 3}\).

\[x^2 - 6x + 9 = 4(x - 3)\]

Square each side.

\[x^2 - 10x + 21 = 0\]

Write in general form.

\[(x - 3)(x - 7) = 0\]

Factor.

\[x - 3 = 0 \quad \Rightarrow \quad x = 3\]

Set 1st factor equal to 0.

\[x - 7 = 0 \quad \Rightarrow \quad x = 7\]

Set 2nd factor equal to 0.

The solutions are \(x = 3\) and \(x = 7\). Check these in the original equation.

**Check Point** Now try Exercise 129.

**Example 13** Solving an Equation Involving a Rational Exponent

\((x - 4)^{2/3} = 25\)

Original equation

Rewrite in radical form.

\(\sqrt[3]{(x - 4)^2} = 25\)

Cube each side.

\((x - 4)^2 = 15,625\)

Take square root of each side.

\(x - 4 = \pm 125\)

Add 4 to each side.

\(x = 129, x = -121\)

**Check Point** Now try Exercise 137.
Equations with Absolute Values

To solve an equation involving an absolute value, remember that the expression inside the absolute value signs can be positive or negative. This results in two separate equations, each of which must be solved. For instance, the equation

$$|x - 2| = 3$$

results in the two equations $x - 2 = 3$ and $-(x - 2) = 3$, which implies that the equation has two solutions: $x = 5$ and $x = -1$.

Example 14  Solving an Equation Involving Absolute Value

Solve $|x^2 - 3x| = -4x + 6$.

Solution

Because the variable expression inside the absolute value signs can be positive or negative, you must solve the following two equations.

First Equation

$$x^2 - 3x = -4x + 6$$  Use positive expression.
$$x^2 + x - 6 = 0$$  Write in general form.
$$(x + 3)(x - 2) = 0$$  Factor.

$$x + 3 = 0 \quad \Rightarrow \quad x = -3$$  Set 1st factor equal to 0.
$$x - 2 = 0 \quad \Rightarrow \quad x = 2$$  Set 2nd factor equal to 0.

Second Equation

$$-(x^2 - 3x) = -4x + 6$$  Use negative expression.
$$x^2 - 7x + 6 = 0$$  Write in general form.
$$(x - 1)(x - 6) = 0$$  Factor.

$$x - 1 = 0 \quad \Rightarrow \quad x = 1$$  Set 1st factor equal to 0.
$$x - 6 = 0 \quad \Rightarrow \quad x = 6$$  Set 2nd factor equal to 0.

Check

$$\begin{align*}
|(-3)^2 - 3(-3)| & \equiv -4(-3) + 6 \\
18 & = 18 \quad \text{Substitute } -3 	ext{ for } x. \\
|2^2 - 3(2)| & \equiv -4(2) + 6 \\
2 & \neq -2 \quad \text{Substitute 2 for } x. \\
|(1)^2 - 3(1)| & \equiv -4(1) + 6 \\
2 & = 2 \quad \text{1 checks. } \checkmark \\
|(-6)^2 - 3(-6)| & \equiv -4(6) + 6 \\
18 & \neq -18 \quad \text{Substitute 6 for } x. \\
\end{align*}$$

The solutions are $x = -3$ and $x = 1$.

Now try Exercise 151.
Common Formulas

The following geometric formulas are used at various times throughout this course. For your convenience, some of these formulas along with several others are also provided on the inside cover of this text.

### Common Formulas for Area $A$, Perimeter $P$, Circumference $C$, and Volume $V$

<table>
<thead>

</table>

![Diagram showing formulas for area, perimeter, circumference, and volume of various shapes.]

**Example 15** Using a Geometric Formula

A cylindrical can has a volume of 200 cubic centimeters ($\text{cm}^3$) and a radius of 4 centimeters ($\text{cm}$), as shown in Figure A.13. Find the height of the can.

**Solution**

The formula for the *volume of a cylinder* is $V = \pi r^2h$. To find the height of the can, solve for $h$.

$$h = \frac{V}{\pi r^2}$$

Then, using $V = 200$ and $r = 4$, find the height.

$$h = \frac{200}{\pi (4)^2} \quad \text{Substitute 200 for $V$ and 4 for $r$.}$$

$$= \frac{200}{16\pi} \quad \text{Simplify denominator.}$$

$$\approx 3.98 \quad \text{Use a calculator.}$$

Because the value of $h$ was rounded in the solution, a check of the solution will not result in an equality. If the solution is valid, the expressions on each side of the equal sign will be approximately equal to each other.

$$V = \pi r^2 h \quad \text{Write original equation.}$$

$$200 \approx \pi (4)^2 (3.98) \quad \text{Substitute 200 for $V$, 4 for $r$, and 3.98 for $h$.}$$

$$200 \approx 200.06 \quad \text{Solution checks. ✓}$$

You can also use unit analysis to check that your answer is reasonable.

$$\frac{200 \text{ cm}^3}{16\pi \text{ cm}^2} \approx 3.98 \text{ cm}$$

**Checkpoint** Now try Exercise 157.
Appendix A  Review of Fundamental Concepts of Algebra

A.5  EXERCISES

VOCABULARY: Fill in the blanks.
1. A(n) ________ is a statement that equates two algebraic expressions.
2. A linear equation in one variable is an equation that can be written in the standard form ________.
3. When solving an equation, it is possible to introduce an ________ solution, which is a value that does not satisfy the original equation.
4. The four methods that can be used to solve a quadratic equation are ________, ________, ________, and the ________.

SKILLS AND APPLICATIONS

In Exercises 5–12, determine whether the equation is an identity or a conditional equation.
5. 4(x + 1) = 4x + 4
6. 2(x - 3) = 7x - 1
7. -6(x - 3) + 5 = -2x + 10
8. 3(x + 2) - 5 = 3x + 1
9. 4(x + 1) - 2x = 2(x + 2)
10. x^2 + 2(3x - 2) = x^2 + 6x - 4
11. \( \frac{3 + 1}{x + 1} = \frac{4x}{x + 1} \)
12. \( \frac{5}{x + 3} = 24 \)

In Exercises 13–26, solve the equation and check your solution.
13. x + 11 = 15
14. 7 - x = 9
15. 7 = 2x = 25
16. 7x + 2 = 23
17. 8x - 5 = 3x + 20
18. 7x + 3 = 3x - 17
19. 4y + 2 - 5y = 7 - 6y
20. 3(x + 3) = 5(1 - x) - 1
21. x - 3(2x + 3) = 8 - 5x
22. 9x - 10 = 5x + 2(2x - 5)
23. \( \frac{3x - 4x}{8} = \frac{4}{3} \)
24. \( \frac{x}{5} - \frac{x}{2} = 3 + \frac{3x}{10} \)
25. \( \frac{2(x + 5)}{x + 24} = 0 \)
26. \( 0.60x + 0.40(100 - x) = 50 \)

In Exercises 27–42, solve the equation and check your solution. (If not possible, explain why.)
27. x + 8 = 2(x - 2) - x
28. 8(x + 2) - 3(2x + 1) = 2(x + 5)
29. \( \frac{100 - 4x}{1} = \frac{5x + 6}{4} + 6 \)
30. \( \frac{17 + y}{1} + \frac{32 + y}{y} = 100 \)
31. \( \frac{5x - 4}{5x + 4} = \frac{2}{3} \)
32. \( \frac{15}{x} - 4 = \frac{6}{x} + 3 \)
33. \( 3 = 2 + \frac{2}{x + 2} \)
34. \( \frac{1}{x} + \frac{2}{x - 5} = 0 \)
35. \( \frac{x}{x + 4} + \frac{4}{x + 4} + 2 = 0 \)
36. \( \frac{7}{2x + 1} - \frac{8x}{2x - 1} = -4 \)
37. \( \frac{2}{(x - 4)(x - 2)} = \frac{1}{x - 4} + \frac{2}{x - 2} \)
38. \( \frac{1}{x - 2} + \frac{3}{x + 3} = \frac{4}{x^2 + x - 6} \)
39. \( \frac{3}{x^2 - 3x} + \frac{4}{x} = \frac{1}{x - 3} \)
40. \( \frac{6}{x} - \frac{2}{x + 3} = \frac{3(x + 5)}{x^2 + 3x} \)
41. \( (x + 2)^2 + 5 = (x + 3)^2 \)
42. \( (2x + 1)^2 = 4(x^2 + x + 1) \)

In Exercises 43–46, write the quadratic equation in general form.
43. \( 2x^2 = 3 - 8x \)
44. \( 13 - 3(x + 7)^2 = 0 \)
45. \( \frac{1}{3}(3x^2 - 10) = 18x \)
46. \( x(x + 2) = 5x^2 + 1 \)

In Exercises 47–58, solve the quadratic equation by factoring.
47. \( 6x^2 + 3x = 0 \)
48. \( 9x^2 - 4 = 0 \)
49. \( x^2 - 2x - 8 = 0 \)
50. \( x^2 - 10x + 9 = 0 \)
51. \( x^2 - 12x + 35 = 0 \)
52. \( 4x^2 + 12x + 9 = 0 \)
53. \( 3 + 5x - 2x^2 = 0 \)
54. \( 2x^2 = 9x + 33 \)
55. \( x^2 + 4x = 12 \)
56. \( \frac{1}{3}x^2 - x - 16 = 0 \)
57. \( x^2 + 2ax + a^2 = 0, a is a real number \)
58. \( (x + a)^2 - b^2 = 0, a and b are real numbers \)

In Exercises 59–70, solve the equation by extracting square roots.
59. \( x^2 = 49 \)
60. \( x^2 = 32 \)
61. \( 3x^2 = 81 \)
62. \( 9x^2 = 36 \)
63. \( (x - 12)^2 = 16 \)
64. \( (x + 13)^2 = 25 \)
65. \( (x + 2)^2 = 14 \)
66. \( (x - 5)^2 = 30 \)
67. \( (2x - 1)^2 = 18 \)
68. \( (2x + 3)^2 - 27 = 0 \)
69. \( (x - 7)^2 = (x + 3)^2 \)
70. \( (x + 5)^2 = (x + 4)^2 \)
In Exercises 71–80, solve the quadratic equation by completing the square.

71. \(x^2 + 4x - 32 = 0\)  
72. \(x^2 + 6x + 2 = 0\)
73. \(x^2 - 12x + 25 = 0\)  
74. \(x^2 - 8x + 14 = 0\)
75. \(8 + 4x - x^2 = 0\)  
76. \(9x^2 - 12x = 14\)
77. \(2x^2 + 5x - 8 = 0\)  
78. \(4x^2 - 4x - 99 = 0\)
79. \(5x^2 - 15x + 7 = 0\)  
80. \(3x^2 + 9x + 5 = 0\)

In Exercises 81–98, use the Quadratic Formula to solve the equation.

81. \(2x^2 + x - 1 = 0\)  
82. \(25x^2 - 20x + 3 = 0\)
83. \(2 + 2x - x^2 = 0\)  
84. \(x^2 - 10x + 22 = 0\)
85. \(x^2 + 14x + 44 = 0\)  
86. \(6x = 4 - x^2\)
87. \(x^2 + 8x - 4 = 0\)  
88. \(4x^2 - 4x - 4 = 0\)
89. \(12x - 9x^2 = -3\)  
90. \(16x^2 + 22 = 40x\)
91. \(9x^2 + 24x + 16 = 0\)  
92. \(16x^2 - 40x + 5 = 0\)
93. \(28x - 49x^2 = 4\)  
94. \(3x + x^2 - 1 = 0\)
95. \(8r = 5 + 2r^2\)  
96. \(25b^2 + 80b + 61 = 0\)
97. \((y - 5)^2 = 2y\)  
98. \((\frac{3}{4}x - 14)^2 = 8x\)

In Exercises 99–104, use the Quadratic Formula to solve the equation. (Round your answer to three decimal places.)

99. \(0.1x^2 + 0.2x - 0.5 = 0\)
100. \(2x^2 - 2.50x - 0.42 = 0\)
101. \(-0.067x^2 - 0.852x + 1.277 = 0\)
102. \(-0.005x^2 + 0.101x - 0.193 = 0\)
103. \(422x^2 - 506x - 347 = 0\)
104. \(-3.22x^2 - 0.08x + 28.651 = 0\)

In Exercises 105–112, solve the equation using any convenient method.

105. \(x^2 - 2x - 1 = 0\)  
106. \(11x^2 + 33x = 0\)
107. \((x + 3)^2 = 81\)  
108. \(x^2 - 14x + 49 = 0\)
109. \(x^2 - x - \frac{11}{4} = 0\)  
110. \(3x + 4 = 2x^2 - 7\)
111. \(4x^2 + 2x + 4 = 2x + 8\)
112. \(a^2x^2 - b^2 = 0, a \text{ and } b \text{ are real numbers, } a \neq 0\)

In Exercises 113–126, find all real solutions of the equation. Check your solutions in the original equation.

113. \(2x^4 - 50x^2 = 0\)  
114. \(20x^3 - 125x = 0\)
115. \(x^4 - 81 = 0\)  
116. \(x^6 - 64 = 0\)
117. \(x^3 + 216 = 0\)  
118. \(9x^4 - 24x^3 + 16x^2 = 0\)
119. \(x^3 - 3x^2 - x + 3 = 0\)  
120. \(x^3 + 2x^2 + 3x + 6 = 0\)
121. \(x^4 + x = x^3 + 1\)
122. \(x^4 - 2x^3 = 16 + 8x - 4x^3\)
123. \(x^4 - 4x^2 + 3 = 0\)  
124. \(36x^4 + 29x^2 - 7 = 0\)
125. \(x^6 + 7x^3 - 8 = 0\)  
126. \(x^6 + 3x^4 + 2 = 0\)

In Exercises 127–154, find all solutions of the equation. Check your solutions in the original equation.

127. \(\sqrt{2x} - 10 = 0\)  
128. \(7\sqrt{x} - 6 = 0\)
129. \(\sqrt{x} - 10 - 4 = 0\)  
130. \(\sqrt{5} - x - 3 = 0\)
131. \(\sqrt{2x} + 5 + 3 = 0\)  
132. \(\sqrt{3} - 2x - 2 = 0\)
133. \(\sqrt{2x} + 1 + 8 = 0\)  
134. \(\sqrt{4} - x - 3 + 2 = 0\)
135. \(\sqrt{5x} - 26 + 4 = x\)  
136. \(\frac{x + 5}{x} = \sqrt{2x - 5}\)
137. \((x - 6)^{3/2} = 8\)  
138. \((x + 3)^{3/2} = 8\)
139. \((x + 3)^{3/2} = 5\)  
140. \((x^2 - x - 22)^{3/2} = 16\)
141. \(3x(x - 1)^{1/2} + 2(x - 1)^{3/2} = 0\)
142. \(4x^2(x - 1)^{1/2} + 6x(x - 1)^{3/2} = 0\)
143. \(x = \frac{3}{x} + \frac{1}{2}\)
144. \(\frac{4}{x + 1} - \frac{3}{x + 2} = 1\)
145. \(\frac{20 - x}{x} = x\)
146. \(4x + 1 = \frac{3}{x}\)
147. \(\frac{x}{x^2 - 4} + \frac{1}{x + 2} = 3\)
148. \(\frac{x + 1}{3} - \frac{x + 1}{x + 2} = 0\)
149. \(|2x - 1| = 5\)
150. \(|13x + 1| = 12\)
151. \(|x| = x^2 + x - 3\)
152. \(|x^2 + 6x| = 3x + 18\)
153. \(|x + 1| = x^2 - 5\)
154. \(|x - 10| = x^2 - 10x\)

**Anthropology** In Exercises 155 and 156, use the following information. The relationship between the length of an adult’s femur (thigh bone) and the height of the adult can be approximated by the linear equations.

\[ y = 0.432x - 10.44 \quad \text{Female} \]
\[ y = 0.449x - 12.15 \quad \text{Male} \]

where \(y\) is the length of the femur in inches and \(x\) is the height of the adult in inches (see figure).

![Diagram of a human skeleton showing femur length](image)
156. From the foot bones of an adult human male, an anthropologist estimates that the person’s height was 69 inches. A few feet away from the site where the foot bones were discovered, the anthropologist discovers a male adult femur that is 19 inches long. Is it likely that both the foot bones and the thigh bone came from the same person?

157. VOLUME OF A BILLIARD BALL A billiard ball has a volume of 5.96 cubic inches. Find the radius of a billiard ball.

158. LENGTH OF A TANK The diameter of a cylindrical propane gas tank is 4 feet. The total volume of the tank is 603.2 cubic feet. Find the length of the tank.

159. GEOMETRY A “Slow Moving Vehicle” sign has the shape of an equilateral triangle. The sign has a perimeter of 129 centimeters. Find the length of each side of the sign. Find the area of the sign.

160. GEOMETRY The radius of a traffic cone is 14 centimeters and the lateral surface area of the cone is 1617 square centimeters. Find the height of the cone.

161. VOTING POPULATION The total voting-age population \( P \) (in millions) in the United States from 1990 through 2006 can be modeled by

\[
P = \frac{182.17 - 1.542t}{1 - 0.018t}, \quad 0 \leq t \leq 16
\]

where \( t \) represents the year, with \( t = 0 \) corresponding to 1990. (Source: U.S. Census Bureau)

(a) In which year did the total voting-age population reach 200 million?

(b) Use the model to predict the year in which the total voting-age population will reach 241 million. Is this prediction reasonable? Explain.

162. AIRLINE PASSENGERS An airline offers daily flights between Chicago and Denver. The total monthly cost \( C \) (in millions of dollars) of these flights is

\[
C = \sqrt{0.2x + 1}, \quad x \text{ is the number of passengers (in thousands).}
\]

The total cost of the flights for June is 2.5 million dollars. How many passengers flew in June?

163. An equation can never have more than one extraneous solution.

164. When solving an absolute value equation, you will always have to check more than one solution.

165. THINK ABOUT IT What is meant by equivalent equations? Give an example of two equivalent equations.

166. Solve \( 3(x + 4)^2 + (x + 4) - 2 = 0 \) in two ways.

(a) Let \( u = x + 4 \), and solve the resulting equation for \( u \). Then solve the \( u \)-solution for \( x \).

(b) Expand and collect like terms in the equation, and solve the resulting equation for \( x \).

(c) Which method is easier? Explain.

THINK ABOUT IT In Exercises 167–170, write a quadratic equation that has the given solutions. (There are many correct answers.)

167. \(-3\) and 6

168. \(-4\) and \(-11\)

169. \(1 + \sqrt{2}\) and \(1 - \sqrt{2}\)

170. \(-3 + \sqrt{3}\) and \(-3 - \sqrt{3}\)

In Exercises 171 and 172, consider an equation of the form \( x + |x - a| = b \), where \( a \) and \( b \) are constants.

171. Find \( a \) and \( b \) when the solution of the equation is \( x = 9 \). (There are many correct answers.)

172. WRITING Write a short paragraph listing the steps required to solve this equation involving absolute values, and explain why it is important to check your solutions.

In Exercises 173 and 174, consider an equation of the form \( x + \sqrt{x - a} = b \), where \( a \) and \( b \) are constants.

173. Find \( a \) and \( b \) when the solution of the equation is \( x = 20 \). (There are many correct answers.)

174. WRITING Write a short paragraph listing the steps required to solve this equation involving radicals, and explain why it is important to check your solutions.

175. Solve each equation, given that \( a \) and \( b \) are not zero.

(a) \( ax^2 + bx = 0 \)

(b) \( ax^2 - ax = 0 \)

176. CAPSTONE

(a) Explain the difference between a conditional equation and an identity.

(b) Give an example of an absolute value equation that has only one solution.

(c) State the Quadratic Formula in words.

(d) Does raising each side of an equation to the \( n \)th power always yield an equivalent equation? Explain.
Introduction
Simple inequalities were discussed in Appendix A.1. There, you used the inequality symbols $\leq$, $\geq$ to compare two numbers and to denote subsets of real numbers. For instance, the simple inequality

$x \geq 3$

denotes all real numbers $x$ that are greater than or equal to 3.

Now, you will expand your work with inequalities to include more involved statements such as

$5x - 7 < 3x + 9$

and

$-3 \leq 6x - 1 < 3$.

As with an equation, you solve an inequality in the variable $x$ by finding all values of $x$ for which the inequality is true. Such values are solutions and are said to satisfy the inequality. The set of all real numbers that are solutions of an inequality is the solution set of the inequality. For instance, the solution set of

$x + 1 < 4$

is all real numbers that are less than 3.

The set of all points on the real number line that represents the solution set is the graph of the inequality. Graphs of many types of inequalities consist of intervals on the real number line. See Appendix A.1 to review the nine basic types of intervals on the real number line. Note that each type of interval can be classified as bounded or unbounded.

Example 1  Intervals and Inequalities

Write an inequality to represent each interval, and state whether the interval is bounded or unbounded.

a. $(-3, 5]$

b. $(-3, \infty)$

c. $[0, 2]$

d. $(-\infty, \infty)$

Solution

a. $(-3, 5]$ corresponds to $-3 < x \leq 5$.  Bounded

b. $(-3, \infty)$ corresponds to $-3 < x$.  Unbounded

c. $[0, 2]$ corresponds to $0 \leq x \leq 2$.  Bounded

d. $(-\infty, \infty)$ corresponds to $-\infty < x < \infty$.  Unbounded

CHECK POINT  Now try Exercise 9.
Properties of Inequalities

The procedures for solving linear inequalities in one variable are much like those for solving linear equations. To isolate the variable, you can make use of the Properties of Inequalities. These properties are similar to the properties of equality, but there are two important exceptions. When each side of an inequality is multiplied or divided by a negative number, the direction of the inequality symbol must be reversed. Here is an example.

\[-2 < 5\]  
\[-3(-2) > (\cdot 3)(5)\]  
\[6 > -15\]

Multiply each side by \(-3\) and reverse inequality. Simplify.

Notice that if the inequality was not reversed, you would obtain the false statement \(6 < -15\).

Two inequalities that have the same solution set are equivalent. For instance, the inequalities

\[x + 2 < 5\]
and

\[x < 3\]

are equivalent. To obtain the second inequality from the first, you can subtract 2 from each side of the inequality. The following list describes the operations that can be used to create equivalent inequalities.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Transitive Property</td>
<td>(a &lt; b) and (b &lt; c) (\Rightarrow) (a &lt; c)</td>
</tr>
<tr>
<td>2. Addition of Inequalities</td>
<td>(a &lt; b) and (c &lt; d) (\Rightarrow) (a + c &lt; b + d)</td>
</tr>
<tr>
<td>3. Addition of a Constant</td>
<td>(a &lt; b) (\Rightarrow) (a + c &lt; b + c)</td>
</tr>
</tbody>
</table>
| 4. Multiplication by a Constant | For \(c > 0\), \(a < b\) \(\Rightarrow\) \(ac < bc\)  
For \(c < 0\), \(a < b\) \(\Rightarrow\) \(ac > bc\)  
Reverse the inequality. |

Each of the properties above is true if the symbol \(<\) is replaced by \(\leq\) and the symbol \(>\) is replaced by \(\geq\). For instance, another form of the multiplication property would be as follows.

\[c > 0, a \leq b \Rightarrow ac \leq bc\]
\[c < 0, a \leq b \Rightarrow ac \geq bc\]
Appendix A.6 Linear Inequalities in One Variable

Solving a Linear Inequality in One Variable

The simplest type of inequality is a linear inequality in one variable. For instance, \(2x + 3 > 4\) is a linear inequality in \(x\).

In the following examples, pay special attention to the steps in which the inequality symbol is reversed. Remember that when you multiply or divide by a negative number, you must reverse the inequality symbol.

**Example 2** Solving a Linear Inequality

Solve \(5x - 7 > 3x + 9\).

**Solution**

1. Write original inequality: \(5x - 7 > 3x + 9\)
2. Subtract 3\(x\) from each side: \(2x - 7 > 9\)
3. Add 7 to each side: \(2x > 16\)
4. Divide each side by 2: \(x > 8\)

The solution set is all real numbers that are greater than 8, which is denoted by \((8, \infty)\). The graph of this solution set is shown in Figure A.14. Note that a parenthesis at 8 on the real number line indicates that 8 is not part of the solution set.

**Graphical Solution**

Use a graphing utility to graph \(y_1 = 1 - \frac{3}{2}x\) and \(y_2 = x - 4\) in the same viewing window. In Figure A.16, you can see that the graphs appear to intersect at the point \((2, -2)\). Use the intersect feature of the graphing utility to confirm this. The graph of \(y_1\) lies above the graph of \(y_2\) to the left of their point of intersection, which implies that \(y_1 \geq y_2\) for all \(x \leq 2\).

**Example 3** Solving a Linear Inequality

Solve \(1 - \frac{3}{2}x \geq x - 4\).

**Algebraic Solution**

1. Write original inequality: \(1 - \frac{3}{2}x \geq x - 4\)
2. Multiply each side by 2: \(2 - 3x \geq 2x - 8\)
3. Subtract 2\(x\) from each side: \(2 - 5x \geq -8\)
4. Subtract 2 from each side: \(-5x \geq -10\)
5. Divide each side by \(-5\) and reverse the inequality: \(x \leq 2\)

The solution set is all real numbers that are less than or equal to 2, which is denoted by \((-\infty, 2]\). The graph of this solution set is shown in Figure A.15. Note that a bracket at 2 on the real number line indicates that 2 is part of the solution set.

**Graphical Solution**

Use a graphing utility to graph \(y_1 = 1 - \frac{3}{2}x\) and \(y_2 = x - 4\) in the same viewing window. In Figure A.16, you can see that the graphs appear to intersect at the point \((2, -2)\). Use the intersect feature of the graphing utility to confirm this. The graph of \(y_1\) lies above the graph of \(y_2\) to the left of their point of intersection, which implies that \(y_1 \geq y_2\) for all \(x \leq 2\).
Sometimes it is possible to write two inequalities as a double inequality. For instance, you can write the two inequalities \(-4 \leq 5x - 2\) and \(5x - 2 < 7\) more simply as
\[
-4 \leq 5x - 2 < 7.
\]
This form allows you to solve the two inequalities together, as demonstrated in Example 4.

**Example 4  Solving a Double Inequality**

To solve a double inequality, you can isolate \(x\) as the middle term.

\[
\begin{align*}
-3 & \leq 6x - 1 < 3 & \text{Original inequality} \\
-3 + 1 & \leq 6x - 1 + 1 < 3 + 1 & \text{Add 1 to each part.} \\
-2 & \leq 6x < 4 & \text{Simplify.} \\
\frac{-2}{6} & \leq \frac{6x}{6} < \frac{4}{6} & \text{Divide each part by 6.} \\
-\frac{1}{3} & \leq x < \frac{2}{3} & \text{Simplify.}
\end{align*}
\]

The solution set is all real numbers that are greater than or equal to \(-\frac{1}{3}\) and less than \(\frac{2}{3}\), which is denoted by \([-\frac{1}{3}, \frac{2}{3})\). The graph of this solution set is shown in Figure A.17.

![Solution interval: \([-\frac{1}{3}, \frac{2}{3})\)](image)

**CHECK Point** Now try Exercise 47.

The double inequality in Example 4 could have been solved in two parts, as follows.

\[
\begin{align*}
-3 & \leq 6x - 1 \quad \text{and} \quad 6x - 1 < 3 \\
-2 & \leq 6x \\
-\frac{1}{3} & \leq x
\end{align*}
\]

The solution set consists of all real numbers that satisfy both inequalities. In other words, the solution set is the set of all values of \(x\) for which
\[
-\frac{1}{3} \leq x < \frac{2}{3}.
\]

When combining two inequalities to form a double inequality, be sure that the inequalities satisfy the Transitive Property. For instance, it is incorrect to combine the inequalities \(3 < x\) and \(x \leq -1\) as \(3 < x \leq -1\). This “inequality” is wrong because 3 is not less than –1.
A graphing utility can be used to identify the solution set of the graph of an inequality. For instance, to find the solution set of $|x - 5| < 2$ (see Example 5a), rewrite the inequality as $|x - 5| - 2 < 0$, enter

$Y1 = \text{abs}(X - 5) - 2$

and press the graph key. The graph should look like the one shown below.

Notice that the graph is below the x-axis on the interval $(3, 7)$.

**Example 5**  
**Solving an Absolute Value Inequality**

Solve each inequality.

**a.** $|x - 5| < 2$  
**b.** $|x + 3| \geq 7$

**Solution**

**a.** $|x - 5| < 2$

Write original inequality.

$-2 < x - 5 < 2$

Write equivalent inequalities.

$-2 + 5 < x - 5 + 5 < 2 + 5$

Add 5 to each part.

$3 < x < 7$

Simplify.

The solution set is all real numbers that are greater than 3 and less than 7, which is denoted by $(3, 7)$. The graph of this solution set is shown in Figure A.18.

**b.** $|x + 3| \geq 7$

Write original inequality.

$x + 3 \leq -7$  
or  
$x + 3 \geq 7$

Write equivalent inequalities.

$x + 3 - 3 \leq -7 - 3$  
$x + 3 - 3 \geq 7 - 3$

Subtract 3 from each side.

$x \leq -10$  
$x \geq 4$

Simplify.

The solution set is all real numbers that are less than or equal to $-10$ or greater than or equal to 4. The interval notation for this solution set is $(-\infty, -10] \cup [4, \infty)$. The symbol $\cup$ is called a union symbol and is used to denote the combining of two sets. The graph of this solution set is shown in Figure A.19.

**Study Tip**

Note that the graph of the inequality $|x - 5| < 2$ can be described as all real numbers within two units of 5, as shown in Figure A.18.

**CHECK POINT**  
Now try Exercise 61.
Applications

A problem-solving plan can be used to model and solve real-life problems that involve inequalities, as illustrated in Example 6.

### Example 6 Comparative Shopping

You are choosing between two different cell phone plans. Plan A costs $49.99 per month for 500 minutes plus $0.40 for each additional minute. Plan B costs $45.99 per month for 500 minutes plus $0.45 for each additional minute. How many additional minutes must you use in one month for plan B to cost more than plan A?

**Solution**

**Verbal Model:**

**Labels:**

- Minutes used (over 500) in one month = \( m \) (minutes)
- Monthly cost for plan A = $0.40\( m \) + $49.99 (dollars)
- Monthly cost for plan B = $0.45\( m \) + $45.99 (dollars)

**Inequality:**

\[
0.45m + 45.99 > 0.40m + 49.99
\]

\[
0.05m > 4
\]

\[
m > 80 \text{ minutes}
\]

Plan B costs more if you use more than 80 additional minutes in one month.

Now try Exercise 111.

### Example 7 Accuracy of a Measurement

You go to a candy store to buy chocolates that cost $9.89 per pound. The scale that is used in the store has a state seal of approval that indicates the scale is accurate to within half an ounce (or \( \frac{1}{16} \) of a pound). According to the scale, your purchase weighs one-half pound and costs $4.95. How much might you have been undercharged or overcharged as a result of inaccuracy in the scale?

**Solution**

Let \( x \) represent the true weight of the candy. Because the scale is accurate to within half an ounce (or \( \frac{1}{16} \) of a pound), the difference between the exact weight (\( x \)) and the scale weight (\( \frac{1}{2} \)) is less than or equal to \( \frac{1}{16} \) of a pound. That is, \( |x - \frac{1}{2}| \leq \frac{1}{16} \).

You can solve this inequality as follows.

\[
-\frac{1}{32} \leq x - \frac{1}{2} \leq \frac{1}{32}
\]

\[
\frac{15}{32} \leq x \leq \frac{17}{32}
\]

\[
0.46875 \leq x \leq 0.53125
\]

In other words, your “one-half pound” of candy could have weighed as little as 0.46875 pound (which would have cost $4.64) or as much as 0.53125 pound (which would have cost $5.25). So, you could have been overcharged by as much as $0.31 or undercharged by as much as $0.30.

Now try Exercise 125.
A69

Appendix A.6 Linear Inequalities in One Variable

VOCABULARY: Fill in the blanks.

1. The set of all real numbers that are solutions of an inequality is the ______ of the inequality.
2. The set of all points on the real number line that represents the solution set of an inequality is the ______ of the inequality.
3. To solve a linear inequality in one variable, you can use the properties of inequalities, which are identical to those used to solve equations, with the exception of multiplying or dividing each side by a ______ number.
4. Two inequalities that have the same solution set are ______.
5. It is sometimes possible to write two inequalities as one inequality, called a ______ inequality.
6. The symbol $\cup$ is called a ______ symbol and is used to denote the combining of two sets.

SKILLS AND APPLICATIONS

In Exercises 7–14, (a) write an inequality that represents the interval and (b) state whether the interval is bounded or unbounded.

7. $[0, 9]$  
8. $(-7, 4)$
9. $[-1, 5]$  
10. $(2, 10)$
11. $(11, \infty)$  
12. $[-5, \infty)$
13. $(-\infty, -2)$  
14. $(-\infty, 7]$ 

In Exercises 15–22, match the inequality with its graph. [The graphs are labeled (a)–(h).]

(a)  
(b)  
(c)  
(d)  
(e)  
(f)  
(g)  
(h)  

15. $x < 3$  
16. $x \geq 5$
17. $-3 < x \leq 4$  
18. $0 \leq x \leq \frac{5}{2}$
19. $|x| < 3$  
20. $|x| > 4$
21. $-1 \leq x \leq \frac{5}{2}$  
22. $-1 < x < \frac{5}{2}$

In Exercises 23–28, determine whether each value of $x$ is a solution of the inequality.

<table>
<thead>
<tr>
<th>Inequality</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>$5x - 12 &gt; 0$</td>
<td>(a) $x = 3$ (b) $x = -3$</td>
</tr>
<tr>
<td>$2x + 1 &lt; -3$</td>
<td>(a) $x = 0$ (b) $x = -\frac{3}{2}$</td>
</tr>
<tr>
<td>$0 &lt; \frac{x - 2}{4} &lt; 2$</td>
<td>(a) $x = 4$ (b) $x = 10$</td>
</tr>
<tr>
<td>$-5 &lt; 2x - 1 \leq 1$</td>
<td>(a) $x = -\frac{1}{2}$ (b) $x = -\frac{5}{2}$</td>
</tr>
<tr>

<td>x - 10</td>
</tr>
<tr>
<td>$</td>
<td>2x - 3</td>
</tr>
</tbody>
</table>

In Exercises 29–56, solve the inequality and sketch the solution on the real number line. (Some inequalities have no solutions.)

29. $4x < 12$  
30. $10x < -40$
31. $-2x > -3$  
32. $-6x > 15$
33. $x - 5 \geq 7$  
34. $x + 7 \leq 12$
35. $2x + 7 < 3 + 4x$  
36. $3x + 1 \geq 2 + x$
37. $2x - 1 \geq 1 - 5x$  
38. $6x - 4 \leq 2 + 8x$
39. $4 - 2x < 3(3 - x)$  
40. $4(x + 1) < 2x + 3$
41. $\frac{2x - 6}{3} \leq x - 7$  
42. $3 + \frac{2}{3}x > x - 2$
43. $\frac{2}{3}(2x + 1) \geq 3x + \frac{2}{3}$  
44. $9x - 1 < \frac{3}{2}(16x - 2)$
45. $3.6x + 11 \geq -3.4$  
46. $15.6 - 1.3x < -5.2$
47. $1 < 2x + 3 < 9$  
48. $-8 \leq -(3x + 5) < 13$
49. $-8 \leq 1 - 3(x - 2) < 13$
50. $0 \leq 2 - 3(x + 1) < 20$
51. \(-4 < \frac{2x - 3}{3} < 4\)  
52. \(0 \leq \frac{x + 3}{2} < 5\)

53. \(\frac{3}{4} > x + 1 > \frac{1}{4}\)  
54. \(-1 < 2 - \frac{x}{3} < 1\)

55. \(3.2 \leq 0.4x - 1 \leq 4.4\)  
56. \(4.5 > \frac{1.5x + 6}{2} > 10.5\)

In Exercises 57–72, solve the inequality and sketch the solution on the real number line. (Some inequalities have no solution.)

57. \(|x| < 5\)  
58. \(|x| \geq 8\)

59. \(\left|\frac{x}{2}\right| > 1\)  
60. \(\left|\frac{x}{5}\right| > 3\)

61. \(|x - 5| < -1\)  
62. \(|x - 7| < -5\)

63. \(|x - 20| \leq 6\)  
64. \(|x - 8| \geq 0\)

65. \(|3 - 4x| \geq 9\)  
66. \(|1 - 2x| < 5\)

67. \(\frac{|x - 3|}{2} \geq 4\)  
68. \(1 - \frac{2x}{3} < 1\)

69. \(|9 - 2x| - 2 < -1\)  
70. \(|x + 14| + 3 > 17\)

71. \(2|x + 10| \geq 9\)  
72. \(3|4 - 5x| \leq 9\)

**GRAPHICAL ANALYSIS** In Exercises 73–82, use a graphing utility to graph the inequality and identify the solution set.

73. \(6x > 12\)  
74. \(3x - 1 \leq 5\)

75. \(5 - 2x \geq 1\)  
76. \(20 < 6x - 1\)

77. \(4(x - 3) \leq 8 - x\)  
78. \(3(x + 1) < x + 7\)

79. \(|x - 8| \leq 14\)  
80. \(|2x + 9| > 13\)

81. \(2|x + 7| \geq 13\)  
82. \(\frac{1}{2}|x + 1| \leq 3\)

**GRAPHICAL ANALYSIS** In Exercises 83–88, use a graphing utility to graph the equation. Use the graph to approximate the values of \(x\) that satisfy each inequality.

<table>
<thead>
<tr>
<th>Equation</th>
<th>Inequalities</th>
</tr>
</thead>
</table>
| \(y = 2x - 3\) | (a) \(y \geq 1\) (b) \(y \leq 0\)
| \(y = \frac{2x}{3} + 1\) | (a) \(y \leq 5\) (b) \(y \geq 0\)
| \(y = -\frac{1}{2}x + 2\) | (a) \(0 \leq y \leq 3\) (b) \(y \geq 0\)
| \(y = -3x + 8\) | (a) \(-1 \leq y \leq 3\) (b) \(y \leq 0\)
| \(y = |x - 3|\) | (a) \(y \leq 2\) (b) \(y \geq 4\)
| \(y = \frac{1}{2}|x + 1|\) | (a) \(y \leq 4\) (b) \(y \geq 1\)

In Exercises 89–94, find the interval(s) on the real number line for which the radicand is nonnegative.

89. \(\sqrt{x - 5}\)  
90. \(\sqrt{x - 10}\)

91. \(\sqrt{x + 3}\)  
92. \(\sqrt{3 - x}\)

93. \(\sqrt{7 - 2x}\)  
94. \(\sqrt{2x + 15}\)

**THINK ABOUT IT** The graph of \(|x - 5| < 3\) can be described as all real numbers within three units of 5. Give a similar description of \(|x - 10| < 8\).

**THINK ABOUT IT** The graph of \(|x - 2| > 5\) can be described as all real numbers more than five units from 2. Give a similar description of \(|x - 8| > 4\).

In Exercises 97–104, use absolute value notation to define the interval (or pair of intervals) on the real number line.

97. \(\frac{1}{2} < x < 3\)

98. \(x < -3\) or \(x > 3\)

99. \(4 < x < 14\) or \(-6 < x < -5\)

100. \(-7 < x < -3\) or \(1 < x < 3\)

101. All real numbers within 10 units of 12

102. All real numbers at least five units from 8

103. All real numbers more than four units from \(-3\)

104. All real numbers no more than seven units from \(-6\)

In Exercises 105–108, use inequality notation to describe the subset of real numbers.

105. A company expects its earnings per share \(E\) for the next quarter to be no less than \$4.10 and no more than \$4.25.

106. The estimated daily oil production \(p\) at a refinery is greater than 2 million barrels but less than 2.4 million barrels.

107. According to a survey, the percent \(p\) of U.S. citizens that now conduct most of their banking transactions online is no more than 45%.

108. The net income \(I\) of a company is expected to be no less than \$239 million.

**PHYSIOLOGY** In Exercises 109 and 110, use the following information. The maximum heart rate of a person in normal health is related to the person’s age by the equation \(r = 220 - A\), where \(r\) is the maximum heart rate in beats per minute and \(A\) is the person’s age in years. Some physiologists recommend that during physical activity a sedentary person should strive to increase his or her heart rate to at least 50% of the maximum heart rate, and a highly fit person should strive to increase his or her heart rate to at most 85% of the maximum heart rate. (Source: American Heart Association)

109. Express as an interval the range of the target heart rate for a 20-year-old.

110. Express as an interval the range of the target heart rate for a 40-year-old.
111. **JOB OFFERS** You are considering two job offers. The first job pays $13.50 per hour. The second job pays $9.00 per hour plus $0.75 per unit produced per hour. Write an inequality yielding the number of units \( x \) that must be produced per hour to make the second job pay the greater hourly wage. Solve the inequality.

112. **JOB OFFERS** You are considering two job offers. The first job pays $3000 per month. The second job pays $1000 per month plus a commission of 4% of your gross sales. Write an inequality yielding the gross sales \( x \) per month for which the second job will pay the greater monthly wage. Solve the inequality.

113. **INVESTMENT** In order for an investment of $1000 to grow to more than $1062.50 in 2 years, what must the annual interest rate be? \([A = P(1 + rt)]\)

114. **INVESTMENT** In order for an investment of $750 to grow to more than $825 in 2 years, what must the annual interest rate be? \([A = P(1 + rt)]\)

115. **COST, REVENUE, AND PROFIT** The revenue from selling \( x \) units of a product is \( R = 115.95x \). The cost of producing \( x \) units is \( C = 95x + 750 \). To obtain a profit, the revenue must be greater than the cost. For what values of \( x \) will this product return a profit?

116. **COST, REVENUE, AND PROFIT** The revenue from selling \( x \) units of a product is \( R = 24.55x \). The cost of producing \( x \) units is \( C = 15.4x + 150,000 \). To obtain a profit, the revenue must be greater than the cost. For what values of \( x \) will this product return a profit?

117. **DAILY SALES** A doughnut shop sells a dozen doughnuts for $4.50. Beyond the fixed costs (rent, utilities, and insurance) of $220 per day, it costs $2.75 for enough materials (flour, sugar, and so on) and labor to produce a dozen doughnuts. The daily profit from doughnut sales varies from $60 to $270. Between what levels (in dozens) do the daily sales vary?

118. **WEIGHT LOSS PROGRAM** A person enrolls in a diet and exercise program that guarantees a loss of at least 1\( \frac{1}{2} \) pounds per week. The person's weight at the beginning of the program is 164 pounds. Find the maximum number of weeks before the person attains a goal weight of 128 pounds.

119. **DATA ANALYSIS: IQ SCORES AND GPA** The admissions office of a college wants to determine whether there is a relationship between IQ scores \( x \) and grade-point averages \( y \) after the first year of school. An equation that models the data the admissions office obtained is \( y = 0.067x - 5.638 \).

(a) Use a graphing utility to graph the model.

(b) Use the graph to estimate the values of \( x \) that predict a grade-point average of at least 3.0.

120. **DATA ANALYSIS: WEIGHTLIFTING** You want to determine whether there is a relationship between an athlete’s weight \( x \) (in pounds) and the athlete’s maximum bench-press weight \( y \) (in pounds). The table shows a sample of data from 12 athletes.

<table>
<thead>
<tr>
<th>Athlete’s weight, ( x )</th>
<th>Bench-press weight, ( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>165</td>
<td>170</td>

<tr>
<td>230</td>
<td>250</td>
</tr>
<tr>
<td>160</td>
<td>155</td>
</tr>
</tbody>
</table>

(a) Use a graphing utility to plot the data.

(b) A model for the data is \( y = 1.3x - 36 \). Use a graphing utility to graph the model in the same viewing window used in part (a).

(c) Use the graph to estimate the values of \( x \) that predict a maximum bench-press weight of at least 200 pounds.

(d) Verify your estimate from part (c) algebraically.

(e) Use the graph to write a statement about the accuracy of the model. If you think the graph indicates that an athlete’s weight is not a particularly good indicator of the athlete’s maximum bench-press weight, list other factors that might influence an individual’s maximum bench-press weight.

121. **TEACHERS’ SALARIES** The average salaries \( S \) (in thousands of dollars) for elementary school teachers in the United States from 1990 through 2005 are approximated by the model

\[ S = 1.09t + 30.9, \quad 0 \leq t \leq 15 \]

where \( t \) represents the year, with \( t = 0 \) corresponding to 1990. (Source: National Education Association)

(a) According to this model, when was the average salary at least $32,500, but not more than $42,000?

(b) According to this model, when will the average salary exceed $54,000?
122. **Egg Production** The numbers of eggs $E$ (in billions) produced in the United States from 1990 through 2006 can be modeled by

$$E = 1.52t + 68.0, \quad 0 \leq t \leq 16$$

where $t$ represents the year, with $t = 0$ corresponding to 1990. (Source: U.S. Department of Agriculture)

(a) According to this model, when was the annual egg production 70 billion, but no more than 80 billion?

(b) According to this model, when will the annual egg production exceed 100 billion?

123. **Geometry** The side of a square is measured as $10.4$ inches with a possible error of $0.25$ centimeter. Using these measurements, determine the interval containing the possible areas of the square.

124. **Geometry** The side of a square is measured as $24.2$ centimeters with a possible error of $1.52$ millimeters. Using these measurements, determine the interval containing the possible areas of the square.

125. **Accuracy of Measurement** You stop at a self-service gas station to buy 15 gallons of 87-octane gasoline at $2.09$ a gallon. The gas pump is accurate to within $\frac{1}{10}$ of a gallon. How much might you be undercharged or overcharged?

126. **Accuracy of Measurement** You buy six T-bone steaks that cost $14.99 per pound. The weight that is listed on the package is 5.72 pounds. The scale that weighed the package is accurate to within $\frac{1}{2}$ ounce. How much might you be undercharged or overcharged?

127. **Time Study** A time study was conducted to determine the length of time required to perform a particular task in a manufacturing process. The times required by approximately two-thirds of the workers in the study satisfied the inequality

$$|t - 15.6| < 1.9$$

where $t$ is time in minutes. Determine the interval on the real number line in which these times lie.

128. **Height** The heights $h$ of two-thirds of the members of a population satisfy the inequality

$$|h - 68.5| \leq 2.7$$

where $h$ is measured in inches. Determine the interval on the real number line in which these heights lie.

129. **Meteorology** An electronic device is to be operated in an environment with relative humidity $h$ in the interval defined by $|h - 50| \leq 30$. What are the minimum and maximum relative humidities for the operation of this device?

130. **Music** Michael Kasha of Florida State University used physics and mathematics to design a new classical guitar. The model he used for the frequency of the vibrations on a circular plate was $v = \frac{2.6\sqrt{E/d^2}}{\pi \rho}$, where $v$ is the frequency (in vibrations per second), $t$ is the plate thickness (in millimeters), $d$ is the diameter of the plate, $E$ is the elasticity of the plate material, and $\rho$ is the density of the plate material. For fixed values of $d$, $E$, and $\rho$, the graph of the equation is a line (see figure).

(a) Estimate the frequency when the plate thickness is 2 millimeters.

(b) Estimate the plate thickness when the frequency is 600 vibrations per second.

(c) Approximate the interval for the plate thickness when the frequency is between 200 and 400 vibrations per second.

(d) Approximate the interval for the frequency when the plate thickness is less than 3 millimeters.

EXPLORATION

TRUE OR FALSE? In Exercises 131 and 132, determine whether the statement is true or false. Justify your answer.

131. If $a$, $b$, and $c$ are real numbers, and $a \leq b$, then $ac \leq bc$.

132. If $-10 \leq x \leq 8$, then $-10 \geq -x$ and $-x \leq -8$.

133. Identify the graph of the inequality $|x - a| \geq 2$.

(a) \[ a - 2 \quad a \quad a + 2 \]

(b) \[ a - 2 \quad a \quad a + 2 \]

(c) \[ 2 - a \quad 2 \quad 2 + a \]

(d) \[ 2 - a \quad 2 \quad 2 + a \]

134. Find sets of values of $a$, $b$, and $c$ such that $0 \leq x \leq 10$ is a solution of the inequality $|ax - b| \leq c$.

135. Give an example of an inequality with an unbounded solution set.

136. **Capstone** Describe any differences between properties of equalities and properties of inequalities.
A.7  ERRORS AND THE ALGEBRA OF CALCULUS

**What you should learn**
- Avoid common algebraic errors.
- Recognize and use algebraic techniques that are common in calculus.

**Why you should learn it**
An efficient command of algebra is critical in mastering this course and in the study of calculus.

**Algebraic Errors to Avoid**
This section contains five lists of common algebraic errors: errors involving parentheses, errors involving fractions, errors involving exponents, errors involving radicals, and errors involving dividing out. Many of these errors are made because they seem to be the easiest things to do. For instance, the operations of subtraction and division are often believed to be commutative and associative. The following examples illustrate the fact that subtraction and division are neither commutative nor associative.

<table>
<thead>
<tr>
<th>Potential Error</th>
<th>Correct Form</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Not commutative</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>$4 - 3 \neq 3 - 4$</td>
<td>$8 - (6 - 2) \neq (8 - 6) - 2$</td>
<td></td>
</tr>
<tr>
<td>$15 \div 5 \neq 5 \div 15$</td>
<td>$20 \div (4 \div 2) \neq (20 \div 4) \div 2$</td>
<td></td>
</tr>
</tbody>
</table>

**Errors Involving Parentheses**

<table>
<thead>
<tr>
<th>Potential Error</th>
<th>Correct Form</th>
<th>Comment</th>

</tbody>
</table>
A good way to avoid errors is to work slowly, write neatly, and talk to yourself. Each time you write a step, ask yourself why the step is algebraically legitimate. You can justify the step below because dividing the numerator and denominator by the same nonzero number produces an equivalent fraction.

\[
\frac{2x}{6} = \frac{2 \cdot x}{2 \cdot 3} = \frac{x}{3}
\]

**Example 1** Using the Property for Adding Fractions

Describe and correct the error: \[\frac{1}{2x} + \frac{1}{3x} = \frac{1}{3x}\]

**Solution**

When adding fractions, use the property for adding fractions: \[\frac{1}{a} + \frac{1}{b} = \frac{b + a}{ab}\]

\[
\frac{1}{2x} + \frac{1}{3x} = \frac{3x + 2x}{6x^2} = \frac{5x}{6x^2} = \frac{5}{6x}
\]

**CHECK Point** Now try Exercise 19.
## Some Algebra of Calculus

In calculus it is often necessary to take a simplified algebraic expression and rewrite it. See the following lists, taken from a standard calculus text.

</tbody>
</table>

The next five examples demonstrate many of the steps in the preceding lists.

#### Example 2  Factors Involving Negative Exponents

Factor $x(x + 1)^{-1/2} + (x + 1)^{1/2}$.

**Solution**

When multiplying factors with like bases, you add exponents. When factoring, you are undoing multiplication, and so you subtract exponents.

$$x(x + 1)^{-1/2} + (x + 1)^{1/2} = (x + 1)^{-1/2} [x(x + 1)^0 + (x + 1)^1]$$

$$= (x + 1)^{-1/2} [x + (x + 1)]$$

$$= (x + 1)^{-1/2} (2x + 1)$$

**CHECK Point**  Now try Exercise 29.

Another way to simplify the expression in Example 2 is to multiply the expression by a fractional form of 1 and then use the Distributive Property.

$$x(x + 1)^{-1/2} + (x + 1)^{1/2} = \left[ x(x + 1)^{-1/2} + (x + 1)^{1/2} \right] \cdot \frac{(x + 1)^{1/2}}{(x + 1)^{1/2}}$$

$$= \frac{x(x + 1)^0 + (x + 1)^1}{(x + 1)^{1/2}} = \frac{2x + 1}{\sqrt{x + 1}}$$

#### Example 3  Inserting Factors in an Expression

Insert the required factor: $\frac{x + 2}{(x^2 + 4x - 3)^2} = \left( \frac{1}{2} \right) \frac{1}{(x^2 + 4x - 3)^2} (2x + 4)$

**Solution**

The expression on the right side of the equation is twice the expression on the left side. To make both sides equal, insert a factor of $\frac{1}{2}$.

$$\frac{x + 2}{(x^2 + 4x - 3)^2} = \left( \frac{1}{2} \right) \frac{1}{(x^2 + 4x - 3)^2} (2x + 4)$$

**CHECK Point**  Now try Exercise 31.
Example 4  Rewriting Fractions

Explain why the two expressions are equivalent.

\[
\frac{4x^2}{9} - 4y^2 = \frac{x^2}{9} - \frac{y^2}{4}
\]

Solution

To write the expression on the left side of the equation in the form given on the right side, multiply the numerators and denominators of both terms by \(\frac{4}{4}\).

\[
\frac{4x^2}{9} - 4y^2 = \frac{4x^2}{9} \left( \frac{1}{4} \right) - 4y^2 \left( \frac{1}{4} \right) = \frac{x^2}{9} - \frac{y^2}{4}
\]

CHECK Point  Now try Exercise 35.

Example 5  Rewriting with Negative Exponents

Rewrite each expression using negative exponents.

a. \(\frac{-4x}{(1 - 2x)^2}\)  b. \(\frac{2}{5x^3} - \frac{1}{\sqrt{x}} + \frac{3}{5(4x)^2}\)

Solution

a. \(\frac{-4x}{(1 - 2x)^2} = -4x(1 - 2x)^{-2}\)

b. Begin by writing the second term in exponential form.

\[
\frac{2}{5x^3} - \frac{1}{\sqrt{x}} + \frac{3}{5(4x)^2} = \frac{2}{5x^3} - \frac{1}{x^{1/2}} + \frac{3}{5(4x)^2}
\]

\[
= \frac{2}{5}x^{-3} - x^{-1/2} + \frac{3}{5}(4x)^{-2}
\]

CHECK Point  Now try Exercise 47.

Example 6  Writing a Fraction as a Sum of Terms

Rewrite each fraction as the sum of three terms.

a. \(\frac{x^2 - 4x + 8}{2x}\)  b. \(\frac{x + 2x^2 + 1}{\sqrt{x}}\)

Solution

a. \(\frac{x^2 - 4x + 8}{2x} = \frac{x^2}{2x} - \frac{4x}{2x} + \frac{8}{2x}\)

\[
= \frac{x}{2} - 2 + \frac{4}{x}
\]

b. \(\frac{x + 2x^2 + 1}{\sqrt{x}} = \frac{x}{\sqrt{x}} + \frac{2x^2}{\sqrt{x}} + \frac{1}{\sqrt{x}}\)

\[
= x^{1/2} + 2x^{3/2} + x^{-1/2}
\]

CHECK Point  Now try Exercise 51.
In Exercises 3–22, describe and correct the error.

VOCABULARY: Fill in the blanks.

1. To write the expression \( \frac{3}{x} \) with negative exponents, move \( x \) to the ________ and change the sign of the exponent.

2. When dividing fractions, multiply by the ________.

SKILLS AND APPLICATIONS

In Exercises 3–22, describe and correct the error.

3. \( \frac{2x}{3} - (3y + 4) = 2x - 3y + 4 \)

4. \( 5z + 3(x - 2) = 5z + 3x - 2 \)

5. \( \frac{4}{x} \)

6. \( \frac{16x}{5} - (2x + 1) = 14x + 1 \)

7. \( \frac{5(yc)}{68} = 30 \)

8. \( \frac{x}{3} + \frac{y}{3} = \frac{x + y}{3} \)

9. \( \frac{x}{y} = \frac{ax}{ay} \)

10. \( \frac{x}{y} = \frac{4x}{4y} \)

11. \( \sqrt{x^3} = 3 \sqrt{x} \)

12. \( \sqrt{x^2} = 5 - x \)

13. \( \frac{2x + 1}{x} = \frac{2x + 1}{x} \)

14. \( 6x + y = \frac{6x + y}{x - y} \)

15. \( \frac{1}{a + b} = \frac{1}{a + b} \)

16. \( \frac{1}{x + y} = \frac{1}{x + y} \)

17. \( \left( x^2 + 5x \right) \left[ (x^2 + 5x)^{1/2} \right] \)

18. \( \left( x^2 + 1 \right)^2 = (2x^2 + 1)^2 \)

19. \( \frac{2x + 4}{x + y} = \frac{2x + 4}{x + y} \)

20. \( \frac{y}{2x} = \frac{y}{2x} \)

21. \( \frac{x + y}{3} = \frac{x + y}{3} \)

In Exercises 23–44, insert the required factor in the parentheses.

23. \( \frac{5x + 3}{4} = \frac{1}{4} \)

24. \( \frac{7x^2}{10} = \frac{7}{10} \)

25. \( \frac{2x^2 + 3x + 5}{6} = \frac{1}{3} \)

26. \( \frac{3x + 1}{2} = \frac{1}{2} \)

27. \( x(x^3 - 1)^2 = (x^3 - 1)^2x^2 \)

28. \( x(1 - 2x)^3 = (1 - 2x)^3(-4x) \)

29. \( 2(y - 5)^{1/2} + y(y - 5)^{-1/2} = (y - 5)^{-1/2} \)

30. \( 3(6x + 1)^{1/2} + (6x + 1)^{1/2} = (6x + 1)^{1/2} \)

31. \( \frac{4x + 6}{(x^2 + 3x + 7)^3} = \frac{1}{(x^2 + 3x + 7)^3} \)

32. \( \frac{x + 1}{(x^2 + 2x - 3)^2} = \frac{1}{(x^2 + 2x - 3)^2} \)

33. \( \frac{3}{x} + \frac{5}{2x} = \frac{3}{2} \)

34. \( \frac{(x - 1)^2}{169} + \frac{(y + 5)^2}{169} = \frac{(x - 1)^2}{169} + \frac{(y + 5)^2}{169} \)

35. \( \frac{25x^2}{36} + \frac{4y^2}{9} = \frac{x^2}{9} + \frac{y^2}{9} \)

36. \( \frac{5x^2}{9} - \frac{16y^2}{49} = \frac{x^2}{9} - \frac{y^2}{9} \)

37. \( \frac{x^2}{3/10} - \frac{y^2}{4/5} = \frac{10x^2}{3/10} - \frac{5y^2}{4/5} \)

38. \( \frac{x^2}{5/8} + \frac{y^2}{5/11} = \frac{8x^2}{5} + \frac{11y^2}{5/11} \)

39. \( x^{1/3} - 5x^{4/3} = x^{1/3} \)

40. \( 3(2x + 1)x^{1/2} + 4x^{3/2} = x^{1/2} \)

41. \( (1 - 3x)^{4/3} - 4x(1 - 3x)^{1/3} = (1 - 3x)^{1/3} \)

42. \( \frac{1}{2 \sqrt{x}} + 5x^{3/2} - 10x^{5/2} = \frac{1}{2 \sqrt{x}} \)

43. \( \frac{1}{10} (2x + 1)^{5/2} - \frac{1}{6} (2x + 1)^{3/2} = \frac{1}{10} (2x + 1)^{3/2} \)

44. \( \frac{3}{7} (t + 4)^{3/4} - \frac{3}{4} (t + 4)^{1/2} = \frac{3}{7} (t + 4)^{3/4} \)

In Exercises 45–50, write the expression using negative exponents.

45. \( \frac{7}{x + 3} \)

46. \( \frac{2x}{x + 1} \)

47. \( \frac{2x^5}{(3x + 5)^4} \)

48. \( \frac{x + 1}{x(6 - x)^{1/2}} \)

49. \( \frac{4}{3x} + \frac{4}{x^2} = \frac{7x}{\sqrt{2x}} \)

50. \( \frac{x}{x - 2} + \frac{1}{2} + \frac{8}{3(9x)} \)

In Exercises 51–56, write the fraction as a sum of two or more terms.

51. \( \frac{x^2 + 6x + 12}{3x} \)

52. \( \frac{x^3 - 5x^2 + 4}{x^2} \)

53. \( \frac{4x^3 - 7x^2 + 1}{x^{1/3}} \)

54. \( \frac{4x^5 - 3x^3 + 5x - 1}{x^{3/2}} \)

55. \( \frac{3 - 5x^2 - x^4}{\sqrt{x}} \)

56. \( \frac{x^3 - 5x^4}{3x^2} \)
In Exercises 57–68, simplify the expression.

57. \[ \frac{-2(x^2 - 3)^3(2)(x^2 + 1)^3 - 3(x^2 - 3)(x^2 + 1)^2}{[(x^2 + 1)^2]^2} \]

58. \[ \frac{x^8(-3)(x^2 + 1)^{-4}(2x) - (x^2 + 1)^{-3}(5)x^4}{(x^2)^2} \]

59. \[ \frac{(6x + 1)^3(2x^2 + 2) - (9x^3 + 2x)(3)(6x + 1)^2(6)}{[(6x + 1)^2]^2} \]

60. \[ \frac{(4x^2 + 9)^{1/2}(2) - (2x + 3)(\frac{1}{2})(4x^2 + 9)^{-1/2}(8x)}{[(4x^2 + 9)^{1/2}]^2} \]

61. \[ \frac{(x + 2)^{3/4}(x + 3)^{-2/3} - (x + 3)^{1/3}(x + 2)^{-1/4}}{[(x + 2)^{3/4}]^2} \]

62. \[ (2x - 1)^{1/2} - (x + 2)(2x - 1)^{-1/2} \]

63. \[ 2(3x - 1)^{1/3} - (x + 1)(\frac{1}{3})(3x - 1)^{-2/3}(3) \]

64. \[ \frac{1}{(x^2 + 4)^{1/2}} \cdot \frac{1}{2}(x^2 + 4)^{-1/2}(2x) \]

65. \[ \frac{1}{x^2 - 6} - \frac{1}{(2x) + \frac{1}{x + 5}}(2) \]

66. \[ (x^2 + 5)^{1/2}(\frac{1}{2})(3x - 2)^{1/2}(3) + (3x - 2)^{3/2}(\frac{1}{2})(x^2 + 5)^{-1/2}(2x) \]

67. \[ (x + 2)^{-1/2}(3)(x - 6)^{1/2}(1) + (x - 6)^{1/2}(\frac{1}{2})(3x + 2)^{-3/2}(3) \]

68. \[ \frac{1}{x^2} - 6(2x) + \frac{1}{x^2 + 5}(2) \]

69. ATHLETICS An athlete has set up a course for training as part of her regimen in preparation for an upcoming triathlon. She is dropped off by a boat 2 miles from the nearest point on shore. The finish line is 4 miles down the coast and 2 miles inland (see figure). She can swim 2 miles per hour and run 6 miles per hour. The time \( t \) (in hours) required for her to reach the finish line can be approximated by the model

\[ t = \frac{\sqrt{x^2 + 4}}{2} + \frac{\sqrt{(4 - x)^2 + 4}}{6} \]

where \( x \) is the distance down the coast (in miles) to the point at which she swims and then leaves the water to start her run.

(a) Find the times required for the triathlete to finish when she swims to the points \( x = 0.5, x = 1.0, \ldots, x = 3.5, \) and \( x = 4.0 \) miles down the coast.

(b) Use your results from part (a) to determine the distance down the coast that will yield the minimum amount of time required for the triathlete to reach the finish line.

(c) The expression below was obtained using calculus. It can be used to find the minimum amount of time required for the triathlete to reach the finish line. Simplify the expression.

\[ \frac{1}{2}x(x^2 + 4)^{-1/2} + \frac{1}{6}(x - 4)(x^2 - 8x + 20)^{-1/2} \]

70. (a) Verify that \( y_1 = y_2 \) analytically.

\[ y_1 = x^2(\frac{1}{3})(x^2 + 1)^{-2/3}(2x) + (x^2 + 1)^{1/3}(2x) \]

\[ y_2 = \frac{2x(4x^2 + 3)}{3(x^2 + 1)^{2/3}} \]

(b) Complete the table and demonstrate the equality in part (a) numerically.

EXPLORATION

71. WRITING Write a paragraph explaining to a classmate why \( \frac{1}{(x - 2)^{1/2} + x^2} \neq (x - 2)^{-1/2} + x^{-4} \).

72. CAPSTONE You are taking a course in calculus, and for one of the homework problems you obtain the following answer.

\[ \frac{1}{10}(2x - 1)^{5/2} + \frac{1}{6}(2x - 1)^{1/2} \]

The answer in the back of the book is \( \frac{1}{15}(2x - 1)^{1/2}(3x + 1) \). Show how the second answer can be obtained from the first. Then use the same technique to simplify each of the following expressions.

(a) \( \frac{2}{3}(2x - 3)^{3/2} - \frac{2}{15}(2x - 3)^{5/2} \)

(b) \( \frac{2}{3}(4 + x)^{3/2} - \frac{2}{15}(4 + x)^{5/2} \)

    (b) Horizontal shrink of one-third
    (c) \( g(x) = f(3x) \)
    (d) \( g(x) = 3 + 2f(x - 4) \)

37. (a) \( f(x) = x^3 \)
    (b) Vertical shift two units upward and horizontal shift one unit to the right
    (c) \( g(x) = f(x - 1) + 2 \)

39. (a) \( f(x) = x^3 \)
    (b) Vertical stretch of three and horizontal shift two units to the right
    (c) \( g(x) = 3f(x - 2) \)

41. (a) \( f(x) = |x| \)
    (b) Reflection in the \( x \)-axis and vertical shift two units downward
    (c) \( g(x) = -f(x) - 2 \)
    (d) \( g(x) = f(x - 9) \)

43. (a) \( f(x) = |x| \)
    (b) Reflection in the \( x \)-axis, horizontal shift four units to the left, and vertical shift eight units upward
    (c) \( g(x) = f(x + 4) - 8 \)

45. (a) \( f(x) = |x| \)
    (b) Reflection in the \( x \)-axis, vertical stretch of two, horizontal shift one unit to the right, and vertical shift four units downward
    (c) \( g(x) = -2f(x - 1) - 4 \)

47. (a) \( f(x) = \lfloor x \rfloor \)
    (b) Reflection in the \( x \)-axis and vertical shift three units upward
    (c) \( g(x) = 3 - f(x) \)

49. (a) \( f(x) = \sqrt{x} \)
    (b) Horizontal shift nine units to the right
    (c) \( g(x) = f(x - 9) \)

51. (a) \( f(x) = \sqrt{x} \)
    (b) Reflection in the \( y \)-axis, horizontal shift seven units to the right, and vertical shift two units downward
53. (a) \( f(x) = \sqrt{x} \)
(b) Horizontal stretch and vertical shift four units downward
(c) \( g(x) = f\left(\frac{1}{2}x\right) - 4 \)
(d) \( g(x) = f(7 - x) - 2 \)

55. \( g(x) = (x - 3)^2 - 7 \)  
57. \( g(x) = (x - 13)^3 \)
59. \( g(x) = -|x| + 12 \)
61. \( g(x) = -\sqrt{-x} + 6 \)
63. (a) \( y = -3x^2 \)  
(b) \( y = 4x^2 + 3 \)
65. (a) \( y = -\frac{1}{2}|x| \)  
(b) \( y = 3|x| - 3 \)
67. Vertical stretch of \( y = x^3; y = 2x^3 \)
69. Reflection in the \( x \)-axis and vertical shrink of \( y = x^2; \) \( y = -\frac{1}{4}x^2 \)
71. Reflection in the \( y \)-axis and vertical shrink of \( y = \sqrt{x}; \) \( y = \frac{1}{2}\sqrt{-x} \)
73. \( y = -(x - 2)^3 + 2 \)
75. \( y = -\sqrt{x} - 3 \)
77. (a) 
(b)

79. (a) Vertical stretch of 128.0 and a vertical shift of 527 units upward
(b) 32; Each year, the total number of miles driven by vans, pick-ups, and SUVs increases by an average of 32 billion miles.
(c) \( f(t) = 527 + 128\sqrt{t + 10}; \) The graph is shifted 10 units to the left.
(d) 1127 billion miles; Answers will vary. Sample answer:
Yes, because the number of miles driven has been steadily increasing.

81. False. The graph of \( y = f(-x) \) is a reflection of the graph of \( f(x) \) in the \( y \)-axis.
83. True. \( [-x] = |x| \)
85. (a) \( g(t) = \frac{1}{2}f(t) \)  
(b) \( g(t) = f(t) + 10,000 \)  
(c) \( g(t) = f(t - 2) \)
87. \((-2, 0), (-1, 1), (0, 2)\)
89. No. \( g(x) = -x^4 - 2 \). Yes. \( h(x) = -(x - 3)^4 \).

Section 1.8 (page 88)
1. addition; subtraction; multiplication; division 
3. \( g(x) \)
5. 
7. 
9. (a) \( 2x \)  
(b) \( 4 \)  
(c) \( x^2 - 4 \)  
(d) \( \frac{x + 2}{x - 2}; \) all real numbers \( x \) except \( x = 2 \)
11. (a) \( x^2 + 4x - 5 \)  
(b) \( x^2 - 4x + 5 \)  
(c) \( 4x^3 - 5x^2 \)  
(d) \( \frac{x^2}{4x - 5}; \) all real numbers \( x \) except \( x = \frac{5}{4} \)
13. (a) \( x^2 + 6 + \sqrt{1 - x} \)  
(b) \( x^2 + 6 - \sqrt{1 - x} \)  
(c) \( (x^2 + 6)\sqrt{1 - x} \)  
(d) \( \frac{(x^2 + 6)\sqrt{1 - x}}{1 - x}; \) all real numbers \( x \) such that \( x < 1 \)
15. (a) $\frac{x + 1}{x^2}$  
(b) $\frac{x - 1}{x^3}$  
(c) $\frac{1}{x^3}$  
(d) $x$; all real numbers $x$ except $x = 0$

17. 3  
19. 5  
21. $9t^2 - 3t + 5$  
23. 74

29.

33. 

35. 

37. (a) $(x - 1)^2$  
(b) $x^2 - 1$  
(c) $x - 2$

39. (a) $x$  
(b) $x$  
(c) $x^6 + 3x^6 + 3x^3 + 2$

41. (a) $\sqrt{x^2 + 4}$  
(b) $x + 4$  

43. (a) $x + 1$  
(b) $\sqrt{x^2 + 1}$  

45. (a) $|x + 6|$  
(b) $|x| + 6$

47. (a) $\frac{1}{x + 3}$  
(b) $\frac{1}{x + 3}$

49. (a) 3  
(b) 0  
(b) 4

51. (a) 0  
(b) 4

53. $f(x) = x^3$; $g(x) = 2x + 1$

55. $f(x) = \sqrt{x}$; $g(x) = x^2 - 4$

57. $f(x) = \frac{1}{x}$; $g(x) = x + 2$

59. $f(x) = \frac{x + 3}{4 + x}$; $g(x) = -x^2$

61. (a) $T = \frac{1}{2}x + \frac{15}{2}x^2$  
(b) $c(t)$ is the percent change in the population due to births and deaths in the year 2005.

65. (a) $(N + M)(t) = 0.227t^3 - 4.11t^2 + 14.6t + 544$, which represents the total number of Navy and Marines personnel combined.  
$(N + M)(0) = 544$  
$(N + M)(6) = 533$  
$(N + M)(12) = 520$

(b) $(N - M)(t) = 0.157t^3 - 3.65t^2 + 11.2t + 200$, which represents the difference between the number of Navy personnel and the number of Marines personnel.  
$(N - M)(0) = 200$  
$(N - M)(6) = 170$  
$(N - M)(12) = 80$

67. $(B - D)(t) = -0.197t^3 + 10.17t^2 - 128.0t + 2043$, which represents the change in the United States population.

69. (a) For each time $t$ there corresponds one and only one temperature $T$.

(b) 60°, 72°

(c) All the temperature changes occur 1 hour later.

(d) The temperature is decreased by 1 degree.

71. $(A - r)(t) = 0.36\pi t^2; (A - r)(t)$ represents the area of the circle at time $t$.

73. (a) $N(T(t)) = 30(3t^2 + 2t + 20)$; This represents the number of bacteria in the food as a function of time.

(b) About 653 bacteria  
(c) 2.846 h

75. $g(f(x))$ represents 3 percent of an amount over $500,000.$

77. False. $(f \circ g)(x) = 6x + 1$ and $(g \circ f)(x) = 6x + 6$

79. (a) $O(M(Y)) = \frac{21 + 2}{2} = 12 + Y$

(b) Middle child is 8 years old; youngest child is 4 years old.

81. Proof

83. (a) Proof

(b) $\frac{1}{2}[f(x) + f(-x)] + \frac{1}{2}[f(x) - f(-x)]$

(c) $f(x) = (x^2 + 1) - (2x)$

$k(x) = \frac{-1}{(x + 1)(x - 1)} + \frac{x}{(x + 1)(x - 1)}$

Section 1.9 (page 98)

1. inverse  
3. range; domain  
5. one-to-one

7. $f^{-1}(x) = \frac{1}{2}x$  
9. $f^{-1}(x) = x - 9$  
11. $f^{-1}(x) = \frac{x - 1}{3}$

13. $f^{-1}(x) = x^3$  
15. c  
16. b  
17. a  
18. d

19. $g(f(x)) = \left(-\frac{2x + 3}{7}\right) = -\frac{7}{2} - \frac{2x + 3}{7} - 3 = x$

$g(f(x)) = g\left(\frac{7}{2} - 3\right) = \left(-\frac{3}{2}x - 3\right) + 6 = x$
21. \( f(g(x)) = f(\sqrt[3]{x - 5}) = (\sqrt[3]{x - 5})^3 + 5 = x \)
\( g(f(x)) = g(x^3 + 5) = \sqrt[3]{(x^3 + 5)^3} - 5 = x \)

23. (a) \( f(g(x)) = f(\frac{x}{2}) = 2 \left( \frac{x}{2} \right) = x \)
\( g(f(x)) = g(2x) = \left( \frac{2x}{2} \right) = x \)

25. (a) \( f(g(x)) = f(\frac{x - 1}{7}) = 7 \left( \frac{x - 1}{7} \right) + 1 = x \)
\( g(f(x)) = g(7x + 1) = \left( \frac{7x + 1}{7} \right) - 1 = x \)

27. (a) \( f(g(x)) = f(\sqrt[8]{8x}) = \left( \sqrt[8]{8x} \right)^8 = x \)
\( g(f(x)) = g\left( \frac{x^3}{8} \right) = \sqrt[8]{\left( \frac{x^3}{8} \right)^8} = x \)

29. (a) \( f(g(x)) = f(x^2 + 4), x \geq 0 \)
\( = \sqrt{(x^2 + 4)^2} - 4 = x \)
\( g(f(x)) = g\left( \sqrt{x - 4} \right) = \left( \sqrt{x - 4} \right)^2 + 4 = x \)

31. (a) \( f(g(x)) = f\left( \sqrt{9 - x} \right), x \leq 9 \)
\( = 9 - \left( \sqrt{9 - x} \right)^2 = x \)
\( g(f(x)) = g(9 - x^2), x \geq 0 \)
\( = \sqrt{9 - (9 - x^2)} = x \)

33. (a) \( f(g(x)) = f\left( \frac{-5x + 1}{x - 1} \right) = -\left( \frac{5x + 1}{x - 1} \right) - 1 \)
\( = -\frac{5x - 1 + 5x - 5}{x - 1} = x \)
\( g(f(x)) = g\left( \frac{x - 1}{x + 5} \right) = -\frac{5x - 1}{x + 5} - 1 \)
\( = -\frac{5x + 5 - x - 5}{x - 1 - x - 5} = x \)

39. Yes
41. No

43. The function has an inverse.
45. The function does not have an inverse.

47. The function does not have an inverse.
49. (a) \( f^{-1}(x) = \frac{x + 3}{2} \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x \).
(d) The domains and ranges of \( f \) and \( f^{-1} \) are all real numbers.

51. (a) \( f^{-1}(x) = \frac{1}{2}x + 2 \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x \).
(d) The domains and ranges of \( f \) and \( f^{-1} \) are all real numbers.

53. (a) \( f^{-1}(x) = \sqrt{4 - x^2}, \ 0 \leq x \leq 2 \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the same as the graph of \( f \).
(d) The domains and ranges of \( f \) and \( f^{-1} \) are all real numbers \( x \) such that \( 0 \leq x \leq 2 \).

55. (a) \( f^{-1}(x) = \frac{4}{x} \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the same as the graph of \( f \).
(d) The domains and ranges of \( f \) and \( f^{-1} \) are all real numbers \( x \) except \( x = 0 \).

57. (a) \( f^{-1}(x) = \frac{2x + 1}{x - 1} \)

59. (a) \( f^{-1}(x) = x^3 + 1 \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x \).
(d) The domains and ranges of \( f \) and \( f^{-1} \) are all real numbers.

61. (a) \( f^{-1}(x) = \frac{5x - 4}{6 - 4x} \)
(b) ![Graph of f^{-1}(x)]
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x \).
(d) The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) except \( x = 2 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) except \( x = \frac{1}{2} \).

65. \( g^{-1}(x) = 8x \)
67. No inverse

69. \( f^{-1}(x) = \sqrt{x} - 3 \)
71. No inverse
73. No inverse

75. \( f^{-1}(x) = \frac{x^2 - 3}{2}, \ x \geq 0 \)

77. \( f^{-1}(x) = \sqrt{x} + 2 \)
The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) such that \( x \geq 2 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) such that \( x \geq 0 \).

79. \( f^{-1}(x) = x - 2 \)
The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) such that \( x \geq -2 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) such that \( x \geq 0 \).
81. \( f^{-1}(x) = \sqrt{x} - 6 \)
   The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) such that \( x \geq -6 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) such that \( x \geq 0 \).

83. \( f^{-1}(x) = \frac{\sqrt{-2(x-5)}}{2} \)
   The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) such that \( x \geq 0 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) such that \( x \leq 5 \).

85. \( f^{-1}(x) = x + 3 \)
   The domain of \( f \) and the range of \( f^{-1} \) are all real numbers \( x \) such that \( x \geq 4 \). The domain of \( f^{-1} \) and the range of \( f \) are all real numbers \( x \) such that \( x \geq 1 \).

87. \( x + \frac{1}{2} \) 69. 600

91. \( 2 \sqrt{x} + 3 \)

93. \( \frac{x + 1}{2} \)

95. \( \frac{x + 1}{2} \)

97. (a) Yes; each European shoe size corresponds to exactly one U.S. shoe size.
   (b) 45  (c) 10  (d) 41  (e) 13

99. (a) Yes
   (b) \( S^{-1} \) represents the time in years for a given sales level.
   (c) \( S^{-1}(8430) = 6 \)
   (d) No, because then the sales for 2007 and 2009 would be the same, so the function would no longer be one-to-one.

101. (a) \( y = \frac{x - 10}{0.75} \)
   \( x \) = hourly wage; \( y \) = number of units produced
   (b) 19 units

103. False. \( f(x) = x^2 \) has no inverse.

107. | \( x \) | 1 | 3 | 4 | 6 |
    | \( y \) | 1 | 2 | 6 | 7 |

| \( x \) | 1 | 2 | 6 | 7 |
| \( f^{-1}(x) \) | 3 | 4 | 4 | 6 |

109. This situation could be represented by a one-to-one function if the runner does not stop to rest. The inverse function would represent the time in hours for a given number of miles completed.

111. This function could not be represented by a one-to-one function because it oscillates.

113. \( k = \frac{1}{4} \)

115. There is an inverse function \( f^{-1}(x) = \frac{\sqrt{x} - 1}{2} \) because the domain of \( f \) is equal to the range of \( f^{-1} \) and the range of \( f \) is equal to the domain of \( f^{-1} \).

Section 1.10  (page 108)

1. variation; regression 3. least squares regression
5. directly proportional 7. directly proportional
9. combined

11. The model is a good fit for the actual data.

13. \( y = \frac{1}{2}x + 3 \)

15. \( y = -\frac{1}{2}x + 3 \)

17. (a) and (b)

19. (a) \( S = 38.3t + 224 \)
The model is a good fit.
(d) 2007: $875.1 million; 2009: $951.7 million
(e) Each year the annual gross ticket sales for Broadway shows in New York City increase by $38.3 million.

119. (a) \( f(x) = x^2 \)
   (b) Reflection in the x-axis, horizontal shift two units to the left, and vertical shift three units upward
   (c)

121. (a) \( f(x) = |x + 2| + 3 \)
   (b) Reflection in the x-axis and vertical shift six units upward
   (c)

123. (a) \( f(x) = |x| \)
   (b) Reflections in the x-axis and the y-axis, horizontal shift four units to the right, and vertical shift six units upward
125. (a) \( f(x) = |x| \)  
(b) Horizontal shift nine units to the right and vertical stretch 
(c) 
```
\[ y = 2x + 2 \]
```
(d) \( h(x) = -2f(x - 4) \)

127. (a) \( f(x) = \sqrt{x} \)  
(b) Reflection in the x-axis, vertical stretch, and horizontal shift four units to the right 
(c) 
```
\[ y = x^2 - 2x + 4 \]
```
(d) \( h(x) = -2f(x - 4) \)

129. (a) \( x^2 + 2x + 2 \)  
(b) \( x^2 - 2x + 4 \)  
(c) \( 2x^3 - x^2 + 6x - 3 \)  
(d) \( \frac{x^2 + 3}{2x - 1}; \) all real numbers except \( x = \frac{1}{2} \)

131. (a) \( x - \frac{9}{7} \)  
(b) \( x - 8 \)  
Domains of \( f, g, f \circ g, \) and \( g \circ f: \) all real numbers

133. \( f(x) = x^3, g(x) = 1 - 2x \)

135. (a) \( (r + c)(t) = 178.8t + 856; \) This represents the average annual expenditures for both residential and cellular phone services.
(b) 
```
\[ \frac{178.8t + 856}{t} = \text{value of shipments} \]
```
(c) \( (r + c)(13) = 3180.4 \)

137. \( f^{-1}(x) = \frac{1}{2}(x - 8) \)  
139. The function has an inverse.

141.
```
\[ f^{-1}(x) = 2x + 6 \]
```

143.
```
The function has an inverse.
```

145. (a) \( f^{-1}(x) = 2x + 6 \)  
(b) 
```
\[ f^{-1}(x) = 2x + 6 \]
```
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x. \)
(d) Both \( f \) and \( f^{-1} \) have domains and ranges that are all real numbers.

147. (a) \( f^{-1}(x) = x^2 - 1, x \geq 0 \)  
(b) 
```
\[ f^{-1}(x) = x^2 - 1, x \geq 0 \]
```
(c) The graph of \( f^{-1} \) is the reflection of the graph of \( f \) in the line \( y = x. \)
(d) \( f \) has a domain of \([-1, \infty)\) and a range of \([0, \infty); f^{-1} \) has a domain of \([0, \infty)\) and a range of \([-1, \infty).\)

149. \( x > 4; f^{-1}(x) = \sqrt{\frac{x}{2} + 4}, x \neq 0 \)

151. (a) 
```
\[ \text{Value of shipments (in billions of dollars)} \]
```
(b) The model is a good fit for the actual data.

153. Model: \( k = \frac{2}{7}; 3.2 \text{ km}, 16 \text{ km} \)

155. A factor of 4  
157. About 2 h, 26 min
159. False. The graph is reflected in the x-axis, shifted 9 units to the left, and then shifted 13 units downward.

161. The Vertical Line Test is used to determine if the graph of \( y \) is a function of \( x \). The Horizontal Line Test is used to determine if a function has an inverse function.

**Chapter Test**  (page 121)

1. Midpoint: \( \left( \frac{2}{3}, \frac{1}{2} \right) \); Distance: \( \sqrt{\frac{16}{9}} \)

2. About 11.937 cm

3. No symmetry

4. \( y \)-axis symmetry

5. \( y \)-axis symmetry

6. \( (x - 1)^2 + (y - 3)^2 = 16 \)

7. \( y = -2x + 1 \)

8. \( y = -1.7x + 5.9 \)

9. (a) \( 5x + 2y = 8 = 0 \)  (b) \( -2x + 5y = 20 = 0 \)

10. (a) \( -\frac{1}{8} \)  (b) \( -\frac{1}{28} \)  (c) \( \frac{\sqrt{3}}{\sqrt{3}^2 - 18x} \)

11. \( x \leq 3 \)

\[
\begin{align*}
&(-\frac{3}{2}, 0), (6, 0) \\
&f(x) = x^2 - 2x - 3 \\
g(x) = -x^2 + 2x + 3 \\
f(x) = 2x^2 + 7x + 3 \\
g(x) = -2x^2 - 7x - 3
\end{align*}
\]

65. 
\[f(x) = x^2 - 10x\]

67. 
\[f(x) = x^2 - 10x\]

69. 
\[f(x) = 2x^2 + 7x + 3 \\
g(x) = -2x^2 - 7x - 3
\]

71. 
\[55, 55, 73, 12, 6, 16, 20, 77, 20\text{ fixtures}\]

79. 
(a) $14,000,000; $14,375,000; $13,500,000 \\
(b) $24; $14,400,000

81. 
(a) \[A = \frac{8x(50 - x)}{3}\]

(b) 
\[
\begin{array}{c|c|c|c|c|c|c}
\hline
x & 5 & 10 & 15 & 20 & 25 & 30 \\
\hline
a & 600 & 1066\frac{2}{3} & 1400 & 1600 & 1666\frac{2}{3} & 1600 \\
\hline
\end{array}
\]

(c) \[x = 25\text{ ft, } y = 33\frac{1}{3}\text{ ft}\]

(d) \[A = -\frac{8}{3}(x - 25)^2 + \frac{1000}{3}\]

(e) They are identical.

83. 
(a) \[R = -100x^2 + 3500x, \quad 15 \leq x \leq 20\]

(b) $17.50; $30,625

85. 
(a) \[4200\]

(b) 4075 cigarettes; Yes, the warning had an effect because the maximum consumption occurred in 1966.

(c) 7366 cigarettes per year; 20 cigarettes per day

87. True. The equation has no real solutions, so the graph has no \(y\)-intercepts.

89. True. The graph of a quadratic function with a negative leading coefficient will be a downward-opening parabola.

91. \[b = \pm 20\]

93. \[b = \pm 8\]

95. \[f(x) = a\left(x + \frac{b}{2a}\right)^2 + \frac{4ac - b^2}{4a}\]

97. (a) 
As \(|a|\) increases, the parabola becomes narrower. For \(a > 0\), the parabola opens upward. For \(a < 0\), the parabola opens downward.
For $h < 0$, the vertex will be on the negative $x$-axis. For $h > 0$, the vertex will be on the positive $x$-axis. As $|h|$ increases, the parabola moves away from the origin.

As $|k|$ increases, the vertex moves upward (for $k > 0$) or downward (for $k < 0$), away from the origin.

99. Yes. A graph of a quadratic equation whose vertex is on the $x$-axis has only one $x$-intercept.

   Relative minima: 2
   Relative maximum: 1
   The number of zeros is the same as the degree, and
   the number of extrema is one less than the degree.

   (c) Zeros: 3
   Relative minimum: 1
   Relative maximum: 1
   The number of zeros and the number of extrema are both less than the degree.

    Domain: \(0 < x < \frac{9}{2}\)
113. \(x = 38.4, \text{ or } \$384,000\)
115. (a) \(V(x) = x^3 + 9x^2 + 26x + 24 = 120\)
    (b) 4 ft \times 5 ft \times 6 ft
117. \(x \approx 40, \text{ or } 4000 \text{ units}\)
119. No. Setting \(p = 9,000,000\) and solving the resulting equation yields imaginary roots.
121. False. The most complex zeros it can have is two, and the Linear Factorization Theorem guarantees that there are three linear factors, so one zero must be real.
123. \(r_1, r_2, r_3\) 125. \(5 + r_1, 5 + r_2, 5 + r_3\)
127. The zeros cannot be determined.

129. Answers will vary. There are infinitely many possible functions for \(f\). Sample equation and graph:
\[f(x) = -2x^3 + 3x^2 + 11x - 6\]

131. Answers will vary. Sample graph:

133. \(f(x) = x^4 + 5x^2 + 4\)
135. \(f(x) = x^3 - 3x^2 + 4x - 2\)
137. (a) \(-2, 1, 4\)
    (b) The graph touches the \(x\)-axis at \(x = 1\).
    (c) The least possible degree of the function is 4, because there are at least four real zeros (1 is repeated) and a function can have at most the number of real zeros equal to the degree of the function. The degree cannot be odd by the definition of multiplicity.
    (d) Positive. From the information in the table, it can be concluded that the graph will eventually rise to the left and rise to the right.
    (e) \(f(x) = x^4 - 4x^3 - 3x^2 + 14x - 8\)
    (f) \(f(x) = x^4 - 4x^3 - 3x^2 + 14x - 8\)

139. (a) Not correct because \(f\) has \((0, 0)\) as an intercept.
    (b) Not correct because the function must be at least a fourth-degree polynomial.
    (c) Correct function
    (d) Not correct because \(k\) has \((-1, 0)\) as an intercept.

    Horizontal asymptote: $y = 25$

85. False. Polynomials do not have vertical asymptotes.
87. False. If the degree of the numerator is greater than the degree of the denominator, no horizontal asymptote exists. However, a slant asymptote exists only if the degree of the numerator is one greater than the degree of the denominator.

Section 2.7 (page 201)

1. positive; negative  3. zeros; undefined values
5. (a) No  (b) Yes  (c) Yes  (d) No
7. (a) Yes  (b) No  (c) No  (d) Yes
9. $\frac{3}{4}$, 1  11. 4, 5
13. $(-3, 3)$  15. $[-7, 3]$
17. $(-\infty, -5] \cup [1, \infty)$
19. $(-3, 2)$
21. $(-3, 1)$
23. $(-\infty, -\frac{4}{3}) \cup (5, \infty)$
25. $(-\infty, -3) \cup (6, \infty)$
27. $(-1, 1) \cup (3, \infty)$
29. $x = \frac{1}{2}$

31. $(-\infty, 0) \cup (0, \frac{2}{5})$
33. $[-2, 0) \cup [2, \infty)$
35. $[-2, \infty)$

The model fits the data well.
(b) $N = -0.00412t^4 + 0.1705t^3 - 2.538t^2 + 16.55t + 31.5$
(d) 2003 to 2006
(e) No: The model decreases sharply after 2006.
89. (c) Answers will vary.
(b) $0 \leq x < 2$
(d) $|x| \geq 2$
83. (a) $(-\infty, -4] \cup [4, \infty)$
(b) If $a > 0$ and $c > 0$, $b \leq -2\sqrt{ac}$ or $b \geq 2\sqrt{ac}$.
85. (a) \((-\infty, -2\sqrt{30}] \cup [2\sqrt{30}, \infty)\)
(b) If \(a > 0\) and \(c > 0\), \(b \leq -2\sqrt{ac}\) or \(b \geq 2\sqrt{ac}\).

87.

For part (b), the \(y\)-values that are less than or equal to 0 occur only at \(x = -1\).

For part (c), there are no \(y\)-values that are less than 0.

For part (d), the \(y\)-values that are greater than 0 occur for all values of \(x\) except 2.

**Review Exercises (page 206)**

1. (a)

   Vertical stretch

(b) Vertical stretch and reflection in the \(x\)-axis

(c) Vertical shift two units upward

(d) Horizontal shift two units to the left

3. \(g(x) = (x - 1)^2 - 1\)

5. \(f(x) = (x + 4)^2 - 6\)

   Vertex: \((1, -1)\)
   Axis of symmetry: \(x = 1\)
   \(x\)-intercepts: \((0, 0), (2, 0)\)

7. \(f(t) = -2(t - 1)^2 + 3\)

9. \(h(x) = 4(x + \frac{1}{2})^2 + 12\)

   Vertex: \((1, 3)\)
   Axis of symmetry: \(t = 1\)
   \(x\)-intercepts: \(\left(1 \pm \frac{\sqrt{6}}{2}, 0\right)\)

   No \(x\)-intercept

11. \(h(x) = (x + \frac{3}{2})^2 - \frac{41}{4}\)

13. \(f(x) = \frac{1}{2}(x + \frac{3}{2})^2 - \frac{41}{4}\)

   Vertex: \(\left(-\frac{3}{2}, -\frac{41}{4}\right)\)
   Axis of symmetry: \(x = -\frac{3}{2}\)
   \(x\)-intercepts: \(\left(\pm\frac{\sqrt{41}}{2}, 0\right)\)

15. \(f(x) = -\frac{1}{2}(x - 4)^2 + 1\)

17. \(f(x) = (x - 1)^2 - 4\)

   (b) \(y = 500 - x\)
   \(A(x) = 500x - x^2\)

   (c) \(x = 250, y = 250\)

21. (a) \(y = 1091\) units
25. \[ y \] \[ y \]
27. \[ y \] \[ y \]

31. Falls to the left, falls to the right
33. Rises to the left, rises to the right
35. \(-8, \frac{4}{3}\), odd multiplicity; turning points: 1
37. \(0, \pm \sqrt{3}\), odd multiplicity; turning points: 2
39. \(0, \) even multiplicity; \( \frac{5}{2} \), odd multiplicity; turning points: 2

149. \((-\infty, 0) \cup [4, 5] \)  
151. 4.9%  
153. False. A fourth-degree polynomial can have at most four zeros, and complex zeros occur in conjugate pairs.
155. Find the vertex of the quadratic function and write the function in standard form. If the leading coefficient is positive, the vertex is a minimum. If the leading coefficient is negative, the vertex is a maximum.

157. An asymptote of a graph is a line to which the graph becomes arbitrarily close as \( x \) increases or decreases without bound.

**Chapter Test**  (page 210)

1. (a) Reflection in the \( x \)-axis followed by a vertical shift two units upward
   (b) Horizontal shift \( \frac{5}{2} \) units to the right
2. \( y = (x - 3)^2 - 6 \)
3. (a) 50 ft
   (b) 5. Yes, changing the constant term results in a vertical translation of the graph and therefore changes the maximum height.
4. Rises to the left, falls to the right

![Graph of a quadratic function]

5. \( 3x + \frac{x - 1}{x^2 + 1} \)
6. \( 2x^3 + 4x^2 + 3x + 6 + \frac{9}{x - 2} \)
7. \( (2x - 5)(x + \sqrt{3})(x - \sqrt{3}) \)
   Zeros: \( \frac{5}{2}, \pm \sqrt{3} \)
8. (a) \(-3 + 5i\)  (b) 7 9. \(-2 - i\)
10. \( f(x) = x^4 - 7x^3 + 17x^2 - 15x \)
11. \( f(x) = 4x^3 - 16x + 16 \)
12. \(-5, -\frac{1}{3}, 1\) 13. \(-2, 4, -1 \pm \sqrt{2}i\)
14. x-intercepts: \((-2, 0), (2, 0)\)
   Vertical asymptote: \( x = 0 \)
   Horizontal asymptote: \( y = -1 \)

![Graph of a rational function]

15. x-intercept: \((-\frac{1}{2}, 0)\)
   y-intercept: \((0, \frac{3}{2})\)
   Vertical asymptote: \( x = -4 \)
   Horizontal asymptote: \( y = 2 \)

![Graph of a rational function]

16. y-intercept: \((0, -2)\)
   Vertical asymptote: \( x = 1 \)
   Slant asymptote: \( y = x + 1 \)

![Graph of a rational function]

17. \( x < -4 \) or \( x > \frac{3}{2} \)
18. \( x \leq -12 \) or \( -6 < x < 0 \)

![Graph of a rational function]

**Problem Solving**  (page 213)

1. Answers will vary. 3. 2 in. × 2 in. × 5 in.
5. (a) and (b) \( y = -x^2 + 5x - 4 \)
7. (a) \( f(x) = (x - 2)x^2 + 5 = x^3 - 2x^2 + 5 \)
   (b) \( f(x) = -(x + 3)x^2 + 1 = -x^3 - 3x^2 + 1 \)
9. \((a + bi)(a - bi) = a^2 + abi - abi - b^2i^2\)
   \[ = a^2 + b^2 \]
11. (a) As \( |a| \) increases, the graph stretches vertically. For \( a < 0 \), the graph is reflected in the \( x \)-axis.
   (b) As \( |b| \) increases, the vertical asymptote is translated. For \( b > 0 \), the graph is translated to the right. For \( b < 0 \), the graph is reflected in the \( x \)-axis and is translated to the left.

**Chapter 3**

**Section 3.1**  (page 224)

1. algebraic 3. One-to-One 5. \( A = P\left(1 + \frac{r}{n}\right)^{nt} \)

34. 1.717
35. 0.281
36. $\ln(x + 4) + \ln(x - 4) - 4 \ln x, x > 4$
37. $\ln \frac{x^2}{\sqrt{x + 3}}, x > 0$
38. $x = \frac{\ln 12}{2} = 1.242$
39. $\ln 6 = 1.792$ or $\ln 7 = 1.946$
40. $e^6 - 2 = 401.429$
Answers to Odd-Numbered Exercises and Tests  A131

41. (a)  
(b) $S = -0.0297t^3 + 1.175t^2 - 12.96t + 79.0$
(c) 

The model is a good fit for the data.
(d) $25.3$ billion; Answers will vary. Sample answer: No, this is not reasonable because the model decreases sharply after 2009.

42. 6.3 h

Problem Solving  (page 277)

1. 

$y = 0.5^x$ and $y = 1.2^x$

3. As $x \to \infty$, the graph of $e^x$ increases at a greater rate than the graph of $x^n$.

5. Answers will vary.

7. (a) 
(b) 
(c) 

9. $f^{-1}(x) = \ln\left(\frac{x + \sqrt{x^2 + 4}}{2}\right)$

11. c

13. $t = \frac{\ln c_1 - \ln c_2}{(\frac{1}{k_2} - \frac{1}{k_1})\ln 1.0310}$

15. (a) $y_1 = 252.606(1.0310)^t$
(b) $y_2 = 400.88t^2 - 1464.6t + 291,782$
(c) 

(d) The exponential model is a better fit. No, because the model is rapidly approaching infinity.

17. 1. $e^x$

19. $y_4 = (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3 - \frac{1}{4}(x - 1)^4$

The pattern implies that

$\ln x = (x - 1) - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3 - \cdots$.

21.

101. (a) 2 cm  (b) 0.11 cm  (c) -1.2 cm

103. False. In each of the four quadrants, the signs of the secant function and the cosine function will be the same, because these functions are reciprocals of each other.

105. As \( \theta \) increases from 0\(^\circ\) to 90\(^\circ\), \( x \) decreases from 12 cm to 0 cm and \( y \) increases from 0 cm to 12 cm. Therefore, \( \sin \theta = y/12 \) increases from 0 to 1 and \( \cos \theta = x/12 \) decreases from 1 to 0. Thus, \( \tan \theta = y/x \) increases without bound. When \( \theta = 90^\circ \), the tangent is undefined.

107. (a) \( \sin t = y \)  (b) \( r = 1 \) because it is a unit circle.
\( \cos t = x \)
(c) \( \sin \theta = y \)  (d) \( \sin t = \sin \theta, \text{ and } \cos t = \cos \theta \).
\( \cos \theta = x \)

15. Period: \( \frac{5\pi}{2} \); Amplitude: \( \frac{5}{3} \)

17. Period: 1; Amplitude: \( \frac{1}{4} \)

19. \( g \) is a shift of \( f \) \( \pi \) units to the right.

21. \( g \) is a reflection of \( f \) in the x-axis.

23. The period of \( f \) is twice the period of \( g \).

25. \( g \) is a shift of \( f \) three units upward.

27. The graph of \( g \) has twice the amplitude of the graph of \( f \).

29. The graph of \( g \) is a horizontal shift of the graph of \( f \) \( \pi \) units to the right.

31.
35. \[ y = g(x) \]

37. \[ y = f(x) \]

39. \[ y = f(x) \]

41. \[ y = g(x) \]

43. \[ y = f(x) \]

45. \[ y = g(x) \]

47. \[ y = f(x) \]

49. \[ y = g(x) \]

51. \[ y = f(x) \]

53. \[ y = g(x) \]

55. \[ y = f(x) \]

57. \[ y = g(x) \]

59. \[ y = f(x) \]

61. (a) \( g(x) \) is obtained by a horizontal shrink of four, and one cycle of \( g(x) \) corresponds to the interval \([\pi/4, 3\pi/4]\).

(b) \[ y = f(x) \]

(c) \( g(x) = f(4x - \pi) \)

63. (a) One cycle of \( g(x) \) corresponds to the interval \([\pi, 3\pi] \), and \( g(x) \) is obtained by shifting \( f(x) \) upward two units.

(b) \[ y = f(x) \]

(c) \( g(x) = f(x - \pi) + 2 \)

65. (a) One cycle of \( g(x) \) is \([\pi/4, 3\pi/4] \), \( g(x) \) is also shifted down three units and has an amplitude of two.

(b) \[ y = f(x) \]

(c) \( g(x) = 2f(4x - \pi) - 3 \)

67. \[ y = f(x) \]

69. \[ y = f(x) \]
71. 

73. \( a = 2, \ b = 1 \)  
75. \( a = -4, \ \ b = 4 \)  
77. \( a = -3, \ \ b = 2, \ c = 0 \)  
79. \( a = 2, \ b = 1, \ c = -\frac{\pi}{4} \)  

81. 

83. \( y = 1 + 2 \sin(2x - \pi) \)  
85. \( y = \cos(2x + 2\pi) - \frac{3}{2} \)  
87. (a) 6 sec  
(b) 10 cycles/min  
(c) 

89. (a) \( I(t) = 46.2 + 32.4 \cos\left(\frac{\pi}{6}t - 3.67\right) \)  
(b) 

The model fits the data well.  
(c) 

The model fits the data well.  
(d) Las Vegas: 80.6°F; International Falls: 46.2°F  
The constant term gives the annual average temperature.  
(e) 12; yes; One full period is one year.  
(f) International Falls; amplitude; The greater the amplitude,  
the greater the variability in temperature.  
91. (a) \( \frac{1}{60} \) sec  
(b) 440 cycles/sec  
93. (a) 365; Yes, because there are 365 days in a year.  
(b) 30.3 gal; the constant term  
95. False. The graph of \( f(x) = \sin(x + 2\pi) \) translates the graph  
of \( f(x) = \sin x \) exactly one period to the left so that the two  
graphs look identical.  
97. True. Because \( \cos x = \sin \left(x + \frac{\pi}{2}\right) \), \( y = -\cos x \) is a  
reflection in the x-axis of \( y = \sin \left(x + \frac{\pi}{2}\right) \).  
99. 

The value of \( c \) is a horizontal translation of the graph.  
101. 

Conjecture: 
\[ \sin x = \cos \left(x - \frac{\pi}{2}\right) \]  
103. (a) 

The graphs appear to coincide from \(-\frac{\pi}{2}\) to \(\frac{\pi}{2}\).  
(b) 

The graphs appear to coincide from \(-\frac{\pi}{2}\) to \(\frac{\pi}{2}\).  
(c) \( \frac{x^7}{7!} - \frac{x^6}{6!} \)  
The interval of accuracy increased.

65. (a)  
(b) \(\frac{\pi}{6} < x < \frac{5\pi}{6}\)  

(c) \(f\) approaches 0 and \(g\) approaches \(+\infty\) because the cosecant is the reciprocal of the sine. 

67. The expressions are equivalent except when \(\sin x = 0\), \(y_1\) is undefined. 

69. The expressions are equivalent. 

71. The expressions are equivalent.
73. \( d, f \to 0 \) as \( x \to 0 \).
74. \( a, f \to 0 \) as \( x \to 0 \).
75. \( b, g \to 0 \) as \( x \to 0 \).
76. \( c, g \to 0 \) as \( x \to 0 \).
77. 

The functions are equal.

81. 

As \( x \to \infty \), \( g(x) \to 0 \).
82. 

As \( x \to \infty \), \( f(x) \to 0 \).
83. 

As \( x \to 0 \), \( g(x) \to 1 \).
84. 

As \( x \to 0 \), \( f(x) \) oscillates between 1 and \(-1\).
85. 

As \( x \to 0 \), \( y \to \infty \).
86. 

As \( x \to 0 \), \( y \to \infty \).
87. 

As \( x \to 0 \), \( f(x) \) oscillates between 1 and \(-1\).

91. \( d = 7 \cot x \)

93. (a) Period of \( H(t) \): 12 mo
(b) Summer; winter
(c) About 0.5 mo
95. (a) \( 0.6 \)
(b) \( y \) approaches 0 as \( t \) increases.

97. True. \( y = \sec x \) is equal to \( y = 1/\cos x \), and if the reciprocal of \( y = \sin x \) is translated \( \pi/2 \) units to the left, then

\[
\frac{1}{\sin \left( x + \frac{\pi}{2} \right)} = \frac{1}{\cos x} = \sec x.
\]
Asymptotes: $y = \pm 1$

$$\frac{9}{\sqrt{x^2 + 81}} \quad x > 0; \quad \frac{-9}{\sqrt{x^2 + 81}} \quad x < 0$$

The graph of $g$ is a horizontal shift one unit to the right of $f$.

The graph of $\frac{1}{x}$ is shifted to the right one unit.

The graph implies that the identity is true.

Domain: $(-\infty, \infty)$
Range: $(0, \pi)$

(b) The domains and ranges of the functions are restricted.

The graphs of $f \cdot f^{-1}$ and $f^{-1} \cdot f$ differ because of the domains and ranges of $f$ and $f^{-1}$.

(c) Answers will vary.

61-63. Answers will vary. 65. 1  67. 2

69. Answers will vary.

71. True. Many different techniques can be used to verify identities.

73. The equation is not an identity because sin \theta = \pm \sqrt{1 - cos^2 \theta}.

Possible answer: \frac{7\pi}{4}

75. The equation is not an identity because 1 - cos^2 \theta = sin^2 \theta.

Possible answer: -\frac{\pi}{2}

77. The equation is not an identity because 1 + tan^2 \theta = sec^2 \theta.

Possible answer: \frac{\pi}{6}

111. \[ \frac{1}{2} \sqrt{10} \text{ ft} \]

115. False. If \( (\pi/2) < \theta < \pi \), then \( \cos(\theta/2) > 0 \). The sign of \( \cos(\theta/2) \) depends on the quadrant in which \( \theta/2 \) lies.

117. True. \( 4 \sin(-x) \cos(-x) = 4(-\sin x) \cos x \)
\( = -4 \sin x \cos x \)
\( = -2(2 \sin x \cos x) \)
\( = -2 \sin 2x \)

119. Reciprocal identities:
\[ \sin \theta = \frac{1}{\csc \theta}, \cos \theta = \frac{1}{\sec \theta}, \tan \theta = \frac{1}{\cot \theta}, \csc \theta = \frac{1}{\sin \theta}, \sec \theta = \frac{1}{\cos \theta}, \cot \theta = \frac{1}{\tan \theta} \]

Quotient identities: \( \tan \theta = \frac{\sin \theta}{\cos \theta}, \cot \theta = \frac{\cos \theta}{\sin \theta} \)

Pythagorean identities: \( \sin^2 \theta + \cos^2 \theta = 1, 1 + \tan^2 \theta = \sec^2 \theta, 1 + \cot^2 \theta = \csc^2 \theta \)

121. \(-1 \leq \sin x \leq 1\) for all \( x \)
123. \( y_1 = y_2 + 1 \)
125. \(-1.8431, 2.1758, 3.9903, 8.8935, 9.8820 \)

\textbf{Chapter Test (page 421)}

1. \( \sin \theta = \frac{6}{\sqrt{61}}, \csc \theta = -\frac{\sqrt{61}}{6} \)
\( \cos \theta = -\frac{5}{\sqrt{61}}, \sec \theta = -\frac{\sqrt{61}}{5} \)
\( \tan \theta = \frac{6}{5}, \cot \theta = \frac{5}{6} \)

2. 1 3 4, \( \csc \theta \sec \theta \)

5. \( \theta = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}, \pi < \theta < 2\pi \)

6. \( y_1 = y_2 \)

7–12. Answers will vary.
13. \( \frac{1}{8}(3 - 4 \cos x + \cos 2x) \)

14. \( \tan 2\theta \)
15. \( 2(\sin 5\theta + \sin \theta) \)

16. \(-2 \sin 2\theta \sin \theta \)
17. \( 0, \frac{3\pi}{4}, \pi, \frac{7\pi}{4} \)

18. \( \frac{\pi}{6}, \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{6} \)

19. \( \frac{\pi}{6}, \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{6} \)

20. \( \frac{\pi}{6}, \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{6} \)

21. \(-2.596, 0, 2.596 \)

22. \( \sqrt{2} - \sqrt{6} \frac{4}{4} \)

23. \( \sin 2u = -\frac{20}{21}, \cos 2u = -\frac{20}{21}, \tan 2u = \frac{20}{21} \)

24. Day 123 to day 223

25. \( t = 0.26 \text{ min} \)
\( 0.58 \text{ min} \)
\( 0.89 \text{ min} \)
\( 1.20 \text{ min} \)
\( 1.52 \text{ min} \)
\( 1.83 \text{ min} \)

\textbf{Problem Solving (page 425)}

1. (a) \( \cos \theta = \pm \sqrt{1 - \sin^2 \theta} \)
\( \tan \theta = \pm \frac{\sin \theta}{\sqrt{1 - \sin^2 \theta}} \)
\( \cot \theta = \pm \frac{\cos \theta}{\sin \theta} \)
\( \sec \theta = \pm \frac{1}{\cos \theta} \)
\( \csc \theta = \pm \frac{1}{\sin \theta} \)

(b) \( \sin \theta = \pm \sqrt{1 - \cos^2 \theta} \)
\( \tan \theta = \pm \frac{\sin \theta}{\sqrt{1 - \cos^2 \theta}} \)
\( \cot \theta = \pm \frac{\cos \theta}{\sin \theta} \)
\( \sec \theta = \pm \frac{1}{\cos \theta} \)
\( \csc \theta = \pm \frac{1}{\sin \theta} \)

3. Answers will vary.
5. \( u + v = w \)

7. \( \sin \frac{\theta}{2} = \sqrt{\frac{1 - \cos \theta}{2}} \)
\( \cos \frac{\theta}{2} = \sqrt{\frac{1 + \cos \theta}{2}} \)
\( \tan \frac{\theta}{2} = \frac{\sin \theta}{1 + \cos \theta} \)

9. (a) \( y = 0.365x + 365 \)

(b) \( t = 91 \) (April 1), \( t = 274 \) (October 1)
(c) Seward; The amplitudes: 6.4 and 1.9
(d) 365.2 days

11. (a) \( \frac{\pi}{6} \leq x \leq \frac{5\pi}{6} \)
(b) \( 2\pi \leq x \leq \frac{4\pi}{3} \)
(c) \( \frac{\pi}{2} < x < \frac{3\pi}{2} \)
(d) \( 0 \leq x \leq \frac{\pi}{4} \)

13. (a) \( \sin(u + v + w) = \sin u \cos v \cos w - \sin u \sin v \sin w + \cos u \sin v \cos w + \cos u \cos v \sin w \)

(b) \( \tan(u + v + w) = \frac{\tan u + \tan v + \tan w - \tan u \tan v \tan w}{1 - \tan u \tan v - \tan u \tan w - \tan v \tan w} \)

15. (a) \( 233.3 \text{ times/sec} \)
Chapter 6

Section 6.1 (page 434)

1. oblique 3. angles; side
5. \( A = 30^\circ, a = 14.14, c = 27.32 \)
7. \( C = 120^\circ, b = 4.75, c = 7.17 \)
9. \( B = 60.9^\circ, b = 19.32, c = 6.36 \)
11. \( B = 42.4^\circ, a = 22.05, b = 14.88 \)
13. \( C = 80^\circ, a = 5.82, b = 9.20 \)
15. \( C = 83^\circ, a = 0.62, b = 0.51 \)
17. \( B = 21.55^\circ, C = 122.45^\circ, c = 11.49 \)
19. \( A = 104.11^\circ, C = 154.19^\circ, c = 11.03 \)
21. \( B = 9.43^\circ, C = 25.57^\circ, c = 10.53 \)
23. \( B = 18.13^\circ, C = 51.23^\circ, c = 40.06 \)
25. \( B = 48.74^\circ, C = 21.26^\circ, c = 48.23 \)
27. No solution
29. Two solutions:
   \( B = 72.21^\circ, C = 49.79^\circ, c = 10.27 \)
   \( B = 107.79^\circ, C = 14.21^\circ, c = 3.30 \)
31. No solution 33. \( B = 45^\circ, C = 90^\circ, c = 1.41 \)
35. (a) \( b \leq 5, b = \frac{5}{\sin 36^\circ} \)  (b) \( 5 < b < \frac{5}{\sin 36^\circ} \)
   (c) \( b > \frac{5}{\sin 36^\circ} \)
37. (a) \( b \leq 10.8, b = \frac{10.8}{\sin 10^\circ} \)  (b) \( 10.8 < b < \frac{10.8}{\sin 10^\circ} \)
   (c) \( b > \frac{10.8}{\sin 10^\circ} \)
39. 10.4 41. 1675.2 43. 3204.5 45. 24.1 m
47. 16.1\(^\circ\) 49. 77 m
51. (a) \( 900 \text{ ft} \) (b) 22.6 mi (c) 21.4 mi (d) 7.3 mi
53. 3.2 mi 55. 5.86 mi
57. True. If an angle of a triangle is obtuse (greater than 90\(^\circ\)), then the other two angles must be acute and therefore less than 90\(^\circ\). The triangle is oblique.
59. False. If just three angles are known, the triangle cannot be solved.
61. (a) \( A = 20\left(15 \sin \frac{30}{2} - 4 \sin \frac{\theta}{2} - 6 \sin \theta \right) \)
   (b) \( 179^\circ \)
   (c) Domain: \( 0 \leq \theta \leq 1.6690 \)
   The domain would increase in length and the area would have a greater maximum value.

Section 6.2 (page 441)

1. Cosines 3. \( b^2 = a^2 + c^2 - 2ac \cos B \)
5. \( A = 38.62^\circ, B = 48.51^\circ, C = 92.87^\circ \)
7. \( B = 23.79^\circ, C = 126.21^\circ, a = 18.59 \)
9. \( A = 30.11^\circ, B = 43.16^\circ, C = 106.73^\circ \)
11. \( A = 92.94^\circ, B = 43.53^\circ, C = 43.53^\circ \)
13. \( B = 27.46^\circ, C = 32.54^\circ, a = 11.27 \)
15. \( A = 141.45^\circ, C = 27.40^\circ, b = 11.87 \)
17. \( A = 27.10^\circ, C = 27.10^\circ, b = 65.84 \)
19. \( A = 33.80^\circ, B = 103.20^\circ, c = 0.54 \)

\( \begin{array}{cccccccc}

107. False. They are equally spaced around the circle centered at the origin with radius \( \frac{\pi}{7} \).

109. Answers will vary. \[ 111. (a) r^2 \quad (b) \cos \theta + i \sin \theta \]

113. Answers will vary.

115. The given equation can be written as \[ x^4 = -16 = 16(\cos \pi + i \sin \pi) \]
which means that you can solve the equation by finding the four fourth roots of \(-16\). Each of these roots has the form \[ \sqrt[4]{16} \left( \cos \frac{\pi + 2mk}{4} + i \sin \frac{\pi + 2mk}{4} \right) \].

**Review Exercises (page 480)**

1. \[ C = 72^\circ, b = 12.21, c = 12.36 \]
2. \[ A = 26^\circ, a = 24.89, c = 56.23 \]
3. \[ C = 66^\circ, a = 2.53, b = 9.11 \]
4. \[ B = 108^\circ, a = 11.76, c = 21.49 \]
5. \[ A = 20.41^\circ, C = 9.59^\circ, a = 20.92 \]
6. \[ B = 39.48^\circ, C = 65.52^\circ, c = 48.24 \]

145. SEE YOU FRIDAY

147. False. The matrix must be square.

149. An error message appears because \((1 \cdot 6 - (-2) \cdot (-3)) = 0\).

151. If \(A\) is a square matrix, the cofactor \(C_{ij}\) of the entry \(a_{ij}\) is \((-1)^{i+j}M_{ij}\), where \(M_{ij}\) is the determinant obtained by deleting the \(i\)th row and \(j\)th column of \(A\). The determinant of \(A\) is the sum of the entries of any row or column of \(A\) multiplied by their respective cofactors.

153. The part of the matrix corresponding to the coefficients of the system reduces to a matrix in which the number of rows with nonzero entries is the same as the number of variables.

Chapter Test  (page 635)

71. True. Two events are independent if the occurrence of one has no effect on the occurrence of the other. 
73. (a) As you consider successive people with distinct birthdays, the probabilities must decrease to take into account the birth dates already used. Because the birth dates of people are independent events, multiply the respective probabilities of distinct birthdays. 
(b) $\frac{365}{365} \times \frac{364}{365} \times \frac{363}{365} \times \frac{362}{365}$ (c) Answers will vary. 
(d) $Q_r$ is the probability that the birthdays are not distinct, which is equivalent to at least two people having the same birthday. 

(f) 23; $Q_r > 0.5$ for $n \geq 23$. 

75. Meteorological records indicate that over an extended period of time with similar weather conditions it will rain 40% of the time.

(3, 8) \( \leftrightarrow \) (1, 5): slope = \( \frac{3}{8} \)
(1, 5); 63.3°, (4, 5); 71.6°, (3, 8); 52.1°
49. \((-4, -1) \leftrightarrow (3, 2): \) slope = \(\frac{3}{7}\)
   \((3, 2) \leftrightarrow (1, 0): \) slope = 1
   \((1, 0) \leftrightarrow (-4, -1): \) slope = \(\frac{1}{5}\)
   \((-4, -1): 11.9^\circ; (3, 2): 21.8^\circ; (1, 0): 146.3^\circ\)

51. 0

53. \(\frac{4\sqrt{10}}{5} \approx 2.5298\)

55. 7

57. \(8\sqrt{37} = 1.3152\)

59. (a) 4 (c) 8

61. (a)

63. \(2\sqrt{2}\)

65. 0.1003, 1054 ft

67. 31.0°

69. \(a = 33.69^\circ; \beta = 56.31^\circ\)

71. True. The inclination of a line is related to its slope by \(m = \tan \theta\).
   If the angle is greater than \(\frac{\pi}{2}\) but less than \(\pi\), then the angle is in the second quadrant, where the tangent function is negative.

73. (a) \(d = \frac{4}{\sqrt{m^2 + 1}}\)
   (c) \(m = 0\)
   (d) The graph has a horizontal asymptote of \(d = 0\). As the slope becomes larger, the distance between the origin and the line, \(y = mx + 4\), becomes smaller and approaches 0.

75. (a) \(d = \frac{3|m + 1|}{\sqrt{m^2 + 1}}\)
   (c) \(m = 1\)
   (d) Yes. \(m = -1\)

77. (e) \(d = 3\). As the line approaches the vertical, the distance approaches 3.

   Perihelion: 0.59 astronomical unit

65. (a) $\frac{x^2}{321.84} + \frac{y^2}{20.89} = 1$
   (b) $-8\sqrt{0.04 - \theta^2}$
   (c) The bottom half
69.\[\left\{ \frac{x}{2}, \frac{y}{\sqrt{2}} \right\}\quad 71.\[\left\{ \frac{x}{\sqrt{5}}, \frac{y}{\sqrt{2}} \right\}\]

73. False. The graph of \((x^2/4) + y^4 = 1\) is not an ellipse. The degree of \(y\) is 4, not 2.

75. (a) \(A = \pi a(20 - a)\)  
(b) \( \frac{x^2}{196} + \frac{y^2}{36} = 1\)

(c) \[
\begin{array}{c|cccccc}
\theta & 8 & 9 & 10 & 11 & 12 & 13 \\
\hline
(a) & 301.6 & 311.0 & 314.2 & 311.0 & 301.6 & 285.9
\end{array}
\]

(d) The shape of an ellipse with a maximum area is a circle. The maximum area is found when \(a = 10\) (verified in part c) and therefore \(b = 10\), so the equation produces a circle.

77. \(\frac{(x - 6)^2}{324} + \frac{(y - 2)^2}{308} = 1\)

   Vertices: \((1, -3 \pm \sqrt{2})\)  
   Foci: \((1, -3 \pm 2\sqrt{3})\)  
   Asymptotes: \(y = -3 \pm \frac{2}{(x - 1)}\)

29. \(\frac{x^2}{4} - \frac{y^2}{12} = 1\)  
31. \(\frac{x^2}{1} - \frac{y^2}{25} = 1\)
The equation is a

\[
\frac{(x - 4)^2}{4} - \frac{y^2}{12} = 1
\]

37. \[
\frac{(x - 5)^2}{9} - \frac{(x - 4)^2}{9} = 1
\]

41. \[
\frac{(x - 3)^2}{4} - \frac{(y - 2)^2}{4} = 1
\]

49. \[
\frac{(x - 3)^2}{4} - \frac{(y - 2)^2}{16/5} = 1
\]

51. (a) \[
\frac{x^2}{1} - \frac{y^2}{169/3} = 1
\]

(b) About 2.403 ft

53. \((3300, -2750)\)

55. (a) \[
\frac{x^2}{1} - \frac{y^2}{27} = 1; -9 \leq y \leq 9
\]

(b) 1.89 ft

57. Ellipse 59. Hyperbola 61. Hyperbola

63. Parabola 65. Ellipse 67. Parabola

69. Parabola 71. Circle

73. True. For a hyperbola, \(c^2 = a^2 + b^2\). The larger the ratio of \(b\) to \(a\), the larger the eccentricity of the hyperbola, \(e = c/a\).

75. False. When \(D = -E\), the graph is two intersecting lines.

77. Answers will vary.

79. \[
y = 1 - 3 \sqrt{\frac{(x - 3)^2}{4} - 1}
\]

81. The equation \(y = x^2 + C\) is a parabola that could intersect the circle in zero, one, two, three, or four places depending on its location on the y-axis.

(a) \(C > 2\) and \(C < -\frac{12}{7}\)

(b) \(C = 2\)

(c) \(-2 < C < 2\), \(C = -\frac{12}{7}\)

(d) \(C = -2\)

(e) \(-\frac{12}{7} < C < -2\)

Section 10.5 (page 767)

1. rotation; axes 3. invariant under rotation 5. \((3, 0)\)

7. \[
\frac{3 + \sqrt{3}}{2}, \frac{3\sqrt{3} - 1}{2}
\]

9. \[
\left(\frac{3\sqrt{3} - \sqrt{3}}{2}, -\frac{\sqrt{3}}{2}\right)
\]

11. \[
\frac{2 + \sqrt{3}}{2}, \frac{12 - \sqrt{3}}{2}
\]

13. \[
\frac{(y')^2}{2} - \frac{(x')^2}{2} = 1
\]

15. \(y' = \pm \frac{\sqrt{2}}{2}\)
43. (a) Parabola
   \( y = \frac{8x - 5 \pm \sqrt{(8x - 5)^2 - 4(16x^2 - 10x)}}{2} \)
(c) 

45. (a) Ellipse
   \( y = \frac{6x \pm \sqrt{36x^2 - 28(12x^2 - 45)}}{14} \)
(c) 

47. (a) Hyperbola
   \( y = \frac{6x \pm \sqrt{36x^2 + 20(x^2 + 4x - 22)}}{-10} \)
(c) 

49. (a) Parabola
   \( y = \frac{-4x - 1 \pm \sqrt{(4x - 1)^2 - 16(x^2 - 5x - 3)}}{8} \)
(c) 

51. 53. 

55. 

57. (2, 2), (2, 4)  59. (-8, 12)  61. (0, 8), (12, 8)  
63. (0, 4)  65. (1, \sqrt{3}), (1, -\sqrt{3})  67. No solution  
69. (0, \sqrt{2}), (-3, 0)  

71. True. The graph of the equation can be classified by finding the discriminant. For a graph to be a hyperbola, the discriminant must be greater than zero. If \( k \geq \frac{1}{4} \), then the discriminant would be less than or equal to zero.  
73. Answers will vary. 
75. Major axis: 4; Minor axis: 2  

Section 10.6 (page 774)  
1. plane curve  3. eliminating; parameter  
5. (a)

29. $y - y_1 = m(x - x_1)$

31. $\frac{(x - h)^2}{a^2} + \frac{(y - k)^2}{b^2} = 1$

33. $x = 3t$
   $y = 6t$

37. $x = 5 \cos \theta$
   $y = 3 \sin \theta$

41. (a) $x = t, y = 3t - 2$
   (b) $x = -t + 2, y = -3t + 4$

43. (a) $x = t, y = 2 - t$
   (b) $x = -t + 2, y = t$

45. (a) $x = t, y = t^2 - 3$
   (b) $x = 2 - t, y = t^2 - 4t + 1$

47. (a) $x = t, y = \frac{1}{t}$
   (b) $x = -t + 2, y = -\frac{1}{t - 2}$

59. (a) Domain: $(-\infty, \infty)$
   Range: $(-\infty, \infty)$

61. (a) Maximum height: 90.7 ft
   Range: 209.6 ft

63. (a) $x = (146.67 \cos \theta)t$
   $y = 3 + (146.67 \sin \theta)t - 16t^2$

65. Answers will vary.
67. \( x = a\theta - b \sin \theta \)  
   \( y = a - b \cos \theta \)
69. True  
   \( x = t \)  
   \( y = t^2 + 1 \implies y = x^2 + 1 \)  
   \( x = 3t \)  
   \( y = 9t^2 + 1 \implies y = x^2 + 1 \)
71. Parametric equations are useful when graphing two functions simultaneously on the same coordinate system. For example, they are useful when tracking the path of an object so that the position and the time associated with that position can be determined.
73. \(-1 < t < \infty\)

67. \( r = 4 \cos \theta \)  
69. \( r = 10 \sec \theta \)  
71. \( r = -2 \csc \theta \)  
73. \( r = \frac{3 \cos \theta - \sin \theta}{1 - \cos \theta} \)  
75. \( r^2 = 16 \sec \theta \csc \theta = 32 \sec 2\theta \)  
77. \( r = \frac{4}{1 - \cos \theta} \)  
79. \( r = a \)  
81. \( r = 2a \cos \theta \)  
83. \( r = \cot^2 \theta \csc \theta \)  
85. \( x^2 + y^2 - 4y = 0 \)  
87. \( x^2 + y^2 + 2x = 0 \)  
89. \( \sqrt{3}x + y = 0 \)  
91. \( \frac{\sqrt{3}}{3}x + y = 0 \)  
93. \( x^2 + y^2 = 16 \)  
95. \( y = 4 \)  
97. \( x = -3 \)  
99. \( x^2 + y^2 - x^{2/3} = 0 \)  
101. \( (x^2 + y^2)^2 = 2xy \)  
103. \( (x^2 + y^2)^2 = 6x^2y - 2y^3 \)  
105. \( x^2 + 4y - 4 = 0 \)  
107. \( 4x^2 - 5y^2 - 36y - 36 = 0 \)  
109. The graph of the polar equation consists of all points that are six units from the pole. \( x^2 + y^2 = 36 \)  
111. The graph of the polar equation consists of all points on the line that makes an angle of \( \pi/6 \) with the positive polar axis. \( -\sqrt{3}x + 3y = 0 \)
113. The graph of the polar equation is not evident by simple inspection, so convert to rectangular form.
\[ x^2 + (y - 1)^2 = 1 \]

115. The graph of the polar equation is not evident by simple inspection, so convert to rectangular form.
\[ (x + 3)^2 + y^2 = 9 \]

117. The graph of the polar equation is not evident by simple inspection, so convert to rectangular form.
\[ x - 3 = 0 \]

119. True. Because is a directed distance, the point \( (r, \theta) \) can be represented as \( (r, \theta \pm 2\pi n) \).

121. \( (x - h)^2 + (y - k)^2 = h^2 + k^2 \)
- Radius: \( \sqrt{h^2 + k^2} \)
- Center: \((h, k)\)

123. (a) Answers will vary.
(b) \((r_1, \theta_1), (r_2, \theta_2)\) and the pole are collinear.
\[ d = \sqrt{r_1^2 + r_2^2 - 2r_1r_2 \cos(\theta_1 - \theta_2)} \]
This represents the distance between two points on the line \( \theta = \theta_1 = \theta_2 \).
(c) \[ d = \sqrt{r_1^2 + r_2^2} \]
This is the result of the Pythagorean Theorem.
(d) Answers will vary. For example:
- Points: \((3, \pi/6), (4, \pi/3)\)
- Distance: 2.053
- Points: \((-3, 7\pi/6), (-4, 4\pi/3)\)
- Distance: 2.053

125. (a)

(b) Yes. \( \theta \approx 3.927, x = -2.121, y = -2.121 \)
(c) Yes. Answers will vary.

15. \( r = 3 \cos \theta \)
Problem Solving  \(\text{(page 807)}\)

1. (a) 1.2016 rad  \(\text{(b) } 2420 \text{ ft, } 5971 \text{ ft} \)

3. \(y^2 = 4p(x + p) \)  \(\text{5. Answers will vary.} \)

7. \[
\frac{(x - 6)^2}{9} - \frac{(y - 2)^2}{7} = 1
\]

9. (a) The first set of parametric equations models projectile motion along a straight line. The second set of parametric equations models projectile motion of an object launched at a height of \(h\) units above the ground that will eventually fall back to the ground.

(b) \(y = (\tan \theta)x; \ y = h + x \tan \theta - \frac{16x^2 \sec^2 \theta}{v_0^2} \)

(c) In the first case, the path of the moving object is not affected by a change in the velocity because eliminating the parameter removes \(v_0\).

11. (a) \(\text{The graph is a line between } -2 \text{ and } 2 \text{ on the } x\)-axis. \(\text{(b) } \text{The graph is a three-sided figure with counterclockwise orientation.} \)

(c) \(\text{The graph is a four-sided figure with counterclockwise orientation.} \)

(e) \(r = 3 \sin \left(\frac{5\theta}{2}\right) \)

(f) \(r = -\cos\left(\sqrt{2}\theta\right) \), \(-2\pi \leq \theta \leq 2\pi\)

12. (a) No. Because of the exponential, the graph will continue to trace the butterfly curve at larger values of \(r\).

(b) \(r = 4.1\). This value will increase if \(\theta\) is increased.

13. (a) \(r_{\text{Neptune}} = \frac{4.4947 \times 10^9}{1 - 0.0086 \cos \theta} \)

(b) Neptune: \(\text{Aphelion } = 4.534 \times 10^9 \text{ km} \)

\(\text{Perihelion } = 4.456 \times 10^9 \text{ km} \)

Pluto: \(\text{Aphelion } = 7.375 \times 10^9 \text{ km} \)

\(\text{Perihelion } = 4.437 \times 10^9 \text{ km} \)

(c) \(\text{(d) Yes, at times Pluto can be closer to the sun than Neptune.} \)

\(\text{Pluto was called the ninth planet because it has the longest orbit around the sun and therefore also reaches the furthest distance away from the sun.} \)

(e) If the orbits were in the same plane, then they would intersect. Furthermore, since the orbital periods differ (Neptune = 164.79 years, Pluto = 247.68 years), then the two planets would eventually collide if the orbits intersect. The orbital inclination of Pluto is significantly larger than that of Neptune (17.16° vs. 1.769°), so further analysis is required to determine if the orbits intersect. \)

49. Limit does not exist.

51. Limit does not exist.
Answers to Odd-Numbered Exercises and Tests  A203

53. 4  55. 3 – 2x  57. 2

61. 

63. 

65. m = 2x – 4; (a) –4  (b) 6

67. m = \(-\frac{4}{(x – 6)^3}\) (a) –4  (b) –1

69. f'(x) = 0  71. h'(x) = \(-\frac{3}{2}\)  73. g(x) = 4x

75. f'(i) = \left(\frac{1}{2\sqrt{i + 5}}\right)^2

79. g'(x) = \frac{1}{2(x + 4)^{3/2}}

81. (a) 0  (b) y = –1  (c)

83. 2  85. –1  87. 0

89. Limit does not exist.

91. 3

93. \(\frac{3}{15}, \frac{15}{15}, \frac{15}{15}\)  95. \(-1, \frac{1}{5}, -\frac{1}{2}, \frac{1}{5}, \frac{1}{5}\, \text{limit:}\, 3, \frac{3}{2}, \frac{3}{2}\)

99. (a) \(S(n) = \frac{n + 1)(5n + 4)}{6n^2}\)

(b) 

<table>
<thead>
<tr>
<th>n</th>
<th>10³</th>

105. 50 square units  107. 15 square units

109. 6 square units  111. \(\frac{4}{3}\) square units

113. (a) \(y = (-3.376068 \times 10^{-7})x^3 + (3.7529 \times 10^{-4})x^2 - 0.17x + 132\)

(b) 

(c) About 87,695.0 ft² (Answers will vary.)

115. False. The limit of the rational function as \(x\) approaches \(\infty\) does not exist.

Chapter Test  (page 903)

1. 

2. 

3. 

The limit does not exist.

4. 

The limit does not exist.

5.

36. $m = \frac{1}{2}(x + 3)^{-1/2}; \frac{1}{2}$
37. $m = -(x + 3)^{-2}; -\frac{1}{16}$
38. \( m = 2x - 1; 1 \)  \( 39. \) Limit does not exist.
40. Limit does not exist.  \( 41. \)  \(-7 \)  \( 42. \)  \( 3 \)  \( 43. \)  \( 0 \)
44.  \( 0 \)  \( 45. \)  \(-42.875 \)  \( 46. \)  \( 8190 \)  \( 47. \)  \( 672,880 \)
48. \( A = 10.5 \) square units  \( 49. \)  \( A = 1.566 \) square units
50.  \( \frac{1}{2} \) square unit  \( 51. \)  \( \frac{3}{2} \) square units  \( 52. \)  \( \frac{11}{2} \) square units

**Problem Solving (page 907)**

1. (a) \( g_1, g_4 \)  \( 3. \) \( g_1, g_3, g_4 \)  \( c. \) \( g_1, g_4 \)

3.

- (a) \( f(\frac{1}{2}) = [\frac{1}{2}] = 4 \)
- (b) \( \lim_{x \to 3} f(x) = 1 \)
- (c) \( f(1) = [1] = 1 \)

5. \( a = 3, b = 6 \)

7. \( \lim_{x \to 0} f(x) \) does not exist. No matter how close \( x \) is to 0, there are still an infinite number of rational and irrational numbers, so \( \lim_{x \to 0} f(x) \) does not exist.

\( \lim_{x \to 0} g(x) = 0. \) When \( x \) is close to 0, both parts of the function are close to 0.

9. \( y = 1 + 3\sqrt{x} \)

11. (a) \( d(m) = \frac{|3m + 3|}{\sqrt{m^2 + 1}} \)

(b)

(c) \( \lim_{m \to \infty} d(m) = 3, \lim_{m \to -\infty} d(m) = 3. \) This indicates that the distance between the point and the line approaches 3 as the slope approaches positive or negative infinity.

13. The error was probably due to the calculator being in degree mode rather than radian mode.

15. (a) \( A = 36 \)

(b) \( A = 36 \)

(c) Base = 6, height = 9; Area = \( \frac{1}{2}bh = 36 \)

**Appendix A**

**Appendix A.1 (page A11)**

1. rational  \( 3. \) origin \( 5. \) composite

7. variables; constants \( 9. \) coefficient

(d) \( -\frac{5}{2}, -9, 5, 0, 1, -4, 2, -11 \)  (e) \( \sqrt{2} \)

13. (a) 1  (b) 1  (c) \(-13, 1, -6 \)

(d) \( 2.01, -13, 1, -6, 0.666 \ldots \)  (e) \( 0.010110111 \ldots \)

15. (a) \( \frac{6}{5}, 8 \)  (b) \( \frac{6}{5}, 8 \)  (c) \( \frac{6}{5}, -1, 8, -22 \)

(d) \( \frac{6}{5}, -7.5, -1, 8, -22 \)  (e) \( -\pi, \frac{1}{2}\sqrt{2} \)

17. (a) \( \frac{1}{2} \)

(b) \( \frac{3}{2} \)

(c) \( \frac{5}{2} \)

(d) \( \frac{7}{2} \)

19. \( 0.625 \)  \( 21. \)  \( 0.727 \)  \( 23. \) \(-2.5 < 2 \)

25. \( -4 > -8 \)

27. \( \frac{3}{7} < 7 \)

29. \( \frac{3}{5} > \frac{2}{7} \)

31. (a) \( x \leq 5 \) denotes the set of all real numbers less than or equal to 5.

(b) \( \begin{array}{cccccccc}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
\end{array} \)  (c) Unbounded

33. (a) \( x < 0 \) denotes the set of all real numbers less than 0.

(b) \( \begin{array}{cccccccc}
-2 & -1 & 0 & 1 & 2 \\
\end{array} \)  (c) Unbounded

35. (a) \( [4, \infty) \) denotes the set of all real numbers greater than or equal to 4.

(b) \( \begin{array}{cccccccc}
1 & 2 & 3 & 4 & 5 & 6 & 7 \\
\end{array} \)  (c) Unbounded

37. (a) \( -2 < x < 2 \) denotes the set of all real numbers greater than \(-2 \) and less than 2.

(b) \( \begin{array}{cccccccc}
-2 & -1 & 0 & 1 & 2 \\
\end{array} \)  (c) Unbounded

39. (a) \(-1 \leq x < 0 \) denotes the set of all real numbers greater than or equal to \(-1 \) and less than 0.

(b) \( \begin{array}{cccccccc}
-2 & -1 & 0 & 1 & 2 \\
\end{array} \)  (c) Bounded

41. (a) \([-2, 5) \) denotes the set of all real numbers greater than or equal to \(-2 \) and less than 5.

(b) \( \begin{array}{cccccccc}
-2 & -1 & 0 & 1 & 2 & 3 & 4 & 5 \\
\end{array} \)  (c) Bounded

#### 121. (a)

<table>
<thead>
<tr>
<th>$\frac{\text{new}}{\text{old}}$</th>
<th>1</th>
<th>0.5</th>
<th>0.01</th>
<th>0.0001</th>
<th>0.000001</th>
</tr>
</thead>
<tbody>
<tr>
<td>$5/\text{new}$</td>
<td>5</td>
<td>10</td>
<td>500</td>
<td>5,000,000</td>
<td>5,000,000</td>
</tr>
</tbody>
</table>

(b) The value of $5/\text{new}$ approaches infinity as $\text{new}$ approaches 0.

#### 125.

True. Because $b < 0$, $a - b$ subtracts a negative number from (or adds a positive number to) a positive number. The sum of two positive numbers is positive.

#### 127.

False. If $a < b$, then $\frac{1}{a} > \frac{1}{b}$, where $a \neq 0$ and $b \neq 0$.

#### 129. (a) No. If one variable is negative and the other is positive, the expressions are unequal.

(b) No. $|a + v| \leq |a| + |v|

The expressions are equal when $u$ and $v$ have the same sign. If $u$ and $v$ differ in sign, $|u + v|$ is less than $|u| + |v|$.

#### 131. The only even prime number is 2, because its only factors are itself and 1.

#### 133. Yes. $|a| = -a$ if $a < 0$.
125. \( a^0 = 1, a \neq 0 \), using the property \( \frac{a^m}{a^n} = a^{m-n} \):

\[
\frac{a^m}{a^n} = a^{m-n} = a^0 = 1.
\]
127. No. A number is in scientific notation when there is only one nonzero digit to the left of the decimal point.
129. No. Rationalizing the denominator produces a number equivalent to the original fraction; squaring does not.

\hline
\text{V (cm^3)} & 384 & 63 & 720 \\
\end{array}
\]
225. \(44x + 308\)
227.
239. 241. 239. 241.

**Appendix A.4 (page A45)**

1. domain  
3. complex  
5. equivalent  
7. All real numbers  
9. All nonnegative real numbers  
11. All real numbers x such that \( x \neq 3 \)  
13. All real numbers x such that \( x \neq 1 \)  
15. All real numbers x such that \( x \neq \frac{3}{5} \)  
17. All real numbers x such that \( x \geq -7 \)  
19. All real numbers x such that \( x \geq \frac{3}{5} \)  
21. All real numbers x such that \( x > 3 \)  
23. 3x, \( x \neq 0 \)  
25. \( \frac{3x}{2} \), \( x \neq 0 \)  
27. \( \frac{3y}{2} \), \( x \neq 0 \)  
29. \( \frac{-4y}{x} \), \( x \neq 1 \)  
31. \( \frac{-1}{x} \), \( x \neq 5 \)  
33. \( y - 4 \), \( y \neq -4 \)  
35. \( \frac{x(x + 3)}{x - 2} \), \( x \neq -2 \)  
37. \( \frac{y - 4}{y + 6} \), \( y \neq 3 \)  
39. \( \frac{-y + 1}{x + 2} \), \( x \neq -2 \)  
41. \( z - 2 \)  
43. When simplifying fractions, you can only divide out common factors, not terms.

45. \[
\begin{array}{c|cccccccc}
  x & 0 & 1 & 2 & 3 & 4 & 5 & 6 \\
  \hline
  x^3 - 2x - 3 & 1 & 2 & 3 & \text{Undef} & 5 & 6 & 7 \\
  x + 1 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
\end{array}
\]

The expressions are equivalent except at \( x = 3 \).

47. \( \frac{\pi}{4} \), \( r \neq 0 \)  
49. \( \frac{1}{5(x - 2)} \), \( x \neq 1 \)  
51. \( \frac{r + 1}{r} \), \( r \neq 1 \)  
53. \( \frac{t - 3}{(t + 3)(t - 2)} \), \( t \neq 2 \)  
55. \( \frac{x(x + 6)(x + 1)}{x^3} \), \( x \neq 6, -1 \)
Appendix A.6 (page A69)

1. solution set 3. negative 5. double

27. (a) Yes (b) Yes (c) Yes (d) Yes
29. $x < 3$
31. $x < \frac{3}{2}$
33. $x \geq 12$
35. $x > 2$
37. $x \geq \frac{2}{7}$
39. $x < 5$
41. $x \geq 4$
43. $x \geq \frac{2}{3}$
45. $x \geq -4$
47. $-1 < x < 3$
49. $-2 < x \leq 5$
51. $-\frac{7}{3} < x < \frac{15}{2}$
53. $-\frac{2}{5} < x < -\frac{1}{5}$
55. $10.5 \leq x \leq 13.5$
57. $-5 < x < 5$
59. $x \leq -2, x > 2$
61. No solution
63. $14 \leq x \leq 26$
65. $x \leq \frac{2}{3}, x \geq \frac{7}{3}$
67. $x \leq -5, x \geq 11$
69. $4 < x < 5$
71. $x \leq -\frac{2}{11}, x \geq -\frac{1}{11}$
73. 
75. 
77. 
79. 
81. 
83. 
(a) $x \geq 2$
(b) $x \leq \frac{2}{7}$
85. 
(a) $-2 \leq x \leq 4$
(b) $x \leq 4$

87. 
(a) $1 \leq x \leq 5$
(b) $x \leq 1, x \geq 7$

89. $[5, \infty)$
91. $[-3, \infty)$
93. $(-\infty, \frac{1}{2}]$

95. All real numbers within eight units of 10
97. $|x| \leq 3$
99. $|x - 7| \geq 3$
101. $|x - 12| < 10$
103. $|x + 3| > 4$
105. $4.10 \leq E \leq 4.25$
107. $p \geq 0.45$
109. $100 \leq r \leq 170$
111. $9.00 + 0.75x > 13.50; x > 6$
113. $r > 3.125%$
115. $x \geq 36$
117. $160 \leq x \leq 280$
119. (a) $5$
(b) $x \geq 129$

121. (a) $1.47 \leq t \leq 10.18$ (Between 1991 and 2000)
(b) $t > 21.19$ (2011)
123. 106.864 in.$^2$ $\leq$ area $\leq 109.464$ in.$^2$
125. You might be undercharged or overcharged by $0.21.$
127. $13.7 < t < 17.5$
129. $20 \leq h \leq 80$

131. False. $c$ has to be greater than zero.
133. $b$
135. Sample answer: $x > 5$

Appendix A.7 (page A78)

1. numerator
3. Change all signs when distributing the minus sign.
   $2x - (3y + 4) = 2x - 3y - 4$
5. Change all signs when distributing the minus sign.
   \[ \frac{4}{16x - (2x + 1)} = \frac{4}{14x - 1} \]
7. $z$ occurs twice as a factor. $(5z)(6z) = 30z^2$
9. The fraction as a whole is multiplied by $a,$ not the numerator and denominator separately.
   \[ a \left( \frac{x}{y} \right) = \frac{ax}{y} \]
11. $\sqrt{x + 9}$ cannot be simplified.
13. Divide out common factors, not common terms.
   $2x^2 + 1 \frac{1}{5x}$ cannot be simplified.
15. To get rid of negative exponents:
   \[ \frac{1}{a^{-1} + b^{-1}} = \frac{1}{a^{-1} + b^{-1}} = \frac{ab}{ab} = \frac{ab}{b + a}. \]

17. Factor within grouping symbols before applying exponent to each factor.
   \[ (x^2 + 5x)^{1/2} = \frac{\sqrt{x(x + 5)}}{x} = \frac{x^{1/2}(x + 5)^{1/2}}{x(5)} \]
19. To add fractions, first find a common denominator.
   \[ \frac{3}{x} + \frac{4}{y} = \frac{3y + 4x}{xy} \]
21. To add fractions, first find a common denominator.
   \[ \frac{x}{2y} + \frac{3}{x} = \frac{3x + 2y^2}{6y} \]
23. $5x + 3$
25. $2x^2 + x + 15$
27. $\frac{1}{3}$
29. $3y - 10$
31. $2$
33. $\frac{1}{2x^2}$
35. $\frac{36}{25} \frac{4}{3}$
37. $3, 4$
39. $1 - 5x$
41. $1 - 7x$
43. $3x - 1$
45. $7(x + 3)^{-5}$
47. $2x^2(3x + 5)^{-4}$
49. $\frac{1}{3}x^{-4} + 4x^{-4} - 7x(2x)^{-1/3}$
51. $\frac{x}{3} + 2 + \frac{4}{x}$
53. $4x^3 - 7x^{5/3} + \frac{1}{x^{1/3}}$
55. $\frac{3}{x^{7/2}} + 5x^{3/2} - x^{7/2}$
57. $-7x^2 - 4x + 9$
59. $27x^2 - 24x + 2$
61. $\frac{27x^2 - 24x + 2}{(6x + 1)^2}$
63. \(\frac{(3x - 1)^{1/3}}{x^3 + 4} \)
65. \(\frac{x}{(x + 3)^{2/3}(x + 2)^{3/4}} \)
67. \(\frac{2(x^2 + 5)^{1/2}}{6}\)

69. (a) $x$
   \[ x | 0.50 | 1.0 | 1.5 | 2.0 \]
   \[ t | 1.70 | 1.72 | 1.78 | 1.89 \]
   \[ x | 2.5 | 3.0 | 3.5 | 4.0 \]
   \[ t | 2.02 | 2.18 | 2.36 | 2.57 \]
   (b) $x = 0.5$ mi
   (c) $\frac{3x\sqrt{x^2 - 8x + 20} + (x - 4)\sqrt{x^2 + 4}}{6\sqrt{x^2} + 4\sqrt{x^2 - 8x + 20}}$

71. You cannot move term-by-term from the denominator to the numerator.
### Index

#### A

**Absolute value**
- of a complex number, 468
- inequality, A67
- solution of, A67
- properties of, A6
- of a real number, A5

**Acute angle**, 281

**Addition**
- of complex numbers, 160
- of fractions
  - with like denominators, A10
  - with unlike denominators, A10
- of matrices, 585
- properties of, 587
- vector, 447, 817
- parallelogram law for, 447
- properties of, 449
- resultant of, 447

**Additive identity**
- for a complex number, 160
- for a matrix, 588
- for a real number, A8

**Additive inverse**
- for a complex number, 160
- for a real number, A8

**Adjacent side of a right triangle**, 299

**Adjoining matrices**, 601

**Algebraic expression**, A7
- domain of, A39
- equivalent, A39
- evaluate, A7
- term of, A7

**Algebraic function**, 216

**Algebraic properties of the cross product**, 825, 845

**Algebraic tests for symmetry**, 17

**Alternative definition of conic**, 791

**Alternative form of Law of Cosines**, 437, 488

**Ambiguous case (SSA)**, 430

**Amplitude of sine and cosine curves**, 321

**Analytic geometry**, solid, 810

**Angle(s)**, 280
- acute, 281
  - between two lines, 727, 728
  - between two planes, 834
  - between two vectors, 459, 490
  - in space, 818
- central, 281
- complementary, 283
- conversions between degrees and radians, 284
- coterminal, 280
  - degree measure of, 283
  - of depression, 304
  - direction, of a vector, 451
  - of elevation, 304
  - initial side of, 280
  - measure of, 281
  - negative, 280
  - obtuse, 280
  - positive, 280
  - radian measure of, 281
  - reference, 312
  - of repose, 349
  - standard position, 280
  - supplementary, 283
  - terminal side of, 280
  - vertex of, 280

**Angular speed**, 285

**Annuity**, increasing, 666

**Aphelion distance**, 749, 796

**Apogee**, 746

**“Approximately equal to” symbol**, A1

**Arc length**, 285

**Arccosine function**, 343

**Arcsine function**, 341, 343

**Arctangent function**, 343

**Area**
- common formulas for, A59
- of an oblique triangle, 432
- of a plane region, 894
- problem, 893
- of a sector of a circle, 287
- of a triangle
  - using a determinant, 619
  - Heron’s Area Formula, 440, 489

**Argument of a complex number**, 468

**Arithmetic combination of functions**, 83

**Arithmetic mean**, 650

**Arithmetic sequence**, 681
- common difference of, 651
- $n$th partial sum of, 655
- $n$th term of, 652
- recursion formula, 653
- sum of a finite, 654, 721

**Associative Property of Addition**
- for complex numbers, 161
- for matrices, 587
- for real numbers, A8

**Associative Property of Multiplication**
- for complex numbers, 161
- for matrices, 591
- for real numbers, A8

**Associative Property of Scalar Multiplication**
- for matrices, 587, 591

**Astronomical unit**, 794

**Asymptote(s)**
- horizontal, 182
- of a hyperbola, 753
- oblique, 187
- of a rational function, 183
- slant, 187
- vertical, 182

**Augmented matrix**, 571

**Average rate of change**, 59, 876

**Average value of a population**, 259

**Axis (axes)**
- conjugate, of a hyperbola, 753
- imaginary, 468
- major, of an ellipse, 742
- minor, of an ellipse, 742
- of a parabola, 127, 734
- polar, 777
- real, 468
- rotation of, 761
- of symmetry, 127
- transverse, of a hyperbola, 751

#### B

**Back-substitution**, 495

**Base**, A14
- natural, 220

**Basic conics**, 733
- circle, 733
- ellipse, 733
- hyperbola, 733
- parabola, 733

**Basic equation of a partial fraction decomposition**, 531

**Basic limits**, 855

**Basic Rules of Algebra**, A8

**Bearings**, 353

**Bell-shaped curve**, 259

**Binomial**, 681, A27
- coefficient, 681
- cube of, A29
- expanding, 684
- square of, A29
- sum and difference of same terms, A29

**Binomial Theorem**, 681, 722

**Book value**, 31

**Bound**
- lower, 174
- upper, 174

**Bounded intervals**, A4

**Boyle’s Law**, 111

**Branches of a hyperbola**, 751

**Break-even point**, 499

**Butterfly curve**, 808

in space, 818
Outcomes, 699
number of, 700

P
Parabola, 126, 734, 791
axis of, 127, 734
classifying
by discriminant, 765
by general equation, 757
directrix of, 734
eccentricity of, 791
focal chord of, 736
focus of, 734
latus rectum of, 736
least squares regression, 528
reflective property of, 736
standard form of the equation of, 734, 805
tangent line to, 736
vertex of, 127, 734
Parallel
lines, 29
planes, 834
vectors in space, 819
Parallelogram law for vector addition, 447
Parameter, 769
eliminating, 771
Parametric equations, 769
of a line in space, 831
Parent functions, 70
Parentheses, errors involving, A73
Partial fraction, 530
decomposition, 530
Partial sum, nth, 645, 655
Pascal’s Triangle, 683
Perfect
cube, A19
square, A19
square trinomial, A31, A32
Perigee, 746
Perihelion distance, 749, 796
Perimeter, common formulas for, A59
Period
of a function, 295
of sine and cosine functions, 322
Periodic function, 295
Permutation(s), 691
distinguishable, 693
of n elements, 691
taken r at a time, 692
Perpendicular
lines, 29
planes, 834
vectors, 460
Phase shift, 323
Piecewise-defined function, 42
Plane(s)
angle between two, 834
coordinate, 810
general form of the equation of, 833
parallel, 834
perpendicular, 834
in space, 833
sketching, 836
standard form of the equation of, 833
trace of, 836
Plane curve, 769
orientation of, 770
Plane region, area of, 894
Plotting, on the real number line, A2
Point(s)
break-even, 499
collinear, 12, 620, 820
test for, 620
doing diminishing returns, 148
equilibrium, 512, 543
fixed, 395
initial, 445
doing the intersection of, 498
solution, 13
terminal, 445
Point-plotting method, 13
Point-slope form of the equation of a line, 28, 32
Polar axis, 777
Polar coordinate system, 777
pole (origin) of, 777
Polar coordinates, 777
collision to rectangular, 778
tests for symmetry in, 784, 785
Polar equation, graph of, 783
Polar equations of conics, 791, 806
Polar form of a complex number, 469
Pole, 777
Polygon, diagonal of, 698
Polynomial(s), A27
without replacement, 689
Range
  of the cosine function, 295
  of a function, 39, 47
  of the sine function, 295
Rate, 30
Rate of change, 30
  average, 59, 876
  instantaneous, 876
Ratio, 30
Rational exponent, A22
Rational expression(s), A39
  improper, 151
  proper, 151
Rational function, 181
  asymptotes of, 183
  domain of, 181
  graph of, guidelines for analyzing, 184
  hole in the graph, 186
  limit of, 857
  limit at infinity, 884
  test intervals for, 184
Rational inequality, 198
  test intervals, 198
Rational number, A1
Rational Zero Test, 167
Rationalizing
  a denominator, 382, A20, A21
  a numerator, A22
Rationalizing technique for evaluating a
group of, 857
  limit at infinity, 884
  test intervals for, 184
Rational function, 181
  asymptotes of, 183
  domain of, 181
  graph of, guidelines for analyzing, 184
  hole in the graph, 186
  limit of, 857
  limit at infinity, 884
  test intervals for, 184
Rational inequality, 198
  test intervals, 198
Rational number, A1
Rational Zero Test, 167
Rationalizing
  a denominator, 382, A20, A21
  a numerator, A22
Rationalizing technique for evaluating a
limit, 863
Real axis of the complex plane, 468
Real number(s), A1
  absolute value of, A5
  classifying, A1
  division of, A8
  subset of, A1
  subtraction of, A8
Real number line, A2
  bounded intervals on, A4
  distance between two points, A6
  order on, A3
  origin of, A2
  plotting on, A2
  unbounded intervals on, A4
Real part of a complex number, 468
Real zeros of a polynomial function, 140
Reciprocal function, 68
Reciprocal identities, 302, 372
Rectangular coordinate system, 2
Rectangular coordinates, conversion to
polar, 778
Recursion formula, 653
Recursive sequence, 642
Reduced row-echelon form of a matrix,
  574
Reducible over the reals, 171
Reduction formulas, 400
Reference angle, 312
Reflection, 75
  of a trigonometric function, 322
Reflective property of a parabola, 736
Region, plane, area of, 894
Regression, least squares
  line, 103, 515
parabola, 528
Relation, 39
Relative maximum, 58
Relative minimum, 58
Remainder, uses in synthetic division, 155
Remainder Theorem, 154, 211
Repeated linear factor, 532
Repeated quadratic factor, 534
Repeated zero, 140
Representation
  of functions, 40
  of matrices, 584
Resultant of vector addition, 447
Right triangle
  adjacent side of, 299
  definitions of trigonometric functions,
    299
  hypotenuse of, 299
  opposite side of, 299
  solving, 304
Right-handed
  orientation, 810
  system, 826
Rigid transformations, 77
Root(s)
  of a complex number, 473, 474
  cube, A18
  nth, A18
  principal nth, A18
  square, A18
Rose curve, 786, 787
Rotation
  of axes, 761
  to eliminate an xy-term, 761
  invariants, 765
Row matrix, 570
  coded, 622
  uncoded, 622
Row operations, 518
  elementary, 572
Row-echelon form, 517
  of a matrix, 574
  reduced, 574
Row-equivalent matrices, 572
Rules of signs for fractions, A10
Sample space, 699
Scalar
  447, 585
  multiple, 585
  of a vector in space, 817
Scalar Identity Property for matrices, 587
Scalar multiplication
  of matrices, 585
  properties of, 587
  of a vector, 447
  properties of, 449
Scaling factor, 321
Scatter plot, 3
Scientific notation, A16
Scibner Log Rule, 503
Secant function, 293, 299
  of any angle, 310
  graph of, 333, 336
Secant line, 59, 873
Second differences, 678
Second, fractional part of a degree, 284
Second-degree polynomial equation, A52
Sector of a circle, 287
  area of, 287
Sequence, 640
  arithmetic, 651
  convergence of, 885
  divergence of, 885
  Fibonacci, 642
  finite, 640
  first differences of, 678
  geometric, 661
  infinite, 640
  limit of, 885
  nth partial sum of, 645
  recursive, 642
  second differences of, 678
  terms of, 640
Series, 645
  finite, 645
  geometric, 665
  infinite, 645
  geometric, 665
Shifting graphs, 73
Shrink
  horizontal, 77
  vertical, 77
Sierpinski Triangle, 723
Sigmoidal curve, 260
Simple harmonic motion, 354, 355
  frequency, 354
Simplest form, of an expression involving
  radicals, A20
Sine curve, 319
  amplitude of, 321
  one cycle of, 319
Sine function, 293, 299
  of any angle, 310
  common angles, 313
  domain of, 295
  graph of, 323, 336
inverse, 341, 343
period of, 322
range of, 295
special angles, 301
Sines, cosines, and tangents of special angles, 301
Singular matrix, 600
Sketching the graph of an equation by point plotting, 13
of an inequality in two variables, 538
Sketching planes in space, 836
Slant asymptote, 187
Slope, 831, 873
of a graph, 873
and inclination, 726, 804
of a line, 24, 26
Slope-intercept form of the equation of a line, 24, 32
Solid analytic geometry, 810
Solution(s), 13
of an absolute value inequality, A67
of an equation, 13, A49
extraneous, A51, A57
feasible, 549, 550
of an inequality, 538, A63
infinitely many, A50
of a linear programming problem, optimal, 549
of a linear system, number of, 520
no, A50
of a quadratic equation, 140
of a system of equations, 494
of a system of inequalities, 540
solution set, 540
Solution point, 13
Solution set
of an inequality, A63
of a system of inequalities, 540
Solving
an absolute value inequality, A67
the basic equation of a partial fraction decomposition, 535
an equation, A49
exponential and logarithmic equations, 244
an inequality, A63
a linear programming problem, 550
a polynomial inequality, 195
a quadratic equation
by completing the square, A52
by extracting square roots, A52
by factoring, A52
using the Quadratic Formula, A52
using the Square Root Principle, A52
a rational inequality, 198
right triangles, 304
a system of equations, 494
Cramer’s Rule, 616, 617
Gaussian elimination, 518, 519
with back-substitution, 576
Gauss-Jordan elimination, 577
graphical method, 498
method of elimination, 505, 506
method of substitution, 494
a trigonometric equation, 387
Space
Distance Formula in, 811
lines in, 831
Midpoint Formula in, 811
planes in, 833
sketching, 836
surface in, 813
vector in, 817
Special angles
cosines of, 301
sines of, 301
tangents of, 301
Special products, A29
Speed
angular, 285
linear, 285
Sphere, 812
standard equation of, 812
Square
of a binomial, A29
of trigonometric functions, 405
Square matrix, 570
determinant of, 608, 611
diagonal, 615
idempotent, 637
lower triangular, 615
main diagonal entries of, 570
minors and cofactors of, 610
triangular, 615
upper triangular, 615
Square root(s), A18
extracting, A52
function, 68
of a negative number, 163
principal, of a negative number, 163
Square Root Principle, A52
Square system of linear equations, 522
Squaring function, 67
Standard equation of a sphere, 812
Standard form
of a complex number, 159
of the equation
of a circle, 19
of an ellipse, 743
of a hyperbola, 751
of a parabola, 734, 805
of a plane, 833
of Law of Cosines, 437, 488
of a polynomial, A27
of a polynomial function, 139
of a quadratic function, 129
Standard position
of an angle, 280
of a vector, 446
Standard unit vector, 450
notation in space, 817
Step function, 69
Stochastic matrix, 597
Straight-line depreciation, 31
Strategies for solving exponential and logarithmic equations, 244
Stretch
horizontal, 77
vertical, 77
Strophoid, 808
Subsets, A1
Substitution
direct, to evaluate a limit, 855
method of, 494
Substitution Principle, A7
Subtraction
of complex numbers, 160
of fractions
with like denominators, A10
with unlike denominators, A10
of matrices, 586
of real numbers, A8
Sum(s)
of complex numbers, 160
of a finite arithmetic sequence, 654, 721
of a finite geometric sequence, 664, 721
of functions, 83
of an infinite geometric series, 665
limit of, 855
nth partial, 645, 665
of powers of integers, 677
properties of, 645, 720
of square differences, 103
of two cubes, A31
of vectors, 447
in space, 817
Sum and difference formulas, 398, 422
Sum and difference of same terms, A29
Summary
of equations of lines, 32
of function terminology, 47
Summation
formulas and properties, 890
index of, 644
limit of, 890
lower limit of, 644
notation, 644
upper limit of, 644
Sum-to-product formulas, 410, 424
Supplementary angles, 282
Surface in space, 813
trace of, 814
Surplus
consumer, 543
producer, 543
Symbol
“approximately equal to”, A1

radical, A18
union, A67
Symmetric equations of a line in space, 831
Symmetry, 17
algebraic tests for, 17
axis of, of a parabola, 127
graphical tests for, 17
in polar coordinates, tests for, 784, 785
with respect to the origin, 17
with respect to the -axis, 17
with respect to the -axis, 17
Synthetic division, 153
uses of the remainder in, 155
System of equations, 494
equivalent, 507, 518
solution of, 494
solving, 494
with a unique solution, 604
System of inequalities, solution of, 540
solution set, 540
System of linear equations
consistent, 508
dependent, 508
inconsistent, 508, 576
independent, 508
square, 522
row operations, 518
row-echelon form, 517
nonsquare, 522
number of solutions, 520
System of inequalities, solution of, 540
solution set, 540
System of linear equations
consistent, 508
dependent, 508
inconsistent, 508, 576
independent, 508
square, 522
row operations, 518
row-echelon form, 517
nonsquare, 522
number of solutions, 520
Triangle
area of
using a determinant, 619
Heron’s Area Formula, 440, 489
oblique, 428
area of, 432
Triangular matrix, 615
Trigonometric equations, solving, 387
Trigonometric form of a complex number, 469
argument of, 469
modulus of, 469
Trigonometric functions, 293, 299, 310
of any angle, 310
evaluating, 313
cosecant, 293, 299, 310
cosine, 293, 299, 310
cotangent, 293, 299, 310
even, 296
horizontal shrink of, 322
horizontal stretch of, 322
vertical shrink of, 321
vertical stretch of, 321
vertical translation of, 324
Trigonometric identities
cofunction, 372
even/odd, 372
fundamental, 302, 372
guidelines for verifying, 380
Pythagorean, 302, 372

Definition of the Six Trigonometric Functions

Right triangle definitions, where $0 < \theta < \pi/2$

- \( \sin \theta = \frac{\text{opp.}}{\text{hyp.}} \)
- \( \cos \theta = \frac{\text{adj.}}{\text{hyp.}} \)
- \( \tan \theta = \frac{\text{opp.}}{\text{adj.}} \)

Circular function definitions, where $\theta$ is any angle

- \( \sin \theta = \frac{y}{r} \)
- \( \cos \theta = \frac{x}{r} \)
- \( \tan \theta = \frac{y}{x} \)

Reciprocal Identities

- \( \sin u = \frac{1}{\csc u} \)
- \( \csc u = \frac{1}{\sin u} \)
- \( \cos u = \frac{1}{\sec u} \)
- \( \sec u = \frac{1}{\cos u} \)
- \( \tan u = \frac{1}{\cot u} \)
- \( \cot u = \frac{1}{\tan u} \)

Pythagorean Identities

- \( \sin^2 u + \cos^2 u = 1 \)
- \( 1 + \tan^2 u = \sec^2 u \)
- \( 1 + \cot^2 u = \csc^2 u \)

Cofunction Identities

- \( \sin \left( \frac{\pi}{2} - u \right) = \cos u \)
- \( \cos \left( \frac{\pi}{2} - u \right) = \sin u \)
- \( \tan \left( \frac{\pi}{2} - u \right) = \cot u \)

Even/Odd Identities

- \( \sin(-u) = -\sin u \)
- \( \cos(-u) = \cos u \)
- \( \tan(-u) = -\tan u \)

Sum and Difference Formulas

- \( \sin(u \pm v) = \sin u \cos v \pm \cos u \sin v \)
- \( \cos(u \pm v) = \cos u \cos v \mp \sin u \sin v \)
- \( \tan(u \pm v) = \frac{\tan u \pm \tan v}{1 \mp \tan u \tan v} \)

Double-Angle Formulas

- \( \sin 2u = 2 \sin u \cos u \)
- \( \cos 2u = \cos^2 u - \sin^2 u = 2 \cos^2 u - 1 = 1 - 2 \sin^2 u \)
- \( \tan 2u = \frac{2 \tan u}{1 - \tan^2 u} \)

Power-Reducing Formulas

- \( \sin^2 u = \frac{1 - \cos 2u}{2} \)
- \( \cos^2 u = \frac{1 + \cos 2u}{2} \)
- \( \tan^2 u = \frac{1 - \cos 2u}{1 + \cos 2u} \)

Sum-to-Product Formulas

- \( \sin u + \sin v = 2 \sin \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right) \)
- \( \sin u - \sin v = 2 \cos \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right) \)
- \( \cos u + \cos v = 2 \cos \left( \frac{u + v}{2} \right) \cos \left( \frac{u - v}{2} \right) \)
- \( \cos u - \cos v = -2 \sin \left( \frac{u + v}{2} \right) \sin \left( \frac{u - v}{2} \right) \)

Product-to-Sum Formulas

- \( \sin u \sin v = \frac{1}{2} \left[ \cos(u - v) - \cos(u + v) \right] \)
- \( \cos u \cos v = \frac{1}{2} \left[ \cos(u - v) + \cos(u + v) \right] \)
- \( \sin u \cos v = \frac{1}{2} \left[ \sin(u + v) + \sin(u - v) \right] \)
- \( \cos u \sin v = \frac{1}{2} \left[ \sin(u + v) - \sin(u - v) \right] \)

Factors and Zeros of Polynomials:
Given the polynomial \( p(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0 \). If \( p(b) = 0 \), then \( b \) is a zero of the polynomial and a solution of the equation \( p(x) = 0 \). Furthermore, \( (x - b) \) is a factor of the polynomial.

Fundamental Theorem of Algebra: An \( n \)th degree polynomial has \( n \) (not necessarily distinct) zeros.

Quadratic Formula: If \( p(x) = ax^2 + bx + c, a \neq 0 \) and \( b^2 - 4ac \geq 0 \), then the real zeros of \( p \) are
\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.
\]

### Special Factors:
- \( x^2 - a^2 = (x - a)(x + a) \)
- \( x^3 - a^3 = (x - a)(x^2 + ax + a^2) \)
- \( x^3 + a^3 = (x + a)(x^2 - ax + a^2) \)
- \( x^4 - a^4 = (x - a)(x + a)(x^2 + a^2) \)
- \( x^4 + a^4 = (x^2 + \sqrt{2}ax + a^2)(x^2 - \sqrt{2}ax + a^2) \)
- \( x^n - a^n = (x - a)(x^{n-1} + ax^{n-2} + \cdots + a^{n-1}), \text{ for } n \text{ odd} \)
- \( x^n + a^n = (x + a)(x^{n-1} - ax^{n-2} + \cdots + a^{n-1}), \text{ for } n \text{ odd} \)

Examples
- \( x^2 - 9 = (x - 3)(x + 3) \)
- \( x^3 - 8 = (x - 2)(x^2 + 2x + 4) \)
- \( x^3 + 4 = (x + \sqrt[3]{4})(x^2 - \sqrt[3]{4}x + \sqrt[3]{16}) \)
- \( x^4 - 4 = (x - \sqrt{2})(x + \sqrt{2})(x^2 + 2) \)
- \( x^4 + 4 = (x^2 + 2x + 2)(x^2 - 2x + 2) \)
- \( x^5 - 1 = (x - 1)(x^4 + x^3 + x^2 + x + 1) \)
- \( x^7 + 1 = (x + 1)(x^6 - x^5 + x^4 - x^3 + x^2 - x + 1) \)
- \( x^6 - 1 = (x^3 - 1)(x^3 + 1) \)

### Binomial Theorem:
- \( (x + a)^2 = x^2 + 2ax + a^2 \)
- \( (x - a)^2 = x^2 - 2ax + a^2 \)
- \( (x + a)^3 = x^3 + 3ax^2 + 3a^2x + a^3 \)
- \( (x - a)^3 = x^3 - 3ax^2 + 3a^2x - a^3 \)
- \( (x + a)^4 = x^4 + 4ax^3 + 6a^2x^2 + 4a^3 + a^4 \)
- \( (x - a)^4 = x^4 - 4ax^3 + 6a^2x^2 - 4a^3x + a^4 \)
- \( (x + a)^n = x^n + nax^{n-1} + \frac{n(n-1)}{2!}a^2x^{n-2} + \cdots + na^{n-1}x + a^n \)
- \( (x - a)^n = x^n - nax^{n-1} + \frac{n(n-1)}{2!}a^2x^{n-2} - \cdots \pm na^{n-1}x \mp a^n \)

Examples
- \( (x + 3)^2 = x^2 + 6x + 9 \)
- \( (x - 5)^2 = x^2 - 10x + 25 \)
- \( (x + 2)^3 = x^3 + 6x^2 + 12x + 8 \)
- \( (x - 1)^3 = x^3 - 3x^2 + 3x - 1 \)
- \( (x + \sqrt{2})^4 = x^4 + 4\sqrt{2}x^3 + 12x^2 + 8\sqrt{2}x + 4 \)
- \( (x - 4)^4 = x^4 - 16x^3 + 96x^2 - 256x + 256 \)
- \( (x + 1)^5 = x^5 + 5x^4 + 10x^3 + 10x^2 + 5x + 1 \)
- \( (x - 1)^6 = x^6 - 6x^5 + 15x^4 - 20x^3 + 15x^2 - 6x + 1 \)

### Rational Zero Test: If \( p(x) = a_nx^n + a_{n-1}x^{n-1} + \cdots + a_1x + a_0 \) has integer coefficients, then every rational zero of \( p(x) = 0 \) is of the form \( x = r/s \), where \( r \) is a factor of \( a_0 \) and \( s \) is a factor of \( a_n \).

### Exponents and Radicals:
- \( a^0 = 1, \ a \neq 0 \)
- \( a^{-r} = \frac{1}{a^r} \)
- \( (a^r)^s = a^{rs} \)
- \( a^r a^s = a^{r+s} \)
- \( \frac{a^r}{a^s} = a^{r-s} \)
- \( \sqrt[n]{a} = a^\frac{1}{n} \)
- \( \sqrt[n]{a^m} = (\sqrt[n]{a})^m = a^{m/n} \)
- \( \sqrt[n]{ab} = \sqrt[n]{a} \sqrt[n]{b} \)
- \( \sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}} \)
